(a) The owner or operator subject to the provisions of this subpart shall conduct a performance test and submit to the Administrator a written report of the results of the test as specified in §60.8(a).

(b) During the initial performance test of a wet scrubber, and at least weekly thereafter, the owner or operator shall record the measurements of both the change in pressure of the gas stream across the scrubber and the scrubbing liquid flow rate.

(c) After the initial performance test of a wet scrubber, the owner or operator shall submit semiannual reports to the Administrator of occurrences when the measurements of the scrubber pressure loss (or gain) or liquid flow rate differ by more than ±30 percent from the average obtained during the most recent performance test.

(d) The reports required under paragraph (c) shall be postmarked within 30 days following the end of the second and fourth calendar quarters.

(e) The requirements of this subsection remain in force until and unless the Agency, in delegating enforcement authority to a State under section 111(c) of the Act, approves reporting requirements or an alternative means of compliance surveillance adopted by such States. In that event, affected sources within the State will be relieved of the obligation to comply with this subsection, provided that they comply with requirements established by the State.

[49 FR 6464, Feb. 21, 1984, as amended at 54 FR 6676, Feb. 14, 1989; 65 FR 61760, Oct. 17, 2000]

§60.385(a) will apply to the Stibnite Gold Project affected facilities subject to this subpart, and therefore Midas Gold will be required to submit written reports of the results of the performance tests conducted.

§60.385(b)-(d) will not apply as Midas Gold is not proposing the use of a wet scrubber on the affected facilities subject to this subpart.

§60.385(e) will apply to the Stibnite Gold Project affected facilities subject to this subpart and will serve as informative.

§60.386 Test methods and procedures.

(a) In conducting the performance tests required in §60.8, the owner or operator shall use as reference methods and procedures the test methods in appendix A of this part or other methods and procedures as specified in this section, except as provided in §60.8(b).

(b) The owner or operator shall determine compliance with the particulate matter standards §60.382 as follows:

~~(1) Method 5 or 17 shall be used to determine the particulate matter concentration. The sample volume for each run shall be at least 1.70 dscm (60 dscf). The sampling probe and filter holder of Method 5 may be operated without heaters if the gas stream being sampled is at ambient temperature. For gas streams above ambient temperature, the Method 5 sampling train shall be operated with a probe and filter temperature slightly above the effluent temperature (up to a maximum filter temperature of 121 °C (250 °F)) in order to prevent water condensation on the filter.~~

(2) Method 9 and the procedures in §60.11 shall be used to determine opacity from ~~stack emissions and~~ process fugitive emissions. The observer shall read opacity only when emissions are clearly identified as emanating solely from the affected facility being observed. A single visible emission observer may conduct visible emission observations for up to three fugitive, ~~stack, or vent~~ emission points within a 15-second interval. This option is subject to the following limitations:

(i) No more than three emission points are read concurrently;

(ii) All three emission points must be within a 70° viewing sector or angle in front of the observer such that the proper sun position can be maintained for all three points; and

(iii) If an opacity reading for any one of the three emission points is within 5 percent opacity of the application standard, then the observer must stop taking readings for the other two points and continue reading just that single point.

~~(c) To comply with §60.385(c), the owner or operator shall use the monitoring devices in §60.384(a) and (b) to determine the pressure loss of the gas stream through the scrubber and scrubbing liquid flow rate at any time during each particulate matter run, and the average of the three determinations shall be computed.~~

[54 FR 6676, Feb. 14, 1989, as amended at 65 FR 61760, Oct. 17, 2000; 79 FR 11250, Feb. 27, 2014]

§60.386(a) and (b)(2) will apply to the Stibnite Gold Project affected facilities subject to this subpart and Midas Gold will be required to conduct performance test using the specified test methods and procedures.

§60.386(b)(1) will not apply as the Stibnite Gold Project affected facilities subject to this subpart are not subject to the PM concentration standard in §60.382(a), and therefore Midas Gold will not be required to conduct a performance test to determine PM concentration.

§60.386(c) will not apply as Midas Gold is not proposing the use of a wet scrubber on the affected facilities subject to this subpart and is therefore not subject to §60.385(c).

SOURCE: 74 FR 19309, Apr. 28, 2009, unless otherwise noted.

§60.670 Applicability and designation of affected facility.

(a)(1) Except as provided in paragraphs (a)(2), (b), (c), and (d) of this section, the provisions of this subpart are applicable to the following affected facilities in fixed or portable nonmetallic mineral processing plants: each crusher, grinding mill, screening operation, ~~bucket elevator,~~ belt conveyor, ~~bagging operation,~~ storage bin, ~~enclosed truck or railcar loading station~~. ~~Also, crushers and grinding mills at hot mix asphalt facilities that reduce the size of nonmetallic minerals embedded in recycled asphalt pavement and subsequent affected facilities up to, but not including, the first storage silo or bin are subject to the provisions of this subpart.~~

~~(2) The provisions of this subpart do not apply to the following operations: All facilities located in underground mines; plants without crushers or grinding mills above ground; and wet material processing operations (as defined in §60.671).~~

~~(b) An affected facility that is subject to the provisions of subparts F or I of this part or that follows in the plant process any facility subject to the provisions of subparts F or I of this part is not subject to the provisions of this subpart.~~

(c) Facilities at the following plants are not subject to the provisions of this subpart:

~~(1) Fixed sand and gravel plants and crushed stone plants with capacities, as defined in §60.671, of 23 megagrams per hour (25 tons per hour) or less;~~

(2) Portable sand and gravel plants and crushed stone plants with capacities, as defined in §60.671, of 136 megagrams per hour (150 tons per hour) or less; and

~~(3) Common clay plants and pumice plants with capacities, as defined in §60.671, of 9 megagrams per hour (10 tons per hour) or less.~~

~~(d)(1) When an existing facility is replaced by a piece of equipment of equal or smaller size, as defined in §60.671, having the same function as the existing facility, and there is no increase in the amount of emissions, the new facility is exempt from the provisions of §§60.672, 60.674, and 60.675 except as provided for in paragraph (d)(3) of this section.~~

~~(2) An owner or operator complying with paragraph (d)(1) of this section shall submit the information required in §60.676(a).~~

~~(3) An owner or operator replacing all existing facilities in a production line with new facilities does not qualify for the exemption described in paragraph (d)(1) of this section and must comply with the provisions of §§60.672, 60.674 and 60.675.~~

(e) An affected facility under paragraph (a) of this section that commences construction, ~~modification, or reconstruction~~ after August 31, 1983, is subject to the requirements of this part.

(f) Table 1 of this subpart specifies the provisions of subpart A of this part 60 that do not apply to owners and operators of affected facilities subject to this subpart or that apply with certain exceptions.

Midas Gold is proposing to operate a nonmetallic mineral processing plant at the Stibnite Gold Project, where they will process limestone. Therefore, the provisions of this subpart will apply per §60.670(a)(1). The limestone mineral processing will consist of a primary and secondary crusher, a primary and secondary screening operation, a ball mill, storage bins and conveyors. The proposed nonmetallic mineral processing plants will be subject to the requirements of this subpart as it will commence construction after August 31, 1983 per §60.670(e). Table 1 of this subpart provides exceptions to applicability per §60.670(f).
In addition, certain construction and maintenance activities during operations may require sized aggregate. To allow for the operational flexibility to produce construction aggregate onsite, Midas Gold is including two portable crushing and screening plants in this application. Each portable plant may include primary and secondary crushers and screens, and multiple conveyors. Each portable plant will be rated at less than 150 ton/hr and therefore exempt from requirements of this subpart per §60.670(c)(2).

§60.671 Definitions.

All terms used in this subpart, but not specifically defined in this section, shall have the meaning given them in the Act and in subpart A of this part.

~~*Bagging operation* means the mechanical process by which bags are filled with nonmetallic minerals.~~

Belt conveyor means a conveying device that transports material from one location to another by means of an endless belt that is carried on a series of idlers and routed around a pulley at each end.

~~*Bucket elevator* means a conveying device of nonmetallic minerals consisting of a head and foot assembly which supports and drives an endless single or double strand chain or belt to which buckets are attached.~~

Building means any frame structure with a roof.

Capacity means the cumulative rated capacity of all initial crushers that are part of the plant.

Capture system means the equipment (including enclosures, hoods, ducts, fans, dampers, etc.) used to capture and transport particulate matter generated by one or more affected facilities to a control device.

Control device means the air pollution control equipment used to reduce particulate matter emissions released to the atmosphere from one or more affected facilities at a nonmetallic mineral processing plant.

Conveying system means a device for transporting materials from one piece of equipment or location to another location within a plant. Conveying systems include but are not limited to the following: Feeders, belt conveyors, bucket elevators and pneumatic systems.

Crush or *Crushing* means to reduce the size of nonmetallic mineral material by means of physical impaction of the crusher or grinding mill upon the material.

Crusher means a machine used to crush any nonmetallic minerals, and includes, but is not limited to, the following types: Jaw, gyratory, cone, roll, rod mill, hammermill, and impactor.

~~*Enclosed truck or railcar loading station* means that portion of a nonmetallic mineral processing plant where nonmetallic minerals are loaded by an enclosed conveying system into enclosed trucks or railcars.~~

Fixed plant means any nonmetallic mineral processing plant at which the processing equipment specified in §60.670(a) is attached by a cable, chain, turnbuckle, bolt or other means (except electrical connections) to any anchor, slab, or structure including bedrock.

Fugitive emission means particulate matter that is not collected by a capture system and is released to the atmosphere at the point of generation.

Grinding mill means a machine used for the wet or dry fine crushing of any nonmetallic mineral. Grinding mills include, but are not limited to, the following types: Hammer, roller, rod, pebble and ball, and fluid energy. The grinding mill includes the air conveying system, air separator, or air classifier, where such systems are used.

Initial crusher means any crusher into which nonmetallic minerals can be fed without prior crushing in the plant.

Nonmetallic mineral means any of the following minerals or any mixture of which the majority is any of the following minerals:

~~(1)~~ Crushed and Broken Stone, including Limestone, ~~Dolomite, Granite, Traprock, Sandstone, Quartz, Quartzite, Marl, Marble, Slate, Shale, Oil Shale, and Shell.~~

~~(2) Sand and Gravel.~~

~~(3) Clay including Kaolin, Fireclay, Bentonite, Fuller's Earth, Ball Clay, and Common Clay.~~

~~(4) Rock Salt.~~

~~(5) Gypsum (natural orsynthetic).~~

~~(6) Sodium Compounds, including Sodium Carbonate, Sodium Chloride, and Sodium Sulfate.~~

~~(7) Pumice.~~

~~(8) Gilsonite.~~

~~(9) Talc and Pyrophyllite.~~

~~(10) Boron, including Borax, Kernite, and Colemanite.~~

~~(11) Barite.~~

~~(12) Fluorospar.~~

~~(13) Feldspar.~~

~~(14) Diatomite.~~

~~(15) Perlite.~~

~~(16) Vermiculite.~~

~~(17) Mica.~~

~~(18) Kyanite, including Andalusite, Sillimanite, Topaz, and Dumortierite.~~

Nonmetallic mineral processing plant means any combination of equipment that is used to crush or grind any nonmetallic mineral wherever located, including lime plants, ~~power plants, steel mills, asphalt concrete plants, portland cement plants, or any other facility processing nonmetallic minerals except as provided in §60.670 (b) and (c).~~

~~*Portable plant* means any nonmetallic mineral processing plant that is mounted on any chassis or skids and may be moved by the application of a lifting or pulling force. In addition, there shall be no cable, chain, turnbuckle, bolt or other means (except electrical connections) by which any piece of equipment is attached or clamped to any anchor, slab, or structure, including bedrock that must be removed prior to the application of a lifting or pulling force for the purpose of transporting the unit.~~

Production line means all affected facilities (crushers, grinding mills, screening operations, ~~bucket elevators,~~ belt conveyors, ~~bagging operations,~~ storage bins, ~~and enclosed truck and railcar loading stations~~) which are directly connected or are connected together by a conveying system.

Saturated material means, for purposes of this subpart, mineral material with sufficient surface moisture such that particulate matter emissions are not generated from processing of the material through screening operations, bucket elevators and belt conveyors. Material that is wetted solely by wet suppression systems is not considered to be “saturated” for purposes of this definition.

Screening operation means a device for separating material according to size by passing undersize material through one or more mesh surfaces (screens) in series, and retaining oversize material on the mesh surfaces (screens). Grizzly feeders associated with truck dumping and static (non-moving) grizzlies used anywhere in the nonmetallic mineral processing plant are not considered to be screening operations.

~~*Seasonal shut down* means shut down of an affected facility for a period of at least 45 consecutive days due to weather or seasonal market conditions.~~

Size means the rated capacity in tons per hour of a crusher, grinding mill, ~~bucket elevator, bagging operation, or enclosed~~

~~truck or railcar loading station;~~ the total surface area of the top screen of a screening operation; the width of a conveyor belt; and the rated capacity in tons of a storage bin.

Stack emission means the particulate matter that is released to the atmosphere from a capture system.

Storage bin means a facility for storage (including surge bins) of nonmetallic minerals prior to further processing or loading.

Transfer point means a point in a conveying operation where the nonmetallic mineral is transferred to or from a belt conveyor except where the nonmetallic mineral is being transferred to a stockpile.

Truck dumping means the unloading of nonmetallic minerals from movable vehicles designed to transport nonmetallic minerals from one location to another. Movable vehicles include but are not limited to: Trucks, front end loaders, skip hoists, and railcars.

Vent means an opening through which there is mechanically induced air flow for the purpose of exhausting from a building air carrying particulate matter emissions from one or more affected facilities.

~~*Wet material processing operation(s)* means any of the following:~~

~~(1) Wet screening operations (as defined in this section) and subsequent screening operations, bucket elevators and belt conveyors in the production line that process saturated materials (as defined in this section) up to the first crusher, grinding mill or storage bin in the production line; or~~

~~(2) Screening operations, bucket elevators and belt conveyors in the production line downstream of wet mining operations (as defined in this section) that process saturated materials (as defined in this section) up to the first crusher, grinding mill or storage bin in the production line.~~

~~*Wet mining operation* means a mining or dredging operation designed and operated to extract any nonmetallic mineral regulated under this subpart from deposits existing at or below the water table, where the nonmetallic mineral is saturated with water.~~

~~*Wet screening operation* means a screening operation at a nonmetallic mineral processing plant which removes unwanted material or which separates marketable fines from the product by a washing process which is designed and operated at all times such that the product is saturated with water.~~

The highlighted definitions in §60.671 will apply to the Stibnite Gold Project affected facilities subject to this subpart.

§60.672 Standard for particulate matter (PM).

(a) Affected facilities must meet the stack emission limits and compliance requirements in Table 2 of this subpart within 60 days after achieving the maximum production rate at which the affected facility will be operated, but not later than 180 days after initial startup as required under §60.8. The requirements in Table 2 of this subpart apply for affected facilities with capture systems used to capture and transport particulate matter to a control device.

(b) Affected facilities must meet the fugitive emission limits and compliance requirements in Table 3 of this subpart within 60 days after achieving the maximum production rate at which the affected facility will be operated, but not later than 180 days after initial startup as required under §60.11. The requirements in Table 3 of this subpart apply for fugitive emissions from affected facilities without capture systems and for fugitive emissions escaping capture systems.

~~(c) [Reserved]~~

(d) Truck dumping of nonmetallic minerals into any screening operation, feed hopper, or crusher is exempt from the requirements of this section.

(e) If any transfer point on a conveyor belt or any other affected facility is enclosed in a building, then each enclosed affected facility must comply with the emission limits in paragraphs (a) and (b) of this section, or the building enclosing the affected facility or facilities must comply with the following emission limits:

(1) Fugitive emissions from the building openings (except for vents as defined in §60.671) must not exceed 7 percent opacity; and

(2) Vents (as defined in §60.671) in the building must meet the applicable stack emission limits and compliance requirements in Table 2 of this subpart.

~~(f) Any baghouse that controls emissions from only an individual, enclosed storage bin is exempt from the applicable stack PM concentration limit (and associated performance testing) in Table 2 of this subpart but must meet the applicable stack opacity limit and compliance requirements in Table 2 of this subpart. This exemption from the stack PM concentration limit does~~

not apply for multiple storage bins with combined stack emissions.

The Stibnite Gold Project Limestone Ball Mill (Source ID LSBM) affected facility will be subject to the stack emission limits and compliance requirements in Table 2 of this subpart as required by §60.672(a), within 60 days after achieving the maximum production rate, but no later than 180 days after initial startup.

Except as discussed below, all other affected facilities in the Stibnite Gold Project nonmetallic mineral processing plant will be subject to the fugitive emission limits and compliance requirements in Table 3 of this subpart as required by §60.672(b), within 60 days after achieving the maximum production rate, but no later than 180 days after initial startup.

§60.672(d) will apply to the Limestone transfer to Primary Crusher Hopper (Source ID LS1), which will therefore be exempt from the particulate matter standards in this subpart.

§60.672(e) will apply to any Stibnite Gold Project affected facility subject to this subpart that is enclosed in a building. Per §60.672(e), any such affected facility must comply with the stated standards individually, or the building enclosing the affected facilities must comply with the standards in §60.672(e)(1) or (2), as applicable.

§60.672(f) will not apply as Midas Gold is not proposing the use of a baghouse on an individual, enclosed storage bin.

§60.673 Reconstruction.

(a) The cost of replacement of ore-contact surfaces on processing equipment shall not be considered in calculating either the "fixed capital cost of the new components" or the "fixed capital cost that would be required to construct a comparable new facility" under §60.15. Ore-contact surfaces are crushing surfaces; screen meshes, bars, and plates; conveyor belts; and elevator buckets.

(b) Under §60.15, the "fixed capital cost of the new components" includes the fixed capital cost of all depreciable components (except components specified in paragraph (a) of this section) which are or will be replaced pursuant to all continuous programs of component replacement commenced within any 2-year period following August 31, 1983.

§60.673 will not apply as the Stibnite Gold Project affected facilities are not being reconstructed.

§60.674 Monitoring of operations.

(a) The owner or operator of any affected facility subject to the provisions of this subpart which uses a wet scrubber to control emissions shall install, calibrate, maintain and operate the following monitoring devices:

(1) A device for the continuous measurement of the pressure loss of the gas stream through the scrubber. The monitoring device must be certified by the manufacturer to be accurate within ±250 pascals ±1 inch water gauge pressure and must be calibrated on an annual basis in accordance with manufacturer's instructions.

(2) A device for the continuous measurement of the scrubbing liquid flow rate to the wet scrubber. The monitoring device must be certified by the manufacturer to be accurate within ±5 percent of design scrubbing liquid flow rate and must be calibrated on an annual basis in accordance with manufacturer's instructions.

(b) The owner or operator of any affected facility for which construction, modification, or reconstruction commenced on or after April 22, 2008, that uses wet suppression to control emissions from the affected facility must perform monthly periodic inspections to check that water is flowing to discharge spray nozzles in the wet suppression system. The owner or operator must initiate corrective action within 24 hours and complete corrective action as expediently as practical if the owner or operator finds that water is not flowing properly during an inspection of the water spray nozzles. The owner or operator must record each inspection of the water spray nozzles, including the date of each inspection and any corrective actions taken, in the logbook required under §60.676(b).

(1) If an affected facility relies on water carryover from upstream water sprays to control fugitive emissions, then that affected facility is exempt from the 5-year repeat testing requirement specified in Table 3 of this subpart provided that the affected facility meets the criteria in paragraphs (b)(1)(i) and (ii) of this section:

(i) The owner or operator of the affected facility conducts periodic inspections of the upstream water spray(s) that are responsible for controlling fugitive emissions from the affected facility. These inspections are conducted according to paragraph (b) of this section and §60.676(b), and

(ii) The owner or operator of the affected facility designates which upstream water spray(s) will be periodically inspected at the time of the initial performance test required under §60.11 of this part and §60.675 of this subpart.

(2) If an affected facility that routinely uses wet suppression water sprays ceases operation of the water sprays or is using a control mechanism to reduce fugitive emissions other than water sprays during the monthly inspection (for example, water from recent rainfall), the logbook entry required under §60.676(b) must specify the control mechanism being used instead of the water sprays.

(c) Except as specified in paragraph (d) ~~or (e)~~ of this section, the owner or operator of any affected facility for which construction, ~~modification, or reconstruction~~ commenced on or after April 22, 2008, that uses a baghouse to control emissions must conduct quarterly 30-minute visible emissions inspections using EPA Method 22 (40 CFR part 60, appendix A-7). The Method 22 (40 CFR part 60, appendix A-7) test shall be conducted while the baghouse is operating. The test is successful if no visible emissions are observed. If any visible emissions are observed, the owner or operator of the affected facility must initiate corrective action within 24 hours to return the baghouse to normal operation. The owner or operator must record each Method 22 (40 CFR part 60, appendix A-7) test, including the date and any corrective actions taken, in the logbook required under §60.676(b). The owner or operator of the affected facility may establish a different baghouse-specific success level for the visible emissions test (other than no visible emissions) by conducting a PM performance test according to §60.675(b) simultaneously with a Method 22 (40 CFR part 60, appendix A-7) to determine what constitutes normal visible emissions from that affected facility's baghouse when it is in compliance with the applicable PM concentration limit in Table 2 of this subpart. The revised visible emissions success level must be incorporated into the permit for the affected facility.

(d) As an alternative to the periodic Method 22 (40 CFR part 60, appendix A-7) visible emissions inspections specified in paragraph (c) of this section, the owner or operator of any affected facility for which construction~~, modification, or reconstruction~~ commenced on or after April 22, 2008, that uses a baghouse to control emissions may use a bag leak detection system. The owner or operator must install, operate, and maintain the bag leak detection system according to paragraphs (d)(1) through (3) of this section.

(1) Each bag leak detection system must meet the specifications and requirements in paragraphs (d)(1)(i) through (viii) of this section.

(i) The bag leak detection system must be certified by the manufacturer to be capable of detecting PM emissions at concentrations of 1 milligram per dry standard cubic meter (0.00044 grains per actual cubic foot) or less.

(ii) The bag leak detection system sensor must provide output of relative PM loadings. The owner or operator shall continuously record the output from the bag leak detection system using electronic or other means (*e.g.*, using a strip chart recorder or a data logger).

(iii) The bag leak detection system must be equipped with an alarm system that will sound when the system detects an increase in relative particulate loading over the alarm set point established according to paragraph (d)(1)(iv) of this section, and the alarm must be located such that it can be heard by the appropriate plant personnel.

(iv) In the initial adjustment of the bag leak detection system, the owner or operator must establish, at a minimum, the baseline output by adjusting the sensitivity (range) and the averaging period of the device, the alarm set points, and the alarm delay time.

(v) Following initial adjustment, the owner or operator shall not adjust the averaging period, alarm set point, or alarm delay time without approval from the Administrator or delegated authority except as provided in paragraph (d)(1)(vi) of this section.

(vi) Once per quarter, the owner or operator may adjust the sensitivity of the bag leak detection system to account for seasonal effects, including temperature and humidity, according to the procedures identified in the site-specific monitoring plan required by paragraph (d)(2) of this section.

(vii) The owner or operator must install the bag leak detection sensor downstream of the fabric filter.

(viii) Where multiple detectors are required, the system's instrumentation and alarm may be shared among detectors.

(2) The owner or operator of the affected facility must develop and submit to the Administrator or delegated authority for approval of a site-specific monitoring plan for each bag leak detection system. The owner or operator must operate and maintain the bag leak detection system according to the site-specific monitoring plan at all times. Each monitoring plan must describe the items in paragraphs (d)(2)(i) through (vi) of this section.

(i) Installation of the bag leak detection system;

(ii) Initial and periodic adjustment of the bag leak detection system, including how the alarm set-point will be established;

(iii) Operation of the bag leak detection system, including quality assurance procedures;

(iv) How the bag leak detection system will be maintained, including a routine maintenance schedule and spare parts inventory list;

(v) How the bag leak detection system output will be recorded and stored; and

(vi) Corrective action procedures as specified in paragraph (d)(3) of this section. In approving the site-specific monitoring plan, the Administrator or delegated authority may allow owners and operators more than 3 hours to alleviate a specific

condition that causes an alarm if the owner or operator identifies in the monitoring plan this specific condition as one that could lead to an alarm, adequately explains why it is not feasible to alleviate this condition within 3 hours of the time the alarm occurs, and demonstrates that the requested time will ensure alleviation of this condition as expeditiously as practicable.

(3) For each bag leak detection system, the owner or operator must initiate procedures to determine the cause of every alarm within 1 hour of the alarm. Except as provided in paragraph (d)(2)(vi) of this section, the owner or operator must alleviate the cause of the alarm within 3 hours of the alarm by taking whatever corrective action(s) are necessary. Corrective actions may include, but are not limited to the following:

(i) Inspecting the fabric filter for air leaks, torn or broken bags or filter media, or any other condition that may cause an increase in PM emissions;

(ii) Sealing off defective bags or filter media;

(iii) Replacing defective bags or filter media or otherwise repairing the control device;

(iv) Sealing off a defective fabric filter compartment;

(v) Cleaning the bag leak detection system probe or otherwise repairing the bag leak detection system; or

(vi) Shutting down the process producing the PM emissions.

~~(e) As an alternative to the periodic Method 22 (40 CFR part 60, appendix A-7) visible emissions inspections specified in paragraph (c) of this section, the owner or operator of any affected facility that is subject to the requirements for processed stone handling operations in the Lime Manufacturing NESHAP (40 CFR part 63, subpart AAAAA) may follow the continuous compliance requirements in row 1 items (i) through (iii) of table 6 to subpart AAAAA of 40 CFR part 63.~~

§60.674(a) will not apply as Midas Gold is not proposing to use a wet scrubber to control emissions from the affected facilities subject to this subpart.

§60.674(b) will not apply as Midas Gold is not proposing the use of wet suppression to control emissions from the affected facilities subject to this subpart.

§60.674(c) will apply as the Stibnite Gold Project nonmetallic mineral processing plant will commence construction after April 22, 2008, and Midas Gold is proposing to use a baghouse to control emissions from the Limestone Ball Mill. Midas Gold will be required to conduct quarterly Method 22 30-minute visible emission inspections or use an alternate method per §60.674(d).

§60.674(d) will apply and provides an alternative to the Method 22 inspections required by §60.674(c).

§60.674(e) will not apply as the Stibnite Gold Project is not a major source of HAP emission, and therefore the nonmetallic mineral processing plant is not subject to the requirements for processed stone handling operations in the Lime Manufacturing NESHAP (40 CFR part 63, subpart AAAAA).

§60.675 Test methods and procedures.

(a) In conducting the performance tests required in §60.8, the owner or operator shall use as reference methods and procedures the test methods in appendices A-1 through A-7 of this part or other methods and procedures as specified in this section, except as provided in §60.8(b). Acceptable alternative methods and procedures are given in paragraph (e) of this section.

(b) The owner or operator shall determine compliance with the PM standards in §60.672(a) as follows:

(1) Except as specified in paragraphs (e)(3) and (4) of this section, Method 5 of appendix A-3 of this part or Method 17 of appendix A-6 of this part shall be used to determine the particulate matter concentration. The sample volume shall be at least 1.70 dscm (60 dscf). For Method 5 (40 CFR part 60, appendix A-3), if the gas stream being sampled is at ambient temperature, the sampling probe and filter may be operated without heaters. If the gas stream is above ambient temperature, the sampling probe and filter may be operated at a temperature high enough, but no higher than 121 °C (250 °F), to prevent water condensation on the filter.

(2) Method 9 of appendix A-4 of this part and the procedures in §60.11 shall be used to determine opacity.

(c)(1) In determining compliance with the particulate matter standards in §60.672(b) or §60.672(e)(1), the owner or operator shall use Method 9 of appendix A-4 of this part and the procedures in §60.11, with the following additions:

(i) The minimum distance between the observer and the emission source shall be 4.57 meters (15 feet).

(ii) The observer shall, when possible, select a position that minimizes interference from other fugitive emission sources

(*e.g.,* road dust). The required observer position relative to the sun (Method 9 of appendix A-4 of this part, Section 2.1) must be followed.

~~(iii) For affected facilities using wet dust suppression for particulate matter control, a visible mist is sometimes generated by the spray. The water mist must not be confused with particulate matter emissions and is not to be considered a visible emission. When a water mist of this nature is present, the observation of emissions is to be made at a point in the plume where the mist is no longer visible.~~

~~(2)(i) In determining compliance with the opacity of stack emissions from any baghouse that controls emissions only from an individual enclosed storage bin under §60.672(f) of this subpart, using Method 9 (40 CFR part 60, appendix A-4), the duration of the Method 9 (40 CFR part 60, appendix A-4) observations shall be 1 hour (ten 6-minute averages).~~

~~(ii) The duration of the Method 9 (40 CFR part 60, appendix A-4) observations may be reduced to the duration the affected facility operates (but not less than 30 minutes) for baghouses that control storage bins or enclosed truck or railcar loading stations that operate for less than 1 hour at a time.~~

(3) When determining compliance with the fugitive emissions standard for any affected facility described under §60.672(b) or §60.672(e)(1) of this subpart, the duration of the Method 9 (40 CFR part 60, appendix A-4) observations must be 30 minutes (five 6-minute averages). Compliance with the applicable fugitive emission limits in Table 3 of this subpart must be based on the average of the five 6-minute averages.

(d) To demonstrate compliance with the fugitive emission limits for buildings specified in §60.672(e)(1), the owner or operator must complete the testing specified in paragraph (d)(1) and (2) of this section. Performance tests must be conducted while all affected facilities inside the building are operating.

(1) If the building encloses any affected facility that commences construction, modification, or reconstruction on or after April 22, 2008, the owner or operator of the affected facility must conduct an initial Method 9 (40 CFR part 60, appendix A-4) performance test according to this section and §60.11.

~~(2) If the building encloses only affected facilities that commenced construction, modification, or reconstruction before April 22, 2008, and the owner or operator has previously conducted an initial Method 22 (40 CFR part 60, appendix A-7) performance test showing zero visible emissions, then the owner or operator has demonstrated compliance with the opacity limit in §60.672(e)(1). If the owner or operator has not conducted an initial performance test for the building before April 22, 2008, then the owner or operator must conduct an initial Method 9 (40 CFR part 60, appendix A-4) performance test according to this section and §60.11 to show compliance with the opacity limit in §60.672(e)(1).~~

(e) The owner or operator may use the following as alternatives to the reference methods and procedures specified in this section:

(1) For the method and procedure of paragraph (c) of this section, if emissions from two or more facilities continuously interfere so that the opacity of fugitive emissions from an individual affected facility cannot be read, either of the following procedures may be used:

(i) Use for the combined emission stream the highest fugitive opacity standard applicable to any of the individual affected facilities contributing to the emissions stream.

(ii) Separate the emissions so that the opacity of emissions from each affected facility can be read.

(2) A single visible emission observer may conduct visible emission observations for up to three fugitive, stack, or vent emission points within a 15-second interval if the following conditions are met:

(i) No more than three emission points may be read concurrently.

(ii) All three emission points must be within a 70 degree viewing sector or angle in front of the observer such that the proper sun position can be maintained for all three points.

(iii) If an opacity reading for any one of the three emission points equals or exceeds the applicable standard, then the observer must stop taking readings for the other two points and continue reading just that single point.

(3) Method 5I of appendix A-3 of this part may be used to determine the PM concentration as an alternative to the methods specified in paragraph (b)(1) of this section. Method 5I (40 CFR part 60, appendix A-3) may be useful for affected facilities that operate for less than 1 hour at a time such as (but not limited to) storage bins or enclosed truck or railcar loading stations.

(4) In some cases, velocities of exhaust gases from building vents may be too low to measure accurately with the type S pitot tube specified in EPA Method 2 of appendix A-1 of this part [*i.e.,* velocity head <1.3 mm H_2O (0.05 in. H_2O)] and referred to in EPA Method 5 of appendix A-3 of this part. For these conditions, the owner or operator may determine the average gas flow rate produced by the power fans (*e.g.,* from vendor-supplied fan curves) to the building vent. The owner or operator may calculate the

average gas velocity at the building vent measurement site using Equation 1 of this section and use this average velocity in determining and maintaining isokinetic sampling rates.

View or download PDF

Where:

V_e = average building vent velocity (feet per minute);

Q_f = average fan flow rate (cubic feet per minute); and

A_e = area of building vent and measurement location (square feet).

~~(f) To comply with §60.676(d), the owner or operator shall record the measurements as required in §60.676(c) using the monitoring devices in §60.674 (a)(1) and (2) during each particulate matter run and shall determine the averages.~~

(g) For performance tests involving only Method 9 (40 CFR part 60 appendix A-4) testing, the owner or operator may reduce the 30-day advance notification of performance test in §60.7(a)(6) and 60.8(d) to a 7-day advance notification.

~~(h) [Reserved]~~

~~(i) If the initial performance test date for an affected facility falls during a seasonal shut down (as defined in §60.671 of this subpart) of the affected facility, then with approval from the permitting authority, the owner or operator may postpone the initial performance test until no later than 60 calendar days after resuming operation of the affected facility.~~

The highlighted portions of §60.675 will apply as Midas Gold will be required to determine compliance with the PM standards in Tables 2 and 3 using the specified methods, or an acceptable alternate method provided in §60.675.

§60.676 Reporting and recordkeeping.

~~(a) Each owner or operator seeking to comply with §60.670(d) shall submit to the Administrator the following information about the existing facility being replaced and the replacement piece of equipment.~~

~~(1) For a crusher, grinding mill, bucket elevator, bagging operation, or enclosed truck or railcar loading station:~~

~~(i) The rated capacity in megagrams or tons per hour of the existing facility being replaced and~~

~~(ii) The rated capacity in tons per hour of the replacement equipment.~~

~~(2) For a screening operation:~~

~~(i) The total surface area of the top screen of the existing screening operation being replaced and~~

~~(ii) The total surface area of the top screen of the replacement screening operation.~~

~~(3) For a conveyor belt:~~

~~(i) The width of the existing belt being replaced and~~

~~(ii) The width of the replacement conveyor belt.~~

~~(4) For a storage bin:~~

~~(i) The rated capacity in megagrams or tons of the existing storage bin being replaced and~~

~~(ii) The rated capacity in megagrams or tons of replacement storage bins.~~

(b)(1) Owners or operators of affected facilities (as defined in §§60.670 and 60.671) for which construction, ~~modification, or reconstruction~~ commenced on or after April 22, 2008, must record each periodic inspection required under §60.674~~(b)~~ or (c), including dates and any corrective actions taken, in a logbook (in written or electronic format). The owner or operator must keep the logbook onsite and make hard or electronic copies (whichever is requested) of the logbook available to the Administrator upon request.

(2) For each bag leak detection system installed and operated according to §60.674(d), the owner or operator must keep the records specified in paragraphs (b)(2)(i) through (iii) of this section.

(i) Records of the bag leak detection system output;

(ii) Records of bag leak detection system adjustments, including the date and time of the adjustment, the initial bag leak detection system settings, and the final bag leak detection system settings; and

(iii) The date and time of all bag leak detection system alarms, the time that procedures to determine the cause of the alarm were initiated, the cause of the alarm, an explanation of the actions taken, the date and time the cause of the alarm was alleviated, and whether the cause of the alarm was alleviated within 3 hours of the alarm.

~~(3) The owner or operator of each affected facility demonstrating compliance according to §60.674(e) by following the requirements for processed stone handling operations in the Lime Manufacturing NESHAP (40 CFR part 63, subpart AAAAA) must maintain records of visible emissions observations required by §63.7132(a)(3) and (b) of 40 CFR part 63, subpart AAAAA.~~

~~(c) During the initial performance test of a wet scrubber, and daily thereafter, the owner or operator shall record the measurements of both the change in pressure of the gas stream across the scrubber and the scrubbing liquid flow rate.~~

~~(d) After the initial performance test of a wet scrubber, the owner or operator shall submit semiannual reports to the Administrator of occurrences when the measurements of the scrubber pressure loss and liquid flow rate decrease by more than 30 percent from the average determined during the most recent performance test.~~

~~(e) The reports required under paragraph (d) of this section shall be postmarked within 30 days following end of the second and fourth calendar quarters.~~

(f) The owner or operator of any affected facility shall submit written reports of the results of all performance tests conducted to demonstrate compliance with the standards set forth in §60.672 of this subpart, including reports of opacity observations made using Method 9 (40 CFR part 60, appendix A-4) to demonstrate compliance with §60.672(b), (e) and (f).

~~(g)The owner or operator of any wet material processing operation that processes saturated and subsequently processes unsaturated materials, shall submit a report of this change within 30 days following such change. At the time of such change, this screening operation, bucket elevator, or belt conveyor becomes subject to the applicable opacity limit in §60.672(b) and the emission test requirements of §60.11.~~

(h) The subpart A requirement under §60.7(a)(1) for notification of the date construction or reconstruction commenced is waived for affected facilities under this subpart.

(i) A notification of the actual date of initial startup of each affected facility shall be submitted to the Administrator.

(1) For a combination of affected facilities in a production line that begin actual initial startup on the same day, a single notification of startup may be submitted by the owner or operator to the Administrator. The notification shall be postmarked within 15 days after such date and shall include a description of each affected facility, equipment manufacturer, and serial number of the equipment, if available.

~~(2) For portable aggregate processing plants, the notification of the actual date of initial startup shall include both the home office and the current address or location of the portable plant.~~

(j) The requirements of this section remain in force until and unless the Agency, in delegating enforcement authority to a State under section 111(c) of the Act, approves reporting requirements or an alternative means of compliance surveillance adopted by such States. In that event, affected facilities within the State will be relieved of the obligation to comply with the reporting requirements of this section, provided that they comply with requirements established by the State.

(k) Notifications and reports required under this subpart and under subpart A of this part to demonstrate compliance with this subpart need only to be sent to the EPA Region or the State which has been delegated authority according to §60.4(b).

§60.676(a) will not apply as the Stibnite Gold Project affected facilities are not existing.

§60.676(b)(1) will apply as the Stibnite Gold Project nonmetallic mineral processing plant will commence construction after April 22, 2008, and Midas Gold is proposing to use a baghouse to control emissions from the Limestone Ball Mill. Midas Gold will be required to record the periodic inspections required under §60.674(c) unless a bag leak detection system is used as an alternate method per §60.674(d).

§60.676(b)(2) will apply to the Stibnite Gold Project Limestone Ball Mill, if a bag leak detection system is installed and operated as an alternative to the visible emissions inspection requirements in §60.674(c).

§60.676(b)(3) will not apply as the Stibnite Gold Project nonmetallic mineral processing plant is not subject to the requirements for processed stone handling operations in the Lime Manufacturing NESHAP (40 CFR part 63, subpart AAAAA).

§60.676(c) – (e) will not apply as Midas Gold is not proposing to use a wet scrubber to control emissions from the affected facilities subject to this subpart.

§60.676(f) will apply to the Stibnite Gold Project affected facilities, and therefore Midas Gold will be required to submit written reports of the results of all performance tests conducted.

§60.676(g) will not apply as Midas Gold is not proposing any wet material processing operation.

§60.676(h) will apply to the Stibnite Gold Project affected facilities. Midas Gold will not be required to submit a notification of the date of construction.

§60.676(i)(1) will apply to the Stibnite Gold Project affected facilities; the notification of the actual date of initial startup will be required to be submitted to the Administrator within 15 days after startup.

§60.676(i)(2) will not apply as Midas Gold is not proposing to operate a portable aggregate processing plant.

§60.676(j) and (k) will apply to the Stibnite Gold Project affected facilities and serve as informative.

Table 1 to Subpart OOO of Part 60—Exceptions to Applicability of Subpart A to Subpart OOO

Subpart A reference	Applies to subpart OOO	Explanation
60.4, Address	Yes	Except in §60.4(a) and (b) submittals need not be submitted to both the EPA Region and delegated State authority (§60.676(k)).
60.7, Notification and recordkeeping	Yes	Except in (a)(1) notification of the date construction or reconstruction commenced (§60.676(h)).
		Also, except in (a)(6) performance tests involving only Method 9 (40 CFR part 60, appendix A-4) require a 7-day advance notification instead of 30 days (§60.675(g)).
60.8, Performance tests	Yes	Except in (d) performance tests involving only Method 9 (40 CFR part 60, appendix A-4) require a 7-day advance notification instead of 30 days (§60.675(g)).
60.11, Compliance with standards and maintenance requirements	Yes	Except in (b) under certain conditions (§§60.675(c)), Method 9 (40 CFR part 60, appendix A-4) observation is reduced from 3 hours to 30 minutes for fugitive emissions.
~~60.18, General control device~~	~~No~~	~~Flares will not be used to comply with the emission limits.~~

The exceptions to applicability of Subpart A to Subpart OOO are highlighted in Table 1.

Table 2 to Subpart OOO of Part 60—Stack Emission Limits for Affected Facilities With Capture Systems

For * * *	The owner or operator must meet a PM limit of * * *	And the owner or operator must meet an opacity limit of * * *	The owner or operator must demonstrate compliance with these limits by conducting * * *
~~Affected facilities (as defined in §§60.670 and 60.671) that commenced construction, modification, or reconstruction after August 31, 1983 but before April 22, 2008~~	~~0.05 g/dscm (0.022 gr/dscf)[a]~~	~~7 percent for dry control devices[b]~~	~~An initial performance test according to §60.8 of this part and §60.675 of this subpart; and~~ ~~Monitoring of wet scrubber parameters according to §60.674(a) and §60.676(c), (d), and (e).~~
Affected facilities (as defined in §§60.670 and 60.671) that commence construction, modification, or reconstruction on or after April 22, 2008	0.032 g/dscm (0.014 gr/dscf)[a]	Not applicable ~~(except for individual enclosed storage bins)~~ ~~7 percent for dry control devices on individual enclosed storage bins~~	An initial performance test according to §60.8 of this part and §60.675 of this subpart; and ~~Monitoring of wet scrubber parameters according to §60.674(a) and §60.676(c), (d), and (e); and~~
			Monitoring of baghouses according to §60.674(c), (d), ~~or (e)~~ and §60.676(b).

[a]Exceptions to the PM limit apply for ~~individual enclosed storage bins and~~ other equipment. See §60.672~~(d) through~~ (f).

~~[b]The stack opacity limit and associated opacity testing requirements do not apply for affected facilities using wet scrubbers.~~

Since the Stibnite Gold Project nonmetallic mineral processing plant will commence construction after April 22, 2008, and is proposing to use a baghouse to control emissions from the Limestone Ball Mill, the baghouse stack will be required to meet the PM limit of 0.032 g/dscm. In addition, there will not be an opacity limit for the ball mill baghouse stack. The Stibnite Gold Project nonmetallic mineral processing plant will not have a baghouse controlling emissions on an individual enclosed storage bin, therefore the 7 percent opacity limit will not apply. Midas Gold will be required to demonstrate compliance on the baghouse with an initial performance test, monitoring visible emissions (or operating a bag leak detection system) and maintaining records.

Table 3 to Subpart OOO of Part 60—Fugitive Emission Limits

For * * *	The owner or operator must meet the following fugitive emissions limit for grinding mills, screening operations, ~~bucket elevators~~, transfer points on belt conveyors, ~~bagging operations~~, storage bins, ~~enclosed truck or railcar loading stations~~ or from any other affected facility (as defined in §§60.670 and 60.671) * * *	The owner or operator must meet the following fugitive emissions limit for crushers at which a capture system is not used * * *	The owner or operator must demonstrate compliance with these limits by conducting * * *
~~Affected facilities (as defined in §§60.670 and 60.671) that commenced construction, modification, or reconstruction after August 31, 1983 but before April 22, 2008~~	~~10 percent opacity~~	~~15 percent opacity~~	~~An initial performance test according to §60.11 of this part and §60.675 of this subpart.~~
Affected facilities (as defined in §§60.670 and 60.671) that commence construction, modification, or reconstruction on or after April 22, 2008	7 percent opacity	12 percent opacity	An initial performance test according to §60.11 of this part and §60.675 of this subpart; ~~and~~ ~~Periodic inspections of water sprays according to §60.674(b) and §60.676(b); and~~
			A repeat performance test according to §60.11 of this part and §60.675 of this subpart within 5 years from the previous performance test for fugitive emissions from affected facilities without water sprays. ~~Affected facilities controlled by water carryover from upstream water sprays that are inspected according to the requirements in §60.674(b) and §60.676(b) are exempt from this 5-year repeat testing requirement.~~

Since the Stibnite Gold Project nonmetallic mineral processing plant will commence construction after April 22, 2008, Midas Gold will be required to meet the fugitive emission limit of 7 percent opacity for all affected facilities subject to this subpart, with the exception of the Limestone Ball Mill (subject to the limits in Table 2), any crusher without a capture system, and any truck dumping. For the Primary Crushing (Source ID LS2) and Secondary Crushing (Source ID LS4) which will not have a capture system, Midas Gold will be required to meet the limit of 12 percent opacity. The Limestone transfer to Primary Crusher Hopper will meet the definition of truck dumping and is exempt from the requirements in Table 3. Midas Gold will be required to demonstrate compliance with the applicable opacity limits with initial performance tests and repeat performance tests every 5 years.

NSPS, Subpart IIII – Standards of Performance for Stationary Compression Ignition Internal Combustion Engines

REC 1664

ELECTRONIC CODE OF FEDERAL REGULATIONS

e-CFR data is current as of January 10, 2019

Title 40: Protection of Environment
PART 60—STANDARDS OF PERFORMANCE FOR NEW STATIONARY SOURCES (CONTINUED)

Subpart IIII—Standards of Performance for Stationary Compression Ignition Internal Combustion Engines

Contents

WHAT THIS SUBPART COVERS

§60.4200 Am I subject to this subpart?

EMISSION STANDARDS FOR MANUFACTURERS

§60.4201 What emission standards must I meet for non-emergency engines if I am a stationary CI internal combustion engine manufacturer?
§60.4202 What emission standards must I meet for emergency engines if I am a stationary CI internal combustion engine manufacturer?
§60.4203 How long must my engines meet the emission standards if I am a manufacturer of stationary CI internal combustion engines?

EMISSION STANDARDS FOR OWNERS AND OPERATORS

§60.4204 What emission standards must I meet for non-emergency engines if I am an owner or operator of a stationary CI internal combustion engine?
§60.4205 What emission standards must I meet for emergency engines if I am an owner or operator of a stationary CI internal combustion engine?
§60.4206 How long must I meet the emission standards if I am an owner or operator of a stationary CI internal combustion engine?

FUEL REQUIREMENTS FOR OWNERS AND OPERATORS

§60.4207 What fuel requirements must I meet if I am an owner or operator of a stationary CI internal combustion engine subject to this subpart?

OTHER REQUIREMENTS FOR OWNERS AND OPERATORS

§60.4208 What is the deadline for importing or installing stationary CI ICE produced in previous model years?
§60.4209 What are the monitoring requirements if I am an owner or operator of a stationary CI internal combustion engine?

COMPLIANCE REQUIREMENTS

§60.4210 What are my compliance requirements if I am a stationary CI internal combustion engine manufacturer?
§60.4211 What are my compliance requirements if I am an owner or operator of a stationary CI internal combustion engine?

TESTING REQUIREMENTS FOR OWNERS AND OPERATORS

§60.4212 What test methods and other procedures must I use if I am an owner or operator of a stationary CI internal combustion engine with a displacement of less than 30 liters per cylinder?
§60.4213 What test methods and other procedures must I use if I am an owner or operator of a stationary CI internal combustion engine with a displacement of greater than or equal to 30 liters per cylinder?

NOTIFICATION, REPORTS, AND RECORDS FOR OWNERS AND OPERATORS

§60.4214 What are my notification, reporting, and recordkeeping requirements if I am an owner or operator of a stationary CI internal combustion engine?

Special Requirements

§60.4215 What requirements must I meet for engines used in Guam, American Samoa, or the Commonwealth of the Northern Mariana Islands?
§60.4216 What requirements must I meet for engines used in Alaska?
§60.4217 What emission standards must I meet if I am an owner or operator of a stationary internal combustion engine using special fuels?

General Provisions

§60.4218 What parts of the General Provisions apply to me?

Definitions

§60.4219 What definitions apply to this subpart?

Back to Top

What This Subpart Covers

Back to Top

§60.4200 Am I subject to this subpart?

(a) The provisions of this subpart are applicable to ~~manufacturers,~~ owners, and operators of stationary compression ignition (CI) internal combustion engines (ICE) and other persons as specified in paragraphs (a)(1) through (4) of this section. For the purposes of this subpart, the date that construction commences is the date the engine is ordered by the owner or operator.

~~(1) Manufacturers of stationary CI ICE with a displacement of less than 30 liters per cylinder where the model year is:~~

~~(i) 2007 or later, for engines that are not fire pump engines;~~

~~(ii) The model year listed in Table 3 to this subpart or later model year, for fire pump engines.~~

(2) Owners and operators of stationary CI ICE that commence construction after July 11, 2005, where the stationary CI ICE are:

(i) Manufactured after April 1, 2006, and are not fire pump engines, or

(ii) Manufactured as a certified National Fire Protection Association (NFPA) fire pump engine after July 1, 2006.

~~(3) Owners and operators of any stationary CI ICE that are modified or reconstructed after July 11, 2005 and any person that modifies or reconstructs any stationary CI ICE after July 11, 2005.~~

(4) The provisions of §60.4208 of this subpart are applicable to all owners and operators of stationary CI ICE that commence construction after July 11, 2005.

~~(b) The provisions of this subpart are not applicable to stationary CI ICE being tested at a stationary CI ICE test cell/stand.~~

(c) If you are an owner or operator of an area source subject to this subpart, you are exempt from the obligation to obtain a permit under 40 CFR part 70 ~~or 40 CFR part 71~~, provided you are not required to obtain a permit under 40 CFR 70.3(a) ~~or 40~~

~~CFR 71.3(a)~~ for a reason other than your status as an area source under this subpart. Notwithstanding the previous sentence, you must continue to comply with the provisions of this subpart applicable to area sources.

~~(d) Stationary CI ICE may be eligible for exemption from the requirements of this subpart as described in 40 CFR part 1068, subpart C (or the exemptions described in 40 CFR part 89, subpart J and 40 CFR part 94, subpart J, for engines that would need to be certified to standards in those parts), except that owners and operators, as well as manufacturers, may be eligible to request an exemption for national security.~~

~~(e) Owners and operators of facilities with CI ICE that are acting as temporary replacement units and that are located at a stationary source for less than 1 year and that have been properly certified as meeting the standards that would be applicable to such engine under the appropriate nonroad engine provisions, are not required to meet any other provisions under this subpart with regard to such engines.~~

[71 FR 39172, July 11, 2006, as amended at 76 FR 37967, June 28, 2011]

Midas Gold proposes to own and operate at the Stibnite Gold Project, three emergency stationary CI ICEs that will be subject to this subpart per §60.4200(a)(2)(i) as they will commence construction after July 11, 2005, will be manufactured after April 1, 2006, and are not fire pumps. In addition, Midas Gold proposes to own and operate at the Stibnite Gold Project, one stationary fire pump CI ICE, that will be subject to this subpart per §60.4200(a)(2)(ii) as it will commence construction after July 11, 2005, and will be manufactured as a certified NFPA fire pump engine after July 1, 2006.

The three emergency stationary CI ICE will be subject to §60.4200(a)(4) as they will commence construction after July 11, 2005. The three new emergency engines will be installed after December 31, 2008, and will therefore meet the applicable requirements for 2007 model year engines per §60.4208(a).

Because the Stibnite Gold Project is an area source, per §60.4200(c), Midas Gold is not required to obtain a permit under 40 CFR part 70 (i.e., Title V permit) solely due to being subject to this subpart.

Emission Standards for Manufacturers

~~§60.4201 What emission standards must I meet for non-emergency engines if I am a stationary CI internal combustion engine manufacturer?~~

~~(a) Stationary CI internal combustion engine manufacturers must certify their 2007 model year and later non-emergency stationary CI ICE with a maximum engine power less than or equal to 2,237 kilowatt (KW) (3,000 horsepower (HP)) and a displacement of less than 10 liters per cylinder to the certification emission standards for new nonroad CI engines in 40 CFR 89.112, 40 CFR 89.113, 40 CFR 1039.101, 40 CFR 1039.102, 40 CFR 1039.104, 40 CFR 1039.105, 40 CFR 1039.107, and 40 CFR 1039.115, as applicable, for all pollutants, for the same model year and maximum engine power.~~

~~(b) Stationary CI internal combustion engine manufacturers must certify their 2007 through 2010 model year non-emergency stationary CI ICE with a maximum engine power greater than 2,237 KW (3,000 HP) and a displacement of less than 10 liters per cylinder to the emission standards in table 1 to this subpart, for all pollutants, for the same maximum engine power.~~

~~(c) Stationary CI internal combustion engine manufacturers must certify their 2011 model year and later non-emergency stationary CI ICE with a maximum engine power greater than 2,237 KW (3,000 HP) and a displacement of less than 10 liters per cylinder to the certification emission standards for new nonroad CI engines in 40 CFR 1039.101, 40 CFR 1039.102, 40 CFR 1039.104, 40 CFR 1039.105, 40 CFR 1039.107, and 40 CFR 1039.115, as applicable, for all pollutants, for the same maximum engine power.~~

~~(d) Stationary CI internal combustion engine manufacturers must certify the following non-emergency stationary CI ICE to the certification emission standards for new marine CI engines in 40 CFR 94.8, as applicable, for all pollutants, for the same displacement and maximum engine power:~~

~~(1) Their 2007 model year through 2012 non-emergency stationary CI ICE with a displacement of greater than or equal to 10 liters per cylinder and less than 30 liters per cylinder;~~

~~(2) Their 2013 model year non-emergency stationary CI ICE with a maximum engine power greater than or equal to 3,700 KW (4,958 HP) and a displacement of greater than or equal to 10 liters per cylinder and less than 15 liters per cylinder; and~~

~~(3) Their 2013 model year non-emergency stationary CI ICE with a displacement of greater than or equal to 15 liters per cylinder and less than 30 liters per cylinder.~~

~~(e) Stationary CI internal combustion engine manufacturers must certify the following non-emergency stationary CI ICE to the certification emission standards and other requirements for new marine CI engines in 40 CFR 1042.101, 40 CFR 1042.107, 40 CFR 1042.110, 40 CFR 1042.115, 40 CFR 1042.120, and 40 CFR 1042.145, as applicable, for all pollutants, for the same displacement and maximum engine power:~~

(1) Their 2013 model year non-emergency stationary CI ICE with a maximum engine power less than 3,700 KW (4,958 HP) and a displacement of greater than or equal to 10 liters per cylinder and less than 15 liters per cylinder; and

(2) Their 2014 model year and later non-emergency stationary CI ICE with a displacement of greater than or equal to 10 liters per cylinder and less than 30 liters per cylinder.

(f) Notwithstanding the requirements in paragraphs (a) through (c) of this section, stationary non-emergency CI ICE identified in paragraphs (a) and (c) may be certified to the provisions of 40 CFR part 94 or, if Table 1 to 40 CFR 1042.1 identifies 40 CFR part 1042 as being applicable, 40 CFR part 1042, if the engines will be used solely in either or both of the following locations:

(1) Remote areas of Alaska; and

(2) Marine offshore installations.

(g) Notwithstanding the requirements in paragraphs (a) through (f) of this section, stationary CI internal combustion engine manufacturers are not required to certify reconstructed engines; however manufacturers may elect to do so. The reconstructed engine must be certified to the emission standards specified in paragraphs (a) through (e) of this section that are applicable to the model year, maximum engine power, and displacement of the reconstructed stationary CI ICE.

(h) Stationary CI ICE certified to the standards in 40 CFR part 1039 and equipped with auxiliary emission control devices (AECDs) as specified in 40 CFR 1039.665 must meet the Tier 1 certification emission standards for new nonroad CI engines in 40 CFR 89.112 while the AECD is activated during a qualified emergency situation. A qualified emergency situation is defined in 40 CFR 1039.665. When the qualified emergency situation has ended and the AECD is deactivated, the engine must resume meeting the otherwise applicable emission standard specified in this section.

[71 FR 39172, July 11, 2006, as amended at 76 FR 37967, June 28, 2011; 81 FR 44219, July 7, 2016]

Midas Gold is not a stationary CI engine manufacturer nor will it own or operate any non-emergency stationary CI ICE; therefore, this section is not applicable.

§60.4202 What emission standards must I meet for emergency engines if I am a stationary CI internal combustion engine manufacturer?

(a) Stationary CI internal combustion engine manufacturers must certify their 2007 model year and later emergency stationary CI ICE with a maximum engine power less than or equal to 2,237 KW (3,000 HP) and a displacement of less than 10 liters per cylinder that are not fire pump engines to the emission standards specified in paragraphs (a)(1) through (2) of this section.

(1) For engines with a maximum engine power less than 37 KW (50 HP):

(i) The certification emission standards for new nonroad CI engines for the same model year and maximum engine power in 40 CFR 89.112 and 40 CFR 89.113 for all pollutants for model year 2007 engines, and

(ii) The certification emission standards for new nonroad CI engines in 40 CFR 1039.104, 40 CFR 1039.105, 40 CFR 1039.107, 40 CFR 1039.115, and table 2 to this subpart, for 2008 model year and later engines.

(2) For engines with a maximum engine power greater than or equal to 37 KW (50 HP), the certification emission standards for new nonroad CI engines for the same model year and maximum engine power in 40 CFR 89.112 and 40 CFR 89.113 for all pollutants beginning in model year 2007.

(b) Stationary CI internal combustion engine manufacturers must certify their 2007 model year and later emergency stationary CI ICE with a maximum engine power greater than 2,237 KW (3,000 HP) and a displacement of less than 10 liters per cylinder that are not fire pump engines to the emission standards specified in paragraphs (b)(1) through (2) of this section.

