LESS WATER, MORE HEAT, DRY FIREWOOD IS HARD TO BEAT

SPLIT
- Split wood dries faster
- Start with the right length wood
- Split wood in different sizes to fit your stove but no larger than 6 inches in diameter

STACK
- Stack wood to allow air to circulate
- Keep wood off the ground by stacking on rails
- Stack wood in a single row with the split side down

Cover
- Cover top of stack to protect it from rain or snow
- Ensure there is space between the cover and stacked wood—don’t let the cover rest directly on top

Store
- Allow time to dry—softwoods take 6 months; hardwoods take 12 months
- Use a moisture meter to ensure wood is dry (20% or less, it’s ready to burn)