(1) For 2007 through 2010 model years, the emission standards in table 1 to this subpart, for all pollutants, for the same maximum engine power.

(2) For 2011 model year and later, the certification emission standards for new nonroad CI engines for engines of the same model year and maximum engine power in 40 CFR 89.112 and 40 CFR 89.113 for all pollutants.

(c) [Reserved]

(d) Beginning with the model years in table 3 to this subpart, stationary CI internal combustion engine manufacturers must certify their fire pump stationary CI ICE to the emission standards in table 4 to this subpart, for all pollutants, for the same model year and NFPA nameplate power.

(e) Stationary CI internal combustion engine manufacturers must certify the following emergency stationary CI ICE that are

not fire pump engines to the certification emission standards for new marine CI engines in 40 CFR 94.8, as applicable, for all pollutants, for the same displacement and maximum engine power:

(1) Their 2007 model year through 2012 emergency stationary CI ICE with a displacement of greater than or equal to 10 liters per cylinder and less than 30 liters per cylinder;

(2) Their 2013 model year and later emergency stationary CI ICE with a maximum engine power greater than or equal to 3,700 KW (4,958 HP) and a displacement of greater than or equal to 10 liters per cylinder and less than 15 liters per cylinder;

(3) Their 2013 model year emergency stationary CI ICE with a displacement of greater than or equal to 15 liters per cylinder and less than 30 liters per cylinder; and

(4) Their 2014 model year and later emergency stationary CI ICE with a maximum engine power greater than or equal to 2,000 KW (2,682 HP) and a displacement of greater than or equal to 15 liters per cylinder and less than 30 liters per cylinder.

(f) Stationary CI internal combustion engine manufacturers must certify the following emergency stationary CI ICE to the certification emission standards and other requirements applicable to Tier 3 new marine CI engines in 40 CFR 1042.101, 40 CFR 1042.107, 40 CFR 1042.115, 40 CFR 1042.120, and 40 CFR 1042.145, for all pollutants, for the same displacement and maximum engine power:

(1) Their 2013 model year and later emergency stationary CI ICE with a maximum engine power less than 3,700 KW (4,958 HP) and a displacement of greater than or equal to 10 liters per cylinder and less than 15 liters per cylinder; and

(2) Their 2014 model year and later emergency stationary CI ICE with a maximum engine power less than 2,000 KW (2,682 HP) and a displacement of greater than or equal to 15 liters per cylinder and less than 30 liters per cylinder.

(g) Notwithstanding the requirements in paragraphs (a) through (d) of this section, stationary emergency CI internal combustion engines identified in paragraphs (a) and (c) may be certified to the provisions of 40 CFR part 94 or, if Table 2 to 40 CFR 1042.101 identifies Tier 3 standards as being applicable, the requirements applicable to Tier 3 engines in 40 CFR part 1042, if the engines will be used solely in either or both of the following locations:

(1) Remote areas of Alaska; and

(2) Marine offshore installations.

(h) Notwithstanding the requirements in paragraphs (a) through (f) of this section, stationary CI internal combustion engine manufacturers are not required to certify reconstructed engines; however manufacturers may elect to do so. The reconstructed engine must be certified to the emission standards specified in paragraphs (a) through (f) of this section that are applicable to the model year, maximum engine power and displacement of the reconstructed emergency stationary CI ICE.

[71 FR 39172, July 11, 2006, as amended at 76 FR 37968, June 28, 2011; 81 FR 44219, July 7, 2016]

Midas Gold is not a stationary CI engine manufacturer however, as required by §60.4205(b), the proposed emergency stationary CI ICE must comply with the emission standards in §60.4202. The three emergency engines will each have a maximum power less than 2,237 KW and greater than 37 KW, with a displacement of less than 10 liters per cylinder, and therefore per §60.4202(a)(2), must meet the certification emission standards in 40 CFR 89.112 and 40 CFR 89.113 for new nonroad CI engines beginning in model year 2007.

40 CFR 89.112 (Oxides of nitrogen, carbon monoxide, hydrocarbon, and particulate matter exhaust emission standards) will apply to the three emergency engines according to model year and maximum engine power.

40 CFR 89.113 (Smoke emission standard) will apply to the three emergency engines.

§60.4203 How long must my engines meet the emission standards if I am a manufacturer of stationary CI internal combustion engines?

Engines manufactured by stationary CI internal combustion engine manufacturers must meet the emission standards as required in §§60.4201 and 60.4202 during the certified emissions life of the engines.

[76 FR 37968, June 28, 2011]

Midas Gold is not a stationary CI engine manufacturer; therefore, this section is not applicable.

EMISSION STANDARDS FOR OWNERS AND OPERATORS

§60.4204 What emission standards must I meet for non-emergency engines if I am an owner or operator of a stationary CI internal combustion engine?

(a) Owners and operators of pre-2007 model year non-emergency stationary CI ICE with a displacement of less than 10 liters per cylinder must comply with the emission standards in table 1 to this subpart. Owners and operators of pre-2007 model year non-emergency stationary CI ICE with a displacement of greater than or equal to 10 liters per cylinder and less than 30 liters per cylinder must comply with the emission standards in 40 CFR 94.8(a)(1).

(b) Owners and operators of 2007 model year and later non-emergency stationary CI ICE with a displacement of less than 30 liters per cylinder must comply with the emission standards for new CI engines in §60.4201 for their 2007 model year and later stationary CI ICE, as applicable.

(c) Owners and operators of non-emergency stationary CI engines with a displacement of greater than or equal to 30 liters per cylinder must meet the following requirements:

(1) For engines installed prior to January 1, 2012, limit the emissions of NO_x in the stationary CI internal combustion engine exhaust to the following:

(i) 17.0 grams per kilowatt-hour (g/KW-hr) (12.7 grams per horsepower-hr (g/HP-hr)) when maximum engine speed is less than 130 revolutions per minute (rpm);

(ii) $45 \cdot n^{-0.2}$ g/KW-hr ($34 \cdot n^{-0.2}$ g/HP-hr) when maximum engine speed is 130 or more but less than 2,000 rpm, where n is maximum engine speed; and

(iii) 9.8 g/KW-hr (7.3 g/HP-hr) when maximum engine speed is 2,000 rpm or more.

(2) For engines installed on or after January 1, 2012 and before January 1, 2016, limit the emissions of NO_x in the stationary CI internal combustion engine exhaust to the following:

(i) 14.4 g/KW-hr (10.7 g/HP-hr) when maximum engine speed is less than 130 rpm;

(ii) $44 \cdot n^{-0.23}$ g/KW-hr ($33 \cdot n^{-0.23}$ g/HP-hr) when maximum engine speed is greater than or equal to 130 but less than 2,000 rpm and where n is maximum engine speed; and

(iii) 7.7 g/KW-hr (5.7 g/HP-hr) when maximum engine speed is greater than or equal to 2,000 rpm.

(3) For engines installed on or after January 1, 2016, limit the emissions of NO_x in the stationary CI internal combustion engine exhaust to the following:

(i) 3.4 g/KW-hr (2.5 g/HP-hr) when maximum engine speed is less than 130 rpm;

(ii) $9.0 \cdot n^{-0.20}$ g/KW-hr ($6.7 \cdot n^{-0.20}$ g/HP-hr) where n (maximum engine speed) is 130 or more but less than 2,000 rpm; and

(iii) 2.0 g/KW-hr (1.5 g/HP-hr) where maximum engine speed is greater than or equal to 2,000 rpm.

(4) Reduce particulate matter (PM) emissions by 60 percent or more, or limit the emissions of PM in the stationary CI internal combustion engine exhaust to 0.15 g/KW-hr (0.11 g/HP-hr).

(d) Owners and operators of non-emergency stationary CI ICE with a displacement of less than 30 liters per cylinder who conduct performance tests in-use must meet the not-to-exceed (NTE) standards as indicated in §60.4212.

(e) Owners and operators of any modified or reconstructed non-emergency stationary CI ICE subject to this subpart must meet the emission standards applicable to the model year, maximum engine power, and displacement of the modified or reconstructed non-emergency stationary CI ICE that are specified in paragraphs (a) through (d) of this section.

(f) Owners and operators of stationary CI ICE certified to the standards in 40 CFR part 1039 and equipped with AECDs as specified in 40 CFR 1039.665 must meet the Tier 1 certification emission standards for new nonroad CI engines in 40 CFR 89.112 while the AECD is activated during a qualified emergency situation. A qualified emergency situation is defined in 40 CFR 1039.665. When the qualified emergency situation has ended and the AECD is deactivated, the engine must resume meeting the otherwise applicable emission standard specified in this section.

[71 FR 39172, July 11, 2006, as amended at 76 FR 37968, June 28, 2011; 81 FR 44219, July 7, 2016]

Midas Gold will not own or operate any non-emergency stationary CI ICE; therefore, this section is not applicable.

§60.4205 What emission standards must I meet for emergency engines if I am an owner or operator of a stationary CI internal combustion engine?

(a) Owners and operators of pre-2007 model year emergency stationary CI ICE with a displacement of less than 10 liters per cylinder that are not fire pump engines must comply with the emission standards in Table 1 to this subpart. Owners and

~~operators of pre-2007 model year emergency stationary CI ICE with a displacement of greater than or equal to 10 liters per cylinder and less than 30 liters per cylinder that are not fire pump engines must comply with the emission standards in 40 CFR 94.8(a)(1).~~

(b) Owners and operators of 2007 model year and later emergency stationary CI ICE with a displacement of less than 30 liters per cylinder that are not fire pump engines must comply with the emission standards for new nonroad CI engines in §60.4202, for all pollutants, for the same model year and maximum engine power for their 2007 model year and later emergency stationary CI ICE.

(c) Owners and operators of fire pump engines with a displacement of less than 30 liters per cylinder must comply with the emission standards in table 4 to this subpart, for all pollutants.

~~(d) Owners and operators of emergency stationary CI engines with a displacement of greater than or equal to 30 liters per cylinder must meet the requirements in this section.~~

~~(1) For engines installed prior to January 1, 2012, limit the emissions of NO_x in the stationary CI internal combustion engine exhaust to the following:~~

~~(i) 17.0 g/KW-hr (12.7 g/HP-hr) when maximum engine speed is less than 130 rpm;~~

~~(ii) $45 \cdot n^{-0.2}$ g/KW-hr ($34 \cdot n^{-0.2}$ g/HP-hr) when maximum engine speed is 130 or more but less than 2,000 rpm, where n is maximum engine speed; and~~

~~(iii) 9.8 g/kW-hr (7.3 g/HP-hr) when maximum engine speed is 2,000 rpm or more.~~

~~(2) For engines installed on or after January 1, 2012, limit the emissions of NO_x in the stationary CI internal combustion engine exhaust to the following:~~

~~(i) 14.4 g/KW-hr (10.7 g/HP-hr) when maximum engine speed is less than 130 rpm;~~

~~(ii) $44 \cdot n^{-0.23}$ g/KW-hr ($33 \cdot n^{-0.23}$ g/HP-hr) when maximum engine speed is greater than or equal to 130 but less than 2,000 rpm and where n is maximum engine speed; and~~

~~(iii) 7.7 g/KW-hr (5.7 g/HP-hr) when maximum engine speed is greater than or equal to 2,000 rpm.~~

~~(3) Limit the emissions of PM in the stationary CI internal combustion engine exhaust to 0.40 g/KW-hr (0.30 g/HP-hr).~~

(e) Owners and operators of emergency stationary CI ICE with a displacement of less than 30 liters per cylinder who conduct performance tests in-use must meet the NTE standards as indicated in §60.4212.

~~(f) Owners and operators of any modified or reconstructed emergency stationary CI ICE subject to this subpart must meet the emission standards applicable to the model year, maximum engine power, and displacement of the modified or reconstructed CI ICE that are specified in paragraphs (a) through (e) of this section.~~

[71 FR 39172, July 11, 2006, as amended at 76 FR 37969, June 28, 2011]

The three emergency stationary CI ICEs will be model year 2007 or later with a displacement of less than 10 liters per cylinder and subject to §60.4205(b). The engines must comply with the emission standards for new nonroad CI engines in §60.4202(a)(2).

The stationary fire pump CI ICE will be model year model year 2009 or later with a displacement of less than 10 liters per cylinder and subject to §60.4205(c). The fire pump engine must comply with the emission standards in table 4 to this subpart, for all pollutants.

If Midas Gold chooses not to install and operate any stationary CI ICE according to the manufacturer's emission-related written instructions, according to §60.4211(g), performance testing will be required to demonstrate compliance. In this case, §60.4202(e) will apply to the proposed engines.

§60.4206 How long must I meet the emission standards if I am an owner or operator of a stationary CI internal combustion engine?

Owners and operators of stationary CI ICE must operate and maintain stationary CI ICE that achieve the emission standards as required in ~~§§60.4204 and~~ 60.4205 over the entire life of the engine.

[76 FR 37969, June 28, 2011]

As required by §60.4206, Midas Gold must operate and maintain the three emergency engines and one fire pump engine so they achieve the standards in §60.4205 for the entire life of the each engine.

Fuel Requirements for Owners and Operators

§60.4207 What fuel requirements must I meet if I am an owner or operator of a stationary CI internal combustion engine subject to this subpart?

(a) ~~Beginning October 1, 2007, owners and operators of stationary CI ICE subject to this subpart that use diesel fuel must use diesel fuel that meets the requirements of 40 CFR 80.510(a).~~

(b) Beginning October 1, 2010, owners and operators of stationary CI ICE subject to this subpart with a displacement of less than 30 liters per cylinder that use diesel fuel must use diesel fuel that meets the requirements of 40 CFR 80.510(b) for nonroad diesel fuel, ~~except that any existing diesel fuel purchased (or otherwise obtained) prior to October 1, 2010, may be used until depleted.~~

(c) ~~[Reserved]~~

(d) ~~Beginning June 1, 2012, owners and operators of stationary CI ICE subject to this subpart with a displacement of greater than or equal to 30 liters per cylinder are no longer subject to the requirements of paragraph (a) of this section, and must use fuel that meets a maximum per gallon sulfur content of 1,000 parts per million (ppm).~~

(e) ~~Stationary CI ICE that have a national security exemption under §60.4200(d) are also exempt from the fuel requirements in this section.~~

[71 FR 39172, July 11, 2006, as amended at 76 FR 37969, June 28, 2011; 78 FR 6695, Jan. 30, 2013]

The three emergency engines and one fire pump engine will be subject to §60.4207(b), and Midas Gold must use diesel fuel that meets the sulfur and cetane index or aromatic content requirements of 40 CFR 80.510(b). Per 40 CFR 80.510(b)(1)(i), the fuel sulfur content cannot exceed 15 ppm.

Other Requirements for Owners and Operators

§60.4208 What is the deadline for importing or installing stationary CI ICE produced in previous model years?

(a) After December 31, 2008, owners and operators may not install stationary CI ICE (excluding fire pump engines) that do not meet the applicable requirements for 2007 model year engines.

~~(b) After December 31, 2009, owners and operators may not install stationary CI ICE with a maximum engine power of less than 19 KW (25 HP) (excluding fire pump engines) that do not meet the applicable requirements for 2008 model year engines.~~

~~(c) After December 31, 2014, owners and operators may not install non-emergency stationary CI ICE with a maximum engine power of greater than or equal to 19 KW (25 HP) and less than 56 KW (75 HP) that do not meet the applicable requirements for 2013 model year non-emergency engines.~~

~~(d) After December 31, 2013, owners and operators may not install non-emergency stationary CI ICE with a maximum engine power of greater than or equal to 56 KW (75 HP) and less than 130 KW (175 HP) that do not meet the applicable requirements for 2012 model year non-emergency engines.~~

~~(e) After December 31, 2012, owners and operators may not install non-emergency stationary CI ICE with a maximum engine power of greater than or equal to 130 KW (175 HP), including those above 560 KW (750 HP), that do not meet the applicable requirements for 2011 model year non-emergency engines.~~

~~(f) After December 31, 2016, owners and operators may not install non-emergency stationary CI ICE with a maximum engine power of greater than or equal to 560 KW (750 HP) that do not meet the applicable requirements for 2015 model year non-emergency engines.~~

(g) ~~After December 31, 2018, owners and operators may not install non-emergency stationary CI ICE with a maximum engine power greater than or equal to 600 KW (804 HP) and less than 2,000 KW (2,680 HP) and a displacement of greater than or equal to 10 liters per cylinder and less than 30 liters per cylinder that do not meet the applicable requirements for 2017 model year non-emergency engines~~.

(h) In addition to the requirements specified in §§~~60.4201,~~ 60.4202, ~~60.4204,~~ and 60.4205, it is prohibited to import stationary CI ICE with a displacement of less than 30 liters per cylinder that do not meet the applicable requirements specified in paragraphs (a) through (g) of this section after the dates specified in paragraphs (a) through (g) of this section.

(i) The requirements of this section do not apply to owners or operators of stationary CI ICE ~~that have been modified, reconstructed, and do not apply to engines~~ that were removed from one existing location and reinstalled at a new location.

[71 FR 39172, July 11, 2006, as amended at 76 FR 37969, June 28, 2011]

The three emergency engines will be installed after December 31, 2008, and must therefore meet the applicable requirements for 2007 model year engines per §60.4208(a).

§60.4208(b)-(g) will not apply to Midas Gold given the proposed stationary CI ICE.

In accordance with §60.4208(h), Midas Gold must not import stationary CI ICE that do not meet the requirement of §60.4208(a). However, per §60.4208(i), the deadlines for importing and installing CI ICE do not apply to engines that are moved from one existing location to another.

§60.4209 What are the monitoring requirements if I am an owner or operator of a stationary CI internal combustion engine?

If you are an owner or operator, you must meet the monitoring requirements of this section. In addition, you must also meet the monitoring requirements specified in §60.4211.

(a) If you are an owner or operator of an emergency stationary CI internal combustion engine that does not meet the standards applicable to non-emergency engines, you must install a non-resettable hour meter prior to startup of the engine.

~~(b) If you are an owner or operator of a stationary CI internal combustion engine equipped with a diesel particulate filter to comply with the emission standards in §60.4204, the diesel particulate filter must be installed with a backpressure monitor that notifies the owner or operator when the high backpressure limit of the engine is approached.~~

[71 FR 39172, July 11, 2006, as amended at 76 FR 37969, June 28, 2011]

The three emergency engines and one fire pump engine will be required to install a non-resettable hour meter prior to startup of the engines per §60.4209(a).

Because none of the proposed CI ICE are subject to the emission standards for non-emergency engines in §60.4204, §60.4209(b) will not apply.

Compliance Requirements

~~**§60.4210 What are my compliance requirements if I am a stationary CI internal combustion engine manufacturer?**~~

~~(a) Stationary CI internal combustion engine manufacturers must certify their stationary CI ICE with a displacement of less than 10 liters per cylinder to the emission standards specified in §60.4201(a) through (c) and §60.4202(a), (b) and (d) using the certification procedures required in 40 CFR part 89, subpart B, or 40 CFR part 1039, subpart C, as applicable, and must test their engines as specified in those parts. For the purposes of this subpart, engines certified to the standards in table 1 to this subpart shall be subject to the same requirements as engines certified to the standards in 40 CFR part 89. For the purposes of this subpart, engines certified to the standards in table 4 to this subpart shall be subject to the same requirements as engines certified to the standards in 40 CFR part 89, except that engines with NFPA nameplate power of less than 37 KW (50 HP) certified to model year 2011 or later standards shall be subject to the same requirements as engines certified to the standards in 40 CFR part 1039.~~

~~(b) Stationary CI internal combustion engine manufacturers must certify their stationary CI ICE with a displacement of greater than or equal to 10 liters per cylinder and less than 30 liters per cylinder to the emission standards specified in §60.4201(d) and (e) and §60.4202(e) and (f) using the certification procedures required in 40 CFR part 94, subpart C, or 40 CFR part 1042, subpart C, as applicable, and must test their engines as specified in 40 CFR part 94 or 1042, as applicable.~~

~~(c) Stationary CI internal combustion engine manufacturers must meet the requirements of 40 CFR 1039.120, 1039.125, 1039.130, and 1039.135, and 40 CFR part 1068 for engines that are certified to the emission standards in 40 CFR part 1039. Stationary CI internal combustion engine manufacturers must meet the corresponding provisions of 40 CFR part 89, 40 CFR part 94 or 40 CFR part 1042 for engines that would be covered by that part if they were nonroad (including marine) engines. Labels on such engines must refer to stationary engines, rather than or in addition to nonroad or marine engines, as appropriate. Stationary CI internal combustion engine manufacturers must label their engines according to paragraphs (c)(1) through (3) of this section.~~

~~(1) Stationary CI internal combustion engines manufactured from January 1, 2006 to March 31, 2006 (January 1, 2006 to June 30, 2006 for fire pump engines), other than those that are part of certified engine families under the nonroad CI engine regulations, must be labeled according to 40 CFR 1039.20.~~

~~(2) Stationary CI internal combustion engines manufactured from April 1, 2006 to December 31, 2006 (or, for fire pump engines, July 1, 2006 to December 31 of the year preceding the year listed in table 3 to this subpart) must be labeled according to paragraphs (c)(2)(i) through (iii) of this section:~~

(i) Stationary CI internal combustion engines that are part of certified engine families under the nonroad regulations must meet the labeling requirements for nonroad CI engines, but do not have to meet the labeling requirements in 40 CFR 1039.20.

(ii) Stationary CI internal combustion engines that meet Tier 1 requirements (or requirements for fire pumps) under this subpart, but do not meet the requirements applicable to nonroad CI engines must be labeled according to 40 CFR 1039.20. The engine manufacturer may add language to the label clarifying that the engine meets Tier 1 requirements (or requirements for fire pumps) of this subpart.

(iii) Stationary CI internal combustion engines manufactured after April 1, 2006 that do not meet Tier 1 requirements of this subpart, or fire pumps engines manufactured after July 1, 2006 that do not meet the requirements for fire pumps under this subpart, may not be used in the U.S. If any such engines are manufactured in the U.S. after April 1, 2006 (July 1, 2006 for fire pump engines), they must be exported or must be brought into compliance with the appropriate standards prior to initial operation. The export provisions of 40 CFR 1068.230 would apply to engines for export and the manufacturers must label such engines according to 40 CFR 1068.230.

(3) Stationary CI internal combustion engines manufactured after January 1, 2007 (for fire pump engines, after January 1 of the year listed in table 3 to this subpart, as applicable) must be labeled according to paragraphs (c)(3)(i) through (iii) of this section.

(i) Stationary CI internal combustion engines that meet the requirements of this subpart and the corresponding requirements for nonroad (including marine) engines of the same model year and HP must be labeled according to the provisions in 40 CFR parts 89, 94, 1039 or 1042, as appropriate.

(ii) Stationary CI internal combustion engines that meet the requirements of this subpart, but are not certified to the standards applicable to nonroad (including marine) engines of the same model year and HP must be labeled according to the provisions in 40 CFR parts 89, 94, 1039 or 1042, as appropriate, but the words “stationary” must be included instead of “nonroad” or “marine” on the label. In addition, such engines must be labeled according to 40 CFR 1039.20.

(iii) Stationary CI internal combustion engines that do not meet the requirements of this subpart must be labeled according to 40 CFR 1068.230 and must be exported under the provisions of 40 CFR 1068.230.

(d) An engine manufacturer certifying an engine family or families to standards under this subpart that are identical to standards applicable under 40 CFR parts 89, 94, 1039 or 1042 for that model year may certify any such family that contains both nonroad (including marine) and stationary engines as a single engine family and/or may include any such family containing stationary engines in the averaging, banking and trading provisions applicable for such engines under those parts.

(e) Manufacturers of engine families discussed in paragraph (d) of this section may meet the labeling requirements referred to in paragraph (c) of this section for stationary CI ICE by either adding a separate label containing the information required in paragraph (c) of this section or by adding the words “and stationary” after the word “nonroad” or “marine,” as appropriate, to the label.

(f) Starting with the model years shown in table 5 to this subpart, stationary CI internal combustion engine manufacturers must add a permanent label stating that the engine is for stationary emergency use only to each new emergency stationary CI internal combustion engine greater than or equal to 19 KW (25 HP) that meets all the emission standards for emergency engines in §60.4202 but does not meet all the emission standards for non-emergency engines in §60.4201. The label must be added according to the labeling requirements specified in 40 CFR 1039.135(b). Engine manufacturers must specify in the owner's manual that operation of emergency engines is limited to emergency operations and required maintenance and testing.

(g) Manufacturers of fire pump engines may use the test cycle in table 6 to this subpart for testing fire pump engines and may test at the NFPA certified nameplate HP, provided that the engine is labeled as “Fire Pump Applications Only”.

(h) Engine manufacturers, including importers, may introduce into commerce uncertified engines or engines certified to earlier standards that were manufactured before the new or changed standards took effect until inventories are depleted, as long as such engines are part of normal inventory. For example, if the engine manufacturers' normal industry practice is to keep on hand a one-month supply of engines based on its projected sales, and a new tier of standards starts to apply for the 2009 model year, the engine manufacturer may manufacture engines based on the normal inventory requirements late in the 2008 model year, and sell those engines for installation. The engine manufacturer may not circumvent the provisions of §60.4201 or §60.4202 by stockpiling engines that are built before new or changed standards take effect. Stockpiling of such engines beyond normal industry practice is a violation of this subpart.

(i) The replacement engine provisions of 40 CFR 89.1003(b)(7), 40 CFR 94.1103(b)(3), 40 CFR 94.1103(b)(4) and 40 CFR 1068.240 are applicable to stationary CI engines replacing existing equipment that is less than 15 years old.

(j) Stationary CI ICE manufacturers may equip their stationary CI internal combustion engines certified to the emission standards in 40 CFR part 1039 with AECDs for qualified emergency situations according to the requirements of 40 CFR 1039.665. Manufacturers of stationary CI ICE equipped with AECDs as allowed by 40 CFR 1039.665 must meet all of the

requirements in 40 CFR 1039.665 that apply to manufacturers. Manufacturers must document that the engine complies with the Tier 1 standard in 40 CFR 89.112 when the AECD is activated. Manufacturers must provide any relevant testing, engineering analysis, or other information in sufficient detail to support such statement when applying for certification (including amending an existing certificate) of an engine equipped with an AECD as allowed by 40 CFR 1039.665.

[71 FR 39172, July 11, 2006, as amended at 76 FR 37969, June 28, 2011; 81 FR 44219, July 7, 2016]

Midas Gold is not a stationary CI engine manufacturer; therefore, this section is not applicable.

§60.4211 What are my compliance requirements if I am an owner or operator of a stationary CI internal combustion engine?

(a) If you are an owner or operator and must comply with the emission standards specified in this subpart, you must do all of the following, except as permitted under paragraph (g) of this section:

(1) Operate and maintain the stationary CI internal combustion engine and control device according to the manufacturer's emission-related written instructions;

(2) Change only those emission-related settings that are permitted by the manufacturer; and

(3) Meet the requirements of 40 CFR parts 89, 94[Marine Engines] and/or 1068, as they apply to you.

(b) If you are an owner or operator of a pre-2007 model year stationary CI internal combustion engine and must comply with the emission standards specified in §§60.4204(a) or 60.4205(a), or if you are an owner or operator of a CI fire pump engine that is manufactured prior to the model years in table 3 to this subpart and must comply with the emission standards specified in §60.4205(c), you must demonstrate compliance according to one of the methods specified in paragraphs (b)(1) through (5) of this section.

(1) Purchasing an engine certified according to 40 CFR part 89 or 40 CFR part 94, as applicable, for the same model year and maximum engine power. The engine must be installed and configured according to the manufacturer's specifications.

(2) Keeping records of performance test results for each pollutant for a test conducted on a similar engine. The test must have been conducted using the same methods specified in this subpart and these methods must have been followed correctly.

(3) Keeping records of engine manufacturer data indicating compliance with the standards.

(4) Keeping records of control device vendor data indicating compliance with the standards.

(5) Conducting an initial performance test to demonstrate compliance with the emission standards according to the requirements specified in §60.4212, as applicable.

(c) If you are an owner or operator of a 2007 model year and later stationary CI internal combustion engine and must comply with the emission standards specified in §60.4204(b) or §60.4205(b), or if you are an owner or operator of a CI fire pump engine that is manufactured during or after the model year that applies to your fire pump engine power rating in table 3 to this subpart and must comply with the emission standards specified in §60.4205(c), you must comply by purchasing an engine certified to the emission standards in §60.4204(b), or §60.4205(b) or (c), as applicable, for the same model year and maximum (or in the case of fire pumps, NFPA nameplate) engine power. The engine must be installed and configured according to the manufacturer's emission-related specifications, except as permitted in paragraph (g) of this section.

(d) If you are an owner or operator and must comply with the emission standards specified in §60.4204(c) or §60.4205(d), you must demonstrate compliance according to the requirements specified in paragraphs (d)(1) through (3) of this section.

(1) Conducting an initial performance test to demonstrate initial compliance with the emission standards as specified in §60.4213.

(2) Establishing operating parameters to be monitored continuously to ensure the stationary internal combustion engine continues to meet the emission standards. The owner or operator must petition the Administrator for approval of operating parameters to be monitored continuously. The petition must include the information described in paragraphs (d)(2)(i) through (v) of this section.

(i) Identification of the specific parameters you propose to monitor continuously;

(ii) A discussion of the relationship between these parameters and NO_x and PM emissions, identifying how the emissions of these pollutants change with changes in these parameters, and how limitations on these parameters will serve to limit NO_x and PM emissions;

(iii) A discussion of how you will establish the upper and/or lower values for these parameters which will establish the limits

on these parameters in the operating limitations;

(iv) A discussion identifying the methods and the instruments you will use to monitor these parameters, as well as the relative accuracy and precision of these methods and instruments; and

(v) A discussion identifying the frequency and methods for recalibrating the instruments you will use for monitoring these parameters.

(3) For non-emergency engines with a displacement of greater than or equal to 30 liters per cylinder, conducting annual performance tests to demonstrate continuous compliance with the emission standards as specified in §60.4213.

(e) If you are an owner or operator of a modified or reconstructed stationary CI internal combustion engine and must comply with the emission standards specified in §60.4204(e) or §60.4205(f), you must demonstrate compliance according to one of the methods specified in paragraphs (e)(1) or (2) of this section.

(1) Purchasing, or otherwise owning or operating, an engine certified to the emission standards in §60.4204(e) or §60.4205(f), as applicable.

(2) Conducting a performance test to demonstrate initial compliance with the emission standards according to the requirements specified in §60.4212 or §60.4213, as appropriate. The test must be conducted within 60 days after the engine commences operation after the modification or reconstruction.

(f) If you own or operate an emergency stationary ICE, you must operate the emergency stationary ICE according to the requirements in paragraphs (f)(1) through (3) of this section. In order for the engine to be considered an emergency stationary ICE under this subpart, any operation other than emergency operation, maintenance and testing, emergency demand response, and operation in non-emergency situations for 50 hours per year, as described in paragraphs (f)(1) through (3) of this section, is prohibited. If you do not operate the engine according to the requirements in paragraphs (f)(1) through (3) of this section, the engine will not be considered an emergency engine under this subpart and must meet all requirements for non- emergency engines.

(1) There is no time limit on the use of emergency stationary ICE in emergency situations.

(2) You may operate your emergency stationary ICE for any combination of the purposes specified in paragraphs (f)(2)(i) through (iii) of this section for a maximum of 100 hours per calendar year. Any operation for non-emergency situations as allowed by paragraph (f)(3) of this section counts as part of the 100 hours per calendar year allowed by this paragraph (f)(2).

(i) Emergency stationary ICE may be operated for maintenance checks and readiness testing, provided that the tests are recommended by federal, state or local government, the manufacturer, the vendor, the regional transmission organization or equivalent balancing authority and transmission operator, or the insurance company associated with the engine. The owner or operator may petition the Administrator for approval of additional hours to be used for maintenance checks and readiness testing, but a petition is not required if the owner or operator maintains records indicating that federal, state, or local standards require maintenance and testing of emergency ICE beyond 100 hours per calendar year.

(ii) Emergency stationary ICE may be operated for emergency demand response for periods in which the Reliability Coordinator under the North American Electric Reliability Corporation (NERC) Reliability Standard EOP-002-3, Capacity and Energy Emergencies (incorporated by reference, see §60.17), or other authorized entity as determined by the Reliability Coordinator, has declared an Energy Emergency Alert Level 2 as defined in the NERC Reliability Standard EOP-002-3.

(iii) Emergency stationary ICE may be operated for periods where there is a deviation of voltage or frequency of 5 percent or greater below standard voltage or frequency.

(3) Emergency stationary ICE may be operated for up to 50 hours per calendar year in non-emergency situations. The 50 hours of operation in non-emergency situations are counted as part of the 100 hours per calendar year for maintenance and testing and emergency demand response provided in paragraph (f)(2) of this section. Except as provided in paragraph (f)(3)(i) of this section, the 50 hours per calendar year for non-emergency situations cannot be used for peak shaving or non-emergency demand response, or to generate income for a facility to an electric grid or otherwise supply power as part of a financial arrangement with another entity.

(i) The 50 hours per year for non-emergency situations can be used to supply power as part of a financial arrangement with another entity if all of the following conditions are met:

(A) The engine is dispatched by the local balancing authority or local transmission and distribution system operator;

(B) The dispatch is intended to mitigate local transmission and/or distribution limitations so as to avert potential voltage collapse or line overloads that could lead to the interruption of power supply in a local area or region.

(C) The dispatch follows reliability, emergency operation or similar protocols that follow specific NERC, regional, state,

~~public utility commission or local standards or guidelines.~~

~~(D) The power is provided only to the facility itself or to support the local transmission and distribution system.~~

~~(E) The owner or operator identifies and records the entity that dispatches the engine and the specific NERC, regional, state, public utility commission or local standards or guidelines that are being followed for dispatching the engine. The local balancing authority or local transmission and distribution system operator may keep these records on behalf of the engine owner or operator.~~

~~(ii) [Reserved]~~

(g) If you do not install, configure, operate, and maintain your engine and control device according to the manufacturer's emission-related written instructions, or you change emission-related settings in a way that is not permitted by the manufacturer, you must demonstrate compliance as follows:

(1) ~~If you are an owner or operator of a stationary CI internal combustion engine with maximum engine power less than 100 HP, you must keep a maintenance plan and records of conducted maintenance to demonstrate compliance and must, to the extent practicable, maintain and operate the engine in a manner consistent with good air pollution control practice for minimizing emissions. In addition, if you do not install and configure the engine and control device according to the manufacturer's emission-related written instructions, or you change the emission-related settings in a way that is not permitted by the manufacturer, you must conduct an initial performance test to demonstrate compliance with the applicable emission standards within 1 year of such action~~.

(2) If you are an owner or operator of a stationary CI internal combustion engine greater than or equal to 100 HP and less than or equal to 500 HP, you must keep a maintenance plan and records of conducted maintenance and must, to the extent practicable, maintain and operate the engine in a manner consistent with good air pollution control practice for minimizing emissions. In addition, you must conduct an initial performance test to demonstrate compliance with the applicable emission standards within 1 year of startup, or within 1 year after an engine and control device is no longer installed, configured, operated, and maintained in accordance with the manufacturer's emission-related written instructions, or within 1 year after you change emission-related settings in a way that is not permitted by the manufacturer.

(3) If you are an owner or operator of a stationary CI internal combustion engine greater than 500 HP, you must keep a maintenance plan and records of conducted maintenance and must, to the extent practicable, maintain and operate the engine in a manner consistent with good air pollution control practice for minimizing emissions. In addition, you must conduct an initial performance test to demonstrate compliance with the applicable emission standards within 1 year of startup, or within 1 year after an engine and control device is no longer installed, configured, operated, and maintained in accordance with the manufacturer's emission-related written instructions, or within 1 year after you change emission-related settings in a way that is not permitted by the manufacturer. You must conduct subsequent performance testing every 8,760 hours of engine operation or 3 years, whichever comes first, thereafter to demonstrate compliance with the applicable emission standards.

~~(h) The requirements for operators and prohibited acts specified in 40 CFR 1039.665 apply to owners or operators of stationary CI ICE equipped with AECDs for qualified emergency situations as allowed by 40 CFR 1039.665.~~

[71 FR 39172, July 11, 2006, as amended at 76 FR 37970, June 28, 2011; 78 FR 6695, Jan. 30, 2013; 81 FR 44219, July 7, 2016]

§60.4211(a) will be applicable. Except as permitted in §60.4211(g), Midas Gold must operate and maintain the three emergency engines and one fire pump engine according to the manufacturer's emission-related written instructions, only change emission-related settings that are permitted by the manufacturer and meet the requirements of 40 CFR 89 and 1068, as they apply.

§60.4211(b) will not apply because Midas Gold will not own or operate any pre-2007 model year stationary CI ICE or a CI fire pump engine that is manufactured prior to 2009.

§60.4211(c) will be applicable. Midas Gold must purchase emergency stationary CI ICE certified to the emission standards in §60.4205(b) and fire pump CI ICE certified to the emission standards in §60.4205(c). Except as permitted in §60.4211(g), the engines must be installed and configured according to the manufacturer's emission-related specifications.

§60.4211(d) will not apply because Midas Gold will not own or operate any stationary CI ICE with a displacement of greater than or equal to 30 liters per cylinder.

§60.4211(e) will not apply because Midas Gold will not own or operate any modified or reconstructed stationary CI ICE.

§60.4211(f) will be applicable. Midas Gold will not be allowed to operate the three emergency engines or fire pump engine for more than 50 hours per year in non-emergency situations, and no more than 100 hours per year for maintenance checks and readiness testing. Any operation for non-emergency situations is counted towards the 100 hours per year allowed for maintenance and testing. There is no time limit on the use of the CI ICE in emergency situations. Midas Gold will not operate any stationary CI ICE for emergency demand response nor as part of a financial arrangement with another entity, and therefore §60.4211(f)(2)(ii) and (iii) and §60.4211(f)(3)(i) will not apply.

If Midas Gold does not install, configure, operate and maintain the stationary CI ICE according to the manufacturer's emission-related

instructions, §60.4211(g)(2) will be applicable to the fire pump engine and §60.4211(g)(3) will be applicable the three emergency engines. Midas Gold will be required to keep a maintenance plan and records, and maintain and operate the CI ICE in a manner consistent with good air pollution control practices. In addition, they will be required to conduct an initial performance test. Midas Gold will also be required to conduct subsequent performance tests on the three emergency engines every 8,760 hours of engine operation or every 3 years.

It is proposed that the three emergency engines and one fire pump engine will not be equipped with AECDs, therefore §60.4211(h) will not apply.

Testing Requirements for Owners and Operators

§60.4212 What test methods and other procedures must I use if I am an owner or operator of a stationary CI internal combustion engine with a displacement of less than 30 liters per cylinder?

Owners and operators of stationary CI ICE with a displacement of less than 30 liters per cylinder who conduct performance tests pursuant to this subpart must do so according to paragraphs (a) through (e) of this section.

(a) The performance test must be conducted according to the in-use testing procedures in 40 CFR part 1039, subpart F, for stationary CI ICE with a displacement of less than 10 liters per cylinder, ~~and according to 40 CFR part 1042, subpart F, for stationary CI ICE with a displacement of greater than or equal to 10 liters per cylinder and less than 30 liters per cylinder.~~

~~(b) Exhaust emissions from stationary CI ICE that are complying with the emission standards for new CI engines in 40 CFR part 1039[Non-Road CI Engines] must not exceed the not-to-exceed (NTE) standards for the same model year and maximum engine power as required in 40 CFR 1039.101(e) and 40 CFR 1039.102(g)(1), except as specified in 40 CFR 1039.104(d). This requirement starts when NTE requirements take effect for nonroad diesel engines under 40 CFR part 1039.~~

(c) Exhaust emissions from stationary CI ICE that are complying with the emission standards for new CI engines in 40 CFR 89.112 or ~~40 CFR 94.8 [Marine Engines], as applicable~~, must not exceed the NTE numerical requirements, rounded to the same number of decimal places as the applicable standard in 40 CFR 89.112 ~~or 40 CFR 94.8, as applicable,~~ determined from the following equation:

NTE requirement for each pollutant = (1.25) x (STD) (Eq. 1)

Where:

STD = The standard specified for that pollutant in 40 CFR 89.112 ~~or 40 CFR 94.8, as applicable~~.

Alternatively, stationary CI ICE that are complying with the emission standards for new CI engines in 40 CFR 89.112 ~~or 40 CFR 94.8~~ may follow the testing procedures specified in §60.4213 of this subpart, as appropriate.

~~(d) Exhaust emissions from stationary CI ICE that are complying with the emission standards for pre-2007 model year engines in §60.4204(a), §60.4205(a), or §60.4205(c) must not exceed the NTE numerical requirements, rounded to the same number of decimal places as the applicable standard in §60.4204(a), §60.4205(a), or §60.4205(c), determined from the equation in paragraph (c) of this section.~~

~~Where:~~

~~STD = The standard specified for that pollutant in §60.4204(a), §60.4205(a), or §60.4205(c).~~

~~Alternatively, stationary CI ICE that are complying with the emission standards for pre-2007 model year engines in §60.4204(a), §60.4205(a), or §60.4205(c) may follow the testing procedures specified in §60.4213, as appropriate.~~

~~(e) Exhaust emissions from stationary CI ICE that are complying with the emission standards for new CI engines in 40 CFR part 1042 must not exceed the NTE standards for the same model year and maximum engine power as required in 40 CFR 1042.101(c).~~

[71 FR 39172, July 11, 2006, as amended at 76 FR 37971, June 28, 2011]

If Midas Gold must demonstrate compliance per §60.4211(g)(2) or (g)(3), §60.4212(a), and (c) will apply to the performance testing to demonstrate compliance with the applicable emission standards.

§60.4212(b), (d) and (e) will not apply to the proposed Midas Gold stationary CI ICE.

~~§60.4213 What test methods and other procedures must I use if I am an owner or operator of a stationary CI internal combustion engine with a displacement of greater than or equal to 30 liters per cylinder?~~

~~Owners and operators of stationary CI ICE with a displacement of greater than or equal to 30 liters per cylinder must conduct performance tests according to paragraphs (a) through (f) of this section.~~

~~(a) Each performance test must be conducted according to the requirements in §60.8 and under the specific conditions that this subpart specifies in table 7. The test must be conducted within 10 percent of 100 percent peak (or the highest achievable)~~

load.

(b) You may not conduct performance tests during periods of startup, shutdown, or malfunction, as specified in §60.8(c).

(c) You must conduct three separate test runs for each performance test required in this section, as specified in §60.8(f). Each test run must last at least 1 hour.

(d) To determine compliance with the percent reduction requirement, you must follow the requirements as specified in paragraphs (d)(1) through (3) of this section.

(1) You must use Equation 2 of this section to determine compliance with the percent reduction requirement:

View or download PDF

Where:

C_i = concentration of NO_X or PM at the control device inlet,

C_o = concentration of NO_X or PM at the control device outlet, and

R = percent reduction of NO_X or PM emissions.

(2) You must normalize the NO_X or PM concentrations at the inlet and outlet of the control device to a dry basis and to 15 percent oxygen (O_2) using Equation 3 of this section, or an equivalent percent carbon dioxide (CO_2) using the procedures described in paragraph (d)(3) of this section.

View or download PDF

Where:

C_{adj} = Calculated NO_x or PM concentration adjusted to 15 percent O_2.

C_d = Measured concentration of NO_X or PM, uncorrected.

5.9 = 20.9 percent O_2 − 15 percent O_2, the defined O_2 correction value, percent.

$\%O_2$ = Measured O_2 concentration, dry basis, percent.

(3) If pollutant concentrations are to be corrected to 15 percent O_2 and CO_2 concentration is measured in lieu of O_2 concentration measurement, a CO_2 correction factor is needed. Calculate the CO_2 correction factor as described in paragraphs (d)(3)(i) through (iii) of this section.

(i) Calculate the fuel-specific F_o value for the fuel burned during the test using values obtained from Method 19, Section 5.2, and the following equation:

View or download PDF

Where:

F_o = Fuel factor based on the ratio of O_2 volume to the ultimate CO_2 volume produced by the fuel at zero percent excess air.

0.209 = Fraction of air that is O_2, percent/100.

F_d = Ratio of the volume of dry effluent gas to the gross calorific value of the fuel from Method 19, dsm^3/J ($dscf/10^6$ Btu).

F_c = Ratio of the volume of CO_2 produced to the gross calorific value of the fuel from Method 19, dsm^3/J ($dscf/10^6$ Btu).

(ii) Calculate the CO_2 correction factor for correcting measurement data to 15 percent O_2, as follows:

$$X_{CO_2} = \frac{5.9}{F_o} \quad \text{(Eq. 5)}$$

View or download PDF

Where:

X_{CO2} = CO_2 correction factor, percent.

5.9 = 20.9 percent O_2 − 15 percent O_2, the defined O_2 correction value, percent.

(iii) Calculate the NO_X and PM gas concentrations adjusted to 15 percent O_2 using CO_2 as follows:

$$C_{adj} = C_d \frac{X_{co_2}}{\%CO_2} \quad \text{(Eq. 6)}$$

View or download PDF

Where:

C_{adj} = Calculated NO_X or PM concentration adjusted to 15 percent O_2.

C_d = Measured concentration of NO_X or PM, uncorrected.

$\%CO_2$ = Measured CO_2 concentration, dry basis, percent.

(e) To determine compliance with the NO_X mass per unit output emission limitation, convert the concentration of NO_X in the engine exhaust using Equation 7 of this section:

$$ER = \frac{C_{adj} \times Q \times T}{KW\text{-}hour} \quad \text{(Eq. 7)}$$

View or download PDF

Where:

ER = Emission rate in grams per KW-hour.

C_d = Measured NO_X concentration in ppm.

1.912×10^{-3} = Conversion constant for ppm NO_X to grams per standard cubic meter at 25 degrees Celsius.

Q = Stack gas volumetric flow rate, in standard cubic meter per hour.

T = Time of test run, in hours.

KW-hour = Brake work of the engine, in KW-hour.

(f) To determine compliance with the PM mass per unit output emission limitation, convert the concentration of PM in the engine exhaust using Equation 8 of this section:

$$ER = \frac{C_{adj} \times Q \times T}{KW\text{-}hour} \quad \text{(Eq. 8)}$$

View or download PDF

Where:

ER = Emission rate in grams per KW-hour.

C_{adj} = Calculated PM concentration in grams per standard cubic meter.

Q = Stack gas volumetric flow rate, in standard cubic meter per hour.

T = Time of test run, in hours.

KW-hour = Energy output of the engine, in KW.

[71 FR 39172, July 11, 2006, as amended at 76 FR 37971, June 28, 2011]

Midas Gold is not proposing to own or operate any stationary CI ICEs with a displacement of greater than or equal to 30 liters per cylinder; therefore, this section is not applicable.

Notification, Reports, and Records for Owners and Operators

§60.4214 What are my notification, reporting, and recordkeeping requirements if I am an owner or operator of a stationary CI internal combustion engine?

(a) Owners and operators of non-emergency stationary CI ICE that are greater than 2,237 KW (3,000 HP), or have a displacement of greater than or equal to 10 liters per cylinder, or are pre-2007 model year engines that are greater than 130 KW (175 HP) and not certified, must meet the requirements of paragraphs (a)(1) and (2) of this section.

(1) Submit an initial notification as required in §60.7(a)(1). The notification must include the information in paragraphs (a)(1)(i) through (v) of this section.

(i) Name and address of the owner or operator;

(ii) The address of the affected source;

(iii) Engine information including make, model, engine family, serial number, model year, maximum engine power, and engine displacement;

(iv) Emission control equipment; and

(v) Fuel used.

(2) Keep records of the information in paragraphs (a)(2)(i) through (iv) of this section.

(i) All notifications submitted to comply with this subpart and all documentation supporting any notification.

(ii) Maintenance conducted on the engine.

(iii) If the stationary CI internal combustion is a certified engine, documentation from the manufacturer that the engine is certified to meet the emission standards.

(iv) If the stationary CI internal combustion is not a certified engine, documentation that the engine meets the emission standards.

(b) If the stationary CI internal combustion engine is an emergency stationary internal combustion engine, the owner or operator is not required to submit an initial notification. Starting with the model years in table 5 to this subpart, if the emergency engine does not meet the standards applicable to non-emergency engines in the applicable model year, the owner or operator must keep records of the operation of the engine in emergency and non-emergency service that are recorded through the non-resettable hour meter. The owner must record the time of operation of the engine and the reason the engine was in operation during that time.

(c) If the stationary CI internal combustion engine is equipped with a diesel particulate filter, the owner or operator must keep records of any corrective action taken after the backpressure monitor has notified the owner or operator that the high backpressure limit of the engine is approached.

(d) If you own or operate an emergency stationary CI ICE with a maximum engine power more than 100 HP that operates or is contractually obligated to be available for more than 15 hours per calendar year for the purposes specified in §60.4211(f)(2)(ii) and (iii) or that operates for the purposes specified in §60.4211(f)(3)(i), you must submit an annual report according to the requirements in paragraphs (d)(1) through (3) of this section. The report must contain the following information:

(i) Company name and address where the engine is located.

(ii) Date of the report and beginning and ending dates of the reporting period.

(iii) Engine site rating and model year.

(iv) Latitude and longitude of the engine in decimal degrees reported to the fifth decimal place.

(v) Hours operated for the purposes specified in §60.4211(f)(2)(ii) and (iii), including the date, start time, and end time for engine operation for the purposes specified in §60.4211(f)(2)(ii) and (iii).

(vi) Number of hours the engine is contractually obligated to be available for the purposes specified in §60.4211(f)(2)(ii) and (iii).

(vii) Hours spent for operation for the purposes specified in §60.4211(f)(3)(i), including the date, start time, and end time for engine operation for the purposes specified in §60.4211(f)(3)(i). The report must also identify the entity that dispatched the engine and the situation that necessitated the dispatch of the engine.

(2) The first annual report must cover the calendar year 2015 and must be submitted no later than March 31, 2016. Subsequent annual reports for each calendar year must be submitted no later than March 31 of the following calendar year.

(3) The annual report must be submitted electronically using the subpart specific reporting form in the Compliance and Emissions Data Reporting Interface (CEDRI) that is accessed through EPA's Central Data Exchange (CDX) (*www.epa.gov/cdx*). However, if the reporting form specific to this subpart is not available in CEDRI at the time that the report is due, the written report must be submitted to the Administrator at the appropriate address listed in §60.4.

(e) Owners or operators of stationary CI ICE equipped with AECDs pursuant to the requirements of 40 CFR 1039.665 must report the use of AECDs as required by 40 CFR 1039.665(e).

[71 FR 39172, July 11, 2006, as amended at 78 FR 6696, Jan. 30, 2013; 81 FR 44219, July 7, 2016]

§60.4214(a) will not apply to the proposed Midas Gold stationary CI ICE.

§60.4214(b) will be applicable. Midas Gold will not be required to submit an initial notification for the three emergency engines and one fire pump engine. Because the emergency engines will not meet the standards applicable to non-emergency engines, Midas Gold must keep records of the time of operation in emergency and non-emergency service and reason for operation.

It is proposed that the three emergency engines and one fire pump engine will not be equipped with diesel particulate filters, therefore §60.4214(c) will not apply.

Midas Gold will not operate any stationary CI ICE for emergency demand response per §60.4211(f)(2)(ii) and (iii) nor as part of a financial arrangement with another entity per §60.4211(f)(3)(i), and therefore §60.4214(d) will not apply.

It is proposed that the three emergency engines and one fire pump engine will not be equipped with AECDs, therefore §60.4214(e) will not apply.

Special Requirements

§60.4215 What requirements must I meet for engines used in Guam, American Samoa, or the Commonwealth of the Northern Mariana Islands?

(a) Stationary CI ICE with a displacement of less than 30 liters per cylinder that are used in Guam, American Samoa, or the Commonwealth of the Northern Mariana Islands are required to meet the applicable emission standards in §§60.4202 and 60.4205.

(b) Stationary CI ICE that are used in Guam, American Samoa, or the Commonwealth of the Northern Mariana Islands are not required to meet the fuel requirements in §60.4207.

(c) Stationary CI ICE with a displacement of greater than or equal to 30 liters per cylinder that are used in Guam, American Samoa, or the Commonwealth of the Northern Mariana Islands are required to meet the following emission standards:

(1) For engines installed prior to January 1, 2012, limit the emissions of NO_X in the stationary CI internal combustion engine exhaust to the following:

(i) 17.0 g/KW-hr (12.7 g/HP-hr) when maximum engine speed is less than 130 rpm;

(ii) $45 \cdot n^{-0.2}$ g/KW-hr ($34 \cdot n^{-0.2}$ g/HP-hr) when maximum engine speed is 130 or more but less than 2,000 rpm, where n is maximum engine speed; and

(iii) 9.8 g/KW-hr (7.3 g/HP-hr) when maximum engine speed is 2,000 rpm or more.

(2) For engines installed on or after January 1, 2012, limit the emissions of NO_X in the stationary CI internal combustion engine exhaust to the following:

(i) 14.4 g/KW-hr (10.7 g/HP-hr) when maximum engine speed is less than 130 rpm;$44 \cdot n^{-0.23}$ g/KW-hr ($33 \cdot n^{-0.23}$ g/HP-hr) when maximum engine speed is greater than or equal to 130 but less than 2,000 rpm and where n is maximum engine speed; and

(ii) 7.7 g/KW-hr (5.7 g/HP-hr) when maximum engine speed is greater than or equal to 2,000 rpm.

(3) Limit the emissions of PM in the stationary CI internal combustion engine exhaust to 0.40 g/KW-hr (0.30 g/HP-hr).

[71 FR 39172, July 11, 2006, as amended at 76 FR 37971, June 28, 2011]

Midas Gold is not proposing to use any engines in Guam, American Samoa, or the Commonwealth of the Northern Mariana Islands; therefore, this section is not applicable.

§60.4216 What requirements must I meet for engines used in Alaska?

(a) Prior to December 1, 2010, owners and operators of stationary CI ICE with a displacement of less than 30 liters per cylinder located in areas of Alaska not accessible by the FAHS should refer to 40 CFR part 69 to determine the diesel fuel requirements applicable to such engines.

(b) Except as indicated in paragraph (c) of this section, manufacturers, owners and operators of stationary CI ICE with a displacement of less than 10 liters per cylinder located in remote areas of Alaska may meet the requirements of this subpart by

manufacturing and installing engines meeting the requirements of 40 CFR parts 94 or 1042, as appropriate, rather than the otherwise applicable requirements of 40 CFR parts 89 and 1039, as indicated in §§60.4201(f) and 60.4202(g).

(c) Manufacturers, owners and operators of stationary CI ICE that are located in remote areas of Alaska may choose to meet the applicable emission standards for emergency engines in §§60.4202 and 60.4205, and not those for non-emergency engines in §§60.4201 and 60.4204, except that for 2014 model year and later non-emergency CI ICE, the owner or operator of any such engine that was not certified as meeting Tier 4 PM standards, must meet the applicable requirements for PM in §§60.4201 and 60.4204 or install a PM emission control device that achieves PM emission reductions of 85 percent, or 60 percent for engines with a displacement of greater than or equal to 30 liters per cylinder, compared to engine-out emissions.

(d) The provisions of §60.4207 do not apply to owners and operators of pre-2014 model year stationary CI ICE subject to this subpart that are located in remote areas of Alaska.

(e) The provisions of §60.4208(a) do not apply to owners and operators of stationary CI ICE subject to this subpart that are located in areas of Alaska not accessible by the FAHS until after December 31, 2009.

(f) The provisions of this section and §60.4207 do not prevent owners and operators of stationary CI ICE subject to this subpart that are located in remote areas of Alaska from using fuels mixed with used lubricating oil, in volumes of up to 1.75 percent of the total fuel. The sulfur content of the used lubricating oil must be less than 200 parts per million. The used lubricating oil must meet the on-specification levels and properties for used oil in 40 CFR 279.11.

[76 FR 37971, June 28, 2011, as amended at 81 FR 44219, July 7, 2016]

Midas Gold is not proposing to use any engines in Alaska; therefore, this section is not applicable.

§60.4217 What emission standards must I meet if I am an owner or operator of a stationary internal combustion engine using special fuels?

Owners and operators of stationary CI ICE that do not use diesel fuel may petition the Administrator for approval of alternative emission standards, if they can demonstrate that they use a fuel that is not the fuel on which the manufacturer of the engine certified the engine and that the engine cannot meet the applicable standards required in §60.4204 or §60.4205 using such fuels and that use of such fuel is appropriate and reasonably necessary, considering cost, energy, technical feasibility, human health and environmental, and other factors, for the operation of the engine.

[76 FR 37972, June 28, 2011]

Midas Gold is not proposing to own or operate any engines using special fuels; therefore, this section is not applicable.

General Provisions

§60.4218 What parts of the General Provisions apply to me?

Table 8 to this subpart shows which parts of the General Provisions in §§60.1 through 60.19 apply to you.

See Table 8 of this subpart for the applicable General Provisions to this subpart.

Definitions

§60.4219 What definitions apply to this subpart?

As used in this subpart, all terms not defined herein shall have the meaning given them in the CAA and in subpart A of this part.

Alaska Railbelt Grid means the service areas of the six regulated public utilities that extend from Fairbanks to Anchorage and the Kenai Peninsula. These utilities are Golden Valley Electric Association; Chugach Electric Association; Matanuska Electric Association; Homer Electric Association; Anchorage Municipal Light & Power; and the City of Seward Electric System.

Certified emissions life means the period during which the engine is designed to properly function in terms of reliability and fuel consumption, without being remanufactured, specified as a number of hours of operation or calendar years, whichever comes first. The values for certified emissions life for stationary CI ICE with a displacement of less than 10 liters per cylinder are given in 40 CFR 1039.101(g). The values for certified emissions life for stationary CI ICE with a displacement of greater than or equal to 10 liters per cylinder and less than 30 liters per cylinder are given in 40 CFR 94.9(a).

Combustion turbine means all equipment, including but not limited to the turbine, the fuel, air, lubrication and exhaust gas systems, control systems (except emissions control equipment), and any ancillary components and sub-components comprising any simple cycle combustion turbine, any regenerative/recuperative cycle combustion turbine, the combustion

turbine portion of any cogeneration cycle combustion system, or the combustion turbine portion of any combined cycle steam/electric generating system.

Compression ignition means relating to a type of stationary internal combustion engine that is not a spark ignition engine.

Date of manufacture means one of the following things:

(1) For freshly manufactured engines and modified engines, date of manufacture means the date the engine is originally produced.

(2) For reconstructed engines, date of manufacture means the date the engine was originally produced, except as specified in paragraph (3) of this definition.

(3) Reconstructed engines are assigned a new date of manufacture if the fixed capital cost of the new and refurbished components exceeds 75 percent of the fixed capital cost of a comparable entirely new facility. An engine that is produced from a previously used engine block does not retain the date of manufacture of the engine in which the engine block was previously used if the engine is produced using all new components except for the engine block. In these cases, the date of manufacture is the date of reconstruction or the date the new engine is produced.

Diesel fuel means any liquid obtained from the distillation of petroleum with a boiling point of approximately 150 to 360 degrees Celsius. One commonly used form is number 2 distillate oil.

Diesel particulate filter means an emission control technology that reduces PM emissions by trapping the particles in a flow filter substrate and periodically removes the collected particles by either physical action or by oxidizing (burning off) the particles in a process called regeneration.

Emergency stationary internal combustion engine means any stationary reciprocating internal combustion engine that meets all of the criteria in paragraphs (1) through (3) of this definition. All emergency stationary ICE must comply with the requirements specified in §60.4211(f) in order to be considered emergency stationary ICE. If the engine does not comply with the requirements specified in §60.4211(f), then it is not considered to be an emergency stationary ICE under this subpart.

(1) The stationary ICE is operated to provide electrical power or mechanical work during an emergency situation. Examples include stationary ICE used to produce power for critical networks or equipment (including power supplied to portions of a facility) when electric power from the local utility (or the normal power source, if the facility runs on its own power production) is interrupted, or stationary ICE used to pump water in the case of fire or flood, etc.

(2) The stationary ICE is operated under limited circumstances for situations not included in paragraph (1) of this definition, as specified in §60.4211(f).

(3) The stationary ICE operates as part of a financial arrangement with another entity in situations not included in paragraph (1) of this definition only as allowed in §60.4211(f)(2)(ii) or (iii) and §60.4211(f)(3)(i).

Engine manufacturer means the manufacturer of the engine. See the definition of "manufacturer" in this section.

Fire pump engine means an emergency stationary internal combustion engine certified to NFPA requirements that is used to provide power to pump water for fire suppression or protection.

Freshly manufactured engine means an engine that has not been placed into service. An engine becomes freshly manufactured when it is originally produced.

Installed means the engine is placed and secured at the location where it is intended to be operated.

Manufacturer has the meaning given in section 216(1) of the Act. In general, this term includes any person who manufactures a stationary engine for sale in the United States or otherwise introduces a new stationary engine into commerce in the United States. This includes importers who import stationary engines for sale or resale.

Maximum engine power means maximum engine power as defined in 40 CFR 1039.801.

Model year means the calendar year in which an engine is manufactured (see "date of manufacture"), except as follows:

(1) Model year means the annual new model production period of the engine manufacturer in which an engine is manufactured (see "date of manufacture"), if the annual new model production period is different than the calendar year and includes January 1 of the calendar year for which the model year is named. It may not begin before January 2 of the previous calendar year and it must end by December 31 of the named calendar year.

(2) For an engine that is converted to a stationary engine after being placed into service as a nonroad or other non-stationary engine, model year means the calendar year or new model production period in which the engine was manufactured

(see “date of manufacture”).

Other internal combustion engine means any internal combustion engine, except combustion turbines, which is not a reciprocating internal combustion engine or rotary internal combustion engine.

Reciprocating internal combustion engine means any internal combustion engine which uses reciprocating motion to convert heat energy into mechanical work.

Remote areas of Alaska means areas of Alaska that meet either paragraph (1) or (2) of this definition.

(1) Areas of Alaska that are not accessible by the Federal Aid Highway System (FAHS).

(2) Areas of Alaska that meet all of the following criteria:

(i) The only connection to the FAHS is through the Alaska Marine Highway System, or the stationary CI ICE operation is within an isolated grid in Alaska that is not connected to the statewide electrical grid referred to as the Alaska Railbelt Grid.

(ii) At least 10 percent of the power generated by the stationary CI ICE on an annual basis is used for residential purposes.

(iii) The generating capacity of the source is less than 12 megawatts, or the stationary CI ICE is used exclusively for backup power for renewable energy.

Rotary internal combustion engine means any internal combustion engine which uses rotary motion to convert heat energy into mechanical work.

Spark ignition means relating to a gasoline, natural gas, or liquefied petroleum gas fueled engine or any other type of engine with a spark plug (or other sparking device) and with operating characteristics significantly similar to the theoretical Otto combustion cycle. Spark ignition engines usually use a throttle to regulate intake air flow to control power during normal operation. Dual-fuel engines in which a liquid fuel (typically diesel fuel) is used for CI and gaseous fuel (typically natural gas) is used as the primary fuel at an annual average ratio of less than 2 parts diesel fuel to 100 parts total fuel on an energy equivalent basis are spark ignition engines.

Stationary internal combustion engine means any internal combustion engine, except combustion turbines, that converts heat energy into mechanical work and is not mobile. Stationary ICE differ from mobile ICE in that a stationary internal combustion engine is not a nonroad engine as defined at 40 CFR 1068.30 (excluding paragraph (2)(ii) of that definition), and is not used to propel a motor vehicle, aircraft, or a vehicle used solely for competition. Stationary ICE include reciprocating ICE, rotary ICE, and other ICE, except combustion turbines.

Subpart means 40 CFR part 60, subpart IIII.

[71 FR 39172, July 11, 2006, as amended at 76 FR 37972, June 28, 2011; 78 FR 6696, Jan. 30, 2013; 81 FR 44219, July 7, 2016]

The definitions applicable to Midas Gold have been highlighted in §60.4219.

Table 1 to Subpart IIII of Part 60—Emission Standards for Stationary Pre-2007 Model Year Engines With a Displacement of <10 Liters per Cylinder and 2007-2010 Model Year Engines >2,237 KW (3,000 HP) and With a Displacement of <10 Liters per Cylinder

[As stated in §§60.4201(b), 60.4202(b), 60.4204(a), and 60.4205(a), you must comply with the following emission standards]

Maximum engine power	Emission standards for stationary pre-2007 model year engines with a displacement of <10 liters per cylinder and 2007-2010 model year engines >2,237 KW (3,000 HP) and with a displacement of <10 liters per cylinder in g/KW-hr (g/HP-hr)				
	NMHC + NO_x	HC	NO_x	CO	PM
KW<8 (HP<11)	10.5 (7.8)			8.0 (6.0)	1.0 (0.75)
8≤KW<19 (11≤HP<25)	9.5 (7.1)			6.6 (4.9)	0.80 (0.60)
19≤KW<37 (25≤HP<50)	9.5 (7.1)			5.5 (4.1)	0.80 (0.60)
37≤KW<56 (50≤HP<75)			9.2 (6.9)		
56≤KW<75 (75≤HP<100)			9.2 (6.9)		
75≤KW<130 (100≤HP<175)			9.2 (6.9)		
130≤KW<225 (175≤HP<300)		1.3 (1.0)	9.2 (6.9)	11.4 (8.5)	0.54 (0.40)
225≤KW<450 (300≤HP<600)		1.3 (1.0)	9.2 (6.9)	11.4 (8.5)	0.54 (0.40)
450≤KW≤560 (600≤HP≤750)		1.3 (1.0)	9.2 (6.9)	11.4 (8.5)	0.54 (0.40)
KW>560 (HP>750)		1.3 (1.0)	9.2 (6.9)	11.4 (8.5)	0.54 (0.40)

Table 1 will not apply because the proposed stationary CI ICEs to be operated at the Stibnite Gold Project are not Pre-2007, or model year 2007-2010 greater than 2,237 KW (3,000 HP).

Table 2 to Subpart IIII of Part 60—Emission Standards for 2008 Model Year and Later Emergency Stationary CI ICE <37 KW (50 HP) With a Displacement of <10 Liters per Cylinder

[As stated in §60.4202(a)(1), you must comply with the following emission standards]

Engine power	Emission standards for 2008 model year and later emergency stationary CI ICE <37 KW (50 HP) with a displacement of <10 liters per cylinder in g/KW-hr (g/HP-hr)			
	Model year(s)	NO_x + NMHC	CO	PM
KW<8 (HP<11)	2008 +	7.5 (5.6)	8.0 (6.0)	0.40 (0.30)
8≤KW<19 (11≤HP<25)	2008 +	7.5 (5.6)	6.6 (4.9)	0.40 (0.30)
19≤KW<37 (25≤HP<50)	2008 +	7.5 (5.6)	5.5 (4.1)	0.30 (0.22)

Table 2 will not apply because the stationary CI ICEs at the Stibnite Gold Project are proposed to be greater than 37 KW.

Table 3 to Subpart IIII of Part 60—Certification Requirements for Stationary Fire Pump Engines

As stated in §60.4202(d), you must certify new stationary fire pump engines beginning with the following model years:

Engine power	Starting model year engine manufacturers must certify new stationary fire pump engines according to §60.4202(d)[1]
KW<75 (HP<100)	2011
75≤KW<130 (100≤HP<175)	2010
130≤KW≤560 (175≤HP≤750)	2009
KW>560 (HP>750)	2008

[1]Manufacturers of fire pump stationary CI ICE with a maximum engine power greater than or equal to 37 kW (50 HP) and less than 450 KW (600 HP) and a rated speed of greater than 2,650 revolutions per minute (rpm) are not required to certify such engines until three model years following the model year indicated in this Table 3 for engines in the applicable engine power category.

[71 FR 39172, July 11, 2006, as amended at 76 FR 37972, June 28, 2011]

Table 3 will not apply as Midas Gold is not a stationary CI ICE manufacturer.

Table 4 to Subpart IIII of Part 60—Emission Standards for Stationary Fire Pump Engines

[As stated in ~~§§60.4202(d) and~~ 60.4205(c), you must comply with the following emission standards for stationary fire pump engines]

Maximum engine power	Model year(s)	NMHC + NO_X	CO	PM
~~KW<8 (HP<11)~~	~~2010 and earlier~~	~~10.5 (7.8)~~	~~8.0 (6.0)~~	~~1.0 (0.75)~~
	~~2011 +~~	~~7.5 (5.6)~~		~~0.40 (0.30)~~
~~8≤KW<19 (11≤HP<25)~~	~~2010 and earlier~~	~~9.5 (7.1)~~	~~6.6 (4.9)~~	~~0.80 (0.60)~~
	~~2011 +~~	~~7.5 (5.6)~~		~~0.40 (0.30)~~
~~19≤KW<37 (25≤HP<50)~~	~~2010 and earlier~~	~~9.5 (7.1)~~	~~5.5 (4.1)~~	~~0.80 (0.60)~~
	~~2011 +~~	~~7.5 (5.6)~~		~~0.30 (0.22)~~
~~37≤KW<56 (50≤HP<75)~~	~~2010 and earlier~~	~~10.5 (7.8)~~	~~5.0 (3.7)~~	~~0.80 (0.60)~~
	~~2011 +[1]~~	~~4.7 (3.5)~~		~~0.40 (0.30)~~
~~56≤KW<75 (75≤HP<100)~~	~~2010 and earlier~~	~~10.5 (7.8)~~	~~5.0 (3.7)~~	~~0.80 (0.60)~~
	~~2011 +[1]~~	~~4.7 (3.5)~~		~~0.40 (0.30)~~
~~75≤KW<130 (100≤HP<175)~~	~~2009 and earlier~~	~~10.5 (7.8)~~	~~5.0 (3.7)~~	~~0.80 (0.60)~~
	~~2010 +[2]~~	~~4.0 (3.0)~~		~~0.30 (0.22)~~
130≤KW<225 (175≤HP<300)	2008 and earlier	10.5 (7.8)	3.5 (2.6)	0.54 (0.40)
	2009 +[3]	4.0 (3.0)		0.20 (0.15)
~~225≤KW<450 (300≤HP<600)~~	~~2008 and earlier~~	~~10.5 (7.8)~~	~~3.5 (2.6)~~	~~0.54 (0.40)~~
	~~2009 +[3]~~	~~4.0 (3.0)~~		~~0.20 (0.15)~~
~~450≤KW≤560 (600≤HP≤750)~~	~~2008 and earlier~~	~~10.5 (7.8)~~	~~3.5 (2.6)~~	~~0.54 (0.40)~~
	~~2009 +~~	~~4.0 (3.0)~~		~~0.20 (0.15)~~
~~KW>560 (HP>750)~~	~~2007 and earlier~~	~~10.5 (7.8)~~	~~3.5 (2.6)~~	~~0.54 (0.40)~~
	~~2008 +~~	~~6.4 (4.8)~~		~~0.20 (0.15)~~

~~[1]For model years 2011-2013, manufacturers, owners and operators of fire pump stationary CI ICE in this engine power category with a rated speed of greater than 2,650 revolutions per minute (rpm) may comply with the emission limitations for 2010 model year engines.~~

~~[2]For model years 2010-2012, manufacturers, owners and operators of fire pump stationary CI ICE in this engine power category with a rated speed of greater than 2,650 rpm may comply with the emission limitations for 2009 model year engines~~.

~~[3]In model years 2009-2011, manufacturers of fire pump stationary CI ICE in this engine power category with a rated speed of greater than 2,650 rpm may comply with the emission limitations for 2008 model year engines.~~

Table 4 will apply to the new stationary fire pump CI ICE to be installed at the Stibnite Gold Project per §60.4205(c).

Table 5 to Subpart IIII of Part 60—Labeling and Recordkeeping Requirements for New Stationary Emergency Engines

[You must comply with ~~the labeling requirements in §60.4210(f) and~~ the recordkeeping requirements in §60.4214(b) for new emergency stationary CI ICE beginning in the following model years:]

Engine power	Starting model year
~~19≤KW<56 (25≤HP<75)~~	~~2013~~
~~56≤KW<130 (75≤HP<175)~~	~~2012~~
KW≥130 (HP≥175)	2011

Table 5 will apply to the emergency engines if they do not meet the standards applicable to non-emergency engines. The labeling requirements in §60.4210(f) will apply to the manufacturer and the recordkeeping requirements in §60.4214(b) will apply to Midas Gold.

~~**Table 6 to Subpart IIII of Part 60—Optional 3-Mode Test Cycle for Stationary Fire Pump Engines**~~

~~[As stated in §60.4210(g), manufacturers of fire pump engines may use the following test cycle for testing fire pump engines:]~~

~~Mode No.~~	~~Engine speed[1]~~	~~Torque (percent)[2]~~	~~Weighting factors~~
~~1~~	~~Rated~~	~~100~~	~~0.30~~
~~2~~	~~Rated~~	~~75~~	~~0.50~~
~~3~~	~~Rated~~	~~50~~	~~0.20~~

~~[1]Engine speed: ±2 percent of point.~~

[2]Torque: NFPA certified nameplate HP for 100 percent point. All points should be ±2 percent of engine percent load value.

Table 6 will not apply because Midas Gold is not a stationary CI engine manufacturer.

Table 7 to Subpart IIII of Part 60—Requirements for Performance Tests for Stationary CI ICE With a Displacement of ≥30 Liters per Cylinder

As stated in §60.4213, you must comply with the following requirements for performance tests for stationary CI ICE with a displacement of ≥30 liters per cylinder:

Each	Complying with the requirement to	You must	Using	According to the following requirements
1. Stationary CI internal combustion engine with a displacement of ≥ 30 liters per cylinder	a. Reduce NO_x emissions by 90 percent or more;	i. Select the sampling port location and number/location of traverse points at the inlet and outlet of the control device;		(a) For NO_x, O_2, and moisture measurement, ducts ≤6 inches in diameter may be sampled at a single point located at the duct centroid and ducts >6 and ≤12 inches in diameter may be sampled at 3 traverse points located at 16.7, 50.0, and 83.3% of the measurement line ('3-point long line'). If the duct is >12 inches in diameter *and* the sampling port location meets the two and half-diameter criterion of Section 11.1.1 of Method 1 of 40 CFR part 60, appendix A-1, the duct may be sampled at '3-point long line'; otherwise, conduct the stratification testing and select sampling points according to Section 8.1.2 of Method 7E of 40 CFR part 60, appendix A-4.
		ii. Measure O_2 at the inlet and outlet of the control device;	(1) Method 3, 3A, or 3B of 40 CFR part 60, appendix A-2	(b) Measurements to determine O_2 concentration must be made at the same time as the measurements for NO_x concentration.
		iii. If necessary, measure moisture content at the inlet and outlet of the control device; and	(2) Method 4 of 40 CFR part 60, appendix A-3, Method 320 of 40 CFR part 63, appendix A, or ASTM D 6348-03 (incorporated by reference, see §60.17)	(c) Measurements to determine moisture content must be made at the same time as the measurements for NO_x concentration.
		iv. Measure NO_x at the inlet and outlet of the control device.	(3) Method 7E of 40 CFR part 60, appendix A-4, Method 320 of 40 CFR part 63, appendix A, or ASTM D 6348-03 (incorporated by reference, see §60.17)	(d) NO_x concentration must be at 15 percent O_2, dry basis. Results of this test consist of the average of the three 1-hour or longer runs.
	b. Limit the concentration of NO_x in the stationary CI internal combustion engine exhaust.	i. Select the sampling port location and number/location of traverse points at the exhaust of the stationary internal combustion engine;		(a) For NO_x, O_2, and moisture measurement, ducts ≤6 inches in diameter may be sampled at a single point located at the duct centroid and ducts >6 and ≤12 inches in diameter may be sampled at 3 traverse points located at 16.7, 50.0, and 83.3% of the measurement line ('3-point long line'). If the duct is >12 inches in diameter *and* the sampling port location meets the two and half-diameter criterion of Section 11.1.1 of Method 1 of 40 CFR part 60, appendix A-1, the duct may be sampled at '3-point long line'; otherwise, conduct the stratification testing and select sampling points according to Section 8.1.2 of Method 7E of 40 CFR part 60, appendix A-4.
		ii. Determine the O_2 concentration of the stationary internal combustion engine exhaust at the sampling port location;	(1) Method 3, 3A, or 3B of 40 CFR part 60, appendix A-2	(b) Measurements to determine O_2 concentration must be made at the same time as the measurement for NO_x concentration.
		iii. If necessary, measure moisture content of the stationary internal combustion engine exhaust at the sampling port location; and	(2) Method 4 of 40 CFR part 60, appendix A-3, Method 320 of 40 CFR part 63, appendix A, or ASTM D 6348-03 (incorporated by reference, see §60.17)	(c) Measurements to determine moisture content must be made at the same time as the measurement for NO_x concentration.
		iv. Measure NO_x at the exhaust of the stationary internal combustion engine; if using a control device, the sampling site must be located at the outlet of the control device.	(3) Method 7E of 40 CFR part 60, appendix A-4, Method 320 of 40 CFR part 63, appendix A, or ASTM D 6348-03 (incorporated by reference, see §60.17)	(d) NO_x concentration must be at 15 percent O_2, dry basis. Results of this test consist of the average of the three 1-hour or longer runs.

	c. Reduce PM emissions by 60 percent or more	i. Select the sampling port location and the number of traverse points;	(1) Method 1 or 1A of 40 CFR part 60, appendix A-1	(a) Sampling sites must be located at the inlet and outlet of the control device.
		ii. Measure O_2 at the inlet and outlet of the control device;	(2) Method 3, 3A, or 3B of 40 CFR part 60, appendix A-2	(b) Measurements to determine O_2 concentration must be made at the same time as the measurements for PM concentration.
		iii. If necessary, measure moisture content at the inlet and outlet of the control device; and	(3) Method 4 of 40 CFR part 60, appendix A-3	(c) Measurements to determine and moisture content must be made at the same time as the measurements for PM concentration.
		iv. Measure PM at the inlet and outlet of the control device.	(4) Method 5 of 40 CFR part 60, appendix A-3	(d) PM concentration must be at 15 percent O_2, dry basis. Results of this test consist of the average of the three 1-hour or longer runs.
	d. Limit the concentration of PM in the stationary CI internal combustion engine exhaust	i. Select the sampling port location and the number of traverse points;	(1) Method 1 or 1A of 40 CFR part 60, appendix A-1	(a) If using a control device, the sampling site must be located at the outlet of the control device.
		ii. Determine the O_2 concentration of the stationary internal combustion engine exhaust at the sampling port location;	(2) Method 3, 3A, or 3B of 40 CFR part 60, appendix A-2	(b) Measurements to determine O_2 concentration must be made at the same time as the measurements for PM concentration.
		iii. If necessary, measure moisture content of the stationary internal combustion engine exhaust at the sampling port location; and	(3) Method 4 of 40 CFR part 60, appendix A-3	(c) Measurements to determine moisture content must be made at the same time as the measurements for PM concentration.
		iv. Measure PM at the exhaust of the stationary internal combustion engine.	(4) Method 5 of 40 CFR part 60, appendix A-3	(d) PM concentration must be at 15 percent O_2, dry basis. Results of this test consist of the average of the three 1-hour or longer runs.

[79 FR 11251, Feb. 27, 2014]

Table 7 will not apply because Midas Gold will not own or operate any stationary CI ICE with a displacement of ≥30 liters per cylinder.

Table 8 to Subpart IIII of Part 60—Applicability of General Provisions to Subpart IIII

[As stated in §60.4218, you must comply with the following applicable General Provisions:]

General Provisions citation	Subject of citation	Applies to subpart	Explanation
§60.1	General applicability of the General Provisions	Yes	
§60.2	Definitions	Yes	Additional terms defined in §60.4219.
§60.3	Units and abbreviations	Yes	
§60.4	Address	Yes	
§60.5	Determination of construction or modification	Yes	
§60.6	Review of plans	Yes	
§60.7	Notification and Recordkeeping	Yes	Except that §60.7 only applies as specified in §60.4214(a).
§60.8	Performance tests	Yes	Except that §60.8 only applies to stationary CI ICE with a displacement of (≥30 liters per cylinder and engines that are not certified.
§60.9	Availability of information	Yes	
§60.10	State Authority	Yes	
§60.11	Compliance with standards and maintenance requirements	No	Requirements are specified in subpart IIII.
§60.12	Circumvention	Yes	
§60.13	Monitoring requirements	Yes	Except that §60.13 only applies to stationary CI ICE with a displacement of (≥30 liters per cylinder.
§60.14	Modification	Yes	
§60.15	Reconstruction	Yes	
§60.16	Priority list	Yes	
§60.17	Incorporations by reference	Yes	
§60.18	General control device requirements	No	
§60.19	General notification and reporting requirements	Yes	

The applicable General Provisions are highlighted in Table 8.

Back to Top

WHAT THIS SUBPART COVERS

§63.11110 What is the purpose of this subpart?

This subpart establishes national emission limitations and management practices for hazardous air pollutants (HAP) emitted from the loading of gasoline storage tanks at gasoline dispensing facilities (GDF). This subpart also establishes requirements to demonstrate compliance with the emission limitations and management practices.

§63.11111 Am I subject to the requirements in this subpart?

(a) The affected source to which this subpart applies is each GDF that is located at an area source. The affected source includes each gasoline cargo tank during the delivery of product to a GDF and also includes each storage tank.

~~(b) If your GDF has a monthly throughput of less than 10,000 gallons of gasoline, you must comply with the requirements in §63.11116.~~

(c) If your GDF has a monthly throughput of 10,000 gallons of gasoline or more, you must comply with the requirements in §63.11117.

~~(d) If your GDF has a monthly throughput of 100,000 gallons of gasoline or more, you must comply with the requirements in §63.11118.~~

(e) An affected source shall, upon request by the Administrator, demonstrate that their monthly throughput is less than ~~the 10,000-gallon or~~ the 100,000-gallon threshold level, as applicable. For new ~~or reconstructed~~ affected sources, as specified in §63.11112(b) ~~and (c),~~ recordkeeping to document monthly throughput must begin upon startup of the affected source. ~~For existing sources, as specified in §63.11112(d), recordkeeping to document monthly throughput must begin on January 10, 2008. For existing sources that are subject to this subpart only because they load gasoline into fuel tanks other than those in motor vehicles, as defined in §63.11132, recordkeeping to document monthly throughput must begin on January 24, 2011.~~ Records required under this paragraph shall be kept for a period of 5 years.

(f) If you are an owner or operator of affected sources, as defined in paragraph (a) of this section, you are not required to obtain a permit under 40 CFR part 70 ~~or 40 CFR part 71~~ as a result of being subject to this subpart. However, you must still apply for and obtain a permit under 40 CFR part 70 ~~or 40 CFR part 71~~ if you meet one or more of the applicability criteria found in 40 CFR 70.3(a) and (b) ~~or 40 CFR 71.3(a) and (b).~~

~~(g) The loading of aviation gasoline into storage tanks at airports, and the subsequent transfer of aviation gasoline within the airport, is not subject to this subpart.~~

(h) Monthly throughput is the total volume of gasoline loaded into, or dispensed from, all the gasoline storage tanks located at a single affected GDF. If an area source has two or more GDF at separate locations within the area source, each GDF is treated as a separate affected source.

(i) If your affected source's throughput ever exceeds an applicable throughput threshold, the affected source will remain subject to the requirements for sources above the threshold, even if the affected source throughput later falls below the applicable throughput threshold.

(j) The dispensing of gasoline from a fixed gasoline storage tank at a GDF into a portable gasoline tank for the on-site delivery and subsequent dispensing of the gasoline into the fuel tank of a motor vehicle or other gasoline-fueled engine or equipment used within the area source is only subject to §63.11116 of this subpart.

(k) For any affected source subject to the provisions of this subpart and another Federal rule, you may elect to comply only with the more stringent provisions of the applicable subparts. You must consider all provisions of the rules, including monitoring, recordkeeping, and reporting. You must identify the affected source and provisions with which you will comply in your Notification of Compliance Status required under §63.11124. You also must demonstrate in your Notification of Compliance Status that each provision with which you will comply is at least as stringent as the otherwise applicable requirements in this subpart. You are responsible for making accurate determinations concerning the more stringent provisions, and noncompliance with this rule is not excused if it is later determined that your determination was in error, and, as a result, you are violating this subpart. Compliance with this rule is your responsibility and the Notification of Compliance Status does not alter or affect that responsibility.

[73 FR 1945, Jan. 10, 2008, as amended at 76 FR 4181, Jan. 24, 2011]

Per §63.11111(a), Midas Gold will be subject to this subpart as they are proposing to operate two Gasoline Dispensing Facilities (GDF) located at the Stibnite Gold Project, which will be an area source. Each GDF will be an affected source subject to this subpart. It is proposed that the Stibnite Gold Project will have two GDFs, each with a monthly throughput of greater than 10,000 gallons of gasoline but less than 100,000 gallons of gasoline and must comply with the requirements in §63.11117 per §63.11111(c). Based on the monthly throughput, §63.11111(b) and (d) will not apply. Midas Gold will be required to demonstrate that the monthly throughput of each GDF is less than the 100,000-gallon threshold level by recording monthly throughput upon startup and keeping records for a period of 5 years per §63.11111(e). Per §63.11111(f) Midas Gold will not be required to obtain a permit under 40 CFR part 70 (i.e., Title V permit) as a result of being subject to this subpart.

§63.11111(g) will not apply as Midas Gold will not load or transfer aviation gasoline.

§63.11111(h) - (k) will apply to Midas Gold as informative requirements.

§63.11112 What parts of my affected source does this subpart cover?

(a) The emission sources to which this subpart applies are gasoline storage tanks and associated equipment components in vapor or liquid gasoline service at new, ~~reconstructed, or existing~~ GDF that meet the criteria specified in §63.11111. Pressure/Vacuum vents on gasoline storage tanks and the equipment necessary to unload product from cargo tanks into the storage tanks at GDF are covered emission sources. The equipment used for the refueling of motor vehicles is not covered by this subpart.

(b) An affected source is a new affected source if you commenced construction on the affected source after November 9, 2006, and you meet the applicability criteria in §63.11111 at the time you commenced operation.

~~(c) An affected source is reconstructed if you meet the criteria for reconstruction as defined in §63.2.~~

~~(d) An affected source is an existing affected source if it is not new or reconstructed.~~

§63.11112(a) will apply to the two Stibnite Gold Project affected sources.
§63.11112(b) will apply to the two Stibnite Gold Project affected sources as construction will commence after November 9, 2006.
§63.11112(c) will not apply because the two Stibnite Gold Project affected sources will not be reconstructed.
§63.11112(d) will not apply because the two Stibnite Gold Project affected sources are not existing.

§63.11113 When do I have to comply with this subpart?

(a) If you have a new ~~or reconstructed~~ affected source, you must comply with this subpart according to paragraphs (a)~~(1) and~~ (2) of this section, ~~except as specified in paragraph (d) of this section.~~

~~(1) If you start up your affected source before January 10, 2008, you must comply with the standards in this subpart no later than January 10, 2008.~~

(2) If you start up your affected source after January 10, 2008, you must comply with the standards in this subpart upon startup of your affected source.

~~(b) If you have an existing affected source, you must comply with the standards in this subpart no later than January 10, 2011.~~

~~(c) If you have an existing affected source that becomes subject to the control requirements in this subpart because of an increase in the monthly throughput, as specified in §63.11111(c) or §63.11111(d), you must comply with the standards in this subpart no later than 3 years after the affected source becomes subject to the control requirements in this subpart.~~

~~(d) If you have a new or reconstructed affected source and you are complying with Table 1 to this subpart, you must comply according to paragraphs (d)(1) and (2) of this section.~~

~~(1) If you start up your affected source from November 9, 2006 to September 23, 2008, you must comply no later than September 23, 2008.~~

~~(2) If you start up your affected source after September 23, 2008, you must comply upon startup of your affected source.~~

~~(e) The initial compliance demonstration test required under §63.11120(a)(1) and (2) must be conducted as specified in paragraphs (e)(1) and (2) of this section.~~

~~(1) If you have a new or reconstructed affected source, you must conduct the initial compliance test upon installation of the complete vapor balance system.~~

~~(2) If you have an existing affected source, you must conduct the initial compliance test as specified in paragraphs (e)(2)(i) or (e)(2)(ii) of this section.~~

~~(i) For vapor balance systems installed on or before December 15, 2009, you must test no later than 180 days after the applicable compliance date specified in paragraphs (b) or (c) of this section.~~

~~(ii) For vapor balance systems installed after December 15, 2009, you must test upon installation of the complete vapor balance system.~~

~~(f) If your GDF is subject to the control requirements in this subpart only because it loads gasoline into fuel tanks other than those in motor vehicles, as defined in §63.11132, you must comply with the standards in this subpart as specified in paragraphs (f)(1) or (f)(2) of this section.~~

~~(1) If your GDF is an existing facility, you must comply by January 24, 2014.~~

~~(2) If your GDF is a new or reconstructed facility, you must comply by the dates specified in paragraphs (f)(2)(i) and (ii) of this section.~~

~~(i) If you start up your GDF after December 15, 2009, but before January 24, 2011, you must comply no later than January 24, 2011.~~

~~(ii) If you start up your GDF after January 24, 2011, you must comply upon startup of your GDF.~~

[73 FR 1945, Jan. 10, 2008, as amended at 73 FR 35944, June 25, 2008; 76 FR 4181, Jan. 24, 2011]

§63.11113(a)(2) will apply because the two Stibnite Gold Project GDFs will start up after January 10, 2008, and Midas Gold will be required to comply with the standards in this subpart upon startup of the affected sources.

§63.11113(b) and (c) will not apply because the two Stibnite Gold Project GDFs are not existing.

§63.11113(d) will not apply because the two Stibnite Gold Project GDFs are not proposing to have a monthly throughput of 100,000 gallons of gasoline or more and are therefore not subject to the requirements in Table 1.

§63.11113(e) will not apply to the two Stibnite Gold Project GDFs, as they will not be required to install a vapor balance system as they are not proposing to have a monthly throughput of 100,000 gallons of gasoline or more.

§63.11113(f) will not apply because the two Stibnite Gold Project GDFs will load gasoline into fuel tanks in motor vehicles.

Emission Limitations and Management Practices

§63.11115 What are my general duties to minimize emissions?

Each owner or operator of an affected source under this subpart must comply with the requirements of paragraphs (a) and (b) of this section.

(a) You must, at all times, operate and maintain any affected source, including associated air pollution control equipment and monitoring equipment, in a manner consistent with safety and good air pollution control practices for minimizing emissions. Determination of whether such operation and maintenance procedures are being used will be based on information available to the Administrator which may include, but is not limited to, monitoring results, review of operation and maintenance procedures, review of operation and maintenance records, and inspection of the source.

(b) You must keep applicable records and submit reports as specified in §63.11125(d) and §63.11126(b).

[76 FR 4182, Jan. 24, 2011]

§63.11115(a) and (b) will apply to Midas Gold. Midas Gold will be required to operate and maintain each GDF in a manner consistent with safety and good air pollution control practices to minimize emissions. They will also be required to keep applicable records and submit specified reports for each GDF.

~~§63.11116 Requirements for facilities with monthly throughput of less than 10,000 gallons of gasoline.~~

(a) You must not allow gasoline to be handled in a manner that would result in vapor releases to the atmosphere for extended periods of time. Measures to be taken include, but are not limited to, the following:

(1) Minimize gasoline spills;

(2) Clean up spills as expeditiously as practicable;

(3) Cover all open gasoline containers and all gasoline storage tank fill-pipes with a gasketed seal when not in use;

(4) Minimize gasoline sent to open waste collection systems that collect and transport gasoline to reclamation and recycling devices, such as oil/water separators.

~~(b) You are not required to submit notifications or reports as specified in §63.11125, §63.11126, or subpart A of this part, but you must have records available within 24 hours of a request by the Administrator to document your gasoline throughput.~~

~~(c) You must comply with the requirements of this subpart by the applicable dates specified in §63.11113.~~

~~(d) Portable gasoline containers that meet the requirements of 40 CFR part 59, subpart F, are considered acceptable for compliance with paragraph (a)(3) of this section.~~

[73 FR 1945, Jan. 10, 2008, as amended at 76 FR 4182, Jan. 24, 2011]

§63.11116(a) will apply to the two Stibnite Gold Project GDFs per §63.11117(a) below.

§63.11117 Requirements for facilities with monthly throughput of 10,000 gallons of gasoline or more.

(a) You must comply with the requirements in section §63.11116(a).

(b) ~~Except as specified in paragraph (c) of this section~~, you must only load gasoline into storage tanks at your facility by utilizing submerged filling, as defined in §63.11132, and as specified in paragraphs ~~(b)(1),~~ (b)(2), or (b)(3) of this section. The applicable distances in paragraphs (b)(1) and (2) shall be measured from the point in the opening of the submerged fill pipe that is the greatest distance from the bottom of the storage tank.

~~(1) Submerged fill pipes installed on or before November 9, 2006, must be no more than 12 inches from the bottom of the tank.~~

(2) Submerged fill pipes installed after November 9, 2006, must be no more than 6 inches from the bottom of the tank.

(3) Submerged fill pipes not meeting the specifications of paragraphs ~~(b)(1) or~~ (b)(2) of this section are allowed if the owner or operator can demonstrate that the liquid level in the tank is always above the entire opening of the fill pipe. Documentation providing such demonstration must be made available for inspection by the Administrator's delegated representative during the course of a site visit.

~~(c) Gasoline storage tanks with a capacity of less than 250 gallons are not required to comply with the submerged fill requirements in paragraph (b) of this section, but must comply only with all of the requirements in §63.11116.~~

(d) You must have records available within 24 hours of a request by the Administrator to document your gasoline throughput.

(e) You must submit the applicable notifications as required under §63.11124(a).

(f) You must comply with the requirements of this subpart by the applicable dates contained in §63.11113.

[73 FR 1945, Jan. 10, 2008, as amended at 73 FR 12276, Mar. 7, 2008; 76 FR 4182, Jan. 24, 2011]

The highlighted portions of §63.11117 will apply to the two Stibnite Gold Project GDFs as they are proposing to have a monthly throughput of 10,000 gallons or more.

~~**§63.11118 Requirements for facilities with monthly throughput of 100,000 gallons of gasoline or more.**~~

~~(a) You must comply with the requirements in §§63.11116(a) and 63.11117(b).~~

~~(b) Except as provided in paragraph (c) of this section, you must meet the requirements in either paragraph (b)(1) or paragraph (b)(2) of this section.~~

~~(1) Each management practice in Table 1 to this subpart that applies to your GDF.~~

~~(2) If, prior to January 10, 2008, you satisfy the requirements in both paragraphs (b)(2)(i) and (ii) of this section, you will be deemed in compliance with this subsection.~~

~~(i) You operate a vapor balance system at your GDF that meets the requirements of either paragraph (b)(2)(i)(A) or paragraph (b)(2)(i)(B) of this section.~~

~~(A) Achieves emissions reduction of at least 90 percent.~~

~~(B) Operates using management practices at least as stringent as those in Table 1 to this subpart.~~

~~(ii) Your gasoline dispensing facility is in compliance with an enforceable State, local, or tribal rule or permit that contains requirements of either paragraph (b)(2)(i)(A) or paragraph (b)(2)(i)(B) of this section.~~

~~(c) The emission sources listed in paragraphs (c)(1) through (3) of this section are not required to comply with the control requirements in paragraph (b) of this section, but must comply with the requirements in §63.11117.~~

~~(1) Gasoline storage tanks with a capacity of less than 250 gallons that are constructed after January 10, 2008.~~

~~(2) Gasoline storage tanks with a capacity of less than 2,000 gallons that were constructed before January 10, 2008.~~

~~(3) Gasoline storage tanks equipped with floating roofs, or the equivalent.~~

(d) Cargo tanks unloading at GDF must comply with the management practices in Table 2 to this subpart.

(e) You must comply with the applicable testing requirements contained in §63.11120.

(f) You must submit the applicable notifications as required under §63.11124.

(g) You must keep records and submit reports as specified in §63.11125 and §63.11126.

(h) You must comply with the requirements of this subpart by the applicable dates contained in §63.11113.

[73 FR 1945, Jan. 10, 2008, as amended at 73 FR 12276, Mar. 7, 2008]

§63.11118 will not apply because Midas Gold is not proposing to operate a GDF with a monthly throughput of 100,000 gallons of gasoline or more.

Testing and Monitoring Requirements

§63.11120 What testing and monitoring requirements must I meet?

(a) Each owner or operator, at the time of installation, as specified in §63.11113(e), of a vapor balance system required under §63.11118(b)(1), and every 3 years thereafter, must comply with the requirements in paragraphs (a)(1) and (2) of this section.

(1) You must demonstrate compliance with the leak rate and cracking pressure requirements, specified in item 1(g) of Table 1 to this subpart, for pressure-vacuum vent valves installed on your gasoline storage tanks using the test methods identified in paragraph (a)(1)(i) or paragraph (a)(1)(ii) of this section.

(i) California Air Resources Board Vapor Recovery Test Procedure TP-201.1E, Leak Rate and Cracking Pressure of Pressure/Vacuum Vent Valves, adopted October 8, 2003 (incorporated by reference, see §63.14).

(ii) Use alternative test methods and procedures in accordance with the alternative test method requirements in §63.7(f).

(2) You must demonstrate compliance with the static pressure performance requirement specified in item 1(h) of Table 1 to this subpart for your vapor balance system by conducting a static pressure test on your gasoline storage tanks using the test methods identified in paragraphs (a)(2)(i), (a)(2)(ii), or (a)(2)(iii) of this section.

(i) California Air Resources Board Vapor Recovery Test Procedure TP-201.3, Determination of 2-Inch WC Static Pressure Performance of Vapor Recovery Systems of Dispensing Facilities, adopted April 12, 1996, and amended March 17, 1999 (incorporated by reference, see §63.14).

(ii) Use alternative test methods and procedures in accordance with the alternative test method requirements in §63.7(f).

(iii) Bay Area Air Quality Management District Source Test Procedure ST-30 Static Pressure Integrity Test Underground Storage Tanks, adopted November 30, 1983, and amended December 21, 1994 (incorporated by reference, *see* §63.14).

(b) Each owner or operator choosing, under the provisions of §63.6(g), to use a vapor balance system other than that described in Table 1 to this subpart must demonstrate to the Administrator or delegated authority under paragraph §63.11131(a) of this subpart, the equivalency of their vapor balance system to that described in Table 1 to this subpart using the procedures specified in paragraphs (b)(1) through (3) of this section.

(1) You must demonstrate initial compliance by conducting an initial performance test on the vapor balance system to demonstrate that the vapor balance system achieves 95 percent reduction using the California Air Resources Board Vapor Recovery Test Procedure TP-201.1, Volumetric Efficiency for Phase I Vapor Recovery Systems, adopted April 12, 1996, and amended February 1, 2001, and October 8, 2003, (incorporated by reference, see §63.14).

(2) You must, during the initial performance test required under paragraph (b)(1) of this section, determine and document alternative acceptable values for the leak rate and cracking pressure requirements specified in item 1(g) of Table 1 to this subpart and for the static pressure performance requirement in item 1(h) of Table 1 to this subpart.

(3) You must comply with the testing requirements specified in paragraph (a) of this section.

(c) Conduct of performance tests. Performance tests conducted for this subpart shall be conducted under such conditions as the Administrator specifies to the owner or operator based on representative performance (*i.e.*, performance based on normal operating conditions) of the affected source. Upon request, the owner or operator shall make available to the Administrator such records as may be necessary to determine the conditions of performance tests.

(d) Owners and operators of gasoline cargo tanks subject to the provisions of Table 2 to this subpart must conduct annual certification testing according to the vapor tightness testing requirements found in §63.11092(f).

[73 FR 1945, Jan. 10, 2008, as amended at 76 FR 4182, Jan. 24, 2011]

§63.11120 will not apply because the Stibnite Gold Project GDFs will not be required to install a vapor balance system as they are not proposing to have a monthly throughput of 100,000 gallons of gasoline or more. Therefore, they will not be required to demonstrate compliance with the requirements of §63.11120.

Notifications, Records, and Reports

§63.11124 What notifications must I submit and when?

(a) Each owner or operator subject to the control requirements in §63.11117 must comply with paragraphs (a)(1) through (3) of this section.

(1) You must submit an Initial Notification that you are subject to this subpart ~~by May 9, 2008, or~~ at the time you become subject to the control requirements in §63.11117, ~~unless you meet the requirements in paragraph (a)(3) of this section. If your affected source is subject to the control requirements in §63.11117 only because it loads gasoline into fuel tanks other than those in motor vehicles, as defined in §63.11132, you must submit the Initial Notification by May 24, 2011.~~ The Initial Notification must contain the information specified in paragraphs (a)(1)(i) through (iii) of this section. The notification must be submitted to the applicable EPA Regional Office and delegated State authority as specified in §63.13.

(i) The name and address of the owner and the operator.

(ii) The address (i.e., physical location) of the GDF.

(iii) A statement that the notification is being submitted in response to this subpart and identifying the requirements in paragraphs (a) through (c) of §63.11117 that apply to you.

(2) You must submit a Notification of Compliance Status to the applicable EPA Regional Office and the delegated State authority, as specified in §63.13, within 60 days of the applicable compliance date specified in §63.11113, ~~unless you meet the requirements in paragraph (a)(3) of this section~~. The Notification of Compliance Status must be signed by a responsible official who must certify its accuracy, must indicate whether the source has complied with the requirements of this subpart, and must indicate whether the facilities' monthly throughput is calculated based on the volume of gasoline loaded into all storage tanks or on the volume of gasoline dispensed from all storage tanks. If your facility is in compliance with the requirements of this subpart at the time the Initial Notification required under paragraph (a)(1) of this section is due, the Notification of Compliance Status may be submitted in lieu of the Initial Notification provided it contains the information required under paragraph (a)(1) of this section.

(3) ~~If, prior to January 10, 2008, you are operating in compliance with an enforceable State, local, or tribal rule or permit that requires submerged fill as specified in §63.11117(b), you are not required to submit an Initial Notification or a Notification of Compliance Status under paragraph (a)(1) or paragraph (a)(2) of this section.~~

~~(b) Each owner or operator subject to the control requirements in §63.11118 must comply with paragraphs (b)(1) through (5) of this section.~~

~~(1) You must submit an Initial Notification that you are subject to this subpart by May 9, 2008, or at the time you become subject to the control requirements in §63.11118. If your affected source is subject to the control requirements in §63.11118 only because it loads gasoline into fuel tanks other than those in motor vehicles, as defined in §63.11132, you must submit the Initial Notification by May 24, 2011. The Initial Notification must contain the information specified in paragraphs (b)(1)(i) through (iii) of this section. The notification must be submitted to the applicable EPA Regional Office and delegated State authority as specified in §63.13.~~

~~(i) The name and address of the owner and the operator.~~

~~(ii) The address (i.e., physical location) of the GDF.~~

~~(iii) A statement that the notification is being submitted in response to this subpart and identifying the requirements in paragraphs (a) through (c) of §63.11118 that apply to you.~~

~~(2) You must submit a Notification of Compliance Status to the applicable EPA Regional Office and the delegated State authority, as specified in §63.13, in accordance with the schedule specified in §63.9(h). The Notification of Compliance Status must be signed by a responsible official who must certify its accuracy, must indicate whether the source has complied with the requirements of this subpart, and must indicate whether the facility's throughput is determined based on the volume of gasoline loaded into all storage tanks or on the volume of gasoline dispensed from all storage tanks. If your facility is in compliance with the requirements of this subpart at the time the Initial Notification required under paragraph (b)(1) of this section is due, the Notification of Compliance Status may be submitted in lieu of the Initial Notification provided it contains the information required under paragraph (b)(1) of this section.~~

~~(3) If, prior to January 10, 2008, you satisfy the requirements in both paragraphs (b)(3)(i) and (ii) of this section, you are not required to submit an Initial Notification or a Notification of Compliance Status under paragraph (b)(1) or paragraph (b)(2) of this subsection.~~

~~(i) You operate a vapor balance system at your gasoline dispensing facility that meets the requirements of either paragraphs (b)(3)(i)(A) or (b)(3)(i)(B) of this section.~~

~~(A) Achieves emissions reduction of at least 90 percent.~~

~~(B) Operates using management practices at least as stringent as those in Table 1 to this subpart.~~

~~(ii) Your gasoline dispensing facility is in compliance with an enforceable State, local, or tribal rule or permit that contains requirements of either paragraphs (b)(3)(i)(A) or (b)(3)(i)(B) of this section.~~

~~(4) You must submit a Notification of Performance Test, as specified in §63.9(e), prior to initiating testing required by §63.11120(a) and (b).~~

~~(5) You must submit additional notifications specified in §63.9, as applicable.~~

[73 FR 1945, Jan. 10, 2008, as amended at 73 FR 12276, Mar. 7, 2008; 76 FR 4182, Jan. 24, 2011]

§63.11124(a) will apply as Midas Gold is proposing to operate two GDFs subject to the control requirements in §63.11117. They will be required to submit an Initial Notification upon startup. In addition, they will be required to submit a Notification of Compliance Status within 60 days of startup of each affected source.

§63.11124(b) will not apply as the Stibnite Gold Project GDFs will not be subject to control requirements in §63.11118.

§63.11125 What are my recordkeeping requirements?

~~(a) Each owner or operator subject to the management practices in §63.11118 must keep records of all tests performed under §63.11120(a) and (b).~~

~~(b) Records required under paragraph (a) of this section shall be kept for a period of 5 years and shall be made available for inspection by the Administrator's delegated representatives during the course of a site visit.~~

~~(c) Each owner or operator of a gasoline cargo tank subject to the management practices in Table 2 to this subpart must keep records documenting vapor tightness testing for a period of 5 years. Documentation must include each of the items specified in §63.11094(b)(2)(i) through (viii). Records of vapor tightness testing must be retained as specified in either paragraph (c)(1) or paragraph (c)(2) of this section.~~

~~(1) The owner or operator must keep all vapor tightness testing records with the cargo tank.~~

~~(2) As an alternative to keeping all records with the cargo tank, the owner or operator may comply with the requirements of paragraphs (c)(2)(i) and (ii) of this section.~~

~~(i) The owner or operator may keep records of only the most recent vapor tightness test with the cargo tank, and keep records for the previous 4 years at their office or another central location.~~

~~(ii) Vapor tightness testing records that are kept at a location other than with the cargo tank must be instantly available (*e.g.*, via e-mail or facsimile) to the Administrator's delegated representative during the course of a site visit or within a mutually agreeable time frame. Such records must be an exact duplicate image of the original paper copy record with certifying signatures.~~

(d) Each owner or operator of an affected source under this subpart shall keep records as specified in paragraphs (d)(1) and (2) of this section.

(1) Records of the occurrence and duration of each malfunction of operation (*i.e.*, process equipment) or the air pollution control and monitoring equipment.

(2) Records of actions taken during periods of malfunction to minimize emissions in accordance with §63.11115(a), including corrective actions to restore malfunctioning process and air pollution control and monitoring equipment to its normal or usual manner of operation.

[73 FR 1945, Jan. 10, 2008, as amended at 76 FR 4183, Jan. 24, 2011]

§63.11125(a)-(b) will not apply as the Stibnite Gold Project GDFs will not be subject to the management practices in §63.11118.

§63.11125(c) will not apply as the Stibnite Gold Project GDFs will be not subject to the management practices in Table 2, as they are not

gasoline cargo tanks.

§63.11125(d) will apply to the two Stibnite Gold Project GDFs and Midas Gold will be required to keep records of each malfunction, including occurrence, duration, and actions taken during periods of malfunction to minimize emission, and corrective actions to restore to normal operation.

§63.11126 What are my reporting requirements?

~~(a) Each owner or operator subject to the management practices in §63.11118 shall report to the Administrator the results of all volumetric efficiency tests required under §63.11120(b). Reports submitted under this paragraph must be submitted within 180 days of the completion of the performance testing.~~

(b) Each owner or operator of an affected source under this subpart shall report, by March 15 of each year, the number, duration, and a brief description of each type of malfunction which occurred during the previous calendar year and which caused or may have caused any applicable emission limitation to be exceeded. The report must also include a description of actions taken by an owner or operator during a malfunction of an affected source to minimize emissions in accordance with §63.11115(a), including actions taken to correct a malfunction. No report is necessary for a calendar year in which no malfunctions occurred.

[76 FR 4183, Jan. 24, 2011]

§63.11126(a) will not apply as the Stibnite Gold Project GDFs will not be subject to the management practices in §63.11118.

§63.11126(b) will apply to the two Stibnite Gold Project GDFs and Midas Gold will be required to submit a report by March 15 of each year, if any malfunctions occurred.

Other Requirements and Information

§63.11130 What parts of the General Provisions apply to me?

Table 3 to this subpart shows which parts of the General Provisions apply to you.

See Table 3 of this subpart for the applicable General Provisions to this subpart.

§63.11131 Who implements and enforces this subpart?

(a) This subpart can be implemented and enforced by the U.S. EPA or a delegated authority such as the applicable State, local, or tribal agency. If the U.S. EPA Administrator has delegated authority to a State, local, or tribal agency, then that agency, in addition to the U.S. EPA, has the authority to implement and enforce this subpart. Contact the applicable U.S. EPA Regional Office to find out if implementation and enforcement of this subpart is delegated to a State, local, or tribal agency.

(b) In delegating implementation and enforcement authority of this subpart to a State, local, or tribal agency under subpart E of this part, the authorities contained in paragraph (c) of this section are retained by the Administrator of U.S. EPA and cannot be transferred to the State, local, or tribal agency.

(c) The authorities that cannot be delegated to State, local, or tribal agencies are as specified in paragraphs (c)(1) through (3) of this section.

(1) Approval of alternatives to the requirements in §§63.11116 through 63.11118 and 63.11120.

(2) Approval of major alternatives to test methods under §63.7(e)(2)(ii) and (f), as defined in §63.90, and as required in this subpart.

(3) Approval of major alternatives to recordkeeping and reporting under §63.10(f), as defined in §63.90, and as required in this subpart.

The implementation and enforcement of this subpart per §63.11131 will apply.

§63.11132 What definitions apply to this subpart?

As used in this subpart, all terms not defined herein shall have the meaning given them in the Clean Air Act (CAA), or in subparts A and BBBBBB of this part. For purposes of this subpart, definitions in this section supersede definitions in other parts or subparts.

~~*Dual-point vapor balance system* means a type of vapor balance system in which the storage tank is equipped with an entry port for a gasoline fill pipe and a separate exit port for a vapor connection.~~

Gasoline means any petroleum distillate or petroleum distillate/alcohol blend having a Reid vapor pressure of 27.6 kilopascals or greater, which is used as a fuel for internal combustion engines.

~~*Gasoline cargo tank* means a delivery tank truck or railcar which is loading or unloading gasoline, or which has loaded or unloaded gasoline on the immediately previous load.~~

Gasoline dispensing facility (GDF) means any stationary facility which dispenses gasoline into the fuel tank of a motor vehicle, motor vehicle engine, nonroad vehicle, or nonroad engine, including a nonroad vehicle or nonroad engine used solely for competition. These facilities include, but are not limited to, facilities that dispense gasoline into on- and off-road, street, or highway motor vehicles, lawn equipment, boats, test engines, landscaping equipment, generators, pumps, and other gasoline-fueled engines and equipment.

Monthly throughput means the total volume of gasoline that is loaded into, or dispensed from, all gasoline storage tanks at each GDF during a month. Monthly throughput is calculated by summing the volume of gasoline loaded into, or dispensed from, all gasoline storage tanks at each GDF during the current day, plus the total volume of gasoline loaded into, or dispensed from, all gasoline storage tanks at each GDF during the previous 364 days, and then dividing that sum by 12.

Motor vehicle means any self-propelled vehicle designed for transporting persons or property on a street or highway.

Nonroad engine means an internal combustion engine (including the fuel system) that is not used in a motor vehicle or a vehicle used solely for competition, or that is not subject to standards promulgated under section 7411 of this title or section 7521 of this title.

Nonroad vehicle means a vehicle that is powered by a nonroad engine, and that is not a motor vehicle or a vehicle used solely for competition.

Submerged filling means, for the purposes of this subpart, the filling of a gasoline storage tank through a submerged fill pipe whose discharge is no more than the applicable distance specified in §63.11117(b) from the bottom of the tank. Bottom filling of gasoline storage tanks is included in this definition.

~~*Vapor balance system* means a combination of pipes and hoses that create a closed system between the vapor spaces of an unloading gasoline cargo tank and a receiving storage tank such that vapors displaced from the storage tank are transferred to the gasoline cargo tank being unloaded.~~

~~*Vapor tight* means equipment that allows no loss of vapors. Compliance with vapor tight requirements can be determined by checking to ensure that the concentration at a potential leak source is not equal to or greater than 100 percent of the Lower Explosive Limit when measured with a combustible gas detector, calibrated with propane, at a distance of 1 inch from the source.~~

~~*Vapor tight gasoline cargo tank* means a gasoline cargo tank which has demonstrated within the 12 preceding months that it meets the annual certification test requirements in §63.11092(f) of this part.~~

[73 FR 1945, Jan. 10, 2008, as amended at 76 FR 4183, Jan. 24, 2011]

The highlighted definitions in §63.11132 will apply to the Stibnite Gold Project GDFs subject to this subpart.

~~Table 1 to Subpart CCCCCC of Part 63—Applicability Criteria and Management Practices for Gasoline Dispensing Facilities With Monthly Throughput of 100,000 Gallons of Gasoline or More~~[1]

~~If you own or operate~~	~~Then you must~~
~~1. A new, reconstructed, or existing GDF subject to §63.11118~~	~~Install and operate a vapor balance system on your gasoline storage tanks that meets the design criteria in paragraphs (a) through (h).~~
	~~(a) All vapor connections and lines on the storage tank shall be equipped with closures that seal upon disconnect.~~
	~~(b) The vapor line from the gasoline storage tank to the gasoline cargo tank shall be vapor-tight, as defined in §63.11132.~~
	~~(c) The vapor balance system shall be designed such that the pressure in the tank truck does not exceed 18 inches water pressure or 5.9 inches water vacuum during product transfer.~~
	~~(d) The vapor recovery and product adaptors, and the method of connection with the delivery elbow, shall be designed so as to prevent the over-tightening or loosening of fittings during normal delivery operations.~~
	~~(e) If a gauge well separate from the fill tube is used, it shall be provided with a submerged drop tube that extends the same distance from the bottom of the storage tank as specified in §63.11117(b).~~
	~~(f) Liquid fill connections for all systems shall be equipped with vapor-tight caps.~~
	~~(g) Pressure/vacuum (PV) vent valves shall be installed on the storage tank vent pipes. The pressure specifications for PV vent valves shall be: a positive pressure setting of 2.5 to 6.0 inches of water and a negative pressure setting of 6.0 to 10.0 inches of water. The total leak rate of all PV vent valves at an affected facility, including connections, shall not exceed 0.17 cubic foot per hour at a pressure of 2.0 inches of water and 0.63 cubic foot per hour at a vacuum of 4 inches of water.~~
	~~(h) The vapor balance system shall be capable of meeting the static pressure performance requirement of the following equation:~~
	~~$Pf = 2e^{-500.887/v}$~~
	~~Where:~~
	~~Pf = Minimum allowable final pressure, inches of water.~~

	v = Total ullage affected by the test, gallons.
	e = Dimensionless constant equal to approximately 2.718.
	2 = The initial pressure, inches water.
2. A new or reconstructed GDF, or any storage tank(s) constructed after November 9, 2006, at an existing affected facility subject to §63.11118	Equip your gasoline storage tanks with a dual-point vapor balance system, as defined in §63.11132, and comply with the requirements of item 1 in this Table.

[1]The management practices specified in this Table are not applicable if you are complying with the requirements in §63.11118(b)(2), except that if you are complying with the requirements in §63.11118(b)(2)(i)(B), you must operate using management practices at least as stringent as those listed in this Table.

[73 FR 1945, Jan. 10, 2008, as amended at 73 FR 35944, June 25, 2008; 76 FR 4184, Jan. 24, 2011]

Table 1 will not apply as Midas Gold is not proposing to operate a GDF with a monthly throughput of 100,000 gallons of gasoline or more.

Table 2 to Subpart CCCCCC of Part 63—Applicability Criteria and Management Practices for Gasoline Cargo Tanks Unloading at Gasoline Dispensing Facilities With Monthly Throughput of 100,000 Gallons of Gasoline or More

If you own or operate	Then you must
A gasoline cargo tank	Not unload gasoline into a storage tank at a GDF subject to the control requirements in this subpart unless the following conditions are met:
	(i) All hoses in the vapor balance system are properly connected,
	(ii) The adapters or couplers that attach to the vapor line on the storage tank have closures that seal upon disconnect,
	(iii) All vapor return hoses, couplers, and adapters used in the gasoline delivery are vapor-tight,
	(iv) All tank truck vapor return equipment is compatible in size and forms a vapor-tight connection with the vapor balance equipment on the GDF storage tank, and
	(v) All hatches on the tank truck are closed and securely fastened.
	(vi) The filling of storage tanks at GDF shall be limited to unloading from vapor-tight gasoline cargo tanks. Documentation that the cargo tank has met the specifications of EPA Method 27 shall be carried with the cargo tank, as specified in §63.11125(c).

[73 FR 1945, Jan. 10, 2008, as amended at 76 FR 4184, Jan. 24, 2011]

Table 2 will not apply as Midas Gold is not proposing to operate a gasoline cargo tank at a GDF with a monthly throughput of 100,000 gallons of gasoline or more.

Table 3 to Subpart CCCCCC of Part 63—Applicability of General Provisions

Citation	Subject	Brief description	Applies to subpart CCCCCC
§63.1	Applicability	Initial applicability determination; applicability after standard established; permit requirements; extensions, notifications	Yes, specific requirements given in §63.11111.
§63.1(c)(2)	Title V Permit	Requirements for obtaining a title V permit from the applicable permitting authority	Yes, §63.11111(f) of subpart CCCCCC exempts identified area sources from the obligation to obtain title V operating permits.
§63.2	Definitions	Definitions for part 63 standards	Yes, additional definitions in §63.11132.
§63.3	Units and Abbreviations	Units and abbreviations for part 63 standards	Yes.
§63.4	Prohibited Activities and Circumvention	Prohibited activities; Circumvention, severability	Yes.
§63.5	Construction/Reconstruction	Applicability; applications; approvals	Yes, except that these notifications are not required for facilities subject to §63.11116
§63.6(a)	Compliance with Standards/Operation & Maintenance—Applicability	General Provisions apply unless compliance extension; General Provisions apply to area sources that become major	Yes.
§63.6(b)(1)-(4)	Compliance Dates for New and Reconstructed Sources	Standards apply at effective date; 3 years after effective date; upon startup; 10 years after construction or reconstruction commences for CAA section 112(f)	Yes.
§63.6(b)(5)	Notification	Must notify if commenced construction or reconstruction after proposal	Yes.
§63.6(b)(6)	[Reserved]		
§63.6(b)(7)	Compliance Dates for New and Reconstructed Area Sources That Become Major	Area sources that become major must comply with major source standards immediately upon becoming major, regardless of whether required to comply when they were an area source	No.
§63.6(c)(1)-(2)	Compliance Dates for Existing Sources	Comply according to date in this subpart, which must be no later than 3 years after effective date; for CAA section 112(f) standards, comply within 90 days of effective date unless compliance extension	No, §63.11113 specifies the compliance dates.
§63.6(c)(3)-(4)	[Reserved]		

§63.6(c)(5)	Compliance Dates for Existing Area Sources That Become Major	Area sources That become major must comply with major source standards by date indicated in this subpart or by equivalent time period (e.g., 3 years)	No.
§63.6(d)	[Reserved]		
63.6(e)(1)(i)	General duty to minimize emissions	Operate to minimize emissions at all times; information Administrator will use to determine if operation and maintenance requirements were met.	No. *See* §63.11115 for general duty requirement.
63.6(e)(1)(ii)	Requirement to correct malfunctions ASAP	Owner or operator must correct malfunctions as soon as possible.	No.
§63.6(e)(2)	[Reserved]		
§63.6(e)(3)	Startup, Shutdown, and Malfunction (SSM) Plan	Requirement for SSM plan; content of SSM plan; actions during SSM	No.
§63.6(f)(1)	Compliance Except During SSM	You must comply with emission standards at all times except during SSM	No.
§63.6(f)(2)-(3)	Methods for Determining Compliance	Compliance based on performance test, operation and maintenance plans, records, inspection	Yes.
§63.6(g)(1)-(3)	Alternative Standard	Procedures for getting an alternative standard	Yes.
§63.6(h)(1)	Compliance with Opacity/Visible Emission (VE) Standards	You must comply with opacity/VE standards at all times except during SSM	No.
§63.6(h)(2)(i)	Determining Compliance with Opacity/VE Standards	If standard does not State test method, use EPA Method 9 for opacity in appendix A of part 60 of this chapter and EPA Method 22 for VE in appendix A of part 60 of this chapter	No.
§63.6(h)(2)(ii)	[Reserved]		
§63.6(h)(2)(iii)	Using Previous Tests To Demonstrate Compliance With Opacity/VE Standards	Criteria for when previous opacity/VE testing can be used to show compliance with this subpart	No.
§63.6(h)(3)	[Reserved]		
§63.6(h)(4)	Notification of Opacity/VE Observation Date	Must notify Administrator of anticipated date of observation	No.
§63.6(h)(5)(i), (iii)-(v)	Conducting Opacity/VE Observations	Dates and schedule for conducting opacity/VE observations	No.
§63.6(h)(5)(ii)	Opacity Test Duration and Averaging Times	Must have at least 3 hours of observation with 30 6-minute averages	No.
§63.6(h)(6)	Records of Conditions During Opacity/VE Observations	Must keep records available and allow Administrator to inspect	No.
§63.6(h)(7)(i)	Report Continuous Opacity Monitoring System (COMS) Monitoring Data From Performance Test	Must submit COMS data with other performance test data	No.
§63.6(h)(7)(ii)	Using COMS Instead of EPA Method 9	Can submit COMS data instead of EPA Method 9 results even if rule requires EPA Method 9 in appendix A of part 60 of this chapter, but must notify Administrator before performance test	No.
§63.6(h)(7)(iii)	Averaging Time for COMS During Performance Test	To determine compliance, must reduce COMS data to 6-minute averages	No.
§63.6(h)(7)(iv)	COMS Requirements	Owner/operator must demonstrate that COMS performance evaluations are conducted according to §63.8(e); COMS are properly maintained and operated according to §63.8(c) and data quality as §63.8(d)	No.
§63.6(h)(7)(v)	Determining Compliance with Opacity/VE Standards	COMS is probable but not conclusive evidence of compliance with opacity standard, even if EPA Method 9 observation shows otherwise. Requirements for COMS to be probable evidence-proper maintenance, meeting Performance Specification 1 in appendix B of part 60 of this chapter, and data have not been altered	No.
§63.6(h)(8)	Determining Compliance with Opacity/VE Standards	Administrator will use all COMS, EPA Method 9 (in appendix A of part 60 of this chapter), and EPA Method 22 (in appendix A of part 60 of this chapter) results, as well as information about operation and maintenance to determine compliance	No.
§63.6(h)(9)	Adjusted Opacity Standard	Procedures for Administrator to adjust an opacity standard	No.
§63.6(i)(1)-(14)	Compliance Extension	Procedures and criteria for Administrator to grant compliance extension	Yes.
§63.6(j)	Presidential Compliance Exemption	President may exempt any source from requirement to comply with this subpart	Yes.
§63.7(a)(2)	Performance Test Dates	Dates for conducting initial performance testing; must conduct 180 days after compliance date	Yes.
§63.7(a)(3)	CAA Section 114 Authority	Administrator may require a performance test under CAA section 114 at any time	Yes.
§63.7(b)(1)	Notification of Performance Test	Must notify Administrator 60 days before the test	Yes.
§63.7(b)(2)	Notification of Re-scheduling	If have to reschedule performance test, must notify Administrator of rescheduled date as soon as practicable and without delay	Yes.
§63.7(c)	Quality Assurance (QA)/Test Plan	Requirement to submit site-specific test plan 60 days before the test or on date Administrator agrees with; test plan approval procedures; performance audit requirements; internal and external QA procedures for testing	Yes.
§63.7(d)	Testing Facilities	Requirements for testing facilities	Yes.
63.7(e)(1)	Conditions for Conducting Performance Tests	Performance test must be conducted under representative conditions	No, §63.11120(c) specifies conditions for conducting performance tests.

§63.7(e)(2)	Conditions for Conducting Performance Tests	Must conduct according to this subpart and EPA test methods unless Administrator approves alternative	Yes.
§63.7(e)(3)	Test Run Duration	Must have three test runs of at least 1 hour each; compliance is based on arithmetic mean of three runs; conditions when data from an additional test run can be used	Yes.
§63.7(f)	Alternative Test Method	Procedures by which Administrator can grant approval to use an intermediate or major change, or alternative to a test method	Yes.
§63.7(g)	Performance Test Data Analysis	Must include raw data in performance test report; must submit performance test data 60 days after end of test with the Notification of Compliance Status; keep data for 5 years	Yes.
§63.7(h)	Waiver of Tests	Procedures for Administrator to waive performance test	Yes.
§63.8(a)(1)	Applicability of Monitoring Requirements	Subject to all monitoring requirements in standard	Yes.
§63.8(a)(2)	Performance Specifications	Performance Specifications in appendix B of 40 CFR part 60 apply	Yes.
§63.8(a)(3)	[Reserved]		
§63.8(a)(4)	Monitoring of Flares	Monitoring requirements for flares in §63.11 apply	Yes.
§63.8(b)(1)	Monitoring	Must conduct monitoring according to standard unless Administrator approves alternative	Yes.
§63.8(b)(2)-(3)	Multiple Effluents and Multiple Monitoring Systems	Specific requirements for installing monitoring systems; must install on each affected source or after combined with another affected source before it is released to the atmosphere provided the monitoring is sufficient to demonstrate compliance with the standard; if more than one monitoring system on an emission point, must report all monitoring system results, unless one monitoring system is a backup	No.
§63.8(c)(1)	Monitoring System Operation and Maintenance	Maintain monitoring system in a manner consistent with good air pollution control practices	No.
§63.8(c)(1)(i)-(iii)	Operation and Maintenance of Continuous Monitoring Systems (CMS)	Must maintain and operate each CMS as specified in §63.6(e)(1); must keep parts for routine repairs readily available; must develop a written SSM plan for CMS, as specified in §63.6(e)(3)	No.
§63.8(c)(2)-(8)	CMS Requirements	Must install to get representative emission or parameter measurements; must verify operational status before or at performance test	No.
§63.8(d)	CMS Quality Control	Requirements for CMS quality control, including calibration, etc.; must keep quality control plan on record for 5 years; keep old versions for 5 years after revisions	No.
§63.8(e)	CMS Performance Evaluation	Notification, performance evaluation test plan, reports	No.
§63.8(f)(1)-(5)	Alternative Monitoring Method	Procedures for Administrator to approve alternative monitoring	No.
§63.8(f)(6)	Alternative to Relative Accuracy Test	Procedures for Administrator to approve alternative relative accuracy tests for continuous emissions monitoring system (CEMS)	No.
§63.8(g)	Data Reduction	COMS 6-minute averages calculated over at least 36 evenly spaced data points; CEMS 1 hour averages computed over at least 4 equally spaced data points; data that cannot be used in average	No.
§63.9(a)	Notification Requirements	Applicability and State delegation	Yes.
§63.9(b)(1)-(2), (4)-(5)	Initial Notifications	Submit notification within 120 days after effective date; notification of intent to construct/reconstruct, notification of commencement of construction/reconstruction, notification of startup; contents of each	Yes.
§63.9(c)	Request for Compliance Extension	Can request if cannot comply by date or if installed best available control technology or lowest achievable emission rate	Yes.
§63.9(d)	Notification of Special Compliance Requirements for New Sources	For sources that commence construction between proposal and promulgation and want to comply 3 years after effective date	Yes.
§63.9(e)	Notification of Performance Test	Notify Administrator 60 days prior	Yes.
§63.9(f)	Notification of VE/Opacity Test	Notify Administrator 30 days prior	No.
§63.9(g)	Additional Notifications when Using CMS	Notification of performance evaluation; notification about use of COMS data; notification that exceeded criterion for relative accuracy alternative	Yes, however, there are no opacity standards.
§63.9(h)(1)-(6)	Notification of Compliance Status	Contents due 60 days after end of performance test or other compliance demonstration, except for opacity/VE, which are due 30 days after; when to submit to Federal vs. State authority	Yes, however, there are no opacity standards.
§63.9(i)	Adjustment of Submittal Deadlines	Procedures for Administrator to approve change when notifications must be submitted	Yes.
§63.9(j)	Change in Previous Information	Must submit within 15 days after the change	Yes.
§63.10(a)	Recordkeeping/Reporting	Applies to all, unless compliance extension; when to submit to Federal vs. State authority; procedures for owners of more than one source	Yes.
§63.10(b)(1)	Recordkeeping/Reporting	General requirements; keep all records readily available; keep for 5 years	Yes.
§63.10(b)(2)(i)	Records related to SSM	Recordkeeping of occurrence and duration of startups and shutdowns	No.
§63.10(b)(2)(ii)	Records related to SSM	Recordkeeping of malfunctions	No. *See* §63.11125(d) for recordkeeping of (1) occurrence and duration and (2) actions taken during malfunction.
§63.10(b)(2)(iii)	Maintenance records	Recordkeeping of maintenance on air pollution control and monitoring equipment	Yes.
§63.10(b)(2)(iv)	Records Related to SSM	Actions taken to minimize emissions during SSM	No.
§63.10(b)(2)(v)	Records Related to SSM	Actions taken to minimize emissions during SSM	No.

§63.10(b)(2)(vi)-(xi)	CMS Records	Malfunctions, inoperative, out-of-control periods	No.
§63.10(b)(2)(xii)	Records	Records when under waiver	Yes.
§63.10(b)(2)(xiii)	Records	Records when using alternative to relative accuracy test	Yes.
§63.10(b)(2)(xiv)	Records	All documentation supporting Initial Notification and Notification of Compliance Status	Yes.
§63.10(b)(3)	Records	Applicability determinations	Yes.
§63.10(c)	Records	Additional records for CMS	No.
§63.10(d)(1)	General Reporting Requirements	Requirement to report	Yes.
§63.10(d)(2)	Report of Performance Test Results	When to submit to Federal or State authority	Yes.
§63.10(d)(3)	Reporting Opacity or VE Observations	What to report and when	No.
§63.10(d)(4)	Progress Reports	Must submit progress reports on schedule if under compliance extension	Yes.
§63.10(d)(5)	SSM Reports	Contents and submission	No. *See* §63.11126(b) for malfunction reporting requirements.
§63.10(e)(1)-(2)	Additional CMS Reports	Must report results for each CEMS on a unit; written copy of CMS performance evaluation; two-three copies of COMS performance evaluation	No.
§63.10(e)(3)(i)-(iii)	Reports	Schedule for reporting excess emissions	No.
§63.10(e)(3)(iv)-(v)	Excess Emissions Reports	Requirement to revert to quarterly submission if there is an excess emissions and parameter monitor exceedances (now defined as deviations); provision to request semiannual reporting after compliance for 1 year; submit report by 30th day following end of quarter or calendar half; if there has not been an exceedance or excess emissions (now defined as deviations), report contents in a statement that there have been no deviations; must submit report containing all of the information in §§63.8(c)(7)-(8) and 63.10(c)(5)-(13)	No.
§63.10(e)(3)(iv)-(v)	Excess Emissions Reports	Requirement to revert to quarterly submission if there is an excess emissions and parameter monitor exceedances (now defined as deviations); provision to request semiannual reporting after compliance for 1 year; submit report by 30th day following end of quarter or calendar half; if there has not been an exceedance or excess emissions (now defined as deviations), report contents in a statement that there have been no deviations; must submit report containing all of the information in §§63.8(c)(7)-(8) and 63.10(c)(5)-(13)	No, §63.11130(K) specifies excess emission events for this subpart.
§63.10(e)(3)(vi)-(viii)	Excess Emissions Report and Summary Report	Requirements for reporting excess emissions for CMS; requires all of the information in §§63.10(c)(5)-(13) and 63.8(c)(7)-(8)	No.
§63.10(e)(4)	Reporting COMS Data	Must submit COMS data with performance test data	No.
§63.10(f)	Waiver for Recordkeeping/Reporting	Procedures for Administrator to waive	Yes.
§63.11(b)	Flares	Requirements for flares	No.
§63.12	Delegation	State authority to enforce standards	Yes.
§63.13	Addresses	Addresses where reports, notifications, and requests are sent	Yes.
§63.14	Incorporations by Reference	Test methods incorporated by reference	Yes.
§63.15	Availability of Information	Public and confidential information	Yes.

[73 FR 1945, Jan. 10, 2008, as amended at 76 FR 4184, Jan. 24, 2011]

The applicable General Provisions are highlighted in Table 3.

APPLICABILITY AND COMPLIANCE DATES

§63.11640 Am I subject to this subpart?

(a) You are subject to this subpart if you own or operate a gold mine ore processing and production facility as defined in §63.11651, that is an area source.

(b) This subpart applies to each new ~~or existing~~ affected source. The affected sources are each collection of "ore pretreatment processes" at a gold mine ore processing and production facility, each collection of "carbon processes with mercury retorts" at a gold mine ore processing and production facility~~, each collection of "carbon processes without mercury retorts" at a gold mine ore processing and production facility, and each collection of "non-carbon concentrate processes" at a gold mine ore processing and production facility,~~ as defined in §63.11651.

~~(1) An affected source is existing if you commenced construction or reconstruction of the affected source on or before April 28, 2010.~~

(2) An affected source is new if you commenced construction or reconstruction of the affected source after April 28, 2010.

~~(c) This subpart does not apply to research and development facilities, as defined in section 112(c)(7) of the Clean Air Act (CAA).~~

(d) If you own or operate a source subject to this subpart, you must have or you must obtain a permit under 40 CFR part 70 ~~or 40 CFR part 71.~~

Midas Gold is proposing to operate a gold mine ore processing and production facility at the Stibnite Gold Project, and as an area source, will therefore be subject to this subpart per §63.11640(a). The affected sources are each collection of "ore pretreatment processes" at a gold mine ore processing and production facility, and each collection of "carbon processes with mercury retorts" at a gold mine ore processing and production facility, per §63.11640(b). The affected sources will be new as they will commence construction after April 28, 2010, per §63.11640(b)(2). Midas Gold will be required to obtain a permit under 40 CFR part 70 (i.e., Title V permit) for the affected sources subject to this subpart, per §63.11640(d).

§63.11641 What are my compliance dates?

~~(a) If you own or operate an existing affected source, you must comply with the applicable provisions of this subpart no later than February 17, 2014.~~

~~(b) If you own or operate a new affected source, and the initial startup of your affected source is on or before February 17, 2011, you must comply with the provisions of this subpart no later than February 17, 2011.~~

(c) If you own or operate a new affected source, and the initial startup of your affected source is after February 17, 2011, you must comply with the provisions of this subpart upon startup of your affected source.

The Stibnite Gold Project will include two new affected sources, each with an initial startup after February 17, 2011, therefore Midas Gold must comply with the provisions of this subpart upon startup of the affected sources per §63.11641(c).

STANDARDS AND COMPLIANCE REQUIREMENTS

§63.11645 What are my mercury emission standards?

~~(a) For existing ore pretreatment processes, you must emit no more than 127 pounds of mercury per million tons of ore processed.~~

~~(b) For existing carbon processes with mercury retorts, you must emit no more than 2.2 pounds of mercury per ton of concentrate processed.~~

~~(c) For existing carbon processes without mercury retorts, you must emit no more than 0.17 pounds of mercury per ton of concentrate processed.~~

~~(d) For existing non-carbon concentrate processes, you must emit no more than 0.2 pounds of mercury per ton of concentrate processed.~~

(e) For new ore pretreatment processes, you must emit no more than 84 pounds of mercury per million tons of ore processed.

(f) For new carbon processes with mercury retorts, you must emit no more than 0.8 pounds of mercury per ton of concentrate processed.

~~(g) For new carbon processes without mercury retorts, you must emit no more than 0.14 pounds of mercury per ton of concentrate processed.~~

~~(h) For new non-carbon concentrate processes, you must emit no more than 0.1 pounds of mercury per ton of concentrate processed.~~

(i) The standards set forth in this section apply at all times.

Midas Gold proposes to operate one new ore pretreatment processes affected source, which must emit no more than 84 pounds of mercury per million tons of ore processed per §63.11645(e). Midas Gold also proposes to operate one new carbon processes with mercury retorts affected source, which must emit no more than 0.8 pounds of mercury per ton of concentrate processed per §63.11645(f). These standards will apply at all times per §63.11645(i).

§63.11646 What are my compliance requirements?

(a) Except as provided in paragraph (b) of this section, you must conduct a mercury compliance emission test within 180 days of the compliance date for all process units at new ~~and existing~~ affected sources according to the requirements in paragraphs (a)(1) through (a)(13) of this section. This compliance testing must be repeated annually thereafter, with no two consecutive annual compliance tests occurring less than 3 months apart or more than 15 months apart.

(1) You must determine the concentration of mercury and the volumetric flow rate of the stack gas according to the following test methods and procedures:

(i) Method 1 or 1A (40 CFR part 60, appendix A-1) to select sampling port locations and the number of traverse points in each stack or duct. Sampling sites must be located at the outlet of the control device (or at the outlet of the emissions source if no control device is present) and prior to any releases to the atmosphere.

(ii) Method 2, 2A, 2C, 2D, 2F (40 CFR part 60, appendix A-1), or Method 2G (40 CFR part 60, appendix A-2) to determine the volumetric flow rate of the stack gas.

(iii) Method 3, 3A, or 3B (40 CFR part 60, appendix A-2) to determine the dry molecular weight of the stack gas. You may use ANSI/ASME PTC 19.10, "Flue and Exhaust Gas Analyses" (incorporated by reference-see §63.14) as an alternative to EPA Method 3B.

(iv) Method 4 (40 CFR part 60, appendix A-3) to determine the moisture content of the stack gas.

(v) Method 29 (40 CFR part 60, appendix A-8) to determine the concentration of mercury, except as provided in paragraphs (a)(1)(vi) and (vii) of this section.

(vi) Upon approval by the permitting authority, ASTM D6784; "Standard Test Method for Elemental, Oxidized, Particle-Bound and Total Mercury in Flue Gas Generated from Coal-Fired Stationary Sources (Ontario Hydro Method)" (incorporated by reference—see §63.14) may be used as an alternative to Method 29 to determine the concentration of mercury.

(vii) Upon approval by the permitting authority, Method 30B (40 CFR part 60, appendix A-8) may be used as an alternative to Method 29 to determine the concentration of mercury for those process units with relatively low particulate-bound mercury as specified in Section 1.2 of Method 30B.

(2) A minimum of three test runs must be conducted for each performance test of each process unit. Each test run conducted with Method 29 must collect a minimum sample volume of 0.85 dry standard cubic meters (30 dry standard cubic feet). If conducted with Method 30B or ASTM D6784, determine sample time and volume according to the testing criteria set forth in the relevant method. If the emission testing results for any of the emission points yields a non-detect value, then the minimum detection limit (MDL) must be used to calculate the mass emissions rate (lb/hr) used to calculate the emissions factor (lb/ton) for that emission point and, in turn, for calculating the sum of the emissions (in units of pounds of mercury per ton of concentrate, or pounds of mercury per million tons of ore) for all emission points subject to the emission standard for determining compliance. If the resulting mercury emissions are greater than the MACT emission standard, the owner or operator may use procedures that produce lower MDL results and repeat the mercury emissions testing one additional time for any emission point for which the measured result was below the MDL. If this additional testing is performed, the results from that testing must be used to determine compliance (*i.e.,* there are no additional opportunities allowed to lower the MDL).

(3) Performance tests shall be conducted under such conditions as the Administrator specifies to the owner or operator based on representative performance of the affected source for the period being tested. Upon request, the owner or operator shall make available to the Administrator such records as may be necessary to determine the conditions of performance tests. Performance tests must be conducted under operating conditions (including process or production throughputs) that are based on representative performance. Record and report to the permit authority the process throughput for each test run. For sources with multiple emission units (*e.g.,* two roasters, or a furnace, electrowinning circuit and a mercury retort) ducted to a common control device and stack, compliance testing must be performed either by conducting a single compliance test with all affected emissions units in operation or by conducting a separate compliance test on each emissions unit. Alternatively, the owner or operator may request approval from the permit authority for an alternative testing approach. If the units are tested separately, any emissions unit that is not tested initially must be tested as soon as is practicable. If the performance test is conducted when all affected units are operating, then the number of hours of operation used for calculating emissions pursuant to paragraphs (a)(6) and (7) of this section must be the total number of hours for the unit that has the greatest total operating hours for that period of time, or based on an appropriate alternative method approved by the permit authority to account for the hours of operation for each separate unit in these calculations.

(4) Calculate the mercury emission rate (lb/hr), based on the average of 3 test run values, for each process unit (or combination of units that are ducted to a common stack and are tested when all affected sources are operating pursuant to paragraph (a)(3) of this section) using Equation (1) of this section:

$$E = Cs * Qs * K \quad \text{(Eq. 1)}$$

View or download PDF

Where:

E = mercury emissions in lb/hr;

Cs = concentration of mercury in the stack gas, in grains per dry standard cubic foot (gr/dscf);

Qs = volumetric flow rate of the stack gas, in dry standard cubic feet per hour; and

K = conversion factor for grains (gr) to pounds (lb), 1.43×10^{-4}.

(5) Monitor and record the number of one-hour periods each process unit operates during each month.

(6) For the initial compliance determination for both new and existing sources, determine the total mercury emissions for all the full calendar months between the compliance date and the date of the initial compliance test by multiplying the emission rate in lb/hr for each process unit (or combination of units ducted to a common stack that are tested together) by the number of one-hour periods each process unit (or the unit that had the greatest total operating hours among the combination of multiple units with one stack that are tested together, or an alternative method approved by the permit authority, pursuant to paragraph (a)(3) of this section) operated during those full calendar months prior to the initial compliance test. This initial period must include at least 1 full month of operations. After the initial compliance test, for subsequent compliance tests, determine the mercury mass emissions for the 12 full calendar months prior to the compliance test in accordance with the procedures in paragraph (a)(7) of this section. ~~Existing sources may use a previous emission test for their initial compliance determination in lieu of conducting a new test if the test was conducted within one year of the compliance date using the methods specified in paragraphs (a)(1) through (a)(4) of this section, and the tests were representative of current operating processes and conditions. If a previous test is used for their initial compliance determination, 3 to 12 full months of data on hours of operation and production (*i.e.*, million tons of ore or tons of concentrate), including the month the test was conducted, must be used to calculate the emissions rate (in units of pounds of mercury per million tons of ore for the ore pretreatment affected sources, or in units of pounds of mercury per tons of concentrate for the other affected sources).~~

(7) For compliance determinations following the initial compliance test for new and existing sources, determine the total mercury mass emissions for each process unit for the 12 full calendar months preceding the performance test by multiplying the emission rate in lb/hr for each process unit (or combination of units ducted to a common stack that are tested together) by the number of one-hour periods each process unit (or the unit that had the greatest total operating hours among the combination of multiple units with one stack that are tested together, or an alternative method approved by the permit authority, pursuant to paragraph (a)(3) of this section) operated during the 12 full calendar months preceding the completion of the performance tests.

(8) You must install, calibrate, maintain and operate an appropriate weight measurement device, mass flow meter, or densitometer and volumetric flow meter to measure ore throughput for each ~~roasting operation and~~ autoclave and calculate hourly, daily and monthly totals in tons of ore according to paragraphs (a)(8)(i) and (a)(8)(ii) of this section.

~~(i) Measure the weight or the density and volumetric flow rate of the oxidized ore slurry as it exits the roaster oxidation circuit(s) and before the carbon-in-leach tanks. Alternatively, the weight of the ore can be measured "as fed" if approved by the permit authority as an acceptable equivalent method to measure amount of ore processed.~~

(ii) Measure the weight or the density and volumetric flow rate of the ore slurry as it is fed to the autoclave(s). Alternatively, the weight or the density and volumetric flow rate of the oxidized ore slurry can be measured as it exits the autoclave and before the carbon-in-leach tanks if approved by the permit authority as an acceptable equivalent method to measure amount of ore processed.

(9) Measure the weight of concentrate (produced by electrowinning, Merrill Crowe process, gravity feed, or other methods) using weigh scales for each batch prior to processing in mercury retorts ~~or melt furnaces~~. For facilities with mercury retorts, the concentrate must be weighed in the same state and condition as it is when fed to the mercury retort. ~~For facilities without mercury retorts, the concentrate must be weighed prior to being fed to the melt furnace before drying in any ovens. For facilities that ship concentrate offsite, measure the weight of concentrate as shipped offsite.~~ You must keep accurate records of the weights of each batch of concentrate processed and calculate, and record the total weight of concentrate processed each month.

(10) You must maintain the systems for measuring density, volumetric flow rate, and weight within ±5 percent accuracy. You must describe the specific equipment used to make measurements at your facility and how that equipment is periodically calibrated. You must also explain, document, and maintain written procedures for determining the accuracy of the measurements and make these written procedures available to your permitting authority upon request. You must determine, record, and maintain a record of the accuracy of the measuring systems before the beginning of your initial compliance test and during each subsequent quarter of affected source operation.

(11) Record the weight in tons of ore for ore pretreatment processes and concentrate for carbon processes with mercury retorts, ~~carbon processes without mercury retorts, and for non-carbon concentrate processes~~ on a daily and monthly basis.

(12) Calculate the emissions from each new and existing affected source for the sum of all full months between the compliance date and the date of the initial compliance test in pounds of mercury per ton of process input using the procedures in paragraphs (a)(12)(i) through (a)(12)(iv) of this section to determine initial compliance with the emission standards in §63.11645. This must include at least 1 full month of data. ~~Or, if a previous test is used pursuant to paragraph (a)(6) of this section for the initial compliance test, use a period of time pursuant to paragraph (a)(6) of this section to calculate the emissions for the affected source. After this initial compliance test period, determine annual compliance using the procedures in paragraph (a)(13) of this section for existing sources.~~

(i) For ore pretreatment processes, divide the sum of mercury mass emissions (in pounds) from all ~~roasting operations and~~ autoclaves during the number of full months between the compliance date and the initial compliance test by the sum of the total amount of gold mine ore processed (in million tons) in these process units during those same full months following the compliance date. ~~Or, if a previous test is used to determine initial compliance, pursuant to paragraph (a)(6) of this section, then the same 3 to 12 full months of production data (i.e., million tons of ore) and hours of operation referred to in paragraph (a)(6) of this section, must be used to determine the emissions in pounds of mercury per million tons of ore.~~

(ii) For carbon processes with mercury retorts, divide the sum of mercury mass emissions (in pounds) from all carbon kilns, preg tanks, electrowinning, mercury retorts, and melt furnaces during the initial number of full months between the compliance date and the initial compliance tests by the total amount of concentrate (in tons) processed in these process units during those same full months following the compliance date. ~~If a previous test is used to determine initial compliance, pursuant to paragraph (a)(6) of this section, then the same 3 to 12 full months of production data (*i.e.*, tons of concentrate) and hours of operation referred to in paragraph (a)(6) of this section, must be used to determine the emissions in pounds of mercury per tons of concentrate.~~

~~(iii) For carbon processes without mercury retorts, divide the sum of mercury mass emissions (in pounds) from all carbon kilns, preg tanks, electrowinning, and melt furnaces during the initial number of full months between the compliance date and the initial compliance tests by the total amount of concentrate (in tons) processed in these process units during those same full months following the compliance date. If a previous test is used to determine initial compliance, pursuant to paragraph (a)(6) of this section, then the same 3 to 12 full months of production data (*i.e.*, tons of concentrate) and hours of operation referred to in paragraph (a)(6) of this section, must be used to determine the emissions in pounds of mercury per tons of concentrate.~~

~~(iv) For non-carbon concentrate processes, divide the sum of mercury mass emissions (in pounds) from mercury retorts and melt furnaces during the initial number of full months between the compliance date and the initial compliance tests by the total amount of concentrate (in tons) processed in these process units during those same full months following the compliance date. If a previous test is used to determine initial compliance, pursuant to paragraph (a)(6) of this section, then the same 3 to 12 full months of production data (*i.e.*, tons of concentrate) and hours of operation referred to in paragraph (a)(6) of this section, must be used to determine the emissions in pounds of mercury per tons of concentrate.~~

(13) After the initial compliance test, calculate the emissions from each new and existing affected source for each 12-month period preceding each subsequent compliance test in pounds of mercury per ton of process input using the procedures in paragraphs (a)(13)(i) through (iv) of this section to determine compliance with the emission standards in §63.11645.

(i) For ore pretreatment processes, divide the sum of mercury mass emissions (in pounds) from all ~~roasting operations and~~ autoclaves in the 12-month period preceding a compliance test by the sum of the total amount of gold mine ore processed (in million tons) in that 12-month period.

(ii) For carbon processes with mercury retorts, divide the sum of mercury mass emissions (in pounds) from all carbon kilns, preg tanks, electrowinning, mercury retorts, and melt furnaces in the 12-month period preceding a compliance test by the total amount of concentrate (in tons) processed in these process units in that 12-month period.

~~(iii) For carbon processes without mercury retorts, divide the sum of mercury mass emissions (in pounds) from all carbon kilns, preg tanks, electrowinning, and melt furnaces in the 12-month period preceding a compliance test by the total amount of concentrate (in tons) processed in these process units in that 12-month period.~~

~~(iv) For non-carbon concentrate processes, divide the sum of mercury mass emissions (in pounds) from mercury retorts and melt furnaces in the 12-month period preceding a compliance test by the total amount of concentrate (in tons) processed in these process units in that 12-month period.~~

(b) At all times, you must operate and maintain any affected source, including associated air pollution control equipment and monitoring equipment, in a manner consistent with safety and good air pollution control practices for minimizing emissions. Determination of whether such operation and maintenance procedures are being used will be based on information available to the Administrator which may include, but is not limited to, monitoring results, review of operation and maintenance procedures, review of operation and maintenance records, and inspection of the source.

Midas Gold will be required to conduct mercury compliance emission tests within 180 days of startup of the two affected sources. The process units to be tested will be the Autoclave, the Carbon Regeneration Kiln, the Electrowinning Cells and Pregnant Solution Tank (combined stack), the Mercury Retort and the Melting Furnace. The compliance tests will be repeated annually thereafter. Compliance with the emission standards in §63.11645(e) and (f) for the ore pretreatment processes affected source and the carbon processes with mercury retorts affected source, respectively, will be determined according to the highlighted methods and procedures in §63.11646(a)(1)-(13). The affected sources will be required to operate consistent with good air pollution control practices per §63.11646(b).

§63.11647 What are my monitoring requirements?

~~(a) Except as provided in paragraph (a)(5) of this section, you must monitor each roaster for mercury emissions using one of the procedures in paragraphs (a)(1), (a)(2), or (a)(3) of this section and establish operating limits for mercury concentration as~~

described in paragraph (a)(4) of this section.

(1) Perform sampling and analysis of the roaster's exhaust for mercury concentration using EPA Performance Specification 12B (40 CFR part 60, appendix B and Procedure 5 of appendix F) or EPA Method 30B (40 CFR part 60, appendix A-8) at least twice per month. A minimum of two measurements must be taken per month that are at least 11 days apart from other consecutive tests. The mercury concentration must be maintained below the operating limit established in paragraph (a)(4) of this section. The results of the sampling must be obtained within 72 hours of the time the sample is taken.

(i) To determine the appropriate sampling duration, you must review the available data from previous stack tests to determine the upper 99th percentile of the range of mercury concentrations in the exit stack gas. Based on this upper end of expected concentrations, select an appropriate sampling duration that is likely to provide a valid sample and not result in breakthrough of the sampling tubes. If breakthrough of the sampling tubes occurs, you must re-sample within 7 days using a shorter sampling duration.

(ii) If any mercury concentration measurement from the twice per month sampling with PS 12B or Method 30B is higher than the operating limit, the exceedance must be reported to the permit authority as a deviation and corrective actions must be implemented within 48 hours upon receipt of the sampling results. Moreover, within 96 hours of the exceedance, the owner or operator must measure the concentration again (with PS 12B (40 CFR part 60, appendix B and Procedure 5 of appendix F), Method 30B or Method 29 (40 CFR part 60, appendix A-8), or ASTM D6784(incorporated by reference—see §63.14)) and demonstrate to the permit authority that the mercury concentration is no higher than the operating limit, or inform the permit authority that the limit continues to be exceeded. If the measured mercury concentration exceeds the operating limit for mercury concentration after these 96 hours, the exceedance must be reported as a deviation within 24 hours to the permitting authority. The owner or operator must conduct a full compliance test pursuant to §63.11646(a) for the roaster operations within 40 days to determine if the affected source is in compliance with the MACT emission standard. For facilities that have roasters and autoclaves, the owner or operator can use the results of the previous compliance test for the autoclaves to determine the emissions for those process units to be used in the calculations of the emissions for the affected source. If the source is determined to be in compliance, the compliance test may also be used to establish a new operating limit for mercury concentration (in accordance with paragraph (e) of this section).

(2) Install, operate, calibrate, and maintain a continuous emissions monitoring system (CEMS) to continuously measure the mercury concentration in the final exhaust stream from each roaster according to the requirements of Performance Specification 12A (40 CFR part 60, appendix B) except that calibration standards traceable to the National Institute of Standards and Technology are not required. You must perform a data accuracy assessment of the CEMS according to section 5 of Appendix F in part 60 and follow the applicable monitoring requirements in §63.8 as provided in Table 1 to subpart EEEEEEE.

(i) You must continuously monitor the daily average mercury concentration from the roaster and maintain the daily average concentration below the operating limit established in paragraph (a)(4) of this section.

(ii) If the daily average mercury concentration from the CEMs is higher than the operating limit, the exceedance must be reported to the permit authority as a deviation and corrective actions must be implemented within 48 hours upon receipt of the sampling results. Moreover, within 96 hours of the exceedance, the owner or operator must measure the concentration again (with the CEMs (40 CFR part 60, appendix B and Procedure 5 of appendix F) and demonstrate to the permit authority that the mercury concentration is no higher than the operating limit, or inform the permit authority that the limit continues to be exceeded. If the measured mercury concentration exceeds the operating limit for mercury concentration after these 96 hours, the exceedance must be reported as a deviation within 24 hours to the permitting authority, and the owner or operator must conduct a full compliance test pursuant to §63.11646(a) for the roaster operations within 40 days to determine if the affected source is in compliance with the MACT emission standard. For facilities that have roasters and autoclaves, the owner or operator can use the results of the previous compliance test for the autoclaves to determine the emissions for those process units to be used in the calculations of the emissions for the affected source. If the source is determined to be in compliance, the compliance test results may also be used to establish a new operating limit for mercury concentration (in accordance with paragraph (e) of this section).

(iii) You must submit a monitoring plan that includes quality assurance and quality control (QA/QC) procedures sufficient to demonstrate the accuracy of the CEMS to your permitting authority for approval 180 days prior to your initial compliance test. At a minimum, the QA/QC procedures must include daily calibrations and an annual accuracy test for the CEMS.

(3) Continuously measure the mercury concentration in the final exhaust stream from each roaster using EPA Performance Specification 12B (40 CFR part 60 appendix B and Procedure 5 of appendix F).

(i) You must continuously measure the mercury concentration in the roaster exhaust and maintain the average daily mercury concentration below the operating limit established in paragraph (a)(4) of this section. To determine the appropriate sampling duration, you must review the available data from previous stack tests to determine the upper 99th percentile of the range of mercury concentrations in the exit stack gas. Based on this upper end of expected concentrations, select an appropriate sampling duration that is likely to provide a valid sample and not result in breakthrough of the sampling tubes. If

breakthrough of the sampling tubes occurs, you must re-sample within 7 days using a shorter sampling duration.

(ii) If the daily average mercury concentration is higher than the operating limit, the exceedance must be reported to the permit authority as a deviation and corrective actions must be implemented within 48 hours upon receipt of the sampling results. Moreover, within 96 hours of the exceedance, the owner or operator must measure the concentration again with PS–12B (40 CFR part 60, appendix B and Procedure 5 of appendix F), Method 30B or Method 29 (40 CFR part 60, appendix A-8), or ASTM D6784(incorporated by reference—see §63.14) and demonstrate to the permit authority that the mercury concentration is no higher than the operating limit, or inform the permit authority that the limit continues to be exceeded. If the measured mercury concentration exceeds the operating limit for mercury concentration after these 96 hours, the exceedance must be reported as a deviation within 24 hours to the permitting authority and the owner or operator must conduct a full compliance test pursuant to §63.11646(a) for the roaster operations within 40 days to determine if the affected source is in compliance with the MACT emission standard. For facilities that have roasters and autoclaves, the owner or operator can use the results of the previous compliance test for the autoclaves to determine the emissions for those process units to be used in the calculations of the emissions for the affected source. If the source is determined to be in compliance, the compliance test results may also be used to establish a new operating limit for mercury concentration (in accordance with paragraph (e) of this section).

(4) Use Equation (2) of this section to establish an upper operating limit for mercury concentration as determined by using the procedures in paragraphs (a)(1), (a)(2), or (a)(3) of this section concurrently while you are conducting your annual compliance performance stack tests according to the procedures in §63.11646(a).

$$OLR = C_{test} * (EL/CT) \qquad \text{(Eq 2)}$$

View or download PDF

Where:

OLR = mercury concentration operating limit for the roaster (or roasters that share a common stack) (in micrograms per cubic meter);

C_{test} = average mercury concentration measured by the monitoring procedures (PS-12A or PS-12B or 30B) during the compliance performance stack test (in micrograms per cubic meter);

EL = emission standard for ore pretreatment processes (in lb/million tons of ore);

CT = compliance test results for ore pretreatment processes (in lb/million tons of ore).

(5) For roasters that utilize calomel-based mercury control systems for emissions controls, you are not required to perform the monitoring for mercury emissions in paragraphs (a)(1), (a)(2), or (a)(3) of this section if you demonstrate to the satisfaction of your permitting authority that mercury emissions from the roaster are less than 10 pounds of mercury per million tons of ore throughput. If you make this demonstration, you must conduct the parametric monitoring as described below in paragraphs (b) and (c) of this section.

(i) The initial demonstration must include three or more consecutive independent stack tests for mercury at least one month apart on the roaster exhaust stacks. Subsequent demonstrations may be based upon the single stack test required in paragraph (a) of section §63.11646. The results of each of the tests must be less than 10 pounds of mercury per million tons of ore. The testing must be performed according to the procedures in §63.11646(a)(1) through (a)(4) to determine mercury emissions in pounds per hour.

(ii) Divide the mercury emission rate in pounds per hour by the ore throughput rate during the test expressed in millions of tons per hour to determine the emissions in pounds per million tons of ore.

(b) For facilities with roasters and a calomel-based mercury control system that choose to monitor for mercury emissions using the procedures in paragraph (a)(1) of this section or that qualify for and choose to follow the requirements in paragraph (a)(5) of this section, you must establish operating parameter limits for scrubber liquor flow (or line pressure) and scrubber inlet gas temperature and monitor these parameters. You may establish your operating parameter limits from the initial compliance test, according to the manufacturer's specifications, or based on limits established by the permitting authority. If you choose to establish your operating parameter limits from the initial compliance test, monitor the scrubber liquor flow (or line pressure) and scrubber inlet gas temperature during each run of your initial compliance test. The minimum operating limit for scrubber liquor flow rate (or line pressure) is either the lowest value during any run of the initial compliance test or 10 percent less than the average value measured during the compliance test, and your maximum scrubber inlet temperature limit is the highest temperature measured during any run of the initial compliance test or 10 percent higher than the average value measured during the compliance test. You must monitor the scrubber liquor flow rate (or line pressure) and scrubber inlet gas temperature hourly and maintain the scrubber liquor flow (or line pressure) at or above the established operating parameter and maintain the inlet gas temperature below the established operating parameter limit.

(c) For facilities with roasters and a calomel-based mercury control system that choose to monitor for mercury emissions using the procedures in paragraph (a)(1) of this section or that qualify for and follow the requirements in paragraph (a)(5) of this section, you must establish operating parameter ranges for mercuric ion and chloride ion concentrations or for oxidation

reduction potential and pH using the procedures in paragraph (c)(1) or (c)(2) of this section respectively.

(1) Establish the mercuric ion concentration and chloride ion concentration ranges for each calomel-based mercury control system. The mercuric ion concentration and chloride ion concentration ranges for each calomel-based mercury control system must be based on the manufacturer's specifications, or based on approval by your permitting authority. Measure the mercuric ion concentration and chloride ion concentrations at least once during each run of your initial compliance test. The measurements must be within the established concentration range for mercuric ion concentration and chloride ion concentration. Subsequently, you must sample at least once daily and maintain the mercuric ion concentration and chloride ion concentrations within their established range.

(2) Establish the oxidation reduction potential and pH range for each calomel-based mercury control system. The oxidation reduction potential and pH range for each calomel-based mercury control system must be based on the manufacturer's specifications, or based on approval by your permitting authority. Install monitoring equipment to continuously monitor the oxidation reduction potential and pH of the calomel-based mercury control system scrubber liquor. Measure the oxidation reduction potential and pH of the scrubber liquor during each run of your initial compliance test. The measurements must be within the established range for oxidation reduction potential and pH. Subsequently, you must monitor the oxidation reduction potential and pH of the scrubber liquor continuously and maintain it within the established operating range.

(d) If you have an exceedance of a control device operating parameter range provided in paragraphs (b) or (c) of this section, you must take corrective action and bring the parameters back into the established parametric ranges. If the corrective actions taken following an exceedance do not result in the operating parameter value being returned within the established range within 48 hours, a mercury concentration measurement (with PS 12B or PS 12A CEMS (40 CFR part 60, appendix B and Procedure 5 of appendix F), Method 30B or Method 29 (40 CFR part 60, appendix A-8), or ASTM D6784 (incorporated by reference—see §63.14)) must be made to determine if the operating limit for mercury concentration is being exceeded. The measurement must be performed and the mercury concentration determined within 48 hours (after the initial 48 hours, or a total of 96 hours from the time the parameter range was exceeded). If the measured mercury concentration meets the operating limit for mercury concentration established under §63.11647(a)(4), the corrective actions are deemed successful, and the owner or operator can request the permit authority to establish a new limit or range for the parameter. If the measured mercury concentration exceeds the operating limit for mercury concentration after these 96 hours, the exceedance must be reported as a deviation within 24 hours to the permitting authority and the owner or operator must conduct a full compliance test pursuant to §63.11646(a) for the roaster operations within 40 days to determine if the affected source is in compliance with the MACT emission standard. For facilities that have roasters and autoclaves, the owner or operator can use the results of the previous compliance test for the autoclaves to determine the emissions for those process units to be used in the calculations of the emissions for the affected source. If the source is determined to be in compliance with the MACT emission standard, the compliance test may also be used to establish a new operating limit for mercury concentration (see paragraph (e) of this section).

(e) You may submit a request to your permitting authority for approval to change the operating limits established under paragraph (a)(4) of this section for the monitoring required in paragraph (a)(1),(a)(2), or (a)(3) of this section. In the request, you must demonstrate that the proposed change to the operating limit detects changes in levels of mercury emission control. An approved change to the operating limit under this paragraph only applies until a new operating limit is established during the next annual compliance test.

(f) You must monitor each process unit at each new and existing affected source that uses a carbon adsorber to control mercury emissions using the procedures in paragraphs (f)(1) or (f)(2) of this section. A carbon adsorber may include a fixed carbon bed, carbon filter packs or modules, carbon columns, and other variations.

(1) Continuously sample and analyze the exhaust stream from the carbon adsorber for mercury using Method 30B (40 CFR part 60, appendix A-8) for a duration of at least the minimum sampling time specified in Method 30B and up to one week that includes the period of the annual performance test.

(i) Establish an upper operating limit for the process as determined using the mercury concentration measurements from the sorbent trap (Method 30B) as calculated from Equation (3) of this section.

$$OLC = C_{trap} * (EL/CT) \qquad \text{(Eq 3)}$$

View or download PDF

Where:

OLC = mercury concentration operating limit for the carbon adsorber control device on the process as measured using the sorbent trap, (micrograms per cubic meter);

C_{trap} = average mercury concentration measured using the sorbent trap during the week that includes the compliance performance test, (micrograms per cubic meter);

EL = emission standard for the affected sources (lb/ton of concentrate);

CT = compliance test results for the affected sources (lb/ton of concentrate).

~~(ii) Sample and analyze the exhaust stream from the carbon adsorber for mercury at least monthly using Method 30B (40 CFR part 60, appendix A-8). When the mercury concentration reaches 75 percent of the operating limit, begin weekly sampling and analysis. When the mercury concentration reaches 90 percent of the operating limit, replace the carbon in the carbon adsorber within 30 days. If mercury concentration exceeds the operating limit, change the carbon in the carbon adsorber within 30 days and report the deviation to your permitting authority.~~

(2) Conduct an initial sampling of the carbon in the carbon bed for mercury 90 days after the replacement of the carbon. A representative sample must be collected from the inlet of the bed and the exit of the bed and analyzed using SW-846 Method 7471B (incorporated by reference—see §63.14). The depth to which the sampler is inserted must be recorded. The design capacity is established by calculating the average carbon loading from the inlet and outlet measurements. Sampling and analysis of the carbon bed for mercury must be performed quarterly thereafter. When the carbon loading reaches 50 percent of the design capacity of the carbon, monthly sampling must be performed until 90 percent of the carbon loading capacity is reached. The carbon must be removed and replaced with fresh carbon no later than 30 days after reaching 90 percent of capacity. For carbon designs where there may be multiple carbon columns or beds, a representative sample may be collected from the first and last column or bed instead of the inlet or outlet. If the carbon loading exceeds the design capacity of the carbon, change the carbon within 30 days and report the deviation to your permitting authority.

(g) You must monitor gas stream temperature at the inlet to the carbon adsorber for each process unit (*i.e.,* carbon kiln, melt furnace, *etc.*) equipped with a carbon adsorber. Establish a maximum value for the inlet temperature either during the annual performance test (required in §63.11646(a)), according to the manufacturer's specifications, or as approved by your permitting authority. If you choose to establish the temperature operating limit during the performance test, establish the temperature operating limit based on either the highest reading during the test or at 10 °F higher than the average temperature measured during the performance test. Monitor the inlet temperature once per shift. If an inlet temperature exceeds the temperature operating limit, you must take corrective actions to get the temperature back within the parameter operating limit within 48 hours. If the exceedance persists, within 144 hours of the exceedance, ~~you must sample and analyze the exhaust stream from the carbon adsorber using Method 30B (40 CFR part 60, appendix A-8) and compare to an operating limit (calculated pursuant to (f)(1)(i)) or~~ you must conduct carbon sampling pursuant to (f)(2) of this section. If ~~the concentration measured with Method 30B is below 90 percent of the operating limit or~~ the carbon sampling results are below 90 percent of the carbon loading capacity, you may set a new temperature operating limit 10 °F above the previous operating limit or at an alternative level approved by your permit authority. If the concentration is ~~above 90 percent of the operating limit or~~ above 90 percent of the carbon loading capacity you must change the carbon in the bed within 30 days and report the event to your permitting authority, and reestablish an appropriate maximum temperature limit based on approval of your permit authority.

(h) For each wet scrubber at each new and existing affected source not followed by a mercury control system, you must monitor the water flow rate (or line pressure) and pressure drop. Establish a minimum value as the operating limit for water flow rate (or line pressure) and pressure drop either during the performance test required in §63.11646(a), according to the manufacturer's specifications, or as approved by your permitting authority. If you choose to establish the operating limit based on the results of the performance test, the new operating limit must be established based on either the lowest value during any test run or 10 percent less than the average value measured during the test. For wet scrubbers on an autoclave, establish the pressure drop range according to manufacturer's specifications. You must monitor the water flow rate and pressure drop once per shift and take corrective action within 24 hours if any daily average is less than the operating limit. If the parameters are not in range within 72 hours, the owner or operator must report the deviation to the permitting authority and perform a compliance test for the process unit(s) controlled with the wet scrubber that has the parameter exceedance within 40 days to determine if the affected source is in compliance with the MACT limit. For the other process units included in the affected source, the owner or operator can use the results of the previous compliance test to determine the emissions for those process units to be used in the calculations of the emissions for the affected source.

(i) You may conduct additional compliance tests according to the procedures in §63.11646 and re-establish the operating limits required in paragraphs ~~(a) through (c) and~~ (f) through (h) of this section at any time. You must submit a request to your permitting authority for approval to re-establish the operating limits. In the request, you must demonstrate that the proposed change to the operating limit detects changes in levels of mercury emission control. An approved change to the operating limit under this paragraph only applies until a new operating limit is established during the next annual compliance test.

Midas Gold is not proposing to operate a roaster, therefore the §63.11647(a)-(e) monitoring requirements will not apply. The Carbon Regeneration Kiln, the Electrowinning Cells and Pregnant Solution Tank combined stack, the Mercury Retort and the Melting Furnace will each have a carbon adsorber to control mercury. Each carbon adsorber will be monitored per §63.11647(f)(2) with an initial sampling of the carbon, continued sampling and analysis and replacement of the carbon as described. For each sampling of the carbon, the average carbon loading will be calculated from the inlet and outlet measurements and compared to the carbon loading capacity provided by the manufacturer. The gas stream temperature at the inlet of each carbon adsorber will be monitored, a maximum value will be established, and corrective actions will be taken for any exceedance per the highlighted portions of §63.11647(g).

The Autoclave will be controlled by a wet scrubber not followed by a mercury control system, therefore §63.11647(h) will apply. The Autoclave wet scrubber water flow rate and pressure drop will be monitored, operating limits will be established, and corrective actions will be taken for any exceedance per §63.11647(h). The Carbon Regeneration Kiln will also be controlled by a wet scrubber, however the wet scrubber will be followed by a mercury control system (carbon adsorber), therefore §63.11647(h) will not apply to the kiln.

The carbon adsorber and wet scrubber operating limits may be re-established per §63.11647(i).

§63.11648 What are my notification, reporting, and recordkeeping requirements?

(a) You must submit the Initial Notification required by §63.9(b)(2) ~~no later than 120 calendar days after the date of publication of the final rule in the FEDERAL REGISTER or~~ within 120 days after the source becomes subject to the standard. The Initial Notification must include the information specified in §63.9(b)(2)(i) through (b)(2)(iv).

(b) You must submit an initial Notification of Compliance Status as required by §63.9(h).

(c) If a deviation occurs during a semiannual reporting period, you must submit a deviation report to your permitting authority according to the requirements in paragraphs (c)(1) and (2) of this section.

(1) The first reporting period covers the period beginning on the compliance date specified in §63.11641 and ending on June 30 or December 31, whichever date comes first after your compliance date. Each subsequent reporting period covers the semiannual period from January 1 through June 30 or from July 1 through December 31. Your deviation report must be postmarked or delivered no later than July 31 or January 31, whichever date comes first after the end of the semiannual reporting period.

(2) A deviation report must include the information in paragraphs (c)(2)(i) through (c)(2)(iv) of this section.

(i) Company name and address.

(ii) Statement by a responsible official, with the official's name, title, and signature, certifying the truth, accuracy and completeness of the content of the report.

(iii) Date of the report and beginning and ending dates of the reporting period.

(iv) Identification of the affected source, the pollutant being monitored, applicable requirement, description of deviation, and corrective action taken.

(d) If you had a malfunction during the reporting period, the compliance report required in §63.11648(b) *[It is assumed this reference is a typographical error and should be §63.11648(c)]* must include the number, duration, and a brief description for each type of malfunction which occurred during the reporting period and which caused or may have caused any applicable emission limitation to be exceeded. The report must also include a description of actions taken by an owner or operator during a malfunction of an affected source to minimize emissions in accordance with §63.11646(b), including actions taken to correct a malfunction.

(e) You must keep the records specified in paragraphs (e)(1) through (e)(3) of this section. The form and maintenance of records must be consistent with the requirements in section 63.10(b)(1) of the General Provisions.

(1) As required in §63.10(b)(2)(xiv), you must keep a copy of each notification that you submitted to comply with this subpart and all documentation supporting any Initial Notification, Notification of Compliance Status, and semiannual compliance certifications that you submitted.

(2) You must keep the records of all performance tests, measurements, monitoring data, and corrective actions required by §§63.11646 and 63.11647, and the information identified in paragraphs (c)(2)(i) through (c)(2)(vi) of this section for each corrective action required by §63.11647.

(i) The date, place, and time of the monitoring event requiring corrective action;

(ii) Technique or method used for monitoring;

(iv) Operating conditions during the activity;

(v) Results, including the date, time, and duration of the period from the time the monitoring indicated a problem to the time that monitoring indicated proper operation; and

(vi) Maintenance or corrective action taken (if applicable).

(3) You must keep records of operating hours for each process as required by §63.11646(a)(5) and records of the monthly quantity of ore and concentrate processed or produced as required by §63.11646(a)(10).

(f) Your records must be in a form suitable and readily available for expeditious review, according to §63.10(b)(1). As specified in §63.10(b)(1), you must keep each record for 5 years following the date of each recorded action. You must keep each record onsite for at least 2 years after the date of each recorded action according to §63.10(b)(1). You may keep the records offsite for the remaining 3 years.

(g) After December 31, 2011, within 60 days after the date of completing each performance evaluation conducted to demonstrate compliance with this subpart, the owner or operator of the affected facility must submit the test data to EPA by entering the data electronically into EPA's WebFIRE data base through EPA's Central Data Exchange. The owner or operator of an affected facility shall enter the test data into EPA's data base using the Electronic Reporting Tool or other compatible electronic spreadsheet. Only performance evaluation data collected using methods compatible with ERT are subject to this requirement to be submitted electronically into EPA's WebFIRE database.

Midas Gold will be subject to all notification, reporting and recordkeeping requirements in §63.11648.

Other Requirements and Information

§63.11650 What General Provisions apply to this subpart?

Table 1 to this subpart shows which parts of the General Provisions in §§63.1 through 63.16 apply to you.

See Table 1 of this subpart for the applicable General Provisions to this subpart.

§63.11651 What definitions apply to this subpart?

Terms used in this subpart are defined in the Clean Air Act, in §63.2, and in this section as follows:

Autoclave means a pressure oxidation vessel that is used to treat gold ores (primarily sulfide refractory ore) and involves pumping a slurry of milled ore into the vessel which is highly pressurized with oxygen and heated to temperatures of approximately 350° to 430 °F.

~~*Calomel-based mercury control system* means a mercury emissions control system that uses scrubbers to remove mercury from the gas stream of a roaster or combination of roasters by complexing the mercury from the gas stream with mercuric chloride to form mercurous chloride (calomel). These scrubbers are also referred to as "mercury scrubbers."~~

Carbon adsorber means a control device consisting of a single fixed carbon bed, multiple carbon beds or columns, carbon filter packs or modules, and other variations that uses activated carbon to remove pollutants from a gas stream.

Carbon kiln means a kiln or furnace where carbon is regenerated by heating, usually in the presence of steam, after the gold has been stripped from the carbon.

Carbon processes with mercury retorts means the affected source that includes carbon kilns, preg tanks, electrowinning cells, mercury retorts, and melt furnaces at gold mine ore processing and production facilities that use activated carbon, or resins that can be used as a substitute for activated carbon, to recover (adsorb) gold from the pregnant cyanide solution.

~~*Carbon processes without mercury retorts* means the affected source that includes carbon kilns, preg tanks, electrowinning cells, and melt furnaces, but has no retorts, at gold mine ore processing and production facilities that use activated carbon, or resins that can be used as a substitute for activated carbon, to recover (adsorb) gold from the pregnant cyanide solution.~~

Concentrate means the sludge-like material that is loaded with gold along with various other metals (such as silver, copper, and mercury) and various other substances, that is produced by electrowinning, the Merrill-Crowe process, flotation and gravity separation processes. *Concentrate* is measured as the input to mercury retorts, or for facilities without mercury retorts, as the input to melt furnaces before any drying takes place. For facilities without mercury retorts or melt furnaces, *concentrate* is measured as the quantity shipped.

Deviation means any instance where an affected source subject to this subpart, or an owner or operator of such a source:

(1) Fails to meet any requirement or obligation established by this subpart, including but not limited to any emissions limitation or work practice standard;

(2) Fails to meet any term or condition that is adopted to implement an applicable requirement in this subpart and that is included in the operating permit for any affected source required to obtain such a permit; or

(3) Exceeds any operating limit established under this subpart.

Electrowinning means a process that uses induced voltage on anode and cathode plates to remove metals from the continuous flow of solution, where the gold in solution is plated onto the cathode. Steel wool is typically used as the plating surface.

Electrowinning Cells means a tank in which the electrowinning takes place.

Gold mine ore processing and production facility means any industrial facility engaged in the processing of gold mine ore that uses any of the following processes: ~~Roasting operations~~, autoclaves, carbon kilns, preg tanks, electrowinning, mercury retorts, or melt furnaces. Laboratories (see CAA section 112(c)(7)), ~~individual prospectors, and very small pilot scale mining~~

operations that processes or produces less than 100 pounds of concentrate per year are not a gold mine ore processing and production facility. A facility that produces primarily metals other than gold, such as copper, lead, zinc, or nickel (where these metals other than gold comprise 95 percent or more of the total metal production) that may also recover some gold as a byproduct is not a gold mine ore processing and production facility. Those facilities whereby 95 percent or more of total mass of metals produced are metals other than gold, whether final metal production is onsite or offsite, are not part of the gold mine ore processing and production source category.

Melt furnace means a furnace (typically a crucible furnace) that is used for smelting the gold-bearing material recovered from mercury retorting, or the gold-bearing material from electrowinning, the Merrill-Crowe process, or other processes for facilities without mercury retorts.

Mercury retort means a vessel that is operated under a partial vacuum at approximately 1,100° to 1,300 °F to remove mercury and moisture from the gold bearing sludge material that is recovered from electrowinning, the Merrill-Crowe process, or other processes. Mercury retorts are usually equipped with condensers that recover liquid mercury during the processing.

Merrill-Crowe process means a precipitation technique using zinc oxide for removing gold from a cyanide solution. Zinc dust is added to the solution, and gold is precipitated to produce a concentrate.

Non-carbon concentrate processes means the affected source that includes mercury retorts and melt furnaces at gold mine ore processing and production facilities that use the Merrill-Crowe process or other processes and do not use carbon (or resins that substitute for carbon) to recover (adsorb) gold from the pregnant cyanide solution.

Ore dry grinding means a process in which the gold ore is ground and heated (dried) prior to additional preheating or prior to entering the roaster.

Ore preheating means a process in which ground gold ore is preheated prior to entering the roaster.

Ore pretreatment processes means the affected source that includes roasting operations and autoclaves that are used to pre-treat gold mine ore at gold mine ore processing and production facilities prior to the cyanide leaching process.

Pregnant solution tank (or preg tank) means a storage tank for pregnant solution, which is the cyanide solution that contains gold-cyanide complexes that is generated from leaching gold ore with cyanide solution.

Pregnant cyanide solution means the cyanide solution that contains gold-cyanide complexes that are generated from leaching gold ore with a dilute cyanide solution.

Quenching means a process in which the hot calcined ore is cooled and quenched with water after it leaves the roaster.

Roasting operation means a process that uses an industrial furnace in which milled ore is combusted across a fluidized bed to oxidize and remove organic carbon and sulfide mineral grains in refractory gold ore. The emissions points of the roasting operation subject to this subpart include ore dry grinding, ore preheating, the roaster stack, and quenching.

The highlighted definitions in §63.11651 will apply to the Stibnite Gold Project.

§63.11652 Who implements and enforces this subpart?

(a) This subpart can be implemented and enforced by the U.S. EPA or a delegated authority, such as your state, local, or tribal agency. If the U.S. EPA Administrator has delegated authority to your state, local, or tribal agency, then that agency has the authority to implement and enforce this subpart. You should contact your U.S. EPA Regional Office to find out if this subpart is delegated to your state, local, or tribal agency.

(b) In delegating implementation and enforcement authority of this subpart to a state, local, or tribal agency under 40 CFR part 63, subpart E, the authorities contained in paragraph (c) of this section are retained by the Administrator of the U.S. EPA and are not transferred to the state, local, or tribal agency.

(c) The authorities that will not be delegated to state, local, or tribal agencies are listed in paragraphs (c)(1) through (4) of this section.

(1) Approval of alternatives to the applicability requirements in §63.11640, the compliance date requirements in §63.11641, and the applicable standards in §63.11645.

(2) Approval of an alternative nonopacity emissions standard under §63.6(g).

(3) Approval of a major change to a test method under §63.7(e)(2)(ii) and (f). A “major change to test method” is defined in §63.90(a).

(4) Approval of a major change to monitoring under §63.8(f). A “major change to monitoring” is defined in §63.90(a).

(5) Approval of a waiver of recordkeeping or reporting requirements under §63.10(f), or another major change to recordkeeping/reporting. A “major change to recordkeeping/reporting” is defined in §63.90(a).

This implementation and enforcement of this subpart per §63.11652 will apply.

~~§63.11653 [Reserved]~~

Table 1 to Subpart EEEEEEE of Part 63—Applicability of General Provisions to Subpart EEEEEE

As stated in §63.11650, you must comply with the applicable General Provisions requirements according to the following table

Citation	Subject	Applies to subpart EEEEEEE	Explanation
§63.1(a)(1), (a)(2), (a)(3), (a)(4), (a)(6), (a)(10)-(a)(12), (b)(1), (b)(3), (c)(1), (c)(2), (c)(5), (e)	Applicability	Yes	
~~§63.1(a)(5), (a)(7)-(a)(9), (b)(2), (c)(3), (c)(4), (d)~~	~~Reserved~~	~~No~~	
§63.2	Definitions	Yes	
§63.3	Units and Abbreviations	Yes	
§63.4	Prohibited Activities and Circumvention	Yes

REC 1719

3.0 PROCESS FLOW DIAGRAM

The process flow diagram can be found in the "Stibnite Gold Project Air Quality Modeling Report" found in Attachment A of this application.

PRI00000380

REC 1720

4.0 REGULATORY ANALYSIS

This section provides a regulatory analysis of the applicable Idaho Air Pollution Rules and Federal regulations to the Midas Gold – SGP. In addition, a few Idaho rules and Federal regulations that could appear to be applicable are discussed and an explanation is provided as to why they have been determined to not apply.

4.1 Rules for the Control of Air Pollution in Idaho

Below is a list of Idaho Administrative Code, IDAPA 58 - Department of Environmental Quality Rules that will apply to the Midas Gold – SGP and require a demonstration of compliance. For each applicable Rule, identification of the emission units to which the rule applies and a statement of how Midas Gold will demonstrate compliance is provided.

58.01.01 - RULES FOR THE CONTROL OF AIR POLLUTION IN IDAHO

123. CERTIFICATION OF DOCUMENTS.

All documents, as stated in 58.01.01.123, will contain a certification by a Midas Gold responsible official. The certification will state that, based on information and belief formed after reasonable inquiry, the statements and information in the document are true, accurate, and complete.

157. TEST METHODS AND PROCEDURES.

Midas Gold will follow all testing procedures and requirements specified in 58.01.01.157 for each performance test conducted to comply with the requirements of the PTC or with state or federal regulations.

200. PROCEDURES AND REQUIREMENTS FOR PERMITS TO CONSTRUCT. [200 THROUGH 228]

Midas Gold is proposing to construct a new non-major facility, and therefore, all requirements specific to major facilities or major modifications do not apply.

201. PERMIT TO CONSTRUCT REQUIRED.

In accordance with 58.01.01.201, Midas Gold will obtain a PTC prior to commencing construction of any stationary source.

202. APPLICATION PROCEDURES.

In accordance with 58.01.01.202, Midas Gold is submitting this application for a PTC for a new non-major facility. This application uses the forms furnished by the IDEQ and attempts to provide all required information in the appropriate application sections and attachments.

PRI00000381

REC 1721

202.01.a.ii. Schedule for Construction

Midas Gold is seeking a PTC in hopes of commencing construction in June 2021. This schedule is tentative and is primarily dictated by the issuance of the final record of decision on the U.S. Forest Service Environmental Impact Statement.

203. PERMIT REQUIREMENTS FOR NEW AND MODIFIED STATIONARY SOURCES.

In accordance with 58.01.01.203, the "Stibnite Gold Project Air Quality Modeling Report" provided in Attachment A, demonstrates that the proposed Midas Gold – SGP will be in compliance with all applicable emission standards, National Ambient Air Quality Standards (NAAQS), and the TAP increments.

209. PROCEDURE FOR ISSUING PERMITS.

Midas Gold reviewed the procedure for issuing permits with the IDEQ during the pre-application meeting on April 4, 2019.

210. DEMONSTRATION OF PRECONSTRUCTION COMPLIANCE WITH TOXIC STANDARDS.

A detailed analysis of the quantification of TAP emission rates and ambient concentrations, if applicable, as well as a demonstration of preconstruction compliance can be found in the "Stibnite Gold Project Air Quality Modeling Report" found in Attachment A of this application. A summary of the facility-wide potential TAP emissions with a determination of compliance/modeling applicability is provided in Table 5 of the "Stibnite Gold Project Air Quality Modeling Report." Further discussion of the TAP analyses is provided under Sections 585 and 586 below.

210.20. NSPS and NESHAP Sources

In accordance with 58.01.01.210.20.b, TAPs regulated by the EPA at the time of permit issuance under 40 CFR part 60 or 40 CFR part 63, do not require further procedures for demonstrating preconstruction compliance for those TAPs as part of the application process, provided that the PTC contains provisions implementing the applicable federal standards, as requested by Midas Gold.

Diesel internal combustion engine HAP emissions are regulated by NESHAP, Subpart ZZZZ and are, therefore, exempt from further TAP analysis. Midas Gold is proposing to operate three emergency generators (Source IDs EDG1, EDG2, and EDG3) and one fire pump (Source ID EDFP) subject to NESHAP, Subpart ZZZZ. In addition, mercury emissions from the Gold Mine Ore Processing and Production affected sources are regulated by NESHAP, Subpart EEEEEEE (NESHAP, Subpart 7E), and are therefore exempt from further TAP analysis. Midas Gold is

PRI00000382

REC 1722

proposing to operate an autoclave (Source ID AC) and refinery (Source IDs CKD, EW, MR, and MF) subject to NESHAP, Subpart 7E.

211. CONDITIONS FOR PERMITS TO CONSTRUCT.

Midas Gold understands that the IDEQ may impose any reasonable conditions upon approval, including conditions, as described in 58.01.01.211.01, for sampling, instrumentation to monitor and record emissions data, instrumentation for ambient monitoring and any other sampling as deemed reasonable. In addition, Midas Gold understands that the IDEQ may cancel a PTC if construction has not begun within two years from date of issuance, or if during the construction, work is suspended for one year. Midas Gold will provide written notification to the IDEQ of the anticipated date of initial start-up and the actual date of initial start-up of the stationary source within the timelines specified in 58.01.01.211.03. Should the IDEQ require performance testing at the SGP, it will be conducted in accordance with 58.01.01.211.04.

212. OBLIGATION TO COMPLY.

In accordance with 58.01.01.212, Midas Gold will comply with all applicable local, state and federal statutes, rules and regulations.

215. MERCURY EMISSION STANDARD FOR NEW OR MODIFIED SOURCES.

In accordance with 58.01.01.215.01, the Midas Gold is exempt from the requirements of 58.01.01.215 as the autoclave (Source ID AC) and refinery (Source IDs CKD, EW, MR, and MF) are within a source category subject to 40 CFR part 63 (i.e., subject to NESHAP, Subpart 7E).

224. PERMIT TO CONSTRUCT APPLICATION FEE.

In accordance with 58.01.01.224, Midas Gold will pay a PTC application fee of $1,000 for this application.

225. PERMIT TO CONSTRUCT PROCESSING FEE.

In accordance with 58.01.01.225, Midas Gold will pay a PTC processing fee in the amount of $7,500 for non-major new sources with an increase of emissions of one hundred tons per year or more. Table 14 provides the total increase of regulated pollutant emissions, excluding fugitive emissions, for the SGP.

PRI00000383

REC 1723

Table 14. SGP Regulated Pollutant Emissions Total

Regulated Pollutant	ton/yr *
PM_{10}	56.3
CO	30.5
NO_X	37.9
SO_2	6.5
VOC	4.8
Total	136.0

* Excluding fugitive emissions

226. PAYMENT OF FEES FOR PERMITS TO CONSTRUCT.

In accordance with 58.01.01.226, Midas Gold is submitting the PTC application fee of $1,000 with this application. The PTC processing fee will be paid upon receipt of an assessment from the IDEQ.

300. PROCEDURES AND REQUIREMENTS FOR TIER I OPERATING PERMITS. [300 through 399]

301. REQUIREMENT TO OBTAIN TIER I OPERATING PERMIT.

The proposed autoclave (Source ID AC) and refinery (Source IDs CKD, EW, MR, and MF) will be subject to the NESHAP, Subpart 7E Gold Mine Ore Processing and Production Area Source Category, and Midas Gold will be required to obtain a Part 70 permit for these emissions units per 63.11640(d). Accordingly, per 58.01.01.006.122.c., the SPG will be a Tier I source for these five emission units. As specified in 58.01.01.301.02.b.iv, Tier I sources not located at major facilities do not require a Tier I operating permit until the source becomes a Tier I source as defined under 58.01.01.006. The Tier I application for applicable sources will be submitted in accordance with 58.01.01.313.01.b.

313. TIMELY APPLICATION.

In accordance with 58.01.01.313.01.b., Midas Gold will submit a complete application for an original Tier I operating permit within twelve months after becoming a Tier I source. 40 CFR 70.3(c)(2) specifies that "[f]or any nonmajor source subject to the part 70 program … the permitting authority shall include in the permit all applicable requirements applicable to emissions units that cause the source to be subject to the part 70 program." Therefore, as further outlined in the EPA's July 10, 1995, *White Paper for Streamlined Development of Part 70 Permit Applications*, only the affected sources are required to be included in a Title V (i.e., Tier I) permit.

PRI00000384

REC 1724

400. PROCEDURES AND REQUIREMENTS FOR TIER II OPERATING PERMITS. [400 through 410]

401. TIER II OPERATING PERMIT.

58.01.01.401.02.a.i, requires a Tier II operating permit for any stationary source not subject to Sections 300 through 399 with a PTC which establishes any emission standard different from those in the 58.01.01 rules. At this time, it is believed that Midas Gold will not be required to obtain a Tier II operating permit for the stationary sources not subject to Sections 300 through 399. As discussed above, Midas Gold will submit an application for a Tier I operating permit for the affected sources that are required to obtain a Title V permit. Midas Gold will further discuss the necessary operating permits with the IDEQ after the commencement of operation.

575. AIR QUALITY STANDARDS AND AREA CLASSIFICATION. [575 THROUGH 587]

576. GENERAL PROVISIONS FOR AMBIENT AIR QUALITY STANDARDS.

In accordance with 58.01.01.576, the general provisions for ambient air quality standards will apply to the Midas Gold - SGP.

578. DESIGNATION OF ATTAINMENT, UNCLASSIFIABLE, AND NONATTAINMENT AREAS.

In accordance with 58.01.01.578, the IDEQ has identified Valley County, where the SGP will be located, as in compliance with the NAAQS; therefore, it is classified as an attainment area for all criteria pollutants.

581. PREVENTION OF SIGNIFICANT DETERIORATION (PSD) INCREMENTS.

The proposed SGP does not have facility-wide emissions of any regulated NSR pollutant that exceed 250 tons per year and is not a major stationary source as defined in 40 CFR 52.21(b)(1)(i). Therefore, PSD requirements, including PSD increments, are not applicable to the SGP.

585. TOXIC AIR POLLUTANTS NON-CARCINOGENIC INCREMENTS.

A comparison of the facility-wide potential uncontrolled emissions for each non-carcinogenic TAP to the applicable TAP non-carcinogenic screening emissions levels (EL) can be found in Table 5 of the "Stibnite Gold Project Air Quality Modeling Report" found in Attachment A of this application. The SGP potential uncontrolled emissions exceed the respective non-carcinogenic screening EL for antimony and sulfuric acid. Therefore, TAP analyses were performed to demonstrate compliance with the Acceptable Ambient Concentrations (AAC, 24 hours averaging period) for these pollutants. Results of these analyses are summarized in Table 1 in Attachment A.

PRI00000385

REC 1725

586. TOXIC AIR POLLUTANTS CARCINOGENIC INCREMENTS.

A comparison of the facility-wide potential uncontrolled emissions for each carcinogenic TAP to the applicable TAP carcinogenic screening EL can be found in Table 5 of the "Stibnite Gold Project Air Quality Modeling Report" found in Attachment A of this application. Based on the TAP analysis determination provided in Table 5, the SGP facility-wide potential uncontrolled emissions exceed the respective carcinogenic screening EL for arsenic, cadmium, formaldehyde, and nickel. Therefore, TAP analyses were performed to demonstrate compliance with the Acceptable Ambient Concentrations for Carcinogens (AACC, annual averaging period) for arsenic, cadmium, formaldehyde, and nickel. Results of these analyses are provided in Table 1 of the "Stibnite Gold Project Air Quality Modeling Report".

For the carcinogenic TAPs with facility-wide uncontrolled emissions below the applicable carcinogenic screening EL, per 58.01.01.210.05, no additional compliance demonstration is needed. For arsenic, cadmium, formaldehyde, and nickel, where the uncontrolled ambient concentrations are below the applicable AACC, per 58.01.01.210.06, no additional compliance demonstration is needed.

590. NEW SOURCE PERFORMANCE STANDARDS.

The New Source Performance Standards (NSPS) applicable to the SGP can be found below in Section 4.2 of this application.

591. NATIONAL EMISSION STANDARDS FOR HAZARDOUS AIR POLLUTANTS.

The National Emission Standards for Hazardous Air Pollutants (NESHAP) applicable to the SGP can be found below in Section 4.2 of this application.

625. VISIBLE EMISSIONS.

In accordance with 58.01.01.625, Midas Gold will not discharge any air pollutant into the atmosphere from any point of emission for a period or periods aggregating more than three (3) minutes in any sixty (60) minute period which is greater than twenty percent (20%) opacity as determined by this section. Midas Gold will demonstrate compliance with this rule by conducting periodic visible emissions observations and EPA Method 9 opacity testing, with opacity calculated as specified in 58.01.01.625.04.b, as required in the PTC.

650. RULES FOR CONTROL OF FUGITIVE DUST.

In accordance with 58.01.01.650, Midas Gold will take reasonable precautions to prevent fugitive particulate matter from becoming airborne at the SGP. Midas Gold will develop a Fugitive Dust Control Plan to include good operating practices and reasonable precautions as described in 58.01.01.651.

675. FUEL BURNING EQUIPMENT -- PARTICULATE MATTER. [675 through 681]

676. STANDARDS FOR NEW SOURCES.

In accordance with 58.01.01.676, Midas Gold will not discharge into the atmosphere from any fuel burning equipment with a maximum rated input of 10 MMBtu/hr or more, particulate matter in excess of the concentrations shown below. Table 15 provides the PM standards that apply to each fuel burning equipment proposed to be installed at SGP. The compliance demonstration for the sources greater than 10 MMBtu/hr can be found in the detailed emission inventory conversions worksheet.

677. STANDARDS FOR MINOR AND EXISTING SOURCES.

In accordance with 58.01.01.677, Midas Gold will not discharge into the atmosphere from any fuel burning equipment with a maximum rated input of less than 10 MMBtu/hr, particulate matter in excess of the concentrations shown below. Table 15 provides the PM standards that apply to each fuel burning equipment proposed to be installed at SGP. The compliance demonstration for the sources less than 10 MMBtu/hr can be found in the detailed emission inventory conversions worksheet.

REC 1728

700. PARTICULATE MATTER -- PROCESS WEIGHT LIMITATIONS. [700 through 703]

In accordance with 58.01.01.700.02, no source shall be required to meet a particulate emission limit of less than one pound per hour.

701. PARTICULATE MATTER -- NEW EQUIPMENT PROCESS WEIGHT LIMITATIONS.

In accordance with 58.01.01.701, Midas Gold will not emit into the atmosphere from any process or process equipment, particulate matter in excess of the amounts shown by the equations in section 701.a and 701.b. This weight limitation does not apply to fuel burning equipment.

Per 58.01.01.006.94, process weight is defined as the total weight of all materials introduced into any source operation which may cause any emissions of particulate matter. Process weight includes solid fuels charged, but does not include liquid and gaseous fuels charged or combustion air. Water which occurs naturally in the feed material shall be considered part of the process weight.

This particulate matter weight limitation will apply to various processes at the SGP. The compliance demonstration for the sources subject can be found in the detailed emission inventory "Process Activity and Emissions" sheets.

725. RULES FOR SULFUR CONTENT OF FUELS.

In accordance with 58.01.01.725, Midas Gold will only use ASTM Grade 2 distillate fuel oil containing no more than 0.5% by weight of sulfur. Midas Gold plans to use ultra-low sulfur diesel with a maximum sulfur content of 15 ppm (0.0015% by weight). They will demonstrate compliance with the distillate fuel oil sulfur content limit by only purchasing ultra-low sulfur diesel.

790. RULES FOR THE CONTROL OF NONMETALLIC MINERAL PROCESSING PLANTS. [790 through 799]

791. GENERAL CONTROL REQUIREMENTS.

In accordance with 58.01.01.791, Midas Gold will take reasonable precautions to prevent the generation of fugitive dust from the nonmetallic mineral processing plant at the SGP.

792. EMISSIONS STANDARDS FOR NONMETALLIC MINERAL PROCESSING PLANTS SUBJECT TO 40 CFR 60, SUBPART OOO.

Midas Gold is proposing to operate a nonmetallic mineral processing plant at the SGP that is subject to NSPS, Subpart OOO. The emission units included in the nonmetallic mineral processing plant are shown in Table 17. As detailed below in Section 4.2 of this application,

PRI00000389

REC 1729

Midas Gold will comply with all applicable emissions standards, monitoring requirements, test methods and procedures, and reporting and recordkeeping requirements of Subpart OOO.

4.2 Applicable Federal Regulations

The sections that follow provide an explanation for the NSPS part 60, and the NESHAP part 63 subparts from the Code of Federal Regulations (CFR) that are applicable to the Midas Gold – Stibnite Gold Project. The Federal Rule Applicability (Form FRA) has been provided in Section 1.13 of the application forms, along with the detailed regulatory review.

4.2.1 NSPS, Subpart LL – Standards of Performance for Metallic Mineral Processing Plants

Midas Gold is proposing to operate a metallic mineral processing plant at the Stibnite Gold Project, where they will operate a combination of equipment to produce gold and silver concentrates from ore. Therefore, the provisions of NSPS, Subpart LL will be applicable per §60.380(a). The metallic mineral processing plant will include crushers, conveyor belt transfer points, and a truck unloading station. The proposed metallic mineral processing plant will be subject to the requirements of this subpart as it will commence construction after August 24, 1982, per §60.380(b). Table 16 lists all the affected facilities subject to NSPS, Subpart LL.

Table 16. NSPS, Subpart LL Sources

OC7	Primary Crusher and Associated Transfers out to Coarse Ore Stockpile Feed Conveyor	Crusher
OC9	Stockpile Transfers to Reclaim Conveyors	Conveyor Belt Transfer Point
OC10	Reclaim Conveyers to SAG Mill Feed Conveyor	Conveyor Belt Transfer Point
OC11	SAG Mill Feed Conveyor Transfer to SAG Mill	Conveyor Belt Transfer Point
OC12	Pebble Crusher and Associated Transfers in (from SAG Mill) and out (to Pebble Discharge Conveyor)	Crusher
OC13	Pebble Discharge Conveyor to SAG Mill Feed Conveyor	Conveyor Belt Transfer Point

PRI00000390

REC 1730

Based on the definition found in §60.381, a conveyor belt transfer point means a point in the conveying operation where the metallic mineral or metallic mineral concentrate is transferred to or from a conveyor belt ***except where the metallic mineral is being transferred to a stockpile***. Therefore, Source ID OC8, Coarse Ore Stockpile Feed Conveyor Transfer to Stockpile is not subject to NSPS, Subpart LL.

4.2.2 NSPS, Subpart OOO – Standards of Performance for Nonmetallic Mineral Processing Plants

Midas Gold is proposing to operate a nonmetallic mineral processing plant at the Stibnite Gold Project, where they will process limestone. Therefore, the provisions of NSPS, Subpart OOO will be applicable per §60.670(a)(1). The limestone mineral processing will consist of a primary and secondary crusher, a primary and secondary screening operation, a ball mill, storage bins and conveyors. The proposed nonmetallic mineral processing plant will be subject to the requirements of this subpart as it will commence construction after August 31, 1983 per §60.670(e). Table 17 list all the affected facilities subject to NSPS, Subpart OOO.

Table 17. NSPS, Subpart OOO Sources

Source ID	Description	Source Type	Control
LS1	Limestone transfer to Primary Crusher Hopper	Storage Bin	None
LS2	Primary Crushing and Associated Transfers In and Out	Crusher	None
LS3	Primary Screening and Associated Transfers In and Out	Screen	None
LS4	Secondary Crushing and Associated Transfers In and Out	Crusher	None
LS5	Secondary Screening and Associated Transfers In and Out	Screen	None
LS6	Limestone transfer to Ball Mill Feed Bin	Conveyor & Storage Bin	None
LS7	Limestone transfer to Ball Mill Feed Conveyor	Conveyor	None
LS8	Ball Mill Feed transfer to Ball Mill	Conveyor	None
LSBM	Limestone Ball Mill	Grinding Mill	Baghouse (BH3)
LS9	Limestone transfer to Kiln Feed Bin	Conveyor & Storage Bin	None
LS10	Limestone transfer to Lime Kiln Feed Conveyor	Conveyor	None
LS11	Fines Screening and Associated Transfers In and Out	Screen	None
LS12	Kiln Feed transfer to PFR Shaft Lime Kiln	Conveyor	None

PRI00000391

REC 1731

Per §60.672(d), truck dumping into a feed hopper is exempt from the standards for particulate matter provided in §60.672. Therefore, Source ID LS1, Limestone transfer to Primary Crusher Hopper, is not subject to the emission limits and compliance requirements in Table 3 of NSPS, Subpart OOO.

Midas Gold is also proposing to operate a cement batch plant that will include an aggregate storage bin, which will process nonmetallic minerals, however, the cement batch plant does not meet the definition per §60.671 of a nonmetallic mineral processing plant as it does not include any crushing or grinding. Therefore, Source IDs CAL and CAU, Aggregate Bin Loading and Aggregate Bin Unloading, are not subject to NSPS, Subpart OOO.

In addition, certain construction and maintenance activities during operations may require sized aggregate. To allow for the operational flexibility to produce construction aggregate onsite, Midas Gold is including two portable crushing and screening plants in this application. Each portable plant may include primary and secondary crushers and screens, and multiple conveyors. Each portable plant will be rated at less than 150 ton/hr and therefore exempt from requirements of this subpart per §60.670(c)(2). Therefore, Source IDs PCSP1 and PCSP2, Portable Crushing and Screening Plants 1 and 2, are not subject to NSPS, Subpart OOO.

4.2.3 NSPS, Subpart IIII – Standards of Performance for Stationary Compression Ignition Internal Combustion Engines

Midas Gold proposes to own and operate at the Stibnite Gold Project, three emergency stationary compression ignition (CI) internal combustion engines (ICE) that will be subject to NSPS, Subpart IIII per §60.4200(a)(2)(i) as they will commence construction after July 11, 2005, will be manufactured after April 1, 2006, and are not fire pumps. In addition, Midas Gold proposes to own and operate at the Stibnite Gold Project, one stationary fire pump CI ICE, that will be subject to this subpart per §60.4200(a)(2)(ii) as it will commence construction after July 11, 2005, and will be manufactured as a certified NFPA fire pump engine after July 1, 2006. Table 18 list all the sources subject to NSPS, Subpart IIII.

Table 18. NSPS, Subpart IIII Sources

Source ID	Description	Power Rating kW	Displacement
EDG1	Camp Emergency Generator (Mfr. Yr. >2007; diesel)	1,000	<10 l/cylinder
EDG2	Plant Emergency Generator #1 (Mfr. Yr. >2007; diesel)	1,000	<10 l/cylinder
EDG3	Plant Emergency Generator #2 (Mfr. Yr. >2007; diesel)	1,000	<10 l/cylinder
EDFP	Mill Fire Pump (Mfr. Yr. >2009; diesel)	200	<10 l/cylinder

PRI00000392

REC 1732

4.2.4 NESHAP, Subpart ZZZZ – National Emissions Standards for Hazardous Air Pollutants for Stationary Reciprocating Internal Combustion Engines

NESHAP, Subpart ZZZZ, applies to all stationary reciprocating internal combustion engines (RICE) operated at a major or area source of HAP emissions. For new (constructed after June 12, 2006, per §63.6590(a)(2)(iii)) stationary CI RICE operated at an area source of HAP emissions, the compliance requirements of NESHAP, Subpart ZZZZ, are met by complying with the requirements of NSPS, Subpart IIII per §63.6590(c)(1). No further requirements apply under NESHAP.

The Midas Gold proposes to own and operate at the Stibnite Gold Project, three emergency stationary and one stationary fire pump CI ICE that will be subject to NSPS, Subpart IIII. These stationary CI RICEs will be classified as new sources under NESHAP, Subpart ZZZZ, and therefore will meet the requirements of Subpart ZZZZ by meeting the requirements of NSPS, Subpart IIII.

4.2.5 NESHAP, Subpart CCCCCC – National Emission Standards for Hazardous Air Pollutants for Source Category: Gasoline Dispensing Facilities

Midas Gold is proposing to operate two Gasoline Dispensing Facilities (GDF) at the Stibnite Gold Project, and as an area source, will be subject to NESHAP, Subpart CCCCCC (NESHAP, Subpart 6C) per §63.11111(a). Each GDF will be an affected source subject to this subpart. It is proposed that the Stibnite Gold Project will have two GDFs, each with a monthly throughput of greater than 10,000 gallons but less than 100,000 gallons and must comply with the requirements in §63.11117 per §63.11111(c). Table 19 list all the sources subject to NESHAP, Subpart 6C.

Table 19. NESHAP, Subpart 6C Sources

Source ID	Description	Capacity gal	Throughput gal/month
TG1	Mine Site Gasoline Tank #1	5,000	20,833
TG2	Mine Site Gasoline Tank #2	5,000	20,833

4.2.6 NESHAP, Subpart EEEEEEE – National Emission Standards for Hazardous Air Pollutants: Gold Mine Ore Processing and Production Area Source Category

Midas Gold is proposing to operate a gold mine ore processing and production facility at the Stibnite Gold Project, and as an area source, will therefore be subject to NESHAP, Subpart EEEEEEE (NESHAP, Subpart 7E) per §63.11640(a). The affected sources are each collection of

PRI00000393

REC 1733

"ore pretreatment processes" at a gold mine ore processing and production facility, and each collection of "carbon processes with mercury retorts" at a gold mine ore processing and production facility, per §63.11640(b). The affected sources will be new as they will commence construction after April 28, 2010, per §63.11640(b)(2). Midas Gold will be required to obtain a permit under 40 CFR part 70 (i.e., Title V permit) for the affected sources subject to this subpart, per §63.11640(d). Table 20 lists all the sources subject to NESHAP, Subpart 7E.

Table 20. NESHAP, Subpart 7E Sources

Source ID	Description	Affected Source
CKD	Carbon Regeneration Kiln (Drum)	Carbon Processes with Mercury Retorts
EW	Electrowinning Cells & Pregnant Solution Tank	Carbon Processes with Mercury Retorts
MR	Mercury Retort	Carbon Processes with Mercury Retorts
MF	Induction Melting Furnace	Carbon Processes with Mercury Retorts
AC	Autoclave	Ore Pretreatment Processes

4.3 Inapplicable Federal Regulations

The sections that follow provide an explanation for a few federal regulations that could appear to be applicable to the Midas Gold – Stibnite Gold Project but have been determined to not apply.

4.3.1 NSPS, Subpart Dc – Standards of Performance for Small Industrial-Commercial-Institutional Steam Generating Units

In accordance with §60.40c(a), the affected facility to which NSPS, Subpart Dc applies is each steam generating unit for which construction, modification, or reconstruction is commenced after June 9, 1989 and that has a maximum design heat input capacity of 100 million British thermal units per hour (MMBtu/hr) or less, but greater than or equal to 10 MMBtu/hr.

Based on the definitions in §60.41c, a steam generating unit means a device that combusts any fuel and produces steam or heats water or heats any heat transfer medium. ***This term does not include process heaters as defined in this subpart.*** A process heater means a device that is primarily used to heat a material to initiate or promote a chemical reaction in which the material participates as a reactant or catalyst.

Midas Gold is proposing to install a 17 MMBtu/hr Pressure Oxidation (POX) Boiler, however this boiler meets the definition of a process heater because the steam produced by the boiler acts as a catalyst to promote the oxidation of the refractory ore by increasing the temperature and pressure in the autoclave. The purpose of the boiler is to heat the ore to cause oxidation of the sulfide minerals.

PRI00000394

REC 1734

Midas Gold is also proposing to install a 22.0 MMBtu/hr Parallel Flow Regenerative (PFR) shaft lime kiln, that will combust propane to provide heat for the calcination of limestone to produce lime. Because the kiln does not produce steam or heat any heat transfer medium, it does not meet the definition of steam generating unit.

Therefore, NSPS, Subpart Dc does not apply to the POX Boiler, PFR Shaft Lime Kiln, nor any other units proposed to be installed at the Midas Gold – Stibnite Gold Project.

4.3.2 NSPS, Subpart HH - Standards of Performance for Lime Manufacturing Plants

In accordance with §60.340(a), NSPS, Subpart HH does not apply to the proposed PFR Shaft Lime Kiln, as this kiln is not a rotary lime kiln as defined in §60.341(d).

4.3.3 NSPS, Subpart OOO - Standards of Performance for Nonmetallic Mineral Processing Plants

NSPS, Subpart OOO is applicable to nonmetallic mineral processing plants that process limestone, but not to equipment that handles or processes lime. The following excerpts from the EPA Applicability Determination Index (ADI) clarify this interpretation:

- ADI Control Number NR14:
    - Abstract:

      Does Subpart OOO apply to a process which pneumatically conveys crushed lime into lime storage silos and exhausting the displaced air through a small baghouse?

      There is no equipment used to crush or grind any non-metallic mineral at this plant. Therefore, the plant is not classified as a non-metallic mineral processing plant, and Subpart OOO does not apply to this lime storage silo facility.
- ADI Control Number 0400016:
    - Abstract:

      Q: Is the processing of lime product at the Greer Lime Company in Riverton, West Virginia subject to 40 CFR part 60, subpart OOO?

      A: No, equipment used to process lime product is not subject to New Source Performance Standards (NSPS) subpart OOO.

PRI00000395

REC 1735

Q: Is a limestone dryer at the Greer Lime Company in Riverton, West Virginia subject to 40 CFR part 60, subpart UUU?

A: No, limestone is not a listed mineral in the definition of a "mineral processing plant," as defined in section 60.730, and therefore is not subject to NSPS subpart UUU.

Table 21 list the lime handling and processing sources that are not subject to NSPS, Subpart OOO.

Table 21. Sources Not Subject to NSPS, Subpart OOO

Source ID	Description
MillS2L	Mill Lime Silo #2 Loading
MillS2U	Mill Lime Silo #2 Unloading to SAG Mill Conveyor

ACS42U	AC Lime Silo #4 Unloading to Lime Slaker
LCR	Lime Mill Crushing and associated transfers In and Out
LSL	Pebble Lime Silo Loading via Bucket Elevator
LSU	Pebble Lime Silo discharge to Lime Slaker

4.3.4 NESHAP, Subpart AAAAA (5A) – National Emission Standards for Hazardous Air Pollutants for Lime Manufacturing Plants

In accordance with §63.7081(a), NESHAP, Subpart AAAAA does not apply to the Stibnite Gold Project as Midas Gold is not proposing to operate a lime manufacturing plant (LMP) that is a major source, or that is located at, or is part of, a major source of hazardous air pollutant (HAP) emissions.

4.3.5 40 CFR Part 70 – Title V Permitting Program

As discussed in Section 4.2.6, the sources subject to NESHAP, Subpart EEEEEEE are required to obtain a Title V permit. However, this requirement is limited to these affected sources because

PRI00000396

REC 1736

the Stibnite Gold Project is a nonmajor source. Per 40 CFR 70.3(c)(2): "For any nonmajor source subject to the part 70 program under paragraph (a) or (b) of this section, the permitting authority shall include in the permit all applicable requirements applicable to emissions units that cause the source to be subject to the part 70 program." Therefore, all other emissions units that do not cause the source to be subject to the part 70 program do not require a Title V permit.

REC 1737

5.0 AMBIENT IMPACT ASSESSMENT

The "Stibnite Gold Project Air Quality Modeling Protocol" was submitted to IDEQ on May 24, 2019. IDEQ provided comments on June 27, 2019, and stated that "*DEQ modeling staff considers the submitted dispersion modeling protocol, with consideration and resolution of the additional items noted above, to be approved*." In accordance with the "State of Idaho Guideline for Performing Air Quality Impact Analyses," Air Sciences has prepared an air quality analysis report, showing the project's compliance with the applicable ambient standards. The "Stibnite Gold Project Air Quality Modeling Report" can be found in Attachment A of this application.

REC 1748

1.0 SUMMARY

Midas Gold Idaho, Inc., proposes to construct and operate the Stibnite Gold Project in Valley County, Idaho, located approximately 100 miles northeast of Boise. The Stibnite Gold Project is in an area that is classified as in attainment with all criteria pollutants and is designated as a Class II area.

The Stibnite Gold Project will consist of conventional open-pit mining operations and onsite ore preparation and gold extraction processes. The potential air emissions from the Stibnite Gold Project are less than the applicable major source thresholds for both criteria and hazardous air pollutants, and therefore, it is expected to be designated as a minor source for Title V and New Source Review requirements, and an area source for National Emission Standards for Hazardous Air Pollutants applicability.

This air quality analyses report provides a detailed description of methods, techniques, and datasets used by Midas Gold Idaho, Inc. for conducting air quality modeling analyses to fulfill the applicable requirements of Idaho Administrative Procedures Act 58.01.01 – Rules of Control of Air Pollution in Idaho, and to obtain a minor source permit to construct for the Stibnite Gold Project.

The results of modeling analyses provided in this report are summarized in Table 1. All concentrations and standards are listed in units of micrograms per cubic meter ($\mu g/m^3$).

PRI00000409

REC 1749

Table 1. Modeling Analyses Results Summary

Pollutant	Averaging Time	Max. Conc. ($\mu g/m^3$)	Back. Conc. ($\mu g/m^3$)	Total Conc. ($\mu g/m^3$)	NAAQS/ AAC/ AACC ($\mu g/m^3$)	In Compliance
CO	8 hours	6,218	1,110	7,328	10,000	Yes
	1 hour	17,054	1,740	18,794	40,000	Yes
NO_2	1 year	2.3	0.9	3.2	100	Yes
	1 hour	116.7	4.3	121.0	188	Yes
$PM_{2.5}$	1 year	4.2	3.5	7.7	12	Yes

Arsenic	Annual	0.00008	--	0.00008	0.00023	Yes
Cadmium	Annual	0.00001	--	0.00001	0.00056	Yes
Formaldehyde	Annual	0.00076	--	0.00076	0.077	Yes
Nickel	Annual	0.00006	--	0.00006	0.0042	Yes
Sulfuric Acid	24 hours	0.52563	--	0.52563	50	Yes

Max. Conc. = maximum modeled concentration; Back. Conc. = background concentration; Total Conc. = total (modeled + background) concentration; NAAQS = National Ambient Air Quality Standards; AAC = Acceptable Ambient Concentrations; AACC = Acceptable Ambient Concentrations for Carcinogens; CO = carbon monoxide; NO_2 = nitrogen dioxide; $PM_{2.5}$ = particulate matter less than 2.5 microns; PM_{10} = particulate matter less than 10 microns; SO_2 = sulfur dioxide

Table 1 shows that the estimated ambient air impacts from the Stibnite Gold Project emissions are expected to show compliance with the applicable standards for both criteria and toxic air pollutants.

The organization of this report follows the Idaho Department of Environmental Quality's "Air Impact Modeling Analyses Report Template Form," version 1, July 2015, and addresses the applicable modeling requirements of the Idaho Department of Environmental Quality's modeling guidelines, version September 2013 (IDEQ 2013b).

The checklist statements indicated in the Idaho Department of Environmental Quality report template are included at the end of relevant sections in an *italicized* font.

PRI00000410

REC 1750

2.0 PROJECT DESCRIPTION AND BACKGROUND AS IT RELATES TO MODELING ANALYSES

Midas Gold Idaho, Inc. (Midas Gold) proposes to construct and operate the Stibnite Gold Project (SGP) in Valley County, Idaho. The SGP will consist of conventional open-pit mining operations and onsite ore preparation and gold extraction processes, along with offsite infrastructure that includes a power transmission line and a site access road. A detailed description of the SGP is provided in Midas Gold's Plan of Restoration and Operations (PRO) (Midas Gold 2016), submitted to the relevant reviewing agencies in September 2016. Relevant information from the SGP PRO is provided in this report.

2.1 General Facility/Project Description

The SGP will require the construction of significant infrastructure, including a power transmission line, a primary mine site access road, onsite haul roads, an ore processing facility, onsite workspaces, employee housing and recreation, water storage and distribution facilities, and sewage disposal facilities.

The SGP will include three years of pre-mining development and construction activities, followed by an operating mine life of approximately 12 years. Mining will occur in three open pits: Yellow Pine pit (YPP), Hangar Flats pit (HFP), and West End pit (WEP). The general sequence of mining will be the YPP deposit, followed by the HFP and WEP deposits. Legacy tailings from the Meadow Creek valley (Bradley Tailings [BT]) also will be reclaimed and reprocessed during the initial project schedule. Surface exploration drilling will continue within the pits and the Scout Prospect decline (underground exploration) throughout the mine operation period. Restoration and reclamation of other legacy mining features will occur prior to mining, throughout the life of the mine, and as part of the mine closure.

Conventional open-pit methods including drilling, blasting, excavating, and hauling will be used to extract ore and waste rock, termed development rock (DR). Hydraulic shovels and front-end loaders will be used to load ore and DR into haul trucks. DR will be used for construction, restoration, and backfilling, or hauled to the dedicated development rock storage facilities (DRSF). Approximately 340 million tons of DR will be handled over the life of the mine. Ore will be hauled to the primary crusher area, where it will be fed directly into the crusher dump pocket or stockpiled. The ore crushing plant will be designed to operate at a maximum rate of 25,000 tons per day (ton/day). Approximately 100 million tons of ore will be mined from the three pits over the life of the project.

The metal-recovery process from ore will include conventional crushing and grinding, followed by froth-flotation circuits that will generate separate gold-silver and antimony-silver concentrates. The antimony-silver concentrate will be shipped offsite for refining, whereas

PRI00000411

REC 1751

additional onsite processing of the gold-silver concentrate will include pressure oxidation, carbon-in-leach circuits, and refining processes to recover gold and minor amounts of silver. The finely ground leftover ore material from the mineral-recovery process, termed tailings, will be neutralized, thickened, and transported via a pipeline to the tailings storage facility (TSF). A simplified ore processing and refining flow diagram is presented in Figure 1. This figure also shows the throughput monitoring locations. In some cases, throughput is monitored at process bottlenecks for monitoring a group of sources.

Lime used in the ore processing will either be purchased or manufactured onsite from limestone available at the site. A simplified lime production flow diagram is presented in Figure 2. This figure also shows the throughput monitoring locations. In addition, certain construction and maintenance activities during operations may require sized aggregate. To allow for the operational flexibility to produce construction aggregate onsite, this application includes two portable crushing and screening plants.

The following air pollutants are expected from operations at the SGP facility:

- Criteria air pollutants: carbon monoxide (CO), oxides of nitrogen (NO_X), particulate matter less than 2.5 microns (μm) and 10 μm ($PM_{2.5}$ and PM_{10}), sulfur dioxide (SO_2), lead (Pb), and ozone (O_3) precursor volatile organic compounds (VOC)
- Hazardous air pollutants (HAP), including mercury (Hg)
- Other non-HAP toxic air pollutants (TAP)
- Greenhouse gases

A summary of SGP facility-wide process and ancillary source maximum potential emissions in tons per year (ton/yr) is provided in Table 2. Emission details are provided in Section 4.0.

Table 2. Process and Ancillary Source Potential Emissions Summary (ton/yr)

CO	NO_X	$PM_{2.5}$	PM_{10}	SO_2	VOC	HAP[1]
30.5	37.9	36.4	56.3	6.5	4.8	1.79

[1] Maximum facility-wide potential emissions for all HAP combined, maximum single HAP emissions are 0.97 ton/yr for cyanide compounds.

The potential emissions from the SGP are less than the applicable major source thresholds for both criteria (100 ton/yr per pollutant) and hazardous air pollutants (HAP) (25 ton/yr aggregate and 10 ton/yr per single HAP); therefore, it is expected to be designated a minor source for Title V and New Source Review (NSR) (applicable threshold is 250 ton/yr per criteria pollutant) requirements and an area source for National Emission Standards for Hazardous Air Pollutants (NESHAP) applicability.

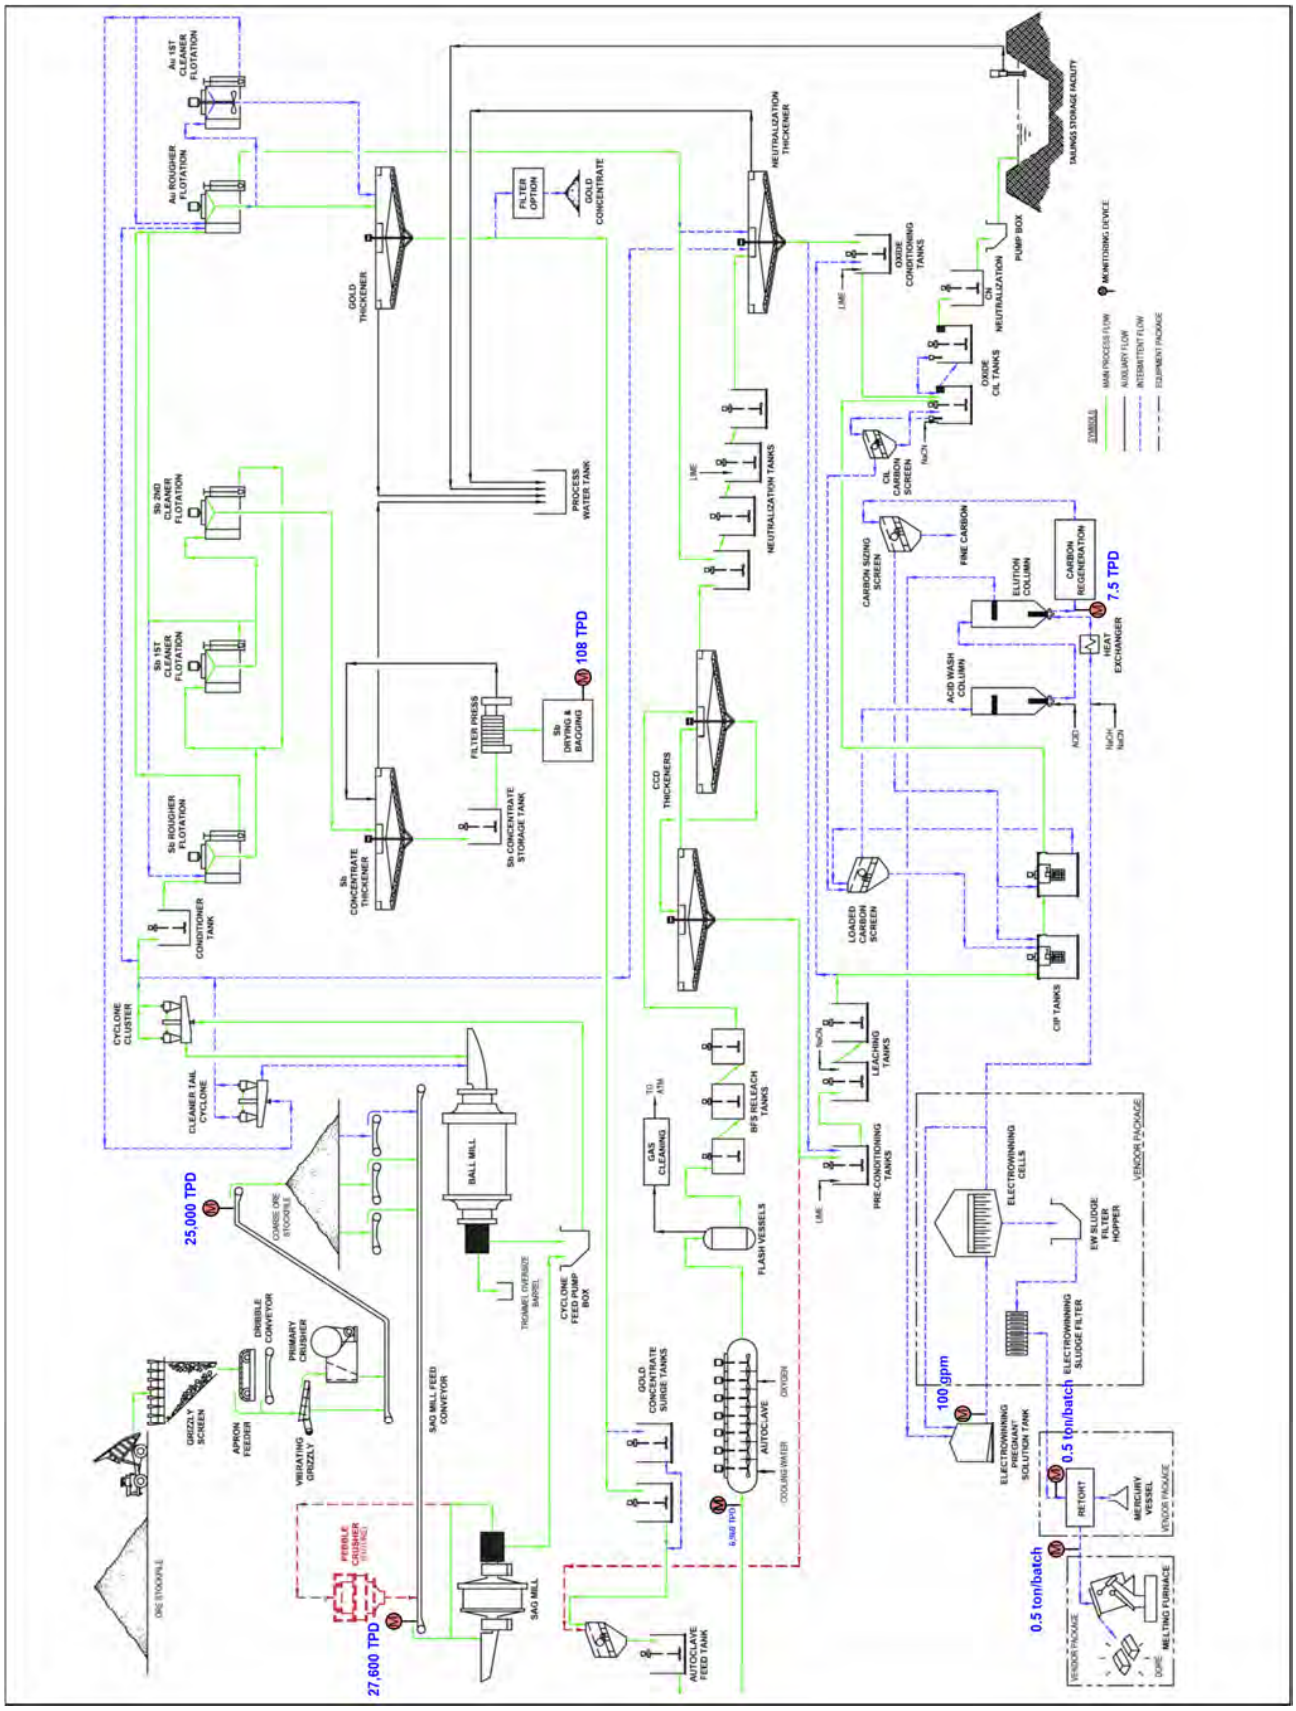

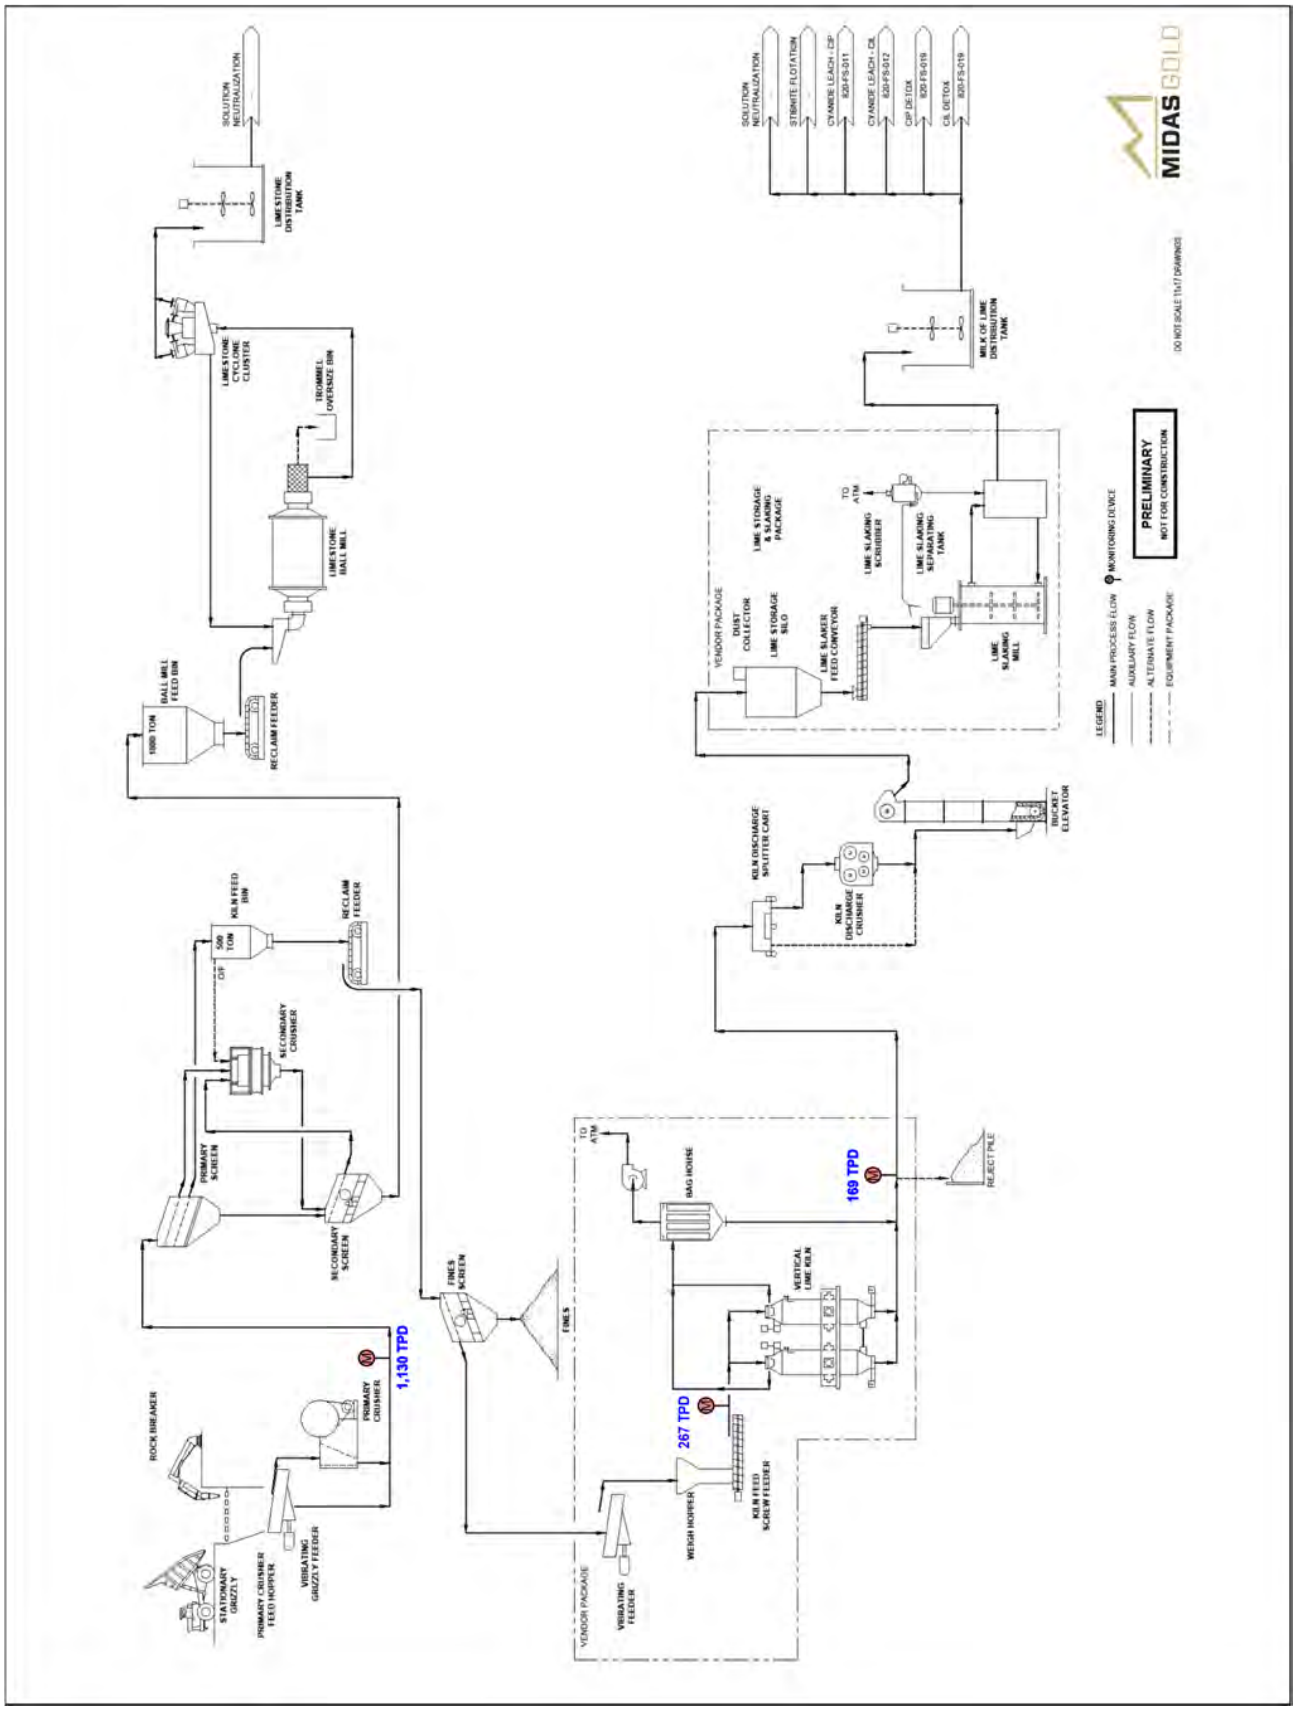

Figure 2. Lime Production Flow Diagram

2.2 Location of Project

The SGP is located in Valley County in central Idaho, approximately 100 miles northeast of Boise, 38 miles east of McCall, and approximately 10 miles east of Yellow Pine. A facility location map for the SGP is presented in Figure 3. This figure also shows the proposed Burntlog Route (access road) that will provide a year-round safe access to the site. The project area comprises a combination of public national forest and private lands. The SGP PRO comprises a comprehensive restoration, operation, and reclamation plan by which an existing heavily disturbed brownfield site will be redeveloped, old tailings will be reprocessed, and the habitat will be enhanced to help rehabilitate an important salmon fishery. Simultaneously, the local economy of Valley County in particular, and of Idaho as a whole, will improve. Over the years, Midas Gold has conducted extensive technical studies to determine the environmental, social, and economic feasibility of redeveloping the SGP. The results of these studies are detailed in the SGP PRO.

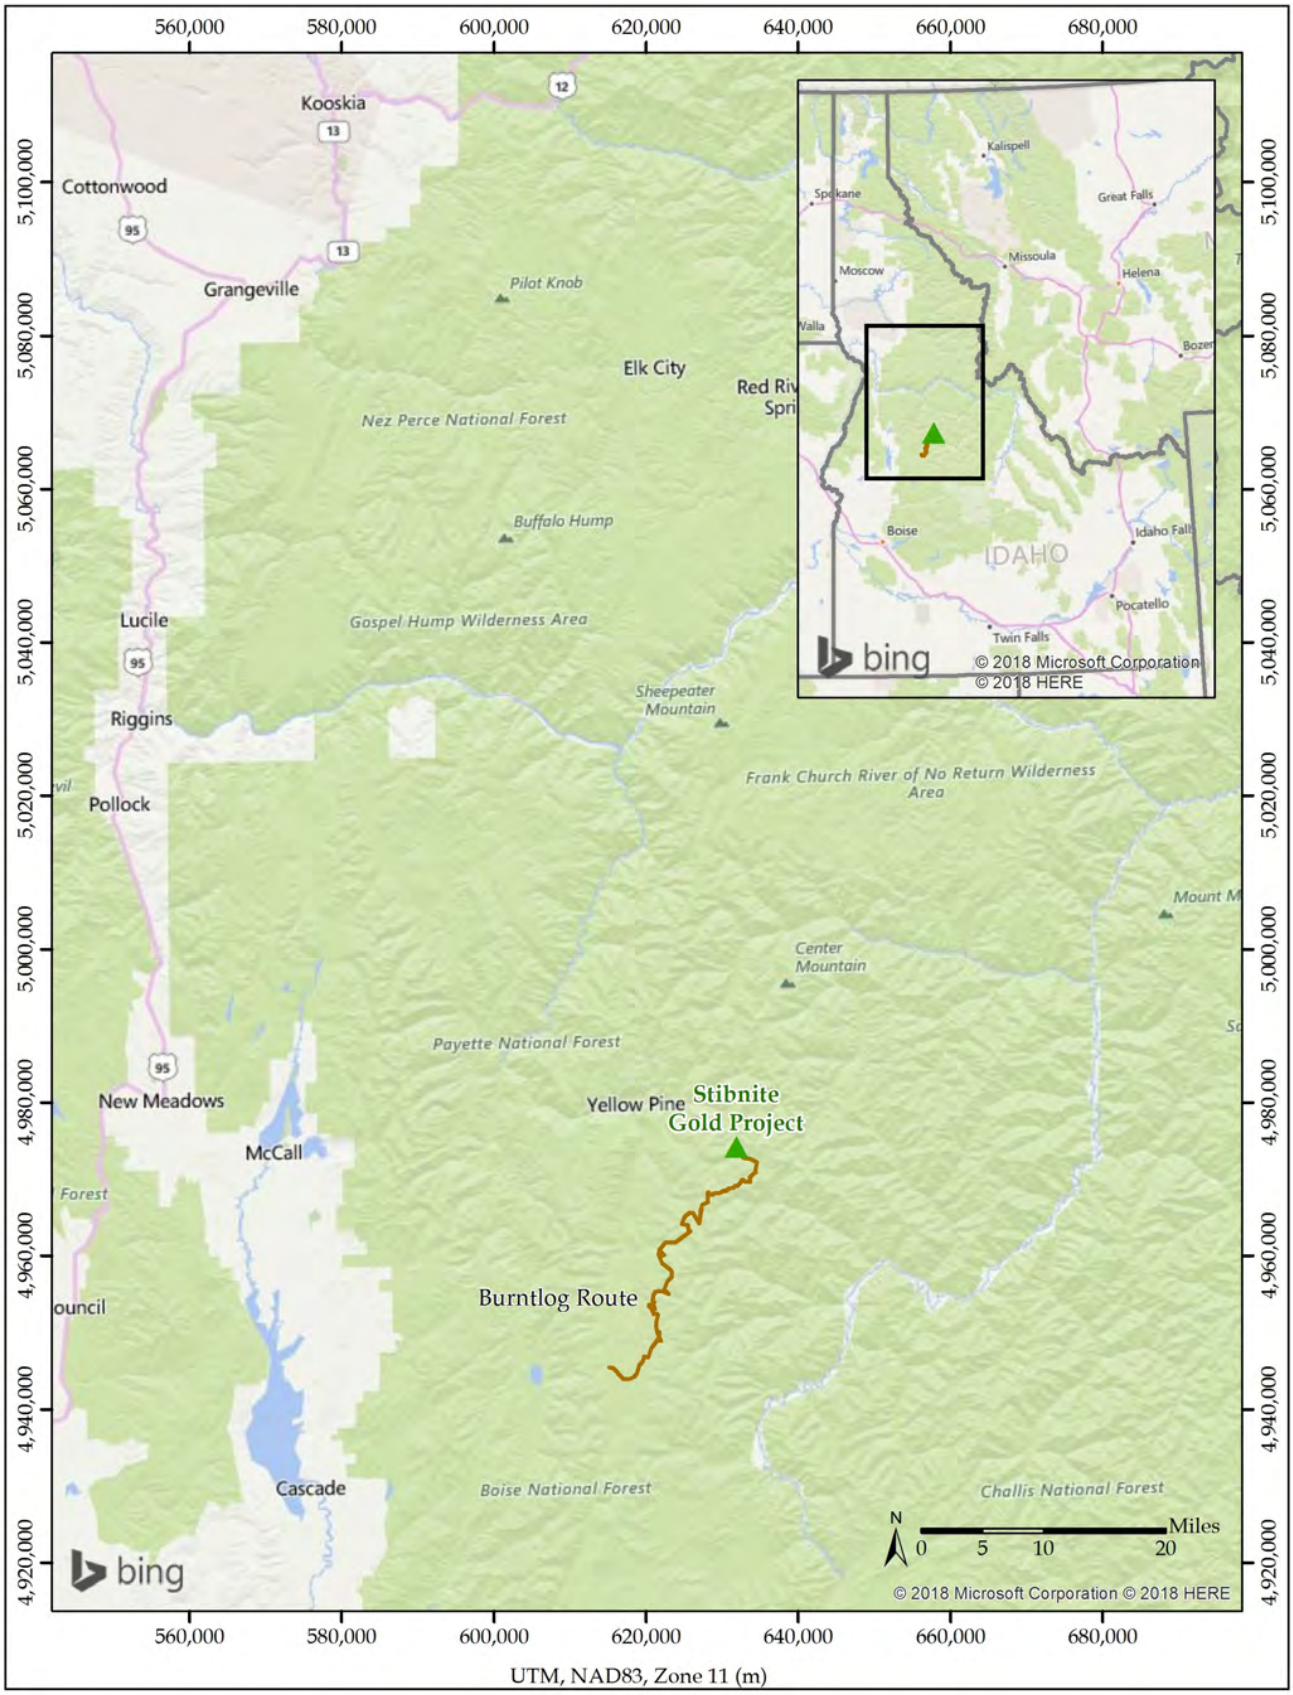
The SGP site layout is presented in Figure 4.

☒ *A map showing the geographical location of the facility is provided in this section or a reference is provided to another location in the application where a map is provided.*

PRI00000415

REC 1755

Figure 3. SGP Facility Location Map



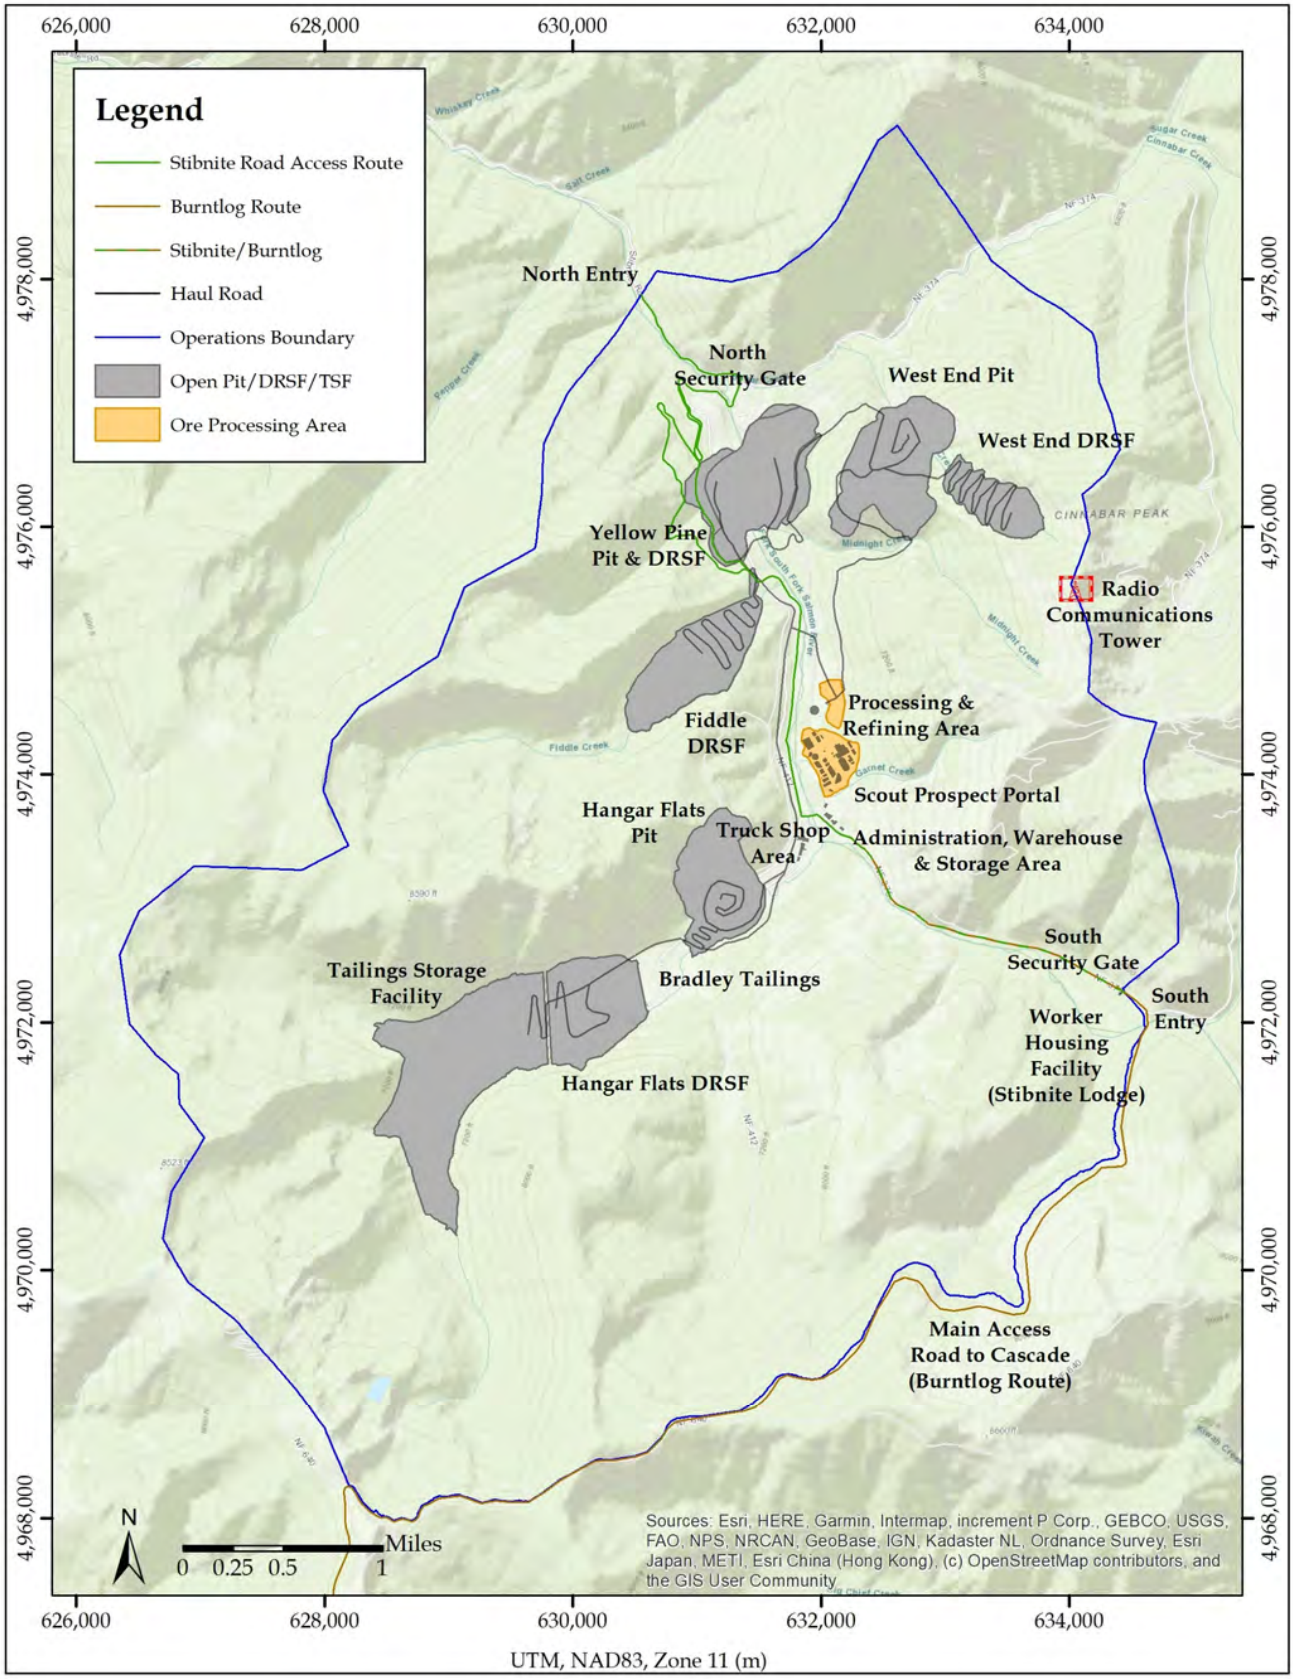


Figure 4. SGP Site Layout and Stibnite Road Access Route

PRI00000417

REC 1757

2.3 Site Characteristics

Midas Gold has prepared an Air Quality Baseline Study Report (Midas Gold 2017a) (SGP baseline study) that provides comprehensive details of the project area's existing site characteristics, including climate and air quality. The following site characterization of the project area is adopted from the SGP baseline study and the SGP PRO.

The SGP is located in the Stibnite-Yellow Pine Mining District in central Idaho, approximately 10 air miles east of the village of Yellow Pine. Located in Valley County, the district is characterized by historic mining activities and unpatented (federal land) and patented (private land) mining claims that include deposits of gold, silver, tungsten, and antimony. The Stibnite-Yellow Pine Mining District lies in both Boise National Forest (BNF) and Payette National Forest (PNF), but is administered by the PNF's Krassel Ranger District (Midas Gold 2017a). The project area terrain is characterized by narrow valleys 6,000 to 6,600 feet above mean sea level (amsl), surrounded by steep mountains ranging over 8,500 feet amsl. The main drainage basin in the project area is the East Fork of the South Fork of the Salmon River (EFSFSR).

The EFSFSR joins Johnson Creek 16 miles downstream, near the village of Yellow Pine. The project area is encompassed by the watersheds of EFSFSR tributaries, including Sugar Creek, Meadow Creek, Johnson Creek, Riordan Creek, Burntlog Creek, Midnight Creek, and Trout Creek. Primary commercial activity in the area comprises mineral exploration, mining, logging, and dispersed recreation.

Currently, the project site can be accessed from State Highway 55 via the Warm Lake, Johnson Creek, and Stibnite Roads. The proposed Burntlog Route, which will include an extension and upgrade of the existing Burntlog Road and portions of Thunder Mountain Road, will provide safe, year-round access to the project site. The Burntlog Route is shown in Figure 3.

At the request of local community citizens, Midas Gold is evaluating an alternative to provide restricted seasonal access through the SGP site between Stibnite Road at Sugar Creek and Thunder Mountain Road at Meadow Creek. This alternative would allow limited access to the Thunder Mountain recreational area from the town of Yellow Pine similar to the existing seasonal route.

The project area climate is characterized as semi-arid due to the proximity of the Cascade and Sierra Nevada Mountains to the west and the Bitterroot and Rocky Mountains to the north, which effectively block large-scale intrusion of Pacific Ocean moisture. Summer monsoonal moisture intrusions are infrequent and significantly modified by the arid Great Basin of Utah and Nevada. The Bitterroot and Rocky Mountains form the headwaters of the Snake and Salmon Rivers and receive copious amounts of winter snow. The Salmon River Range that surrounds the site lies at a slightly lower elevation than either of these other greater ranges, and as a result, it receives less overall snowfall.

PRI00000418

REC 1758

Data on the seasonal average temperatures in degrees (°) Fahrenheit (F), precipitation, and snow depth in inches (in) are provided in Table 3. These seasonal statistics were derived from data provided in the SGP baseline study (Midas Gold 2017a).

Table 3. Project Area Seasonal Temperature, Precipitation, and Snow Depth Data

Season	Months	Average Temperature (°F)	Average Precipitation (in)	Average Snow Depth (in)
Winter	December – February	10 – 33	6.0	21 – 68
Spring	March – May	17 – 59	6.1	66 – 84
Summer	June – August	38 – 80	2.5	0 – 21
Fall	September – November	19 – 68	4.5	0 – 3

2.4 Site Attainment Status and Ambient Air Quality Standards

The United States Environmental Protection Agency (EPA) classifies geographical regions as attainment, maintenance, or nonattainment based on prevailing air quality in the region. The SGP area is in compliance with National Ambient Air Quality Standards (NAAQS) for applicable pollutants; therefore, it is classified as in attainment with all criteria pollutants and designated as a Class II area (EPA 2018c) (IDEQ n.d.).

2.5 Coordinate System

The Universal Transverse Mercator (UTM) North American Datum of 1983 (NAD83), Zone 11 coordinate system was used in this modeling analysis to define all locations in the modeling domain (sources, buildings, and receptors).

General SGP facility NAD83, UTM Zone 11 coordinates are 632,038 meters east and 4,973,751 meters north (administration building).

2.6 Existing Permits and Modeling Analyses Performed

The SGP is a proposed new facility and does not have any existing air quality permits or modeling analyses.

☐ *Any existing air quality permits are listed and described in this section, and any associated air quality modeling analyses have been described and referenced, and submitted if appropriate.*

PRI00000419

REC 1759

3.0 MODELING ANALYSES APPLICABILITY AND PROTOCOL

A comparison of the criteria pollutant Level I modeling thresholds from Table 2 of the Idaho Department of Environmental Quality (IDEQ) modeling guidelines (IDEQ 2013b), with applicable facility-wide maximum potential to emit estimates, is provided in Table 4.

Table 4. Criteria Pollutant Modeling Applicability Determination

Source Category	CO	NO_X		$PM_{2.5}$		PM_{10}	SO_2		Pb
	lb/hr	ton/yr	lb/hr	ton/yr	lb/hr	lb/hr	ton/yr	lb/hr	lb/month
Process and ancillary	33.5	37.9	55.4	36.4	13.4	21.7	6.5	1.88	0.0437
Mining fugitive	1,742.0	17.1	46.8	98.9	22.5	224.7	0.03	0.09	--
Total	1,775.5	55.0	102.2	135.3	35.9	246.4	6.5	1.97	0.0437
Level I threshold	15.0	1.2	0.2	0.35	0.054	0.22	1.2	0.21	14.0
Modeling required	Yes	Yes	Yes	Yes	Yes	Yes	Yes	Yes	No

Table 4 shows that the SGP facility-wide maximum potential to emit are greater than the respective Level I thresholds for all criteria pollutants and averaging periods except for Pb. Therefore, modeling is triggered for applicable averaging periods for CO, NO_X, $PM_{2.5}$, PM_{10}, and SO_2; and modeling is not required for Pb.

A comparison of the applicable non-carcinogenic and carcinogenic screening emission levels (EL) for the TAP from Idaho Administrative Procedures Act (IDAPA) 58.01.01, Sections 585 and 586, respectively, with applicable facility-wide maximum potential TAP emissions is provided in Table 5.

Table 5. TAP Modeling Applicability Determination

CAS No.	TAP	Emissions (lb/hr)				EL (lb/hr)		Determination

(1) TAP emissions from propane combustion.

(2) TAP emissions from diesel combustion. Diesel engine HAP emissions are regulated by Code of Federal Regulations, Title 40, Part 63 (40 CFR 63), Subpart ZZZZ and therefore exempt from TAP analysis per IDAPA 58.01.01 Section 210.20.

(3) TAP emissions from material processing.

(4) Non-carcinogenic EL from IDAPA 58.01.01 Section 585.

(5) Carcinogenic EL from IDAPA 58.01.01 Section 586.

Table 5 shows that the SGP facility-wide potential TAP emissions exceed the respective EL for antimony, arsenic, cadmium, formaldehyde, nickel, and sulfuric acid.

PRI00000421

REC 1761

3.1 Applicable Standards

Based on the criteria pollutant modeling applicability determination provided in Table 4, the SGP facility-wide maximum potential emissions were evaluated to demonstrate compliance with applicable NAAQS provided in Table 6. NAAQS are provided in applicable units of parts per billion (ppb) and/or micrograms per cubic meter (µg/m^3). Table 6 also shows design value for each NAAQS. Applicable modeled values (form or rank) were used for compliance determination for each pollutant-averaging time combination.

Table 6. Applicable NAAQS for SGP Air Quality Analyses

Pollutant	Averaging Time	NAAQS		NAAQS Form/Design Value Rank
		(ppb)	(µg/m^3)	
CO	8 hours	9,000	10,000	Not to be exceeded more than once per year
	1 hour	35,000	40,000	
NO_2	1 year	53	100	Annual mean
	1 hour	100	188	98th percentile of 1-hour daily maximum concentrations, averaged over 3 years
$PM_{2.5}$	1 year	--	12	Annual mean, averaged over 3 years
	24 hours	--	35	98th percentile, averaged over 3 years
PM_{10}	24 hours	--	150	Not to be exceeded more than once per year on average over 3 years
SO_2	3 hours	500	1,300	Not to be exceeded more than once per year
	1 hour	75	196	99th percentile of 1-hour daily maximum concentrations, averaged over 3 years

Based on the TAP modeling applicability determination provided in Table 5, TAP analyses were performed to show compliance with the applicable Acceptable Ambient Concentrations (AAC, in milligrams per cubic meter (mg/m^3), 24-hour averaging time) for non-carcinogenic TAP and Acceptable Ambient Concentrations for Carcinogens (AACC, in µg/m^3, annual averaging time) for carcinogenic TAP provided in Table 7.

Table 7. Applicable AACC for SGP TAP Analyses

CAS No.	TAP	Averaging Time	AAC[1] (mg/m^3)	AACC[2] (µg/m^3)
7440-36-0	Antimony	24 hours	2.5E-2	--
7440-38-2	Arsenic	Annual	--	2.3E-4
7440-43-9	Cadmium	Annual	--	5.6E-4
50-00-0	Formaldehyde	Annual	--	7.7E-2
7440-02-0	Nickel	Annual	--	4.2E-3
7664-93-9	Sulfuric Acid	24 hours	5.0E-2	--

[1] IDAPA 58.01.01 Section 585.

[2] IDAPA 58.01.01 Section 586.

Modeled 24-hour and annual average concentrations were used to demonstrate compliance with applicable AAC and AACC respectively.

☒ *All TAPs identified in the emissions inventory for the project are listed in the TAPs EL and AAC/AACC Table in this section.*

3.2 Criteria Pollutant Modeling Applicability

A comparison of criteria pollutant level I modeling thresholds from Table 2 of the Idaho Department of Environmental Quality (IDEQ) modeling guidelines (IDEQ 2013b) with applicable facility-wide maximum potential to emit estimates is provided in Table 4.

Table 4 shows that the SGP facility-wide maximum potential emissions are greater than the respective level I thresholds for all criteria pollutants and averaging times, except that for Pb. Therefore, modeling is triggered for applicable averaging times for CO, NO_X, $PM_{2.5}$, PM_{10}, and SO_2, whereas modeling is not required for Pb.

☒ *Explanations/documentation why modeling was or was not performed for each criteria pollutant are provided in this section.*

☒ *Emissions calculations that clearly show how the modeling applicability determination was performed are provided in this section.*

3.3 TAP Modeling Applicability

Based on the TAP modeling applicability determination provided in Table 5, the SGP facility-wide potential TAP emissions exceed the respective carcinogenic EL for antimony, arsenic, cadmium, formaldehyde, nickel, and sulfuric acid. The facility-wide potential emissions for the remaining TAP identified in Table 5 are below their respective EL and therefore do not require modeling.

☒ *Explanation/documentation on why modeling was or was not performed for emissions of each TAP identified in the emissions inventory of the application are provided in this section.*

3.4 Modeling Protocol

A modeling protocol for the SGP analyses was submitted to IDEQ prior to the application, on May 30, 2019. The protocol was submitted by Brown and Caldwell on behalf of Midas Gold. Conditional IDEQ protocol approval (IDEQ 2019) was provided to Brown and Caldwell on June 27, 2019. Project-specific modeling and other required impact analyses were generally conducted using the data and methods described in the protocol and in the Idaho Air Quality Modeling Guideline.

PRI00000423

REC 1763

☒ *If a protocol was submitted to DEQ prior to performing the modeling analyses, the protocol and DEQ's conditional protocol approval notice is included in Attachment 1 of this Modeling Report.*

☒ *Concerns identified by DEQ in the protocol approval notice have been addressed in the analyses performed and in this Modeling Report.*

PRI00000424

REC 1764

4.0 MODELED EMISSIONS SOURCES

Detailed SGP facility-wide potential emissions calculations (including uncontrolled emissions for process and ancillary sources) are provided in Appendix B. The air emissions inventory contains detailed emission calculations of the potential to emit for the SGP mining operations (including haul roads) and ore processing (including refining) activities. Emissions were estimated for the following:

- Criteria air pollutants: CO, NO_X, $PM_{2.5}$, PM_{10}, SO_2, Pb, and O_3 precursor VOC
- Applicable HAP from Section 112(b) of the Clean Air Act
- Applicable TAP listed in IDAPA 58.01.01 Sections 585 and 586
- Greenhouse gases: Carbon dioxide, methane, nitrous oxide, and carbon dioxide equivalent

The SGP emissions calculations were based on project-specific activity rates (e.g., production rates, materials hauled, blasting agent consumption), operation methods (e.g., open-pit mining, refining methods), design criteria (e.g., equipment type and size, hauling distances), emission abatement techniques (e.g., watering, baghouse, carbon filter), material characteristics (e.g., moisture content, silt content, density), and site characteristics (e.g., wind, precipitation) obtained from the following resources:

- SGP Prefeasibility Study (M3 2014)
- SGP Soil Resources Baseline Study (Midas Gold 2015)
- SGP PRO (Midas Gold 2016)
- SGP Mine Plan and Equipment Schedule (Midas Gold 2017b)
- SGP Baseline Study (Midas Gold 2017a)
- SGP Geographic Information System files (Midas Gold 2017d)
- Other technical information received from Midas Gold and M3 (Midas Gold 2017c) (Midas Gold 2017e) (Midas Gold 2017f) (Midas Gold 2018a) (Midas Gold 2018b) (Midas Gold 2018c) (Midas Gold 2018e) (Midas Gold 2018f) (Midas Gold 2018d) (Midas Gold 2018g) (Midas Gold 2019a) (Midas Gold 2019b) (Midas Gold 2019c) (Midas Gold 2019d) (M3 2017a) (M3 2017b) (M3 2017c) (M3 2017d) (M3 2019)

PRI00000425

REC 1765

Activity-specific (e.g., drilling, blasting, material crushing and conveying, refining, and other ancillary sources) emissions were estimated based on maximum activity rates, coupled with applicable emission estimation techniques. Maximum emissions were calculated on a short-term (hourly and daily) and long-term (annual) basis for ore processing and mining operations, as discussed below.

The ore-processing rate will range from 20,000 ton/day to 25,000 ton/day at full production. Therefore, maximum potential daily ore processing emissions were based on the maximum design rate of 25,000 ton/day. Maximum potential annual emissions were based on potential daily emissions multiplied by 365 days per year.

Emissions from mining operations (drilling, blasting, material extraction and movement, mobile mine machinery use, and other ancillary sources) vary for each year of the life of the mine (LOM). However, for the modeling analyses, the mining operation potential emissions were estimated using conservatively high maximum activity rates provided in Table 8.

Table 8. Mining Activity Rates for Potential Emission Calculations

Activity	Maximum Rate[1]		Comments
Drilling	600	drill holes per blast	
Blasting	2	blasts per day	
	1	blast per hour	
Material extraction and hauling	180,000	tons per day	Ore or DR
Onsite dozing	144	hours per day	6 dozers operating continuously
Onsite grading	72	hours per day	3 graders operating continuously
Onsite water trucking	48	hours per day	2 trucks operating continuously

[1] A conservatism analysis for the mining rates is provided in Appendix A.

The potential hourly emission rates for ore processing and mining operation activities were calculated by dividing the daily rate by the 24 hour per day operation schedule, and annual rates were calculated by multiplying maximum daily emissions with 365 days per year. This is conservative because the mine is expected to operate for only 355 days per year.

The maximum mine production rate is approximately 42.7 million (MM) tons per year (ton/yr); however, a maximum daily production rate of 180,000 ton/day used for potential emission calculations results in a conservatively higher production rate of approximately 65.7 MMton/yr, approximately 50 percent higher than the projected production rate.

Midas will employ newer model year mining and maintenance machines (excavators, shovels, haul trucks, dozers, graders, portable light plants, etc.) that are expected to meet or exceed applicable regulatory emission standards. Nonroad mobile equipment engines are exempt from

PRI00000426

REC 1766

permitting requirements; therefore, the tailpipe emissions resulting from fuel combustion in the nonroad mobile equipment are not quantified for the SGP facility.

The approximately 38-mile long Burntlog Route mine access road will be outside the project ambient air boundary and open to the public. Traffic emissions on public roads generally are considered to be part of background concentrations. Therefore, emissions on the Burntlog Route mine access road that are outside of the project boundary are not included in the SGP analyses. However, the emissions associated with the portion of the Burntlog Route mine access road that is within project boundary (from the south gate to the process area) are included in the SGP analyses. These include dust emissions generated from travel of maintenance equipment, light-duty pickup trucks and buses used for employee, visitor, and contractor transportation, and heavy-duty trucks used for cargo (including fuel, consumables, machine parts, ore processing supplies, ore concentrate, etc.) and services (including food supplies, trash, recyclables, etc.) transportation.

The emission estimation methods were based on activity-specific emission factors (EF) and techniques provided in governmental, scientific, and industry technical documents, including, but not limited to, the following:

- EPA AP-42: "Compilation of Air Pollutant Emission Factors" and associated background documents (EPA 1995)
- Published emission estimation reports (including reports from the EPA and other environmental experts) (Card, T. 2009) (Eckley 2010) (EPA 1994) (EPA 2009) (Schmidt 2010)
- EPA emission estimation models, such as TANKS (EPA 1999)
- Applicable regulatory emission requirements from Title 40 of the Code of Federal Regulations (CFR 2018a) (CFR 2018b) (CFR 2018c)

4.1 Emission Factors and Controls

The emission factors and controls used to calculate process and fugitive emissions are discussed in the following sections.

4.1.1 Emission Factors

The AP-42 EF used to calculate the process source emissions are provided in Table 9.

Table 9. Process Source EF from AP-42

Source/Activity	Pollutant	EF	Pollutant	Reference
Material transfer, controlled	$PM_{2.5}$	0.000013	$PM_{2.5}$	AP-42, Table 11.19.2-2 (08/04); conveyor transfer, controlled.

[1] A conservatism analysis for the unpaved road emission factor equation is provided in Appendix A. This analysis also addresses road silt content and mean vehicle weight.

The following emission calculation methods were used in addition to the EF provided in Tables 9 through 11:

- The stationary internal combustion engine (emergency generators and a fire pump) emissions were calculated based on applicable EF from new source performance standards, depending on engine specifications.

- Fuel storage tank (diesel and gasoline) emissions were calculated from the EPA TANKS program, version 4.0.9d (EPA 1999).

- Emissions from the use of xanthate and sodium cyanide reagents used in the ore processing facility have potential to produce carbon disulfide and cyanide compounds emissions, respectively. The calculation methods for these pollutants are as follows:

    - Emissions of carbon disulfide from the decomposition of xanthate used in the rougher flotation circuit were calculated based on measurements of carbon disulfide generation in a laboratory scale ore pulp flotation reactor detailed in a technical memorandum by Air Sciences Inc. (Air Sciences 2020).

    - Emissions of cyanide compounds from the use of sodium cyanide in the mill process tanks (cyanide detox tanks, carbon-in-pulp leach tanks, and carbon-in-leach tanks) and the carbon stripping and electrowinning processes were calculated based on cyanide measurements directed by EPA at several Nevada gold mines (Card, T. 2009) (EPA 2009) (Schmidt 2010) (APT 2009).

4.1.2 Emission Controls

The emission control techniques and associated control efficiencies used in the SGP emission inventory calculations are presented in Table 12.

Table 12. Control Techniques and Efficiencies in Emission Calculations

Source Category	Control	Efficiency
Unpaved roads	Chemical application	90%
	Watering (daily emissions only; annual emissions rely on the precipitation equation)	33%
Underground/ enclosed transfers	Enclosure	80%
Material handling	Water sprays/moisture carryover	Included in controlled EF
Silo loading	Bin vent	Included in controlled EF
Antimony bagging	Baghouse	Included in controlled EF
Autoclave	Wet scrubber	Included in controlled EF
Carbon kiln	Wet scrubber	Included in controlled EF

PRI00000431

REC 1771

Source Category	Control	Efficiency
Induction melting furnace	Baghouse	Included in controlled EF
Central mixer	Bin vent or enclosure	Included in controlled EF
Lime ball mill	Fabric filter	Included in controlled EF
Lime kiln	Fabric filter	Included in controlled EF
Lime crushing	Fabric filter	Included in controlled EF
Lime silo transfers	Fabric filter	Included in controlled EF

The control efficiency on unpaved roads from watering and chemical suppressant application is based on AP-42 Chapter 13.2.2, and details are provided in a separate memorandum (Air Sciences 2018). A conservatism analysis of the control efficiencies attributed to watering and chemical suppressant application is provided in Appendix A. This conservatism analysis addresses the potential use of magnesium chloride as the chemical suppressant.

The 90 percent control efficiency was applied to the graders because they will be traveling on unpaved roads that have been treated (prior to grading) for dust control by periodic application of water and chemical dust suppressant. This is the same control efficiency applied to all traffic traveling on these unpaved roads.

Continuous application of water and chemical dust suppressant in front of a grader is not consistent with standard industry practices. Grading is an important part of road surface preparation prior to chemical application. Grading immediately following the chemical application may remove or displace the freshly applied suppressant, rendering it ineffective. Also, the displaced chemical may end up in roadside drains and/or vegetation creating environmental concerns. Following are excerpts from the U. S. Department of Transportation unpaved road management guidance that provides additional details.

"*The process of preparing an unpaved road before applying a chemical treatment generally follows standard procedures and uses standard road construction and maintenance equipment.*"

"*Spraying chemical treatments onto unprepared roads is a waste of time and money. The dust control effect will be short lived, ride quality will not be improved, and the road will soon require some form of maintenance, which will reduce the life of the treatment. Conversely, spraying a chemical treatment onto a well-prepared road should slow the rate of deterioration, providing improved and safer driving conditions for extended periods before maintenance is required. Prior to any spray-on application, shape the road to ensure an adequate crown is present, and then blade to provide a quality driving surface*" (U. S. DOT 2013).

Treatment of unpaved roads with chemical dust suppressant creates a hard-packed surface on the road, which reduces dust from forming. The purpose of road maintenance with graders is to smooth this surface with minimal disturbance to the treated crustal surface. In addition, grading

PRI00000432

REC 1772

is typically performed when the road surface is moist, either from natural moisture (light rain, morning dew, etc.) or from watering. A moist surface is slightly softer and easier for the grader to smooth. Midas Gold's standard operating practice will be to visually assess the road surface moisture (wetness) prior to road maintenance grading. If surface moisture is insufficient for proper grading conditions, then a water truck will be called to wet the road surface.

In addition to road maintenance (smoothing), graders at the SGP will also be used for road cleanup, i.e., removing snow and/or large rocks. Road cleanup is conservatively assumed (in the emission inventory) to emit the same amount of dust as road maintenance grading, even though it is expected to create significantly less dust.

With respect to continuous application of water spray, this is also potentially wasteful and impractical to implement. Midas Gold will apply water for dust suppressant, as needed, to control dust with reasonable precautions, as prescribed in IDAPA 58.01.01.650.

Lastly, it is important to note that the emission inventory uses the AP-42 Section 11.9 emission factor equations for grading, and these equations "*conservatively overestimate*" the "*grading emission factors*" (MRI 1998).

The 80 percent control efficiency for the underground/enclosed material transfers was calculated from the wind speed-based material handling emission calculation empirical equation (Equation 1) provided in AP-42 Chapter 13.2.4. Using this equation, material handling EF were calculated for the average onsite SGP wind speed of 5.17 miles per hour (mph) and the lowest wind speed applicable to this equation at 1.3 mph. The control efficiency was calculated as:

$$Control\ Efficiency\ (\%) = 1 - \frac{AP-42\ 13.2.4\ Eq1\ EF_{1.3\ mph}}{AP-42\ 13.2.4\ Eq1\ EF_{5.17\ mph}}$$

For the remaining control techniques listed in Table 12, controlled EF were used instead of applying control efficiencies to uncontrolled EF.

The EF and control efficiencies described in this section were chosen based on the following criteria: representativeness to the activity being characterized, prior use in similar projects, robustness of the scientific techniques used in their derivation, and the entity (e.g., EPA) publishing the information. As described in this section, most of the EF and control efficiencies stem from published EPA data, models, regulations, and test methods. This information was supplemented with data from air permits for similar sources, scientific papers, and relevant technical information.

PRI00000433

REC 1773

4.2 Pollutant Emissions

For the SGP analyses, several modeling scenarios were considered to evaluate the worst-case air impacts from the SGP facility. The different modeling scenarios are discussed in Section 4.3. The annual potential emissions summary for each criteria pollutant and HAP (including TAP) for the highest emission modeling scenario (Section 4.3) is provided in Table 13. Hg emissions are provided in units of pounds per year (lb/yr); all other emissions are provided in units of ton/yr.

Table 13. Maximum Annual Potential Emissions Summary

Source Category	CO	NO_X	$PM_{2.5}$	PM_{10}	SO_2	VOC	Pb	HAP[1]	Hg
	(ton/yr)								(lb/yr)
Process and ancillary	30.5	37.9	36.4	56.3	6.5	4.8	0.0003	1.8	24.9
Mining fugitive	635.8	17.1	98.9	985.6	0.03	--	--	0.004	7.1
SGP Total	666.3	55.0	135.3	1,041.9	6.53	4.8	0.0003	1.804	32.0

[1] Includes Pb and Hg. Maximum facility-wide potential emissions for a single HAP are 0.97 ton/yr for cyanide compounds.

It is important to note that the process and ancillary source emissions remain the same for each modeling scenario discussed in Section 4.3.

4.3 Modeling Scenarios

As discussed in Section 2.1, conventional open-pit methods will be used to extract ore and DR from three pits: YPP, HFP, and WEP, and legacy tailings from BT. Ore will be hauled to the crushing area, and the DR will be moved to four DRSF: Yellow Pine (YPDRSF), Hangar Flats (HFDRSF), West End (WEDRSF), and Fiddle (FDRSF). The SGP site layout provided in Figure 4 shows these facilities' locations.

Midas Gold plans for an up to three-year construction schedule to build mine site facilities and infrastructure, as well as the power transmission line, followed by 12 years of mining operations (i.e., LOM Years 1 through 12). Depending on the mine design and operating schedule, mining activity rates will vary temporally and spatially during the 12 years of mine production and operation. For example, ore production varies from approximately 6.8 MMton in LOM Year 1 (67% in YPP, 26% in WEP, and 7% in BT) to 9 MMton in LOM 3 (78% in YPP, 10% in BT, 7% in WEP, and 5% in HFP). Similarly, DR production varies from approximately 4.8 MMton in LOM Year 12 (100% in WEP) to 34 MMton in each of LOM Years 4 through 9, with varying distribution among the four DRSF for each LOM Year. The total material (ore and DR) production varies from approximately 12.5 MMton in LOM Year 12 to 42.7 MMton in LOM Year 4.

PRI00000434

REC 1774

Similar to the material production, the distribution and hauling of DR to the four destinations (YPDRSF, HFDRSF, WEDRSF, FDRSF) also will vary for each LOM year. Depending on the material origin (pits and BT) and destination (crushing area and DRSF), material hauling distances also will vary for each LOM year.

Therefore, depending on material production rates and origin, DR destination, and hauling distances, mining emissions will vary spatially and temporally throughout the mine life. For permitting purposes, Midas Gold has decided to use a maximum production rate of 180,000 tons of material (ore and/or DR) per day, for an annual production rate of 65.7 MMton/yr. This annual production rate is more than 50% higher than the estimated maximum total material production rate of 42.7 MMton/yr. A conservatism analysis of the mining production rate is provided in Appendix A.

In order to allow Midas Gold with operation flexibility and to capture variability in material origin and destination in the air quality analyses, several pit scenarios were developed for the SGP air quality analyses. Each pit scenario uses the maximum production rate of 180,000 ton/day in a single pit and uses a single material destination. Each pit has a dedicated ore scenario that assumes all material produced is ore and is hauled to the crusher area; and depending on mine design multiple DR destination scenarios each assuming all material produced is DR and is transported to a single DRSF. For example, most of the DR from HFP will be moved to HFDRSF and during LOM Years 2 through 10, but a fraction of this rock will be moved to FDRSF during LOM Years 3 and 8, and a fraction to YPDRSF during LOM Year 9. Therefore, in order to evaluate all hauling scenarios originating from HFP, the following four (one for ore hauling, three for DR hauling) HFP scenarios were modeled:

1. HFP Scenario 1 – 180,000 ton/day of ore produced and hauled to the crusher area
2. HFP Scenario 2 – 180,000 ton/day of DR produced and hauled to the FDRSF
3. HFP Scenario 3 – 180,000 ton/day of DR produced and hauled to the HFDRSF
4. HFP Scenario 4 – 180,000 ton/day of DR produced and hauled to the YPDRSF

Overall, 14 scenarios were modeled for $PM_{2.5}$ and PM_{10} analyses to cover all possible origin and destination combinations. Each modeling scenario included processing and ancillary source potential emissions discussed in this section and shown in Table 13. The multiple scenarios modeled for $PM_{2.5}$ and PM_{10} analyses are presented in Table 14. This table also shows the six origin/destination options that are not applicable to the Project as denoted by "0 ton/day."

PRI00000435

REC 1775

Table 14. Modeling Scenarios for $PM_{2.5}$ and PM_{10} Analyses

Scenario ID	Pit/Origin (ton/day)				Ore Destination (ton/day)	DR Destination (ton/day)			
	YPP	HFP	WEP	BT	STKP	FDRSF	HFDRSF	YPDRSF	WEDRSF
Y1	180,000	--	--	--	180,000	--	--	--	--
Y2	180,000	--	--	--	--	180,000	--	--	--
Y3	180,000	--	--	--	--	--	180,000	--	--
Y4	0	--	--	--	--	--	--	0	--
Y5	0	--	--	--	--	--	--	--	0
H1	--	180,000	--	--	180,000	--	--	--	--
H2	--	180,000	--	--	--	180,000	--	--	--
H3	--	180,000	--	--	--	--	180,000	--	--
H4	--	180,000	--	--	--	--	--	180,000	--
H5	--	0	--	--	--	--	--	--	0
W1	--	--	180,000	--	180,000	--	--	--	--
W2	--	--	180,000	--	--	180,000	--	--	--
W3	--	--	180,000	--	--	--	180,000	--	--
W4	--	--	180,000	--	--	--	--	180,000	--
W5	--	--	180,000	--	--	--	--	--	180,000
B1	--	--	--	180,000	180,000	--	--	--	--
B2	--	--	--	180,000	--	--	180,000	--	--
B3	--	--	--	0	--	0	--	--	--
B4	--	--	--	0	--	--	--	0	--
B5	--	--	--	0	--	--	--	--	0

Scenario Y4 is not applicable because the YPDRSF and the YPP are in the same area; therefore, the pit cannot be backfilled with development rock until after mining of the pit is completed. Scenarios Y5 and H5 are not applicable because the WEDRSF will only be utilized by the WEP because of its proximity; it is only accessible from the WEP. Scenarios B3, B4 and B5 are not applicable because the development rock from the BT will only be hauled to the HFDRSF because of its proximity. All other development rock storage facilities are significantly farther away from BT.

The fugitive CO, NO_2, and SO_2 emissions are limited to pits only, and they do not vary by ore and/or DR hauling and destinations. Therefore, for these pollutants, one scenario for each pit, including processing and ancillary source potential emissions, was modeled, i.e., scenarios Y1, H1, W1, and B1.

PRI00000436

REC 1776

The TAP emissions are limited to processing and ancillary sources, so a single scenario was modeled for each applicable TAP analysis.

4.4 Modeled Sources and Characterization

All emission sources and activities described in previous sections were included in the modeling analyses for SGP. Source characterization and parameters for model input for different source categories are discussed in this section.

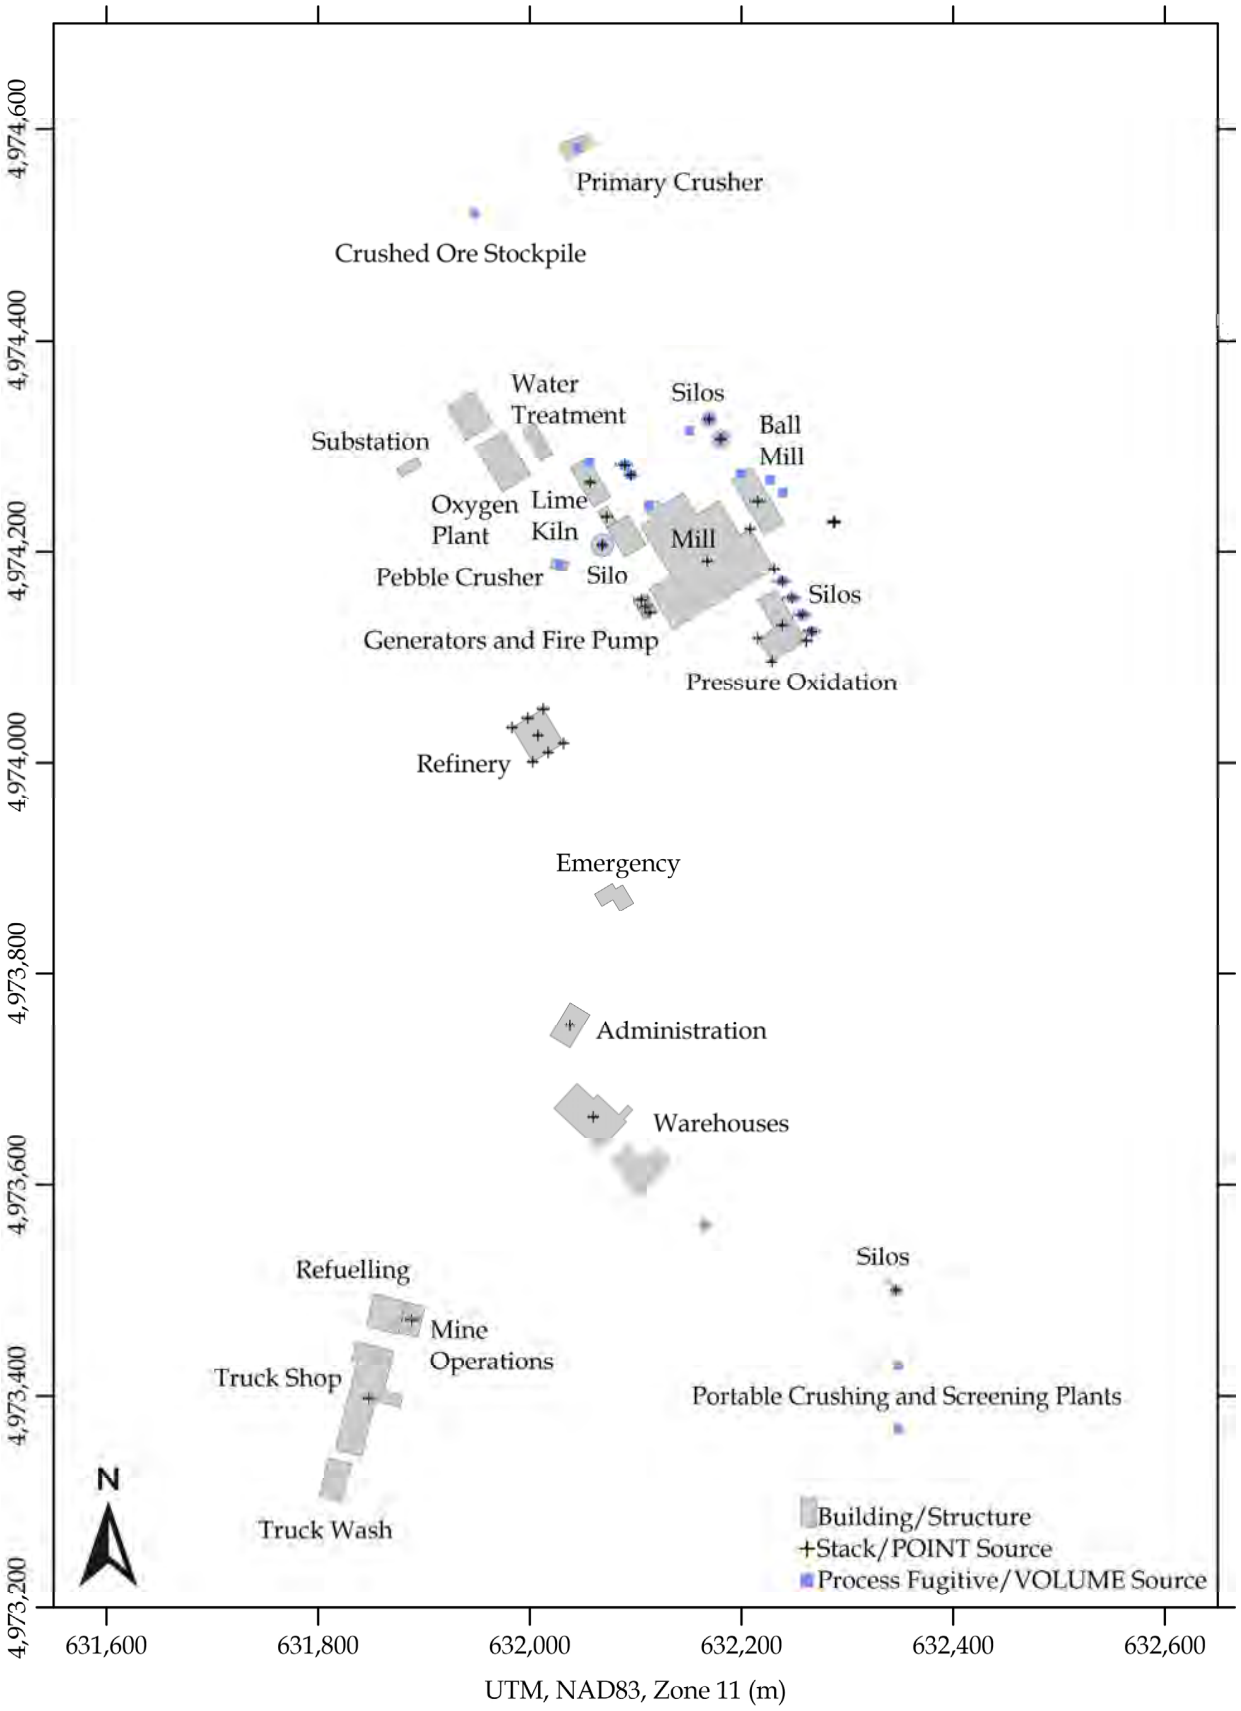
4.4.1 Processing, Refining, and Ancillary Sources

The processing, refining, and ancillary sources with exhaust stacks, such as baghouse-equipped sources, generators, process and building heaters, autoclave, retort, smelting furnace, carbon kiln, lime kiln, etc., were modeled as POINT sources. The process sources without exhaust stacks, such as material transfers, ore screening and crushing, etc., were modeled as VOLUME sources. A plot plan showing the processing and refining area buildings and sources is provided in Figure 5. Process and ancillary source model input physical parameters and associated documentation are provided in Appendix B.

4.4.2 Fugitive Sources: Blasting, Material Origin and Destination and Underground Exploration Emissions

Blasting emissions were represented by a VOLUME source located inside a pit. Each material origin location (YPP, HFP, WEP, BT) was modeled as an AREA source and comprised appropriate emissions from drilling, material loading, dozing, and surface exploration. Ore destination – crusher area was modeled as a VOLUME source and comprised ore unloading emissions. Each DR destination (FDRSF, HFDRSF, YPDRSF, WEDRSF) was modeled as a VOLUME source comprising appropriate emissions from DR unloading, dozing, and wind erosion. Emissions from underground core sampling drilling (UGEXP) in the Scout prospect decline were represented by an AREA source characterized by the portal opening dimensions.

Model input physical characteristics for blasting and possible material origin and destination locations, and Scout portal are presented in Table 15. This table also shows the source type and associated dimensions for each of the modeled fugitive source/location.



The VOLUME source dimensions for blasting provided in Table 15 were based on an estimated blast area. For the remaining AREA and VOLUME sources listed in Table 15, the dimensions were developed by reasonably fitting an equal-area rectangle within the actual footprint of each fugitive source.

Blasting is not expected to occur in BT. However, blasting emissions were modeled in BT (BTBL) per IDEQ's suggestion in order to streamline the permitting process.

Model ID	Base Elevation (m)	Release Height (m)	Initial Lateral Dispersion (m)	Initial Vertical Dispersion (m)
HFDRSF	2,079.8	4.7	174.8	4.4
YPDRSF	1,904.1	4.7	182.2	4.4
WEDRSF	2,376.5	4.7	124.1	4.4
UGEXP	2,018.0	0	N/A	0

The blasting physical parameters were developed from dimensions (provided in Table 15) based on blast area used in the emission calculation. The blasting release height is the midpoint of the blasting height (30 m).

The initial lateral and vertical dispersion dimensions for blasting were calculated per methods specified in (EPA 2018d), as:

$$Initial\ Lateral\ Dispersion\ = \frac{Width\ (87\ m)}{4.3}$$

$$Initial\ Vertical\ Dispersion\ = \frac{Height\ (30\ m)}{4.3}$$

For the pit and DRSF fugitive activity locations listed in Table 15, i.e., YPP, HFP, WEP, BT, FDRSF, HFDRSF, and WEDRSF, the release height was based on the haul truck height (weighted based on model-specific usage) and calculated using the recommendations provided in the Haul Road Workgroup Report (EPA 2012), as:

$$Release\ Height = \frac{Plume\ Top\ (Weighted\ Truck\ Height\ \times 1.7)}{2}$$

The applicable initial lateral dispersion for each VOLUME source was calculated from the respective shorter dimension and EPA-specified methods (EPA 2018d) (EPA 2016) as follows:

$$Initial\ Lateral\ Dispersion\ = \frac{Shorter\ Lateral\ Dimension}{2.15}$$

The applicable initial vertical dispersion for each AREA and VOLUME source was calculated from the respective vertical dimension and EPA-specified methods (EPA 2018d) (EPA 2016) as follows:

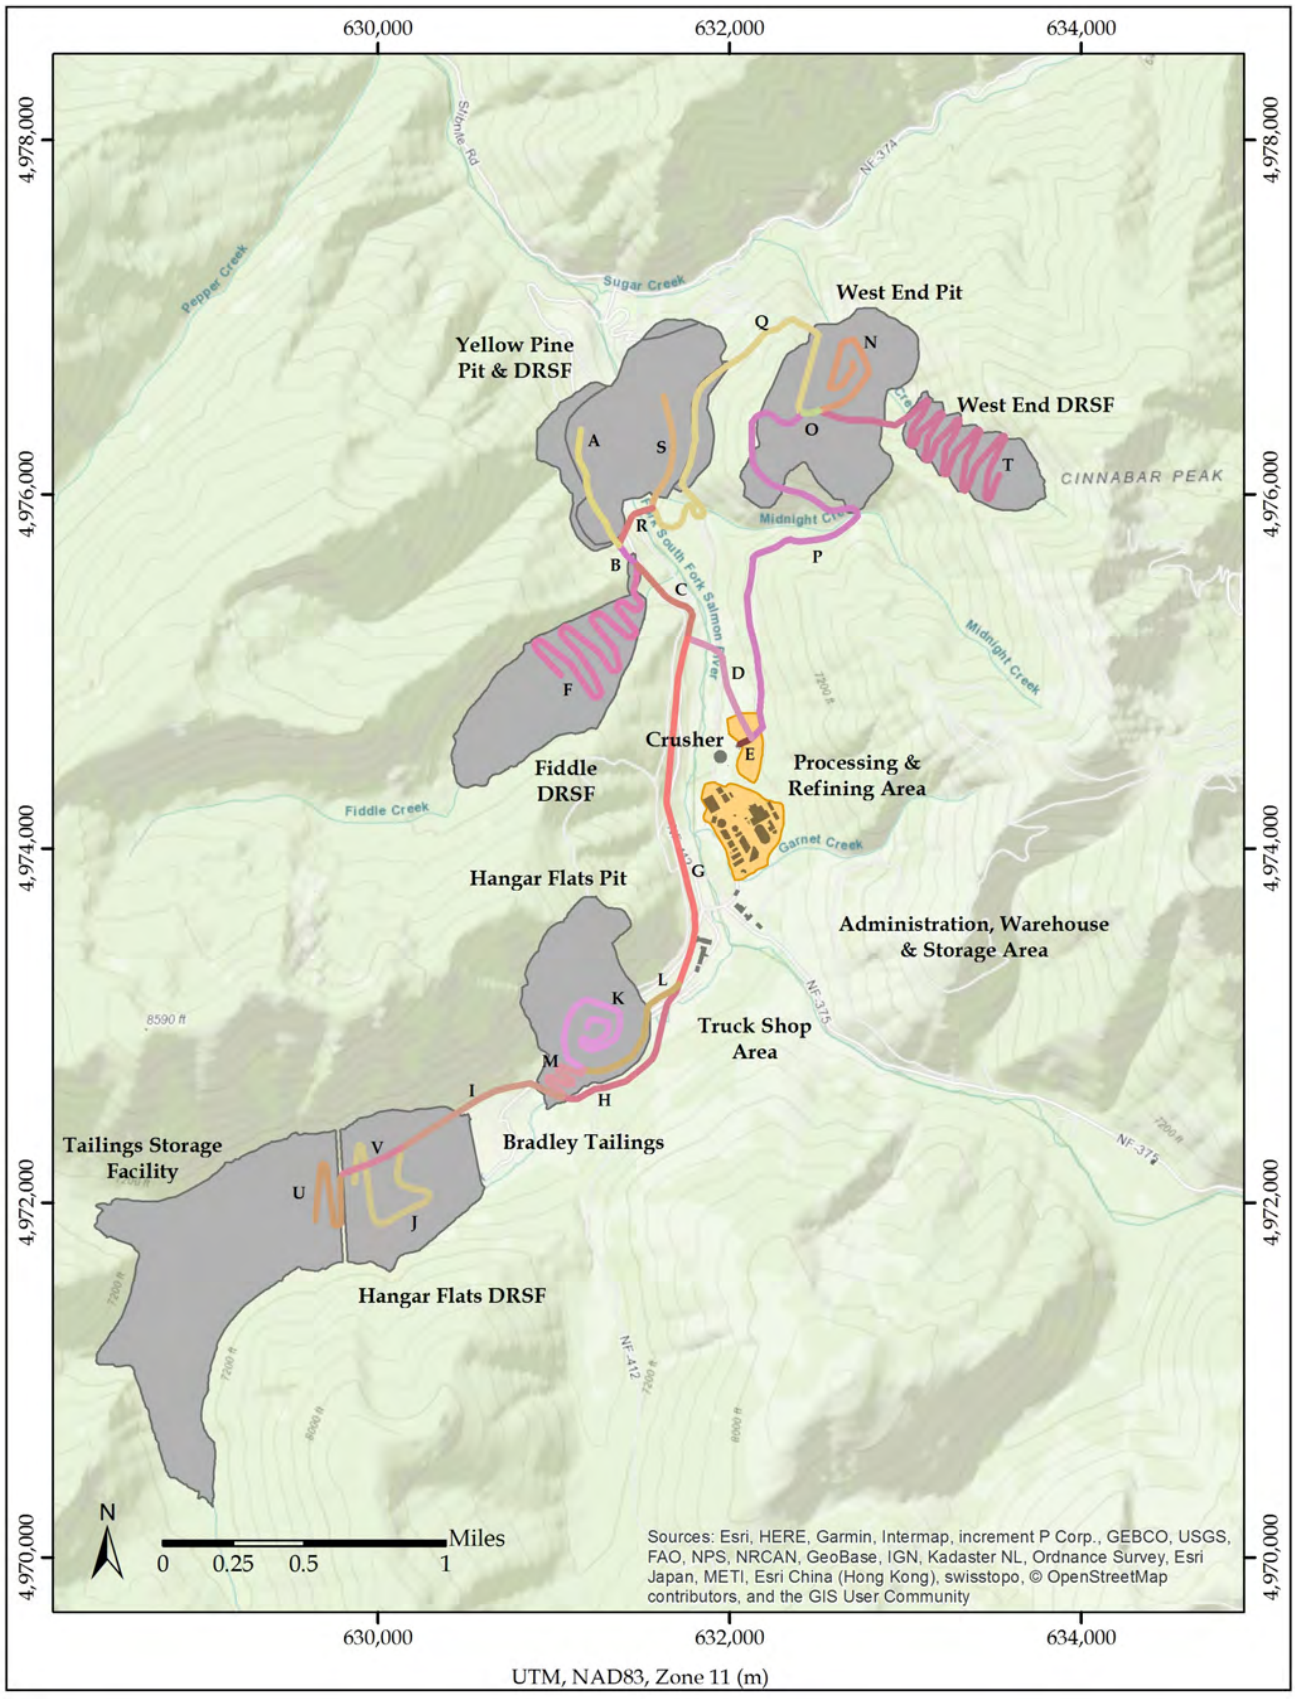
$$Initial\ Vertical\ Dispersion\ = \frac{Plume\ Top\ (Weighted\ Truck\ Height\ \times 1.7)}{2.15}$$

Scout portal was modeled as a surface-based AREA source with zero release height.

PRI00000440

REC 1780

4.4.3 Fugitive Sources: Haul Roads



A representative haul road network for hauling material from inside the pit (or origin) to various destinations was developed for each pit scenario provided in Table 14. The haul road network is presented in Figure 6.

As shown in Figure 6, the haul road network was divided into 22 sections, A through V. Each section was further divided into multiple segments with a length equal to twice the adjusted haul road width of 32.5 m (26 m road width plus 6 m (EPA 2012)). Each of the segments was characterized as an individual VOLUME source in the model, with a release height of 4.75 m (weighted-average truck height times 1.7, divided by 2 (EPA 2012)), an initial lateral dispersion of 15.1 m (adjusted road width divided by 2.15 (EPA 2012)), and an initial vertical dispersion of 4.42 m (weighted-average top-of-plume height divided by 2.15 (EPA 2012)). Material hauling emissions associated with each origin-destination route were assigned to each segment along the route based on estimated total emissions along the route and traffic distribution along each section, as provided in Table 17 for the five HFP scenarios.

V	7	--	--	--	--

The top row in Table 17 shows the pit scenarios, and the next two rows show hauling route and the associated segment emission denominator (SED) used to distribute segment emissions along each route. The remainder of Table 17 presents the number of segments for each road section (shown in Figure 6) and the associated traffic distribution factor for each route. The emission distribution for each applicable segment is illustrated in the following example.

Route: HFP–STKP (Hangar Flats pit to crusher stockpile): Figure 6 shows that material from HFP will be hauled to the crusher area following the route along Sections K, L, G, and D. All (100%) of the ore from HFP will travel on each of these sections; therefore, each of these sections has a traffic distribution factor of 1.0 for this route.

PRI00000443

REC 1783

The SED for each route is the sum-product of the number of segments and traffic distribution for the applicable sections. The SED for the HFP–STKP route is calculated as:

$$SED_{(HFP-STKP)} = (28 \times 1) + (16 \times 1) + (38 \times 1) + (14 \times 1) = 96$$

Emissions for each section-segment were estimated by dividing the total emissions along the route by its SED and multiplying by the section distribution factor. For example, the emission rate for each of the 28 segments along Section K was calculated as:

$$Emission\ Rate - Section\ K\ _{(Segments\ 1-28)} = \frac{Total\ Emissions_{(HFP-STKP)}}{96} \times 1$$

4.4.4 Fugitive Sources: Burntlog Route Access Road

The access road portion within the operations boundary was characterized by a series of LINE sources laid along the actual route. These sources were assigned a release height of 3 m and an initial vertical dispersion of 2.8 m. These release parameters were based on an estimated average vehicle height of 3.5 m, which is representative of an overall approximation of anticipated vehicle heights (grader – 3.7 m, heavy-duty truck – 3.6 m, and pickup truck – 3.2 m) and the AREA source parameterization recommendations provided in the Haul Road Workgroup Report (EPA 2012). The AERMOD emission input units for AREA source are grams per meter square. The access road emissions were evenly distributed along the road by dividing the total access road emissions by its total area, i.e., the Burntlog Route section within the operations boundary (2,950 m) multiplied by the road width (6.1 m).

4.5 Short- and Long-Term Emissions for Model Input

Short-term (up to 24-hour averaging period) model input emission rates for the process sources, including ore processing, refining, and other support activities, were based on the equipment/process-specific maximum hourly or daily design throughput rates. Short-term model input emission rates for the fugitive sources associated with mining activity were based on short-term activity rates provided in Table 8. Long-term (annual) model input rates for both process and fugitive sources were based on continuous operation (24 hours per day, 365 days per year) and the respective maximum hourly or daily throughput rates.

☒ *The modeling emissions inventory and the emissions inventory presented in other parts of the permit application are consistent, and if they are not identical numbers, it is clearly shown, with calculations submitted, how the modeled value was derived from the value provided in the emissions inventory.*

4.6 Criteria Pollutants

The criteria pollutant emission rates used in the modeling analyses described in this section were determined as described in Sections 4.0 through 4.5.

PRI00000444

REC 1784

4.6.1 Modeled Emission Rates for Significant Impact Level Analyses

Based on the magnitude of the facility-wide emissions and preliminary modeling analyses, it was determined that the impacts from the SGP emissions exceeded the Significant Impact Levels (SIL) for most criteria pollutants. Therefore, SIL analyses were considered redundant and not performed for this report.

4.6.2 Modeled Emission Rates for Cumulative Impact Analyses

The modeled emission rates used in the cumulative impact analyses were determined as described in Sections 4.0 through 4.5, and the emission calculation details are provided in Appendix B. For 1-, 3-, and 8-hour averaging times, hourly emission rates provided in pounds per hour were used. For 24-hour averaging time, daily emission rates provided in pounds per day were used. For the annual averaging time, annual emission rates provided in tons per year were used. The total model input emission rates (highest emission scenario) are shown in Table 18.

Table 18. Criteria Pollutant Modeled Emission Rates

Pollutant	Averaging Time	Emissions[(1)]	
CO	8 hours	1,775.50	lb/hr
	1 hour	1,775.50	lb/hr
NO_2	1 year	54.93	ton/yr
	1 hour	58.07	lb/hr
$PM_{2.5}$	1 year	135.23	ton/yr
	24 hours	781.69	lb/day
PM_{10}	24 hours	5,768.93	lb/day
SO_2	3 hours	1.97	lb/hr
	1 hour	1.97	lb/hr

[(1)] Combined process, ancillary, and fugitive emissions modeled. Fugitive emissions vary by pit scenario, maximum pit scenario emissions are shown.

The nearest significant permitted facility to SGP is Tamarack Mill, located more than 75 km west. This facility is located too far away to cause a significant concentration gradient along the periphery of the SGP and was therefore not included in the cumulative impact analyses for SGP.

☒ *Emissions rates in Appendix B are identical to those in the model input files for the cumulative NAAQS impact analyses.*

☒ *Calculation of modeled emissions are thoroughly documented in Appendix B, and any unique handling of emissions in the model have been described.*

PRI00000445

REC 1785

4.6.3 NO_2/NO_X Ratio for NO_X Chemistry Modeling

The default option of the Ozone Limiting Method (OLM), a third-tier method from 40 CFR 51, Appendix W, was used to estimate the NO_2 1-hour and annual impacts for these analyses. The OLM method requires an input of in-stack NO_2/NO_X ratio for each modeled source.

An in-depth literature review was conducted to identify reasonable NO_2/NO_X ratios for different combustion source categories. Based on this research, the NO_2/NO_X ratio recommended for the heavy-duty diesel trucks in the California Air Pollution Control Officers Association (CAPCOA) Guidance Document (CAPCOA 2011) was selected for stationary diesel combustion sources. This NO_2/NO_X ratio (11 percent) is conservatively higher than the diesel combustion NO_2/NO_X ratio provided in the EPA ISR (In-Stack Ratio) database: 6 percent average, 9.8 percent maximum. The CAPCOA document and the EPA ISR database do not provide an NO_2/NO_X ratio for propane boilers. The CAPCOA-recommended NO_2/NO_X ratio for natural gas boilers was selected for the propane boilers. The natural gas boilers NO_2/NO_X ratio is considered appropriate for the propane boilers because both are gaseous fuels with relatively similar combustion characteristics and are expected to have similar NO_2/NO_X ratios. The NO_2/NO_X ratio for blasting is based on blasting plume measurements provided in the Australian study (CSIRO 2008). The NO_2/NO_X ratios used for the SGP NO_2 analyses are presented in Table 19.

Table 19. NO_2/NO_X Ratios

Source Type	NO_2/NO_X Ratio	Reference/Comments
Blasting	0.036	Commonwealth Scientific and Industrial Research Organization (CSIRO 2008)
Diesel Engines	0.11	CAPCOA Guidance Document, heavy-duty diesel trucks (CAPCOA 2011)
Propane Heaters	0.10	CAPCOA Guidance Document, natural gas boilers (CAPCOA 2011)

4.6.4 Special Methods for Modeling Criterial Pollutant Emissions

- Multiple pit scenarios were modeled, as described in Section 4.3.
- The alternately processed meteorological dataset described in Section 5.2 was used for the select analyses addressed in Section 6.1.

4.7 Toxic Air Pollutants

SGP facility-wide TAP emissions for different source categories are provided in Table 5. TAP emissions from propane-fired heaters were calculated using the emission factors provided in AP-42, Tables 1.4-3 and 1.4-4. These emission factors along with estimated TAP emissions for propane-fired heaters at SGP are provided in Table 20.

[1] 0K represents ambient temperature in model.

The pneumatic transfer silo loadings and bin transfers (LS1L, MillS2L, ACS1L, ACS2L, ACS3L, ACS4L, PSL, CS1L, CS2L, LS6, LSBM, LS9, LSL) were modeled as POINT sources with a 3-foot bin vent above standard silo height as release height. Exit velocity was estimated using the standard stack diameter and flow rates for similar sources (NDEP 2019) or 0.001 meter per second for horizontal exhaust. These sources were modeled with ambient exhaust temperature.

For propane-fired process (Sb1, ACB, CKB, PV, HS) and building heaters (H1M, H2M, HM, HAC, HR, HA, HMO, HTS, HW), exhaust flow rates were calculated using EPA Method 9 with 3% oxygen content and 15% moisture content. Standard stack diameters were selected based on the heater rating. The process heaters were modeled with a 10-foot stack above the building,

PRI00000454

REC 1794

whereas the building heaters were modeled with a release height of 1 foot above the respective buildings.

Similar source exhaust temperature, flow, and diameter from (NDEP 2017) were used for refinery sources, including the carbon regeneration kiln (CKD), electrowinning cells (EW), mercury retort (MR), and induction furnace (MF). Each of these sources was modeled with a 10-foot stack above the refinery building.

For emergency generators (EDG1, EDG2, EDG3) and the fire pump (EDFP), the exhaust flow rates were calculated using EPA Method 9 with 9% oxygen content and 8% moisture content. Standard stack diameters were selected based on engine rating. Each engine was modeled with a 7-foot-high stack.

Antimony bagging (Sb2), autoclave (AC), lime kiln (LK) (common stack with kiln burner (LKC)), and lime crushing (LCR) were characterized with similar source parameters from (NDEP 2015b), (APT 2013), and (NDEP 2010). Each of these sources was modeled with a 10-foot stack above its respective building.

The model input release parameters for the process and ancillary sources modeled as VOLUME sources are provided in Table 30.

For the following VOLUME source characterization discussion, release height was estimated as half of the vertical length (for example, building height), initial vertical dispersion was calculated by dividing the vertical length by the applicable EPA-recommended constant (EPA 2018d) for a single VOLUME source (4.3), and initial lateral dispersion was determined using the lesser lateral dimension (for example, building width) divided by the applicable EPA-recommended constant (EPA 2018d) for the surface source or elevated source with a building (2.15).

The sources associated with the primary crusher building, including loader transfer (OC1), grizzly feeder (OC2), apron feeders (OC3, OC4), ore transfers (OC5, OC6), and primary crusher (OC7), were characterized by the primary crusher building dimensions: 128′ high and 52.9′ wide.

The stockpile height (71.6′) and the conveyor width (3′) were used to determine the VOLUME source parameters for the stockpile feed conveyor (OC8).

PRI00000456

REC 1796

Tunnel exit dimensions (8′ high and 8′ wide) were used to estimate the VOLUME release parameters for the stockpile transfer points (OC9, OC10). The SAG mill feed conveyor transfer (OC11) was characterized by a building opening (4′ high and 4′ wide) at the mid-height (70′) of the mill building.

Pebble crusher building dimensions (20′ high and 32.7′ wide) were used to characterize the pebble crusher-associated sources (OC12, OC13).

Silo/bin unloading sources (LS1U, Mill2SU, ACS1U, ACS2U, ACS3U, ACS42U, PSU) were characterized by a typical screw discharge feeder characteristic, i.e., 5′ above the ground with a 1′ diameter.

Aggregate transfer and handling sources (CS1U, CS2U, CAL, CAU, CM) were characterized by the aggregate stockpile dimensions: 20′ high and 72.2′ wide.

Each portable crushing and screening plant was characterized by typical portable crushing and screening plant dimensions: 14′ high and 185′ wide.

Sources associated with limestone crushing (LS1, LS2, LS3, LS4, LS5) were characterized by the associated crusher building dimensions: 22.6′ high and 22.6′ wide.

The crushed limestone/pebble lime transfers (LS7, LS10, LSU) were characterized by a typical screw discharge to a conveyor characteristic, i.e., 5′ above the ground, 3′ drop, and a 1′ diameter.

The limestone ball mill feed discharge (LS8) was characterized by a building opening (4′ high and 4′ wide) at the mid-height (30′) of the ball mill building.

The limestone fines screening (LS11) was characterized by screen dimensions: 5′ drop and 8′ wide.

The limestone kiln feed (LS12) was characterized by a building opening (4′ high and 4′ wide) at the mid-height (70′) of the kiln building.

Model input source characterization for fugitive emissions is described in Section 4.4. Fugitive activity locations and their respective dimensions are provided in Table 15 and associated release parameters are listed in Table 16.

☒ *Thorough justification/documentation of release parameters for all modeled sources is provided in this section.*

☒ *The specific methods used to determine/calculate given release parameters is described in this section.*

5.0 MODELING METHODOLOGY

Refined modeling techniques using the preferred air quality models were used to estimate pollutant concentrations at receptor locations resulting from the SGP air emissions to demonstrate that air emissions resulting from the SGP activities do not cause or significantly contribute to a violation of applicable NAAQS, or AACC as identified in Tables 6 and 7. The methods and techniques, regulatory options, and datasets for these air quality analyses are detailed in the following subsections.

Key modeling parameters used in the SGP impact analyses are presented in Table 31.

Table 31. Key Modeling Parameters

Parameter	Description/Value	Documentation/Additional Description
General facility location	Attainment	See Section 2.4
Analysis type	NAAQS and TAP	SIL analysis was not performed, See Section 4.6.1

	Grid 4	1,000-m spacing, 5 km to 10 km out
	Hot-spot	25-m spacing, 200-m × 200-m around highest model impacts

5.1 Model Selection

The most recent version (19191) of the AERMOD (American Meteorological Society/ Environmental Protection Agency Regulatory Model) modeling system was used for the SGP air quality analyses. AERMOD is an enhanced steady-state, Gaussian plume model that incorporates air dispersion based on planetary boundary layer turbulence structure and scaling concepts, including treatment of both surface and elevated sources and both simple and

PRI00000459

REC 1799

complex terrains. The AERMOD modeling system is listed as the recommended model for short-range analysis (up to 50 km) in 40 CFR 51, Appendix W.

☒ *The current versions of all models and associated programs were used in analyses, or alternate versions were specifically approved by DEQ.*

☒ *Any non-default model options used were approved by DEQ in advance.*

5.2 Meteorological Data

AERMOD requires an input of hourly meteorological data to estimate pollutant concentrations in ambient air resulting from modeled source emissions. For the analyses provided in herein, one year (January 1, 2014 to December 31, 2014) of site-specific hourly surface meteorological data collected at the Stibnite monitoring station were used. This dataset has been approved by IDEQ (IDEQ 2015b) for SGP air quality analyses. The data quality protocols and IDEQ approval references are provided in Section 5.8.

The site-specific surface data were supplemented with the twice-daily upper-air data (all levels) collected at the National Weather Service (NWS) station in Boise, Idaho (WBAN 24131).

These meteorological datasets were processed with the most recent version (19191) of the AERMOD meteorological pre-processor, AERMET, to produce AERMOD-input-ready hourly surface and profile meteorological files. The default option of adjusted surface friction velocity (ADJ_U*) and the Bulk Richardson (BULKRN) method for boundary layer parameter calculations was used for this meteorological data processing.

Additionally, an alternative meteorological dataset was processed without using the BULKRN method. This alternate processing used the onsite and upper air datasets discussed above, supplemented with the cloud-cover data collected at the NWS station in McCall, Idaho (WBAN 94182).

Both processing methods (with and without BULKRN) are considered default for regulatory modeling analyses.

5.2.1 Surface Characteristics for AERMET Processing

AERMET requires the input of three surface boundary layer parameters: midday Bowen ratio (B_o), midday albedo (r), and surface roughness length (z_o). These parameters are dependent on the land use and vegetative cover of the area being evaluated.

The EPA-recommended model, AERSURFACE, was used to estimate these surface parameters for the Stibnite meteorological data processing. AERSURFACE uses 1992 National Land Cover Data to determine these surface characteristics.

PRI00000460

REC 1800

The determination of B_o is dependent on ambient moisture conditions (i.e., wet, average, or dry). For this purpose, historic 30-year (1985–2014) precipitation data from the Taylor Ranch station in Idaho (the closest station from which this type of data is available) were used.

The 70th and 30th percentile values estimated from the 30-year precipitation data were used to assign a moisture class to each calendar month per the following scheme: monthly precipitation greater than the 70th percentile was considered "wet"; between the 70th and 30th percentiles was considered "average"; and less than the 30th percentile was considered "dry." The monthly season and moisture classifications and estimated r and B_o for 2014 Stibnite meteorological data processing are presented in Table 32.

Table 32. 2014 Monthly Season and Moisture Classification, and Calculated r and B_o

Month	Season	r	30-Year Precipitation Percentile (in)		2014 Precipitation (in)	Moisture Classification	B_o
			30th	70th			
January	Winter	0.38	0.64	1.29	0.74	Average	0.50

REC 1804

5.3 Effects of Terrain

The most recent version of the AERMOD terrain preprocessor, AERMAP (Version 18081), was used to develop receptor elevations and hill heights. U.S. Geological Survey (USGS) fine-resolution, one-third-arc-second or 10-m resolution National Elevation Dataset files were used to process receptors for the SGP analyses.

☒ *The datum of terrain data, building corner locations, emissions sources, and the ambient air boundary are specified and are consistent such that the modeled plot plan accurately represents the facility and surroundings.*

5.4 Facility Layout

A facility-wide plot plan showing an overall layout of pits, DRSF, process area and ambient air boundary is provided in Figure 4. A detailed layout of the process area showing buildings and sources is supplied in Figure 5, and the haul road network is depicted in Figure 6.

☒ *The facility layout plot plan is provided in this section that clearly and accurately depicts buildings, emissions points, and the ambient air boundary.*

☒ *This section of the Modeling Report has thoroughly described how locations of emissions sources, building corners, and the ambient air boundary were determined, specifying the datum used.*

5.5 Effects of Building Downwash

The effects of building-induced downwash were incorporated into the modeling analyses. The building downwash parameters were calculated using the most recent version of the Building Profile Input Program (BPIP) with the Plume Rise Model Enhancement (PRIME) algorithm (BPIP-PRIME Version 04274).

Building locations, orientation and dimensions were obtained from project drawings (Midas Gold 2017d).

5.6 Ambient Air Boundary

EPA defines ambient air as "*that portion of the atmosphere, external to buildings, to which the general public has access*" (40 CFR 50.1(e)). EPA also recognizes that some areas external to buildings are not covered by this definition. The EPA's longstanding policy on "ambient air" was that the atmosphere over land that is owned or controlled by the source and where public access is precluded by a fence or other physical barriers can be excluded from the definition of ambient air. Recently EPA proposed a restatement of its longstanding policy for public comment, "Draft Revised Policy on Exclusions from Ambient Air" (EPA 2018b). Without changing the underlying definition, EPA's updated policy allows consideration of additional methods to restrict public access. It replaces the phrase "*a fence or other physical barriers*" with "*measures, which may include physical barriers, that are effective in deterring or precluding access to the land by the*

PRI00000465

REC 1805

general public." To keep up with practical considerations, and technological advancements in surveillance and security, the revised policy states:

"*… the EPA believes there are various measures other than fencing or other physical barriers that a facility can employ to serve as an effective deterrent to public access. These measures may include traditional fencing, but may also include video surveillance and monitoring, clear signage, routine security patrols, drones, and other potential future technologies.*"

This revised policy provides guidance to reviewing agencies to make ambient air determinations:

"*Air agencies should evaluate the effectiveness of a "measure" in precluding public access based on the relevant, specific circumstances. This evaluation should address relevant factors, such as the nature of the measure used (e.g., physical or non-physical), facility location (e.g., rural or urban), type and size of facility and property to be excluded, surrounding area (including the proximity, nature, and size of the population in the area), and other factors affecting the extent to which persons would be likely or able to trespass upon or otherwise have access to the facility's land. Air agencies should consider any information provided by the regulated entity, or otherwise available to the air agencies, regarding the effectiveness of the measures to prevent public access. For instance, the use of clearly visible, well-spaced "No Trespassing" signs, either with or without fencing, may be effective in certain areas. Another example of an effective measure may involve atypical public access such as swamps and large tracts of undeveloped private land.*"

"*Air agencies are expected to apply a rule of reason in assessing the effectiveness of proposed measures.*"

"*… measures should provide reasonable assurance that the general public will not have access.*"

"*… determinations concerning the adequacy of such measures can only be made by air agencies on a case-by-case basis after consideration of the relevant administrative record in each case.*"

The second aspect of the access evaluation did not change in EPA's restatement; that is whether the source has the legal authority to preclude access by the public to the area of land it owns. In the conclusion section, the revised policy states:

"*This change replaces the specific concept of a fence or other physical barriers with the more general concept of measures, which may include physical barriers, that are effective in deterring or precluding access by the general public. Accordingly, the EPA's revised ambient air policy, consistent with its discretion available under the regulatory definition of ambient air, is that it is appropriate to exclude the atmosphere over land owned or controlled by the stationary source, where the owner or operator of the source employs measures, which may include physical barriers, that are effective in deterring or precluding access to the land by the general public.*"

Midas Gold will legally control the SGP, an active industrial site where mining activities will occur, such as heavy equipment operation. Most areas of the mine will require strict safety protocols and controlled access. Midas Gold has established an operations boundary to identify the area where public access will be excluded. Public access inside the operations boundary will be restricted for the life of the mine by physical barriers at points of potential access, including the current Stibnite Road point of entry and proposed site access via the Burntlog Route, as well as natural features of the landscape that prevent access. Consistent with the guidance provided in the EPA's draft revised policy on ambient air (EPA 2018b), public access control will include the following measures:

- Primary Access Points: The Stibnite Road (north) and Burntlog Route (south) access points will include locked gates. The southern access point also will include a guard shack that onsite personnel will monitor continuously. Security staff at the southern access point will monitor the gate at the northern access point using video camera surveillance. Each gate also will include appropriate adjacent barriers (i.e., fencing, bollards, boulders, or other barriers) to prevent any vehicle from circumventing the gate and gaining site access. These primary access points are also controlled by adjacent natural features, such as streams and creeks, steep topography, and areas of thick vegetation and undergrowth that serve as natural barriers or impediments to access.

- Secondary Access Points: Other potential access points, such as secondary roadways and trails, will include posted signs warning the public against entry into the site. At these locations, boulders will be placed across the trail and at an appropriate width adjacent to the trail to prevent any vehicle from circumventing the barrier. These secondary access points also incorporate adjacent natural features, such as streams and creeks, steep topography, and areas of thick vegetation and undergrowth that serve as natural barriers or impediments to access. Some mine features, such as the TSF and process plant areas, will include perimeter fencing.

- Surveillance: Midas Gold security personnel will routinely patrol mine facilities and roadways for unauthorized individuals. In addition, all onsite personnel will be trained on the necessity of restricting public access to areas within the operations boundary. Any suspected trespassing by unauthorized individuals will be reported immediately to security, and trespassers will be escorted off the site.

In response to comments from local community citizens, Midas Gold will manage an access route to provide the general public with limited access through the SGP site between Stibnite Road at Sugar Creek and Thunder Mountain Road at Meadow Creek (shown in Figure 4). This route will be managed in accordance with the Stibnite Road Access Management Plan provided in Attachment 2 and summarized as follows:

PRI00000467

REC 1807

The proposed Stibnite Road access route through the SGP site is meant to provide controlled through-site access that is safe, provides travel-time comparable to current conditions and is consistent with the United States Forest Service travel management plan. The Stibnite Road access route extends from the north entry point southward to the Administration, Warehouse and Storage Area. Continuing southward, the Stibnite Road access route incorporates the Burntlog access road segment that occurs within the operations area and extends to the south entry point as shown on Figure 4. Midas Gold has the legal authority to control access to the Stibnite Road access route and would provide seasonal (non-winter conditions) access only. At the discretion of Midas Gold, additional access controls may occur during various phases of construction, during mine operations that present potential safely hazards such as blasting, due to inclement weather, or under any other circumstances that may present a threat to the protection of public or employee health and safety. Midas Gold has the legal and practical ability to enforce its control over roadway access and to monitor traffic passing through the SGP site. Signage will be placed at the North Security Gate (near the bridge over Sugar Creek) and the South Security Gate (near the Stibnite Lodge) to provide information to travelers, and guard shacks will be located at each gate to monitor all vehicle ingress/egress. Persons wishing to traverse the SGP site on the Stibnite Road access route will be required to check in at the security gate to receive a safety briefing and to alert mine staff of their presence. Travelers will be required to check out upon exiting the site to ensure passage through the site in a safe and timely manner. Travelers will not be allowed to stop or loiter while traveling though the operations area. Along its full length, the Stibnite Road access route would have appropriate signage to direct travelers and would be separated from mine haul roads and areas of mine operations by fencing, berms, or gates to prevent travelers from straying from the route. When possible and to the degree practicable, anticipated public access restrictions will be communicated to the public in a timely manner so that they may plan appropriately. Receptors on the Stibnite Road access route were not included in the SGP air quality analyses as this road is not considered ambient air.

The worker housing facility will be located within the project operations boundary, near the south access security gate. This housing facility will be used strictly for accommodating employees, contractors, and official visitors, and it will not be accessible to the general public. Therefore, the atmosphere over the land occupied by the worker housing facility is not considered ambient air, and receptors were not placed at this location for the air quality analyses.

The operations boundary, shown in Figures 4 and 9, was used to define the ambient air boundary for the air dispersion modeling purposes.

☒ *If any of the following apply, the effect on areas excluded from ambient air is thoroughly described in this section: a river/stream bisecting the facility; the facility is on leased property or is leasing property to*

PRI00000468

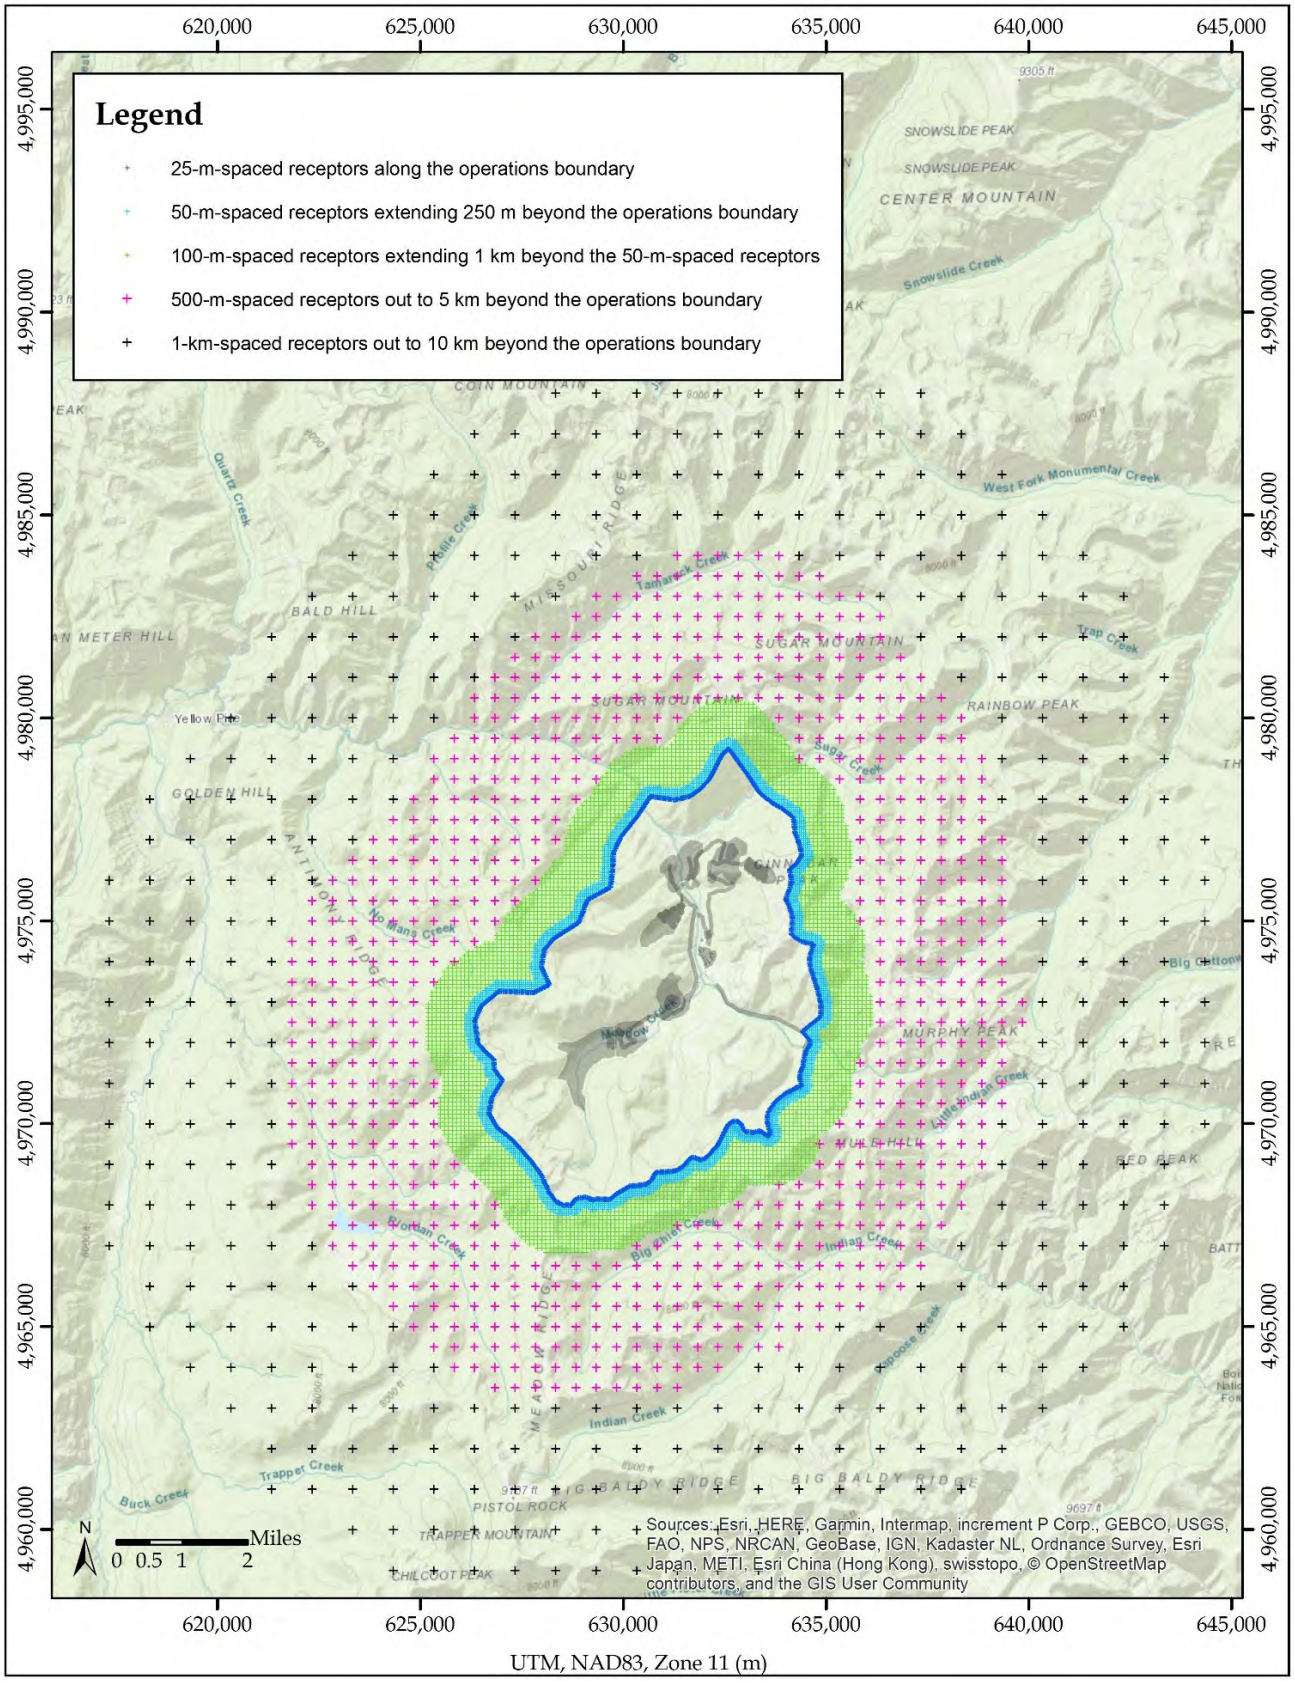
REC 1808

another entity; the facility is not completely fenced; there are right-of-way areas on the facility; the nature of business is such that the general public have access to part or all of the facility.

☒ *This section thoroughly describes how the facility can legally preclude public access (and practically preclude access) to areas excluded from ambient air in the modeling analyses.*

5.7 Receptor Network

The SGP air quality analyses was performed using the following receptor spacing and extents:



- 25-meter (m)-spaced receptors placed along the ambient air boundary;
- 50-m-spaced receptors extending 250 m beyond the ambient air boundary;
- 100-m-spaced receptors extending 1 km beyond the 50-m-spaced receptors;
- 500-m-spaced receptors extending 5 km beyond the ambient air boundary; and
- 1-km-spaced receptors extending 10 km beyond the ambient air boundary.

In addition, each highest modeled impact was evaluated further by performing a hot-spot analysis using a finer 25m-spacing receptor grid. The modeling receptor grid is shown in Figure 9.

PRI00000469

REC 1809

Figure 9. SGP Operations Boundary and Modeling Receptor Grid

☒ *This section of the Modeling Report provides justification that receptor spacing used in the air impact analyses was adequate to reasonably resolve the maximum modeled concentrations to the point that NAAQS or TAP compliance is assured.*

5.8 Background Concentrations

This section describes the background concentrations representative of the SGP area.

5.8.1 Onsite Particulate Monitoring

To establish background ambient air conditions for the SGP area, Midas Gold developed an onsite monitoring program to collect site-specific meteorological parameters and determine ambient particulate matter ($PM_{2.5}$ and PM_{10}) concentrations at its Stibnite monitoring station (shown in Figure 8). Midas Gold submitted the "Monitoring Protocol and Quality Assurance Project Plan" (JBR 2013) for this monitoring station to the IDEQ, and it was approved formally in December 2013 (IDEQ 2013a).

In September 2015, Midas Gold submitted the data collected at the Stibnite monitoring station for the period of November 2013 through June 2015 to IDEQ. After reviewing the data and associated quality control procedures, IDEQ concluded that the $PM_{2.5}$ and PM_{10} data collected at the Stibnite monitoring station satisfied the applicable regulatory requirements and approved the data to be used for background concentrations in the SGP air quality analyses (IDEQ 2015b). In its conclusions, IDEQ recommended that the $PM_{2.5}$ and PM_{10} background concentrations should be based on calendar year 2014 instead of the complete dataset (November 2013 through June 2015).

IDEQ-approved $PM_{2.5}$ and PM_{10} background concentrations, in units of micrograms per cubic meter ($\mu g/m^3$), are provided in Table 34.

Table 34. IDEQ-Approved $PM_{2.5}$ and PM_{10} Background Concentrations for SGP

Pollutant	Averaging Time	Background Concentration ($\mu g/m^3$)	Design Value Rank
$PM_{2.5}$	1 year	3.5	Weighted average of quarterly means
	24 hours	15	98th percentile/8th high
PM_{10}	24 hours	37	Highest 2nd high

5.8.2 Gaseous Pollutant Background Concentrations

With a few exceptions of very large facilities or facilities located in nonattainment areas, regulatory agencies do not require the collection of gaseous criteria pollutants, including CO, NO_X (and/or nitrogen dioxide [NO_2]), O_3, and SO_2. For these gaseous pollutants, data collected at government-regulated monitoring stations located in settings similar to the project area in

PRI00000471

REC 1811

terms of terrain, land use, and proximity of emission sources are typically used to establish background concentrations.

To determine representative background concentrations of CO, NO_X, O_3, and SO_2 for the SGP site, which is located in a remote rural area, the IDEQ-maintained ambient monitoring network was reviewed. This review revealed that IDEQ only conducts limited trace monitoring for CO, NO_X, O_3, and SO_2 in the Boise metropolitan area along the Interstate 84 corridor. Thus, the data collected at these monitors are exposed to high emissions from industrial, urban, and transportation sources (IDEQ 2015a) (IDEQ 2018). For this reason, the gaseous pollutant concentrations recorded at these urban monitoring locations were not considered to be representative of a rural area, like the SGP site.

The EPA-maintained monitoring stations (EPA 2018a) in Idaho and surrounding states also were reviewed to determine representative gaseous pollutant background concentrations for the SGP site. This review also did not identify any representative monitoring station to establish background gaseous pollutant concentrations for the SGP site.

The IDEQ-recommended (IDEQ 2019) CO, NO_X, O_3, and SO_2 background concentrations for the SGP air quality analyses in units of parts per billion (ppb) and $\mu g/m^3$, are provided in Table 35.

Table 35. IDEQ-Recommended Gaseous Pollutant Background Concentrations for SGP

Pollutant	Averaging Time	Background Concentration		Reference
		(ppb)	($\mu g/m^3$)	
CO	8 hours	970	1,110	NW AIRQUEST, 2014-2017 design value
	1 hour	1,520	1,740	
NO_2	1 year	0.5	0.9	
	1 hour	2.3	4.3	
O_3 (for NO_2 modeling)	8 hours	55	107.9	
SO_2	3 hours	6.4	16.8	
	1 hour	4.7	12.3	

The IDEQ-provided gaseous pollutant concentrations shown in Table 35 were determined using the Northwest International Air Quality Environmental Science and Technology Consortium (NW AIRQUEST) online tool provided through Washington State University. The NW AIRQUEST tool uses regional scale modeling of pollutants in Washington, Oregon, and Idaho, with model results adjusted according to available monitoring data.

PRI00000472

REC 1812

5.8.3 Medium Traffic Pollutant Background Concentrations

For additional information, background concentrations were obtained from NW AIRQUEST for the road section between mile markers 143 and 144 on Highway 55 passing through the town of McCall. This site (latitude 44.906° N, longitude 116.098° W) is approximately 38 miles west of the SGP. The annual average daily traffic count for this road section is over 10,000 vehicles per day. Table 36 provides the background concentrations for this medium traffic site. Although these concentrations are not representative of the rural SGP area, they do provide additional information regarding the relative contribution of traffic emissions.

Table 36. Medium Traffic Background Concentrations

Pollutant	Averaging Time	Background Concentration		Reference
		(ppb)	(μg/m³)	
CO	8 hours	1,000	1,145	NW AIRQUEST, 2014-2017 design value, near McCall, ID (44.91°N, 116.10°W)
	1 hour	1,570	1,797	
NO_2	1 year	1.4	2.6	
	1 hour	7.6	14.3	
$PM_{2.5}$	1 year	--	5.1	
	24 hours	--	17.5	
PM_{10}	24 hours	--	60.1	
SO_2	3 hours	6.4	16.8	
	1 hour	4.7	12.3	

☒ *Background concentrations have been thoroughly documented and justified for all criteria pollutants where a cumulative NAAQS impact analysis was performed.*

5.9 NOx Chemistry

The NO_X emissions from the combustion sources principally are composed of NO (nitric oxide) and NO_2. Once in the atmosphere, NO can convert to NO_2 through chemical reactions with ambient O_3. To address this atmospheric conversion process, the Guideline on Air Quality Models (40 CFR 51, Appendix W) recommends the following three-tiered screening approach for evaluating NO_2 impacts:

i. A first-tier (most conservative) "full" conversion approach;

ii. A second-tier approach that assumes ambient equilibrium between NO and NO_2; and

PRI00000473

REC 1813

iii. A third-tier approach consisting of several detailed screening techniques that account for ambient O_3 and the relative amount of NO and NO_2 emitted from a source.

The default third-tier OLM method with the combined plume option (keywords OLMGROUP ALL) was used in modeling the NO_2 1-hour and annual impacts for these analyses.

The use of OLM requires the following additional input parameters:

- Ambient Equilibrium NO_2/NO_X Ratio: The AERMOD default NO_2/NO_X ambient equilibrium ratio of 0.90 was used for these analyses.

- In-Stack NO_2/NO_X Ratio: The NO_2/NO_X ratios used for the SGP analyses are listed in Table 19 in Section 4.6.3.

- Background O_3 Concentrations: The use of the OLM option in AERMOD requires the input of hourly O_3 concentrations. The O_3 concentration values may be entered as a single value, as hourly values corresponding with meteorological data, or as temporally varying profiles. For the SGP NO2 analyses, a single O_3 concentration of 55 ppb provided by IDEQ (IDEQ 2019) was used.

☒ *If OLM or PVMRM was used to address NOx chemistry, reasons for selecting one algorithm over the other are provided in this section.*

5.9.1 Treatment of Intermittent Sources for NO_2 1-Hour Analyses

In its most recent guidance on NO_2 1-hour modeling (EPA 2011), the EPA has recognized that intermittent sources that do not operate continuously or frequently enough, specifically emergency generators, are less likely to contribute significantly to the annual distribution of daily maximum 1-hour values. The EPA also recommends "*that compliance demonstrations for the 1-hour NO_2 NAAQS be based on emission scenarios that can logically be assumed to be relatively continuous or which occur frequently enough to contribute significantly to the annual distribution of daily maximum 1-hour concentrations*" (EPA 2011). Also, "*EPA believes the most appropriate data to use for compliance demonstration for the 1-hour NO_2 NAAQS are those based on emission scenarios that are continuous enough or frequent enough to contribute significantly to the annual distribution of daily maximum 1-hour concentrations*" (EPA 2011).

The emergency equipment for the SGP includes backup power generators and a fire pump. This equipment is essential to ensure safety and uninterrupted essential operations in case of unforeseen power failures and/or other emergency situations. This equipment is proposed to operate for 100 hours per year for purposes of determining potential emissions, but it may operate for far fewer hours and on a random schedule. Thus, operation of emergency equipment will not be frequent enough to contribute significantly to the annual distribution of

PRI00000474

REC 1814

daily maximum 1-hour concentrations, and inclusion of the equipment's maximum hourly emissions does not represent a logical emission scenario.

After reviewing the EPA guidance, and public and industry comments, as well as conducting its internal review and test model runs, the IDEQ has determined that NO_2 emissions from emergency equipment may be excluded from the NAAQS analyses (IDEQ 2013b).

Based on guidance provided by IDEQ on the intermittent source modeling for NO_2 1-hour NAAQS emissions from emergency equipment were not included for NO_2 1-hour NAAQS analyses. However, for the other pollutants, the emergency equipment short-term (up to 24 hours) emissions were based on one hour of operation and the annual emissions were based on 100 hours of operation.

5.10 Particulate Deposition

For $PM_{2.5}$ and PM_{10} analyses default particulate modeling methods, including deposition (Method 1, to account for depletion due to particulate settling), were used. To account for particulate settling, AERMOD requires the following source-specific variables:

1. Mass-mean aerodynamic particle diameter (PARTDIAM) for each particle size bin
2. Mass fraction (MASSFRAX) for each particle size bin
3. Particle density (PARTDENS) for each particle size bin

A list of references that were used to develop the broad source category particle size bins and associated mass fractions is provided in Table 37. This table also provides material type and associated density in grams per cubic centimeter (g/cm^3) for each source category.

Midas Gold (Midas Gold 2017b) provided the ore and DR material densities. The diesel and propane combustion particulate densities were adopted from technical literature (UMN 2002) and (Khalizov et al. 2012), respectively. Densities for the remaining materials listed in Table 37 were obtained from the Engineering Toolbox.[1] An average density was used when a material-specific density range was available.

For sources that were aggregated and modeled as activity locations as discussed in Section 4.4.2, deposition parameters were selected for the dominant source within the activity location. For open-pits (YPP, HFP, WEP), approximately 90% of emissions were associated with drilling; therefore, drilling deposition parameters were assigned to these sources. Similarly, emissions from dozing accounted for over 70% of emissions in the DRSF (FDRSF, HFDRSF, WEDRSF) and BT; therefore, these sources were assigned deposition parameters based on a dozing particulate profile.

The deposition parameters including mass fractions, mass mean diameters, and densities for broader source categories/groups are provided in Table 38.

In order to account for variability in ore and DR densities for different pits, pit-specific densities were used for the ore and DR for each modeling scenario, with the following exception – for haul roads, access roads, and portable crushers, the average DR density from YP, HF, and WE pits was used. Note, the BT density was excluded from those sources because the BT material will not be used for roads or construction. The pit-specific ore and DR densities are provided in Table 39.

5.11 Mobile Equipment Tailpipe Emissions

In its comments letter (IDEQ 2019) on the Midas modeling protocol, IDEQ recognizes that tailpipe emissions from mobile sources are not subject to permitting requirements and are therefore not considered for impact analyses. Traditionally, mobile source emissions are considered a part of background concentrations. Because the SGP facility is not constructed yet, IDEQ believes that the resulting tailpipe emissions are not a part of current background concentrations. Therefore, IDEQ suggested that at the least, the impacts from the SGP-related tailpipe emissions must be addressed qualitatively by demonstrating that the conservative aspects of modeling analyses ensure NAAQS compliance even if tailpipe emissions were not specifically included in the model.

Midas believes that even though SGP-related mobile equipment tailpipe emissions were not included in the modeling analyses, the results provided in this report are conservatively high, ensuring NAAQS compliance, for the following reasons:

- Inherent conservatism built into the regulatory dispersion modeling system.
- The estimated total ambient concentrations (maximum modeled design concentration plus the applicable design background concentration) from the SGP emissions were compared with applicable ambient standards for compliance demonstration. The estimated total ambient concentrations are expected to be conservatively high because the applicable design background concentrations were added to the maximum design model outputs, even though the two are not expected to be temporally or spatially paired.
- The modeled emissions were based on maximum short-term activity rates occurring continuously, including blasting emissions based on one blast occurring every hour for the applicable 1-hour standards, and two blasts occurring every day for the applicable 24-hour standards. The actual blasting is not expected to exceed one blast per day. Inflated daily production and mining activity rates were also used to estimate the conservatively high emissions from processing and mining sources.

PRI00000479

REC 1819

- Applicable mining activity fugitive emissions were concentrated in a single pit, a single material destination (crusher area or a DRSF), and a single hauling route for each of the multiple modeling scenarios. The actual mining activity fugitive emissions will be spread out over multiple pits, material destinations, and hauling routes for a given LOM year.

- The higher background concentrations that include medium traffic emissions discussed in Section 5.8.3 may be combined with the SGP model-predicted maximum design concentrations in Section 6.1 to provide an additional level of conservatism in demonstrating compliance.

Portable light plants powered by diesel-fired generators will be used to support nighttime operations at the SGP. The portable light plants will be operated within the SGP stationary source year-round and will not remain at any single location within the stationary source for more than 12 consecutive months. Therefore, these light plant generator engines will meet the following criteria of nonroad engines from 40 CFR 1068.30:

a) Mounted on a piece of equipment (i.e., skid, trailer, or platform) that is portable; and

b) Not remain at a single location for more than 12 consecutive months.

PRI00000480

REC 1820

6.0 RESULTS AND DISCUSSION

This section provides the SGP air quality analyses results for the criteria pollutants and TAP. The model input, output, and the associated processing files are provided on a digital media in Appendix D.

6.1 Criteria Pollutant Impact Results

As discussed in Section 4.6.1, SIL analyses were not performed for this report. The results (highest of 14 scenarios) from AERMOD dispersion modeling performed for the SGP NAAQS impact analyses are provided in Table 40. See Appendix C for the results of each scenario.

Table 40. SGP NAAQS Impact Analyses Results

Pollutant	Averaging Time[1]	Max. Conc. (μg/m³)	Model Scenario	Back. Conc. (μg/m³)	Total Conc. (μg/m³)	NAAQS (μg/m³)	In Compliance
CO	8 hours	6,218	W1	1,110	7,328	10,000	Yes
	1 hour	17,054	W1	1,740	18,794	40,000	Yes
NO_2	1 year	2.3	W1	0.9	3.2	100	Yes
	1 hour	116.7	B1	4.3	121.0	188	Yes
$PM_{2.5}$[2]	1 year	4.2	W5	3.5	7.7	12	Yes
	24 hours	11.0	W5	15.0	26.0	35	Yes
PM_{10}[2]	24 hours	75.7	W5	37.0	112.7	150	Yes
SO_2	3 hours	1.8	B1	16.8	18.6	1,300	Yes
	1 hour	3.2	B1	12.3	15.5	196	Yes

Max. Conc. = maximum modeled design concentration; Back. Conc. = background concentration; Total Conc. = total (modeled + background) concentration

[1] See Table 6 for the design values/ranks.

[2] Results with alternate meteorological data.

Table 40 provides the model-predicted maximum design concentration (including the hot-spot analyses) and the associated modeling scenario, the background concentration, and the estimated total concentration (SGP impact plus background) for each pollutant-averaging time combination. A comparison of the estimated total concentrations with the applicable NAAQS is also provided in this table.

As shown in Table 40, the estimated total concentrations from the SGP cumulative analyses do not exceed the applicable NAAQS.

The PM_{10} modeling with the meteorological dataset processed with the BULKRN method shows up to two receptors for three modeling scenarios (W1, W3, and W5) with slight exceedance of NAAQS. For these three scenarios, the PM_{10} 24-hour hot-spot analyses were performed with the

PRI00000481

REC 1821

alternate meteorological dataset processed without the BULKRN method (discussed in Section 5.2). The hot-spot analyses results show compliance with the PM_{10} 24-hour NAAQS, and the highest impact from the hot-spot analyses is shown in Table 40. For consistency purpose, the $PM_{2.5}$ results provided in Table 40 are also from the hot-spot analyses performed with alternate meteorological data.

The locations of the maximum impacts for each pollutant and averaging time are illustrated in Figure 10. The results presented in this figure include the hot-spot analysis conducted for each applicable pollutant-averaging time combination.

As discussed in Section 5.11, the higher background concentrations that include medium traffic emissions provided in Section 5.8.3 may be combined with the SGP model-predicted maximum design concentrations (Table 40) to provide an additional level of conservatism in demonstrating compliance. These results are shown in Table 41.

Table 41. SGP NAAQS Impact Analyses Results with Medium Traffic Background Concentrations

Pollutant	Averaging Time[(1)]	Max. Conc. (μg/m³)	Model Scenario	Back. Conc. (μg/m³)	Total Conc. (μg/m³)	NAAQS (μg/m³)	In Compliance
CO	8 hours	6,218	W1	1,145	7,363	10,000	Yes
	1 hour	17,054	W1	1,797	18,851	40,000	Yes
NO_2	1 year	2.3	W1	2.6	4.9	100	Yes
	1 hour	116.7	B1	14.3	131.0	188	Yes

SO_2	3 hours	1.8	B1	16.8	18.6	1,300	Yes
	1 hour	3.2	B1	12.3	15.5	196	Yes

Max. Conc. = maximum modeled design concentration; Back. Conc. = background concentration; Total Conc. = total (modeled + background) concentration

(1) See Table 6 for the design values/ranks.

(2) Results with alternate meteorological data.

Modeling for ozone and secondary $PM_{2.5}$ were not performed for this minor stationary source. These analyses are typically associated with applications for major stationary sources. Nonetheless, ratioing the VOC, NO_X, and SO_2 emissions from Table 2 and Table 4 by the emissions and resulting concentrations of O_3 and secondary $PM_{2.5}$ from EPA's modeled emission rates for precursors (MERPs) guidance yields estimated O_3 and secondary $PM_{2.5}$ concentrations of less than 1 ppb of O_3 and less than 0.1 μg/m³ of $PM_{2.5}$ (24-hour and annual)

PRI00000482

REC 1822

for the SGP. These estimated concentrations will have a negligible effect on compliance demonstration with the NAAQS.

☒ *Model input and output files for the cumulative NAAQS impact analyses are provided with the application.*

☒ *If there were modeled NAAQS violations, all violations were analyzed and clearly show that the project did not significantly contribute to those modeled violations. If there were multiple violations at a given receptor, all cumulative impacts (including background) for the averaging period analyzed were ranked along with the project contribution, and the project contributions were below the applicable SIL. A table was included to show all ranked impacts above the NAAQS along with the project contribution.*

6.2 TAP Impact Analyses

The SGP TAP modeling results and their comparison with the applicable AACC are provided in Table 42.

Table 42. SGP TAP Analyses Results

Pollutant	Averaging Time	Maximum Modeled Concentration (µg/m³)	Model Scenario	AAC (µg/m³)	AACC (µg/m³)	In Compliance
Antimony	24 hours	0.02705	B1	25	--	Yes
Arsenic	Annual	0.00008	All	--	0.00023	Yes
Cadmium	Annual	0.00001	All	--	0.00056	Yes
Formaldehyde	Annual	0.00076	All	--	0.077	Yes
Nickel	Annual	0.00006	All	--	0.0042	Yes
Sulfuric Acid	24 hours	0.52563	All	50	--	Yes

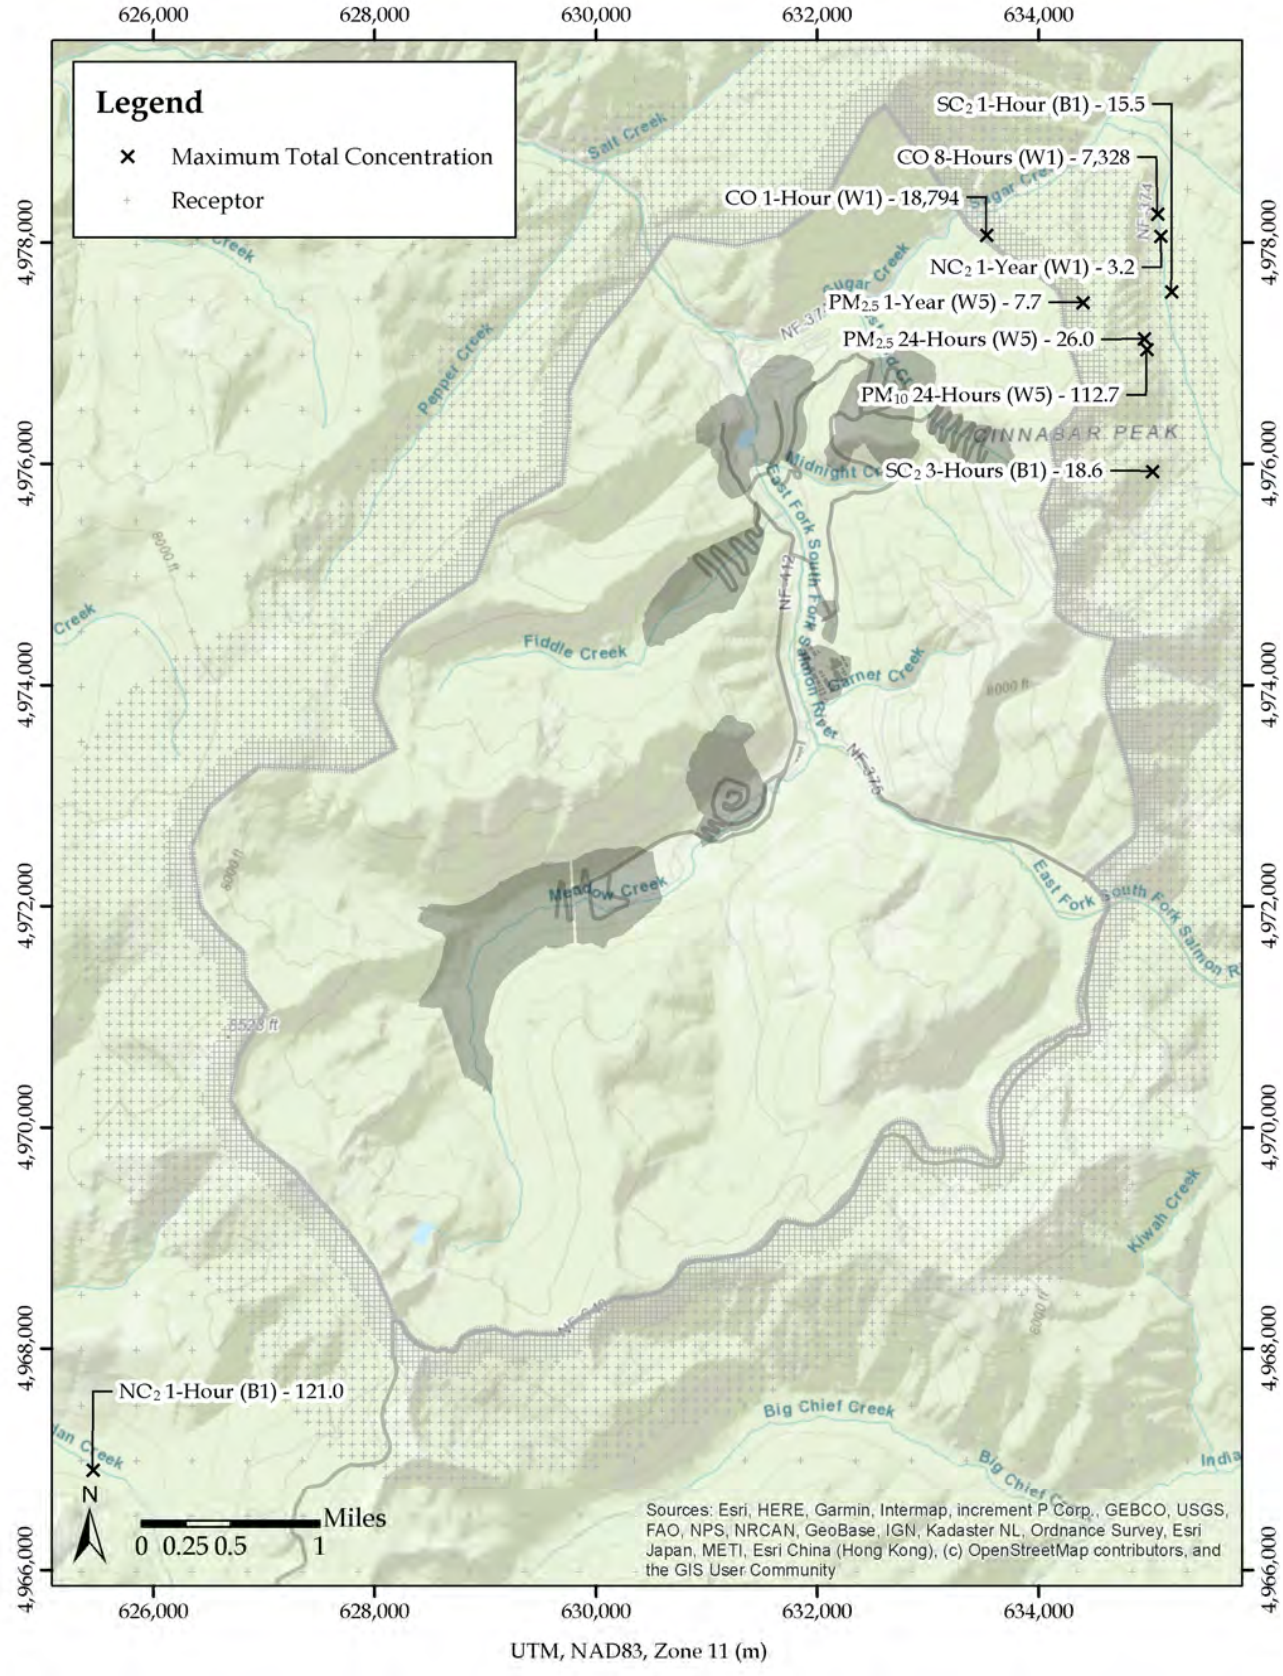

Table 42 shows that the modeled TAP impacts from the SGP sources do not exceed the applicable AACC.

The locations of the maximum impacts for each TAP are presented in Figure 11.

7.0 QUALITY ASSURANCE/CONTROL

Proven and standard quality assurance and quality control methods were used to ensure that possible errors were identified and eliminated. Applicable agency-reviewed and approved datasets (meteorological, background) were used. Utmost care and caution were exercised during each step of the emission and source characterization, model setup, and data processing (AERMAP, AERSURFACE, AERMET, BPIP, etc.)

The emission factors, underlying assumptions, calculations, and characterizations for the model input were peer and/or agency-reviewed for accuracy and appropriateness. The model input building and source characterization were carefully reviewed using the Air Sciences visual model tool available at https://aerearth.airsci.com/. This tool generates a three-dimensional depiction of the buildings and sources from AERMOD input files that can be reviewed on Google Earth. Other in-house tools were utilized to verify if the emission rates and source parameters were accurately imported into the AERMOD input files. Model output files and results were carefully reviewed to identify and eliminate possible errors. Additional modeling tools like source contributions, were used to logically verify the modeling results.

Tables

Table 1. Summary of Parameters and Conservatism A-2

PRI00000493

REC 1833

1.0 Introduction

This appendix provides conservatism analyses, requested by DEQ, for four key parameters used in the modeling analyses:

- Unpaved Road Daily Emission Factor
- Unpaved Road Control Efficiency
- Mining Production Rate
- AERMOD Model

These analyses are presented on the DEQ form provided to Midas Gold during the October 15, 2019 application meeting. The level of conservatism of each parameter is summarized in Table 1.

Table 1. Summary of Parameters and Conservatism

Parameter	Value Used in Application	Comparative Value	Comparative Value Basis
Unpaved Road Daily Emission Factor	3.55 lb PM_{10}/VMT	0.683 lb PM_{10}/VMT	Wyoming Division of Air Quality
Unpaved Road Control Efficiency			
• Chemical suppressants (all tpyes)	90%	90% - 99%	AP-42 Section 13.2.2 referenced test reports
• $MgCl_2$	90%	98%	AP-42 Section 13.2.2 referenced test reports
• Watering	33%	75% - 95%	AP-42 Figure 13.2.2-2
Mining Production Rate	65,700,000 ton/yr 2 blast/day	42,692,000 ton/yr 1 blast/day	Actual peak production rates
	Unit Model Results	**Unit Observed Results**	
AERMOD Model	**1.41 – 3.21**	**1**	EPA evaluation studies

As shown in Table 1, the parameters used in the application are conservative.

PRI00000494

REC 1834

2.0 Unpaved Road Daily Emission Factor

Parameter / Assumption / Data**:** Unpaved Road Daily Emission Factor
Description: AP-42 Section 13.2.2. Unpaved Roads, $E = k (s/12)^a (W/3)^b$ where • E = 3.55 lb PM_{10}/VMT • k, a, b = empirical constants provided in AP-42 Table 13.2.2-1 • s = surface material silt content (4%) • W = mean vehicle weight (182.6 tons)
Sensitivity of Results to Parameter: Haul truck travel on haul roads accounts for 50% of the total daily PM_{10} emissions and 32% of the total daily $PM_{2.5}$ emissions (based on Scenario W5; the highest PM_{10} and $PM_{2.5}$ modeling scenarios).
Uncertainty Associated with Parameter Value: The EPA quality rating for this emission factor is B. This quality code is retained because of the following: • The silt content used comes from onsite data.[1,2] • The silt content (4%) is in the AP-42 range of 1.8%–25.2%. • The mean vehicle weight (182.6 tons) is in the AP-42 range of 2–290 tons. [1] Note that the use of non-onsite, default silt values from AP-42 Table 13.2.2-1 would reduce the quality code by two letters (EPA 2006). [2] The use of onsite parent soil silt data is conservative because tests "show that road silt is normally lower than in the surrounding parent soil" (EPA 2006).
Variability of Parameter: The emission factor varies by silt content and mean vehicle weight. The applicable ranges for these parameters are as follows: • Silt – 3.5%–4%[1] • Mean vehicle weight – 59.4–256.6 tons[2] [1] The silt value is derived from site-specific soil data: a geomean of 3.5% and a median value of 4.0% (Midas Gold 2015). See the soil data calculation following this form. As noted in the background documentation for EPA AP-42 Section 13.2.2, EPA uses the geomean to average environmental measurements, as these measurements vary widely and do not yield a normal distribution curve (MRI 1998) (MRI 2006); however, this application uses the higher median value for a more conservative estimate. [2] A weight of 182.6 tons was used in this application, and it is based on a 20:12 ratio of 200- and 44-ton haul trucks with average weights of 256.6 and 59.4 tons, respectively. A higher ratio of 200-ton trucks would result in a higher emission factor. However, it would also reduce the number of hauling trips and vehicle miles traveled (VMT), which would lower emissions.
Conservatism of Parameter: The conservatism of the emission factor can be assessed by comparing the emission factor used in the application with the Wyoming Division of Air Quality (WDAQ) unpaved road emission factor: $E = k*0.81s(S/30)^2(0.62)(2.5)$. where • E = 0.683 lb PM_{10}/VMT • k = PM_{10} size fraction factor; 1.5/4.9 = 0.306 (EPA 2006)

PRI00000495

REC 1835

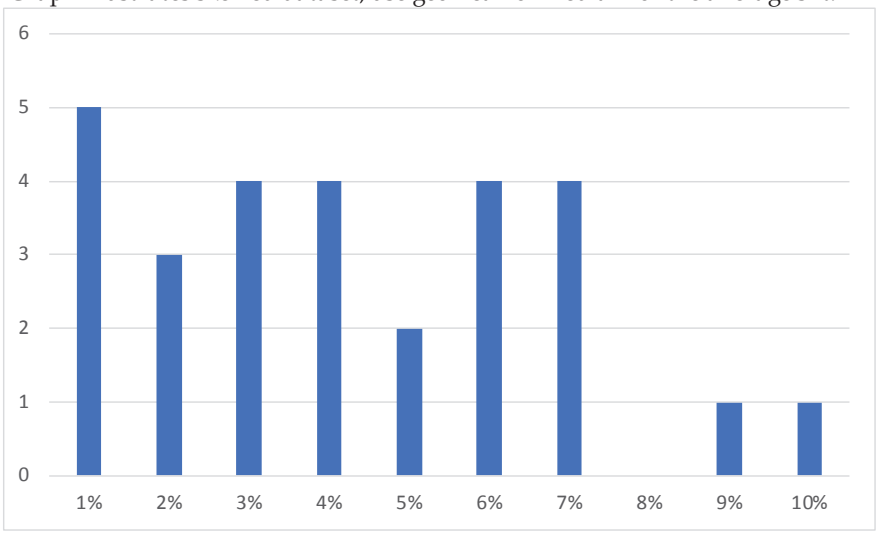
- s = surface material silt content; 4%
- S = vehicle speed; 20 mph

The application value of 3.55 lb PM_{10}/VMT is more conservative than the WDAQ value of 0.683 lb PM_{10}/VMT.

Other Notes/Considerations: AP-42 suggests that the silt content of a chemically treated road may be increased through the grinding of small particles by vehicles. AP-42 provides no information as to what this increase might be or how it is calculated. AP-42 also states that the same vehicles will decrease the road silt content because "fines are continually removed by the vehicle traffic" (EPA 2006).

Neither AP-42 nor the AP-42 background documents provide any quantification of the competing vehicle processes that both increase road silt (vehicle grinding) and at the same time decrease it (vehicle traffic). Midas Gold knows of no methodology that has been used in air quality analyses to quantify the net effect of vehicles on the silt content of chemically treated roads.

It is, however, a common and accepted practice to apply control efficiency for chemical suppressant application and/or watering to the unpaved road emission factor and to use a silt value from the following sources, presented from most to least representative:



- Onsite data; parent soil silt is a conservative approximation of road surface silt
- EPA default values by state; Idaho
- AP-42 default values from Table 13.2.2-1; "use of this data is strongly discouraged when it is feasible to obtain locally gathered data" (EPA 2006)

3.0 Unpaved Road Control Efficiency

Parameter / Assumption / Data: Unpaved Road Control Efficiency

Description:

- 90% control efficiency for dust from chemical dust suppressant application
- 33% control efficiency for dust from watering for daily emissions
- 0% control efficiency for dust from watering for annual emissions (the precipitation equation is used instead of a control efficiency factor)

Sensitivity of Results to Parameter: See the discussion in Section 2.0.

Uncertainty Associated with Parameter Value: The control efficiency is dependent on proper application, which can be verified through monitoring and record keeping.

Variability of Parameter:

Chemical Suppressant Application

Air Sciences' memorandum dated January 12, 2018 (Air Sciences 2018) provides the range of control efficiencies published in the chemical suppressant test studies referenced by AP-42 Section 13.2.2. These test studies measured a variety of chemicals and showed the following ranges of control efficiencies for PM_{10}:

- All chemicals: 90% to 99%
- Hygroscopic chloride salts (e.g., $CaCl_2$ and $MgCl_2$): 93% to 98%[1]

[1] The DRI 1996 test study (DRI 1996) cited a 1994 test study that showed a 98% reduction in PM_{10} emissions from unpaved roads treated with $MgCl_2$ (Flocchini et al. 1994). This data point was not included in the Air Sciences' memorandum because the memorandum only included the results from the actual test studies conducted for the purpose of the report and not data cited from other documents for comparative purposes.

Midas Gold currently plans to use $MgCl_2$ (Midas Gold 2016), but it may use other chemicals that are equally effective and environmentally safe.

Watering

Watering reduces dust by 75% to 95%. See AP-42 Figure 13.2.2-2 (EPA 2006) for moisture ratios ranging from 2 to 5. Because the unpaved road emission factor in AP-42 Section 13.2.2 is based on a very dry surface moisture of 0.2% (MRI 1998), increasing the surface moisture to only 1% moisture is all that is required to achieve 95% control.

Conservatism of Parameter: The conservatism of the control efficiency can be assessed by comparing the values used in this application with the AP-42 data discussed above:

- **The application value of 90% for chemical suppressant is more conservative than the AP-42 referenced test data of 90% to 99% (98% for $MgCl_2$).**
- **The application value of 33% for watering is more conservative than the AP-42 range of 75% to 95%.**

Other Notes/Considerations:

PRI00000498

REC 1838

4.0 Mining Production Rate

Parameter / Assumption / Data: Mining Production Rate
Description: This application is based on the following mining production rates: • 180,000 ton/day, total of ore and development rock • 2 blast/day
Sensitivity of Results to Parameter: Mining activities account for 95% of the total PM_{10} emissions and 73% of the total $PM_{2.5}$ emissions (Scenario W3).
Uncertainty Associated with Parameter Value: None – These production rates are highly conservative maximums, which can be verified through monitoring and record keeping.
Variability of Parameter: None – These production rates are highly conservative maximums.
Conservatism of Parameter: The conservatism of the mining production rates can be assessed by comparing the values used in this application with the actual production rates for the peak mining year. During the peak mining year, the production will be 42,692,000 ton/yr and 1 blast/day. **The application values of 62,700,000 ton/yr (180,000 ton/day * 365 day/yr) and 2 blast/day are more conservative than the actual peak production rates of 42,692,000 ton/yr and 1 blast/day.**
Other Notes/Considerations:

5.0 AERMOD Model

Parameter / Assumption / Data: AERMOD Model

Description:
This application utilized the AERMOD model to predict ambient air pollutant concentrations. The meteorological data processing (met processing) utilized the default options of the adjusted surface friction velocity (ADJ_U*) and the Bulk Richardson (BULKRN) method for boundary-layer parameter calculations or the non-BULKRN method that included McCall cloud cover data.

Sensitivity of Results to Parameter: Not applicable

Uncertainty Associated with Parameter Value: None – The model and met processing options are EPA-approved default methods.

Variability of Parameter: None – The maximum design value (a single value for each pollutant and averaging time) is used to determine compliance.

Conservatism of Parameter: The conservatism of the model and met processing was evaluated by EPA as a part of its approval process. This evaluation quantified the bias of the model compared to the actual observed concentrations. The results of the evaluation for the same modeling conditions[1] used in this application are provided below:

Evaluation	Modeled/Observed[2]
Tracy Power Plant, NV	1.7
Lovett Power Plant, NY	2.21–3.21
Oak Ridge, TN	1.41
Cordero Rojo Mine, WY	1.72
Idaho Falls, ID	2.08

[1] The modeling conditions for the above evaluation studies are as follows: complex terrain and/or low-level sources, 10-meter tower meteorological data, and met processing with ADJ_U*, no turbulence, and non-BULKRN (EPA 2018) (EPA 2017) (EPA 2016). The conditions match those used in the application.
[2] (EPA 2017)

The AERMOD modeling performed for the application has a conservative bias to over predict impacts by a factor of 1.41 to 3.21.

Other Notes/Considerations: As discussed above, modeling was performed using the following two methods:

- ADJ_U*/BULKRN
- ADJ_U*/non-BULKRN (the same method as that in the EPA evaluation studies)

For all model runs, the ADJ_U*/BULKRN method resulted in higher design value concentrations than the ADJ_U*/non-BULKRN method did; therefore, the percentage of conservatism for the ADJ_U*/BULKRN method is higher.

(1) *HAP/TAP from propane combustion. Detailed emission calculations are provided in ProcHAP sheet.*

(2) *HAP/TAP from diesel combustion. Detailed emission calculations are provided in ProcHAP sheet.*
Diesel engine HAP are regulated by 40CFR63, Subpart ZZZZ and therefore exempt from TAP analysis per IDAPA 58.01.01 Section 210.20.

(3) *HAP/TAP from material processing. Detailed emission calculations are provided in ProcHAP sheet.*

(4) *Fugitive HAP/TAP from mining activity. Detailed emission calculations are provided in MineHg sheet.*

(5) *Non-carcinogenic emission screening level (EL) from IDAPA 58.01.01 Section 585.*

(6) *Carcinogenic EL from IDAPA 58.01.01 Section 586.*

TRUE

GHG Emissions Summary

Source Category	CO2e *(ton/yr)*
Propane Combustion	28,708
Diesel Combustion	246
Autoclaving	47,316
Lime Kiln	30,311
Total GHGs	**106,580**

GHG and Emission Summary by Source

ID Description CO2e_tpy

Source ID	Description	CO2e ton/yr
Sb1	Sb Dryer (2.72 MMBtu/hr Propane-Fired)	1,658
ACB	POX Boiler (17 MMBtu/hr Propane-Fired)	35
CKB	Carbon Regeneration Kiln (Burners)	1,375
PV	Propane Vaporizer (0.1 MMBtu/hr Propane-Fired)	61
HS	Strip Circuit Solution Heater (5 MMBtu, Propane-Fired)	3,048
H1M	Mine Air Heater #1 (4 MMBtu/hr Propane-Fired)	2,438
H2M	Mine Air Heater #2 (4 MMBtu/hr Propane-Fired)	2,438
HM	Mill HVAC Heaters (4 x 1.0 MMBtu Propane-Fired)	2,438
HAC	Autoclave HVAC Heater (0.25 MMBtu Propane-Fired)	152
HR	Refinery HVAC Heater (0.25 MMBtu Propane-Fired)	152
HA	Admin HVAC Heater (0.25 MMBtu Propane-Fired)	152
HMO	Mine Ops. HVAC Heaters (2 x 0.25 MMBtu Propane-Fired)	305
HTS	Truck Shop HVAC Heaters (2 x 1.0 MMBtu Propane-Fired)	1,219
HW	Warehouse HVAC Heaters (3 x 1.0 MMBtu Propane-Fired)	1,829
LKC	PFR Shaft Lime Kiln Combustion	11,407
EDG1	Camp Emergency Generator	77
EDG2	Plant Emergency Generator #1	77
EDG3	Plant Emergency Generator #2	77
EDFP	Mill Fire Pump	15
AC	Autoclave	47,316
LK	Parallel Flow Regenerative (PFR) Shaft Lime Kiln	30,311
Total		106,580

AIR EMISSION CALCULATIONS	PROJECT TITLE: Stibnite Gold Project	BY: K. Lewis
	PROJECT NO: 335-1-4	PAGE: 1 OF: 2 SHEET: MineLimits
	SUBJECT: Max Case Operation	DATE: June 22, 2020

Maximum Mining Activity Rate

Maximum Operating Schedule

24 hr/day
365 day/yr

Maximum Production

180,000 ton/day, ore and rock *(Midas Gold 2019b)*
180,000 ton/day, ore *(Midas Gold 2019b)*
180,000 ton/day, rock *(Midas Gold 2019b)*

2 blasts per day *(Midas Gold 2019b)*
600 holes per blast *(Midas Gold 2019a)*

Material density 150.2 lb/ft^3 *(Midas Gold 2017b), Average Ore & Waste (YP, HF, WE, BT)*

0.075 ton/ft^3

Material specific volume 13.3 ft^3/ton

TD volume (V) 1,896 ft^3

Conical surface calculations

Side slope 38 deg *Typical*

0.7 rad

Conical surface area (SA) Π × r × (h^2 + r^2)^0.5

Conical volume (V) (Π × h × r^2) ÷ 3

Conical base radius r = s × cos(slope)

Conical height h = s × sin(slope)

Sloped side length s = (h^2 + r^2)^0.5

Solution of conical volume equation

Replacing h and r with s × sin(slope) and s × cos(slope), respectively:

s = [3 × V/(pi × sin(slope) × cos^2(slope)]^(1/3) 16.8 ft

r 13.2 ft

h 10.3 ft

SA 698 ft^2

Model Scenario W3

Wind Erosion - continued

Stockpile Surface Wind Erosion Event Emission Calculations - Notes

(1) u10 = wind speed at 10 meters reference height, m/s

(2) u10+ = fastest-mile wind speed, m/s
Based on hourly to fastest-mile wind speed conversion factor of 1.2 *(EPA 1994)*

(3) Pile: u* = friction velocity, m/s = (us/ur) × 0.1 × u10+ *AP-42, Sec. 13.2.5, Eqs. 6 & 7, 11/06*

Area ID	A	B	C
(us/ur)	0.9	0.6	0.2

AP-42, Page 13.2.5-10, 11/06

Flat surface:
u* = friction velocity, m/s = 0.053 × u10+ *AP-42, Sec. 13.2.5, Eq. 4, 11/06*

(4) Hours elapsed since previous wind erosion event

(5) Erodible surface area = hours elapsed since previous erosion event × hourly erodible surface area (acre) × surface regime area fraction Surface regime area fractions:

Area ID	A	B	C
% Surface	0.12	0.48	0.4

AP-42, Page 13.2.5-10, 11/06

(6) Erosion potential, g/m^2, = P = 58(u* - ut*)^2 + 25(u* - ut*); P = 0 for u* ≤ ut*
where, ut* = threshold friction velocity = 1.02 m/s *AP-42, Page 13.2.5-5 (overburden), 11/06*
P converted to lb/acre by multiplying with: 0.002205 lb/g and 4,046.86 m^2/acre
Solving u* = (us/ur) × 0.1 × u10+ for u10, when u* = ut* = 1.02 m/s and u10+ = u* × 1.2
yields the following minimum wind speeds to disturb the each stockpile surface regime:
ID-A 9.44 m/s
ID-B 14.17 m/s
ID-C 42.50 m/s
The threshold wind speed to disturbe flat surfaces is 1.02/0.053/1.2
Flat surface 16.04 m/s
The maximum hourly wind speed in the onsite data is 10.4 m/s, which is less than the threshold wind speeds to cause a disturbance of stockpile regimes ID-B and ID-C, and flat surfaces.

(7) PM emissions, lb = P (lb/acre) × erodible surface area (acre)

(8) Total PM emissions, lb = PM (ID-A), lb + PM (ID-B), lb + PM(ID-C), lb

(9) Total PM10 emissions, lb = total PM emissions, lb × PM10 scaling factors of 0.5 *AP-42, Page 13.2.5-3, 11/06*

(10) Total PM2.5 emissions, lb = total PM emissions, lb × PM2.5 scaling factors of 0.075 *AP-42, Page 13.2.5-3, 11/06*

Subject: **Facility ID No. 085-00011, Perpetua Resources Idaho, Inc., Stibnite Gold Project –TAP Addendum Report**

Dear **Ms. Wetzel**:

Perpetual Resources, Inc. is providing the enclosed TAP Addendum report (Addendum) for the Stibnite Gold Project. The Addendum contains the hazardous air pollutant (HAP) and toxic air pollutant (TAP) emissions calculations provided in the PTC application and as requested by IDEQ, supplements that information to support IDEQ's responses to comments.

If you have any questions regarding this submittal, please contact me at 208-901-3053 or alan.haslam@perpetua.us.

Thank you for reviewing this information.

Sincerely,
Perpetua Resources

Alan Haslam
Vice President – Permitting

REC 1925

1.0 INTRODUCTION

On September 10, 2020 and February 18, 2021, the Idaho Department of Environmental Quality (IDEQ) provided notices for public comment on the Perpetua Resources Idaho, Inc. (hereafter referred to as Perpetua Resources) Stibnite Gold Project (SGP) complete application materials (Application), draft permit to construct (Draft PTC), and statement of basis (SOB). The public comments received included requests for additional information regarding hazardous air pollutant (HAP) and toxic air pollutant (TAP) emission estimates and modeling.

The purpose of this TAP Addendum (Addendum) is to provide that additional information to support IDEQ's responses to comments. The information provided in this Addendum confirms the following determinations made by Perpetua Resources and IDEQ at the time of the public notices:

1. The SGP is an area source for HAP emissions.
2. The SGP complies with the Idaho TAP provisions (IDAPA 58.01.01.210).
3. The SGP complies with the Idaho mercury rule (IDAPA 58.01.01.215).

This Addendum supplements information in the complete Application and supports those determinations highlighted during the public comment. Section 2.0 provides a description of the HAP/TAP emission calculations and source status. Section 3.0 provides a TAP emissions evaluation and modeling analysis, including TAP emission sources covered by IDAPA 58.01.01.210.20. Section 4.0 compares arsenic modeling analyses for actual and potential arsenic emissions. Section 5.0 provides a discussion of the emission reductions that demonstrate compliance with carcinogenic TAPs. Section 6.0 provides a Toxic Air Pollutant Reasonably Available Control Technology (T-RACT) analysis. Section 7.0 provides proposed permit conditions for demonstrating compliance with carcinogenic TAPs, and Section 8.0 provides a discussion of mercury emissions, including mercury emission sources covered by IDAPA 58.01.01.215.01.

IDAPA 58.01.01.210 and 215 reduce the information required from a PTC applicant and streamline the PTC review required by IDEQ in those circumstances where the HAP/TAP emissions are covered or addressed by federal regulations (IDAPA 58.01.01.210) or the mercury emissions are below a specific exemption threshold (IDAPA 58.01.01.215). Perpetua Resources referenced these rules in the Application and relied on these provisions to present a complete HAP/TAP emissions inventory that aligned with these rules. To support IDEQ's responses to public comments, IDEQ requested that Perpetua Resources expand its HAP/TAP analyses beyond the requirements of these rules and reconfirm compliance with TAP thresholds. This additional work reconfirms IDEQ's earlier findings that the SGP is an area source, and the proposed HAP/TAP emissions comply with IDAPA 58.01.01.210 and 215.

PRI00000586

REC 1926

2.0 HAP/TAP EMISSIONS

During the two IDEQ public comment periods, IDEQ received comments regarding the following:

1. SGP source status for HAPs
2. Metal HAP/TAP emissions from fugitive dust
3. Metal HAP/TAP emissions from the autoclave and lime kiln processes
4. Fugitive emissions of hydrogen cyanide (HCN)

To support IDEQ's responses to comments and confirm the SGP area source status, the potential-to-emit (PTE)[1] HAP/TAP emission inventory in Appendix A of this Addendum contains emission calculations for all HAPs and TAPs emitted from all the SGP processes, including:

- Metals from mining fugitive dust emissions
- Metals from ore processing, ore concentration and refining, and lime, aggregate, and concrete production
- Antimony (Sb) emissions from the Sb drying and bagging circuit
- Sulfuric acid (H_2SO_4) and hydrogen sulfide (H_2S) from the autoclave, and hydrochloric acid (HCl) emissions and lime kiln
- Evaporative HCN from cyanide leaching and the tailings storage facility
- Various HAPs/TAPs from fuel storage and combustion
- Carbon disulfide emissions from the use of xanthate
- Evaporative mercury from mining surfaces

This HAP/TAP emission inventory was conducted for all 14 modeling scenarios evaluated in the Application. The emissions provided in Appendix A reflect the highest emissions scenario (HAP/TAP Emission Calculations – Scenario W3, 180,000 T/day).[2]

[1] PTE in this Addendum refers to the potential emissions after applying all proposed *air pollution control equipment and restrictions on hours of operation or on the type or amount of material combusted, stored or processed* per IDAPA 58.01.01.006.88 (i.e., PTE is the proposed permitted emissions).

[2] HAP/TAP Emission Calculations – Scenario W3, 180,000 T/day: HAP/TAP emissions based on the potential mining production rate of 180,000 tons per day (T/day) and the highest emissions scenario (Modeling Scenario W3).

PRI00000587

REC 1927

2.1 Description of HAP Source Status

2.1.1 Controlled HAP Emissions

The controlled HAP emissions (PTE) from the SGP are below the major source thresholds; therefore, the SOB classified the SGP as an area source for HAP emissions. This is consistent with EPA's determination that all U.S. gold mine ore processing and production facilities are area sources.[3] The emissions inventory provided in Appendix A shows the total HAP emissions are 3.67 tons per year (ton/yr) for a single HAP and 12.56 ton/yr for all the HAPs combined for the highest emissions scenario (Modeling Scenario W3). The major source levels are 10 ton/yr for a single HAP and/or 25 ton/yr for all the HAPs combined.

2.1.2 Uncontrolled HAP Emissions

Uncontrolled HAP emissions are estimated to exceed 25 ton/yr, combined; therefore, to support the area source designation, Perpetua Resources committed to operational limitations and emission controls in the Application that achieve area source status.

2.2 Description of HAP/TAP Emission Calculations

This section provides a brief description of the methods used to calculate the HAP/TAP emissions provided in Appendix A. The references used for the HAP/TAP calculations were presented in the Application. Any new references are provided in this section.

2.2.1 Metal Emissions from Mining Fugitive Dust

The metal HAP/TAP emissions from fugitive dust generated by mining activities (drilling, blasting, excavating, hauling, etc.) were calculated by multiplying the HAP/TAP-specific median metal concentration in the ore[4] by the activity-specific total particulate matter (PM) emissions. The median metal concentrations were derived from over 55,000 core samples taken primarily from the more mineralized zones of the SGP pits (i.e., in and around gold ore deposits).

This emissions inventory does not reflect any of the emission reductions described in Section 5.0 for carcinogenic TAP compliance.

[3] *EPA recently gathered data and evaluated emissions of other HAP, including cyanide and non-mercury metals. The data indicate that the gold mining processing and production category consists of only area sources (i.e., facilities that emit less than ten tons per year of any one HAP and less than 25 tons per year of any combination of HAP)* (EPA 2010).

[4] Iron (Fe) and selenium (Se) were not included in the Application because the concentrations of these metals were similar to typical crustal abundance levels. In response to comments on HAPs/TAPs emissions, the concentrations of these metals (18,200 ppm of Fe and 0.4 ppm of Se) are provided (Midas Gold 2020).

PRI00000588

REC 1928

2.2.2 Metal Emissions from Ore Processing and Lime/Aggregate Production

2.2.2.1 Crushing, Screening, and Material Handling

The metal HAP/TAP emissions generated by process and production sources (the crushing, screening, and handling of ore, limestone, lime, and aggregate) were calculated by multiplying the PM emissions from these sources by the median concentration of metals in the ore, limestone, lime, or aggregate. The ore median metal concentrations are discussed in Section 2.2.1. The limestone, lime, and aggregate metal concentrations are provided in Table 1.

The limestone metal concentrations were measured from core hole samples through the middle marble formation in the proposed limestone quarry's footprint. These rock samples were specifically analyzed to assess the formation as a viable limestone source. As a conservative estimate, the limestone metal profile was also used for aggregate production.

Table 1. Metal TAP Concentrations for Limestone and Lime

CAS	TAP Name	Concentration (ppm) [1]
7440-38-2	Arsenic	23

7440-36-0	Antimony	2.5
7723-14-0	Phosphorus	130
7440-22-4	Silver	0
7429-90-5	Aluminum	22,600
7440-39-3	Barium	145
1317-65-3	Calcium Carbonate [2]	274,500
1305-78-8	Calcium Oxide [3]	740,000
7440-50-8	Copper	5
7439-89-6	Iron	10,350
7439-98-7	Molybdenum	0.5
7440-28-0	Thallium	5
7440-61-1	Uranium	5

PRI00000589

REC 1929

CAS	TAP Name	Concentration (ppm) [1]
7440-62-2	Vanadium	15.5
7440-33-7	Tungsten	5
7440-66-6	Zinc	18

[1] Median of 98 samples of the SGP limestone material (M3 2018).
[2] Calcium carbonate ($CaCO_3$) is used for limestone processing.
[3] Calcium oxide (CaO) is used for lime processing. 40% to 74% CaO (NLA 2007).

2.2.2.2 Lime Kiln

The non-mercury metal HAP/TAP emissions from the lime kiln were calculated by multiplying the PM emissions by the median concentration of metals in the limestone shown in Table 1. The mercury emissions from the lime kiln were conservatively estimated by assuming all mercury in the limestone feed is volatilized and emitted.

2.2.2.3 Autoclave

Mercury emissions from the SGP autoclave were based on the SysCAD modeling of the SGP autoclave performed by Perpetua Resources' engineering contractor: M3 Engineering. This modeling predicted 0.0105 grams per second of mercury emissions exiting the autoclave mercury control system, which is comprised of a venturi scrubber, a vent gas cleaning tower, a vent gas steam condensation tower, and one or more sulfur-impregnated activated carbon filters.

The non-mercury metal HAP/TAP emissions from the autoclave mercury control system are expected to be less than the mercury emissions because non-mercury HAP/TAP emissions are only particulates and more easily controlled by the emissions control system. Mercury emissions move through the control system as both particulate and gas. For this review, the non-mercury HAP/TAP emissions were conservatively assumed to be equal to the mercury emissions.

2.2.2.4 EW Cells, Pregnant Solution Tank, Retort, Furnace, and Carbon Kiln

Mercury emissions from the SGP electrowinning (EW) cells, pregnant solution tank, mercury retort, induction melting furnace, and carbon regeneration kiln were calculated based on stack test data from similar sources utilizing similar mercury control systems at Nevada gold mines.

The non-mercury metal HAP/TAP emissions exiting these mercury control systems are expected to be less than the mercury emissions because non-mercury HAP/TAP emissions are only particulates and more easily controlled by the emissions control system. Mercury emissions move through the control system as both particulate and gas. For this review, the non-mercury HAP/TAP emissions were conservatively assumed to be equal to the respective mercury emissions.

PRI00000590

REC 1930

2.2.2.5 Antimony Dryer and Dry Bagging

The Sb circuit proposed in the Application was replaced with a new dewatering/packaging circuit. The new circuit eliminates the potential for metal emissions from dust and mercury evaporation emissions from concentrate heating. Instead, the Sb concentrate will be dewatered using a filter press and then bagged as a wet (damp) product. There are no HAP/TAP emissions associated with this new circuit.

2.2.3 Metal Emissions from Concrete Production

The metal HAP/TAP emissions from concrete production were calculated using EPA emission factors from AP-42 Section 11.12, Concrete Batching. This section provides controlled emission factors for cement silo filling and central mix batching. There are no emission factors for cement silo unloading. Therefore, the cement silo filling factors were used for cement silo unloading as a conservative estimate.

Chromium (VI) percentages of the total chromium were provided by IDEQ for cement silo filling and central mix batching. These percentages were used to calculate chromium (VI) emissions from cement silo filling and unloading and central mix batching.

There are no HAP/TAP emission factors for the dust generated from aggregate handling in the concrete production process. As a conservative estimate, the limestone metals profile provided in Table 1 of Section 2.2.2.1 was used to estimate the HAP/TAP emissions from aggregate handling.

2.2.4 H_2SO_4 and H_2S Emissions from the Autoclave

H_2SO_4 and H_2S emissions from the SGP autoclave were calculated based on source test data from similar autoclaves at gold mines in Nevada.

2.2.5 HCl Emissions from the Lime Kiln

The HCl emissions from the lime kiln were calculated using the HCl emission factor obtained from EPA's EPCRA Section 313 Guidance for Reporting Hydrochloric Acid (EPA 1999b).

2.2.6 HCN Emissions from Cyanide Leaching and Tailings Storage Facility

The evaporative HCN emissions from cyanide leaching and the tailings storage facility were calculated using the flux methodology developed by EPA and the Nevada Mining Association as part of the 40 CFR 63 rule-making process. The methodology is based on empirical measurements at several gold mines in Nevada taken under the direction of EPA. Numerous gold mines in several states have used this method since its development in 2010.

2.2.7 HAP/TAP Emissions from Fuel Storage and Fuel Combustion

HAP/TAP emissions from fuel combustion (propane and diesel) were calculated using fuel combustion rates and the applicable EPA AP-42 emission factors.

PRI00000591

REC 1931

HAP/TAP emissions from fuel storage (gasoline) were calculated from the tank volatile organic compound (VOC) emissions multiplied by the weight percentages of HAP/TAP in the fuel. The percentages were obtained from EPA's EPCRA Section 313 Industry Guidance Metal Mining Facilities, Table 3-8 for gasoline (EPA 1999a).

2.2.8 Carbon Disulfide Emissions from Xanthate

Carbon disulfide (CS_2) emissions from potassium amyl xanthate (PAX) use were calculated based on the decomposition of xanthate to CS_2 gas. The decomposition rate was determined from published experimental data.

2.2.9 Evaporative Mercury Emissions from Mining Surfaces

Mercury can evaporate from rock surfaces in pits, tailings facilities, development rock storage facilities, and stockpiles. The rate of mercury evaporation (or flux) is a function of the mercury concentration in the material. Mercury flux rates and concentration measurements taken at a gold mine in Nevada were adjusted for the SGP mercury concentrations to estimate mercury flux emissions from the SGP pits, tailings facility, development rock storage facilities, and ore stockpiles.

PRI00000592

REC 1932

3.0 TAP ANALYSIS

A complete inventory of the PTE TAP emissions is provided in Appendix A, as discussed in Section 2.0. Appendix A also identifies the applicability of IDAPA 58.01.01.210.20. According to IDAPA 58.01.01.210.20, no further demonstration of compliance with the TAP provisions is required to obtain a PTC for new source emissions, such as the SGP, from:

a. The equipment or activities covered by a New Source Performance Standards (NSPS) or National Emissions Standards for Hazardous Air Pollutants (NESHAP); or

b. The source category of equipment or activities addressed by a NSPS or NESHAP even if the specific equipment or activity is not subject to compliance requirements under the federal rule.

After applying IDAPA 58.01.01.210.20 as described in Section 3.1, the remaining TAP emissions are subject to further compliance demonstration and are compared to the screening emission levels (EL) described in Section 3.3. TAP emissions that below the screening EL, require no further demonstration of compliance with the TAP provisions. TAP emissions above the screening EL require modeling, as described in Section 3.4. To identify the TAPs subject to review, Section 3.2 provides a comparison of the metals analyzed in the SGP ore, development rock, and limestone to the TAPs listed in IDAPA 58.01.01.585 and IDAPA 58.01.01.586.

3.1 Equipment or Activities Covered or Addressed by NESHAP or NSPS

In accordance with IDAPA 58.01.01.210.20, the equipment and activities at the SGP that are either covered or addressed by NESHAP or NSPS are discussed in the following subsections. TAPs emitted from these sources that are also HAPs require no further evaluation to demonstrate compliance with the TAP provisions. TAP emissions from these sources that are not HAPs require additional review to demonstrate compliance with the TAP provisions.

3.1.1 NESHAP Subpart ZZZZ

40 CFR 63, Subpart ZZZZ, NESHAP for Stationary Reciprocating Internal Combustion Engines covers HAP emissions from the SGP emergency generators and fire pump (Source ID No. EDG1, EDG2, EDG3, and EDFP). IDAPA 58.01.01.210.20(a) applies to Source ID No. EDG1, EDG2, EDG3, and EDFP.

PRI00000593

REC 1933

3.1.2 NESHAP Subpart AAAAA

40 CFR 63, Subpart AAAAA, NESHAP for Lime Manufacturing Plants addresses HAP emissions from the SGP lime manufacturing sources (Source ID No. LS12, LK, LS-L/U, LCR, and LKC).[5] IDAPA 58.01.01.210.20(b) applies to Source ID No. LS12, LK, LS-L/U, LCR, and LKC.

3.1.3 NESHAP Subpart CCCCCC

40 CFR 63, Subpart CCCCCC, NESHAP for Source Category: Gasoline Dispensing Facilities covers the SGP gasoline storage tanks (Source ID No. TG1 and TG2). IDAPA 58.01.01.210.20(a) applies to Source ID No. TG1 and TG2.

3.1.4 NESHAP Subpart EEEEEEE

40 CFR 63, Subpart EEEEEEE, NESHAP: Gold Mine Ore Processing and Production Area Source Category covers HAP emissions from the SGP autoclave (Source ID No. AC) and the EW cells, pregnant solution tank, mercury retort, induction melting furnace, and carbon regeneration kiln (Source ID No. EW, MR, MF, and CKD). IDAPA 58.01.01.210.20(a) applies to Source ID No. AC, EW, MR, MF, and CKD.

The NESHAP source category addresses HAP emissions from mining activities, specifically fugitive dust-generating activities (drilling, blasting, excavating, hauling, etc.), explosives use and storage (Source ID No. PS), cyanide leaching (Source ID No. CIP Leach 1-4, CIL 1-6, CIP 1-6, and CN Detox 1-2), tailings storage, ore processing (Source ID No. OC1-13), ore processing heating (Source ID No. ACB, CKB, PV, and HS), and the ore processing reagent use of PAX and sodium cyanide (NaCN). The NESHAP source category is defined as "*Gold Ore Mining ..., NAICS code 212221, Establishments primarily engaged in developing the mine site, mining, and/or beneficiating (i.e., preparing) ores valued chiefly for their gold content. Establishments primarily engaged in transformation of the gold into bullion or doré bar in combination with mining activities are included in this industry*" (EPA 2011b). EPA's rule-making docket (Docket ID EPA-HQ-OAR-2010-0239) provides documents evaluating HAP metal emissions from mining fugitive dust, HCN emissions from cyanide leaching, and downwind HCN ambient concentrations.[6]

---

[5] NESHAP Subpart AAAAA defines the affected source as follows: *each lime kiln and its associated cooler, each individual PSH [processed stone handling] system. The individual types of emission units in a PSH system are conveying system transfer points, bulk loading or unloading systems, screening operations, bucket elevators, and belt conveyors-if they follow the processed stone storage bin or storage pile in the sequence of PSH operations. The materials processing operations (MPO) associated with lime products (such as quicklime and hydrated lime), lime kiln dust handling, quarry or mining operations, limestone sizing operations, and fuels are not subject to today's final NESHAP. Processed stone handling operations are further distinguished in the final NESHAP as follows: (1) whether their emissions are vented through a stack, (2) whether their emissions are fugitive emissions, (3) whether their emissions are vented through a stack with some fugitive emissions from the partial enclosure, and/or (4) whether the source is enclosed in a building* (69 Fed. Reg. 394, 397 (January 5, 2004)).

[6] EPA-HQ-OAR-2010-0239-0132, *Profile of the Metal Mining Industry;* EPA-HQ-OAR-2010-0239-0157, *Recommended Methodology for Quantification of Fugitive Dust Metals Emissions from Mining Activities for Title V Applicability;* EPA-HQ-OAR-2010-0239-0102, *QAPP Comprehensive Air Emissions Testing for Hydrogen Cyanide;* EPA-HQ-OAR-2010-0239-0134, -0135 -0136 -0137 -0161 -0162 -0378, *Meteorological and Hydrogen Cyanide (HCN) Fence Line Monitoring* reports.

PRI00000594

REC 1934

In response to public comments, this Addendum applies IDAPA 58.01.01.210.20(a) to those sources of HAP emissions at the SGP that are covered by Subpart EEEEEEE. This Addendum provides further evaluation of the sources of HAP emissions that are addressed by the NESHAP per IDAPA 58.01.01.210.20(b) – the mining emissions.[7]

3.1.5 NSPS Subpart LL

40 CFR 60, Subpart LL, Standards of Performance for Metallic Mineral Processing Plant covers the SGP ore processing (Source ID No. OC1-13). IDAPA 58.01.01.210.20(a) applies to Source ID No. OC1-13.

3.1.6 NSPS Subpart OOO

40 CFR 60, Subpart OOO, Standards of Performance for Nonmetallic Mineral Processing Plants covers the SGP limestone processing sources (Source ID LS1-11 and LSBM), aggregate production (Source ID No. PCSP1 and PCSP2), and aggregate handling in the concrete production process (Source ID No. CA-L/U). IDAPA 58.01.01.210.20(a) applies to Source ID No. LS1-11, LSBM, PCSP1, PCSP2, CA-L/U.

3.2 Metals Review for TAP Provisions Applicability

Table 2 provides a comparison of the metals analyzed in the SGP ore, development rock, and limestone to the TAPs listed in IDAPA 58.01.01.585 and IDAPA 58.01.01.586.

Table 2. Metals Comparison to IDAPA 58.01.01.585-586 TAPs

[1] Over 95% of the samples were at or below the detection limit for Bismuth of 2 ppm. Limited sampling for tellurium indicates 90% of the samples are below 0.5 ppm. Mineralogical studies have not identified telluride minerals as a significant phase in the deposits. Based on these low levels and deposit mineralogy, no significant bismuth telluride is expected to be found in the ore body or development rock.

[2] Although the CAS numbers do not match, the calcium in the ore, limestone, and aggregate is expected to be in the form of calcium carbonate ($CaCO_3$). For lime, the calcium will be in the form of calcium oxide (CaO).

[3] The principal vanadium mineral in Idaho shale-hosted vanadium deposits is metahewettite ($CaV_6O_{162} \bullet H2O$) (USGS n.d.). Although not a TAP, vanadium in the ore, limestone, and aggregate is conservatively assumed to be V_2O_5 for the purpose of the TAP evaluation included in this HAP/TAP Addendum.

3.3 Screening Level Analysis of TAP Emissions

As discussed in Section 2.0, the highest TAP emissions scenario is Model Scenario W3, that estimates emissions from a potential throughput of 180,000 T/day. Table A in Appendix A

PRI00000597

REC 1937

provides a summary of the TAP emissions for Model Scenario W3, identifies whether the sources are covered or addressed by IDAPA 58.01.01.210.20(a) or (b) (Section 3.1), and notes the TAP screening EL. TAPs that exceed the screening EL are highlighted in Table A. These TAPs require further demonstrations of compliance with the applicable ambient air concentration (AAC) and are listed in Table 3 below.

Table 3. TAPs Exceeding the Screening Emission Level

CAS	TAP Name	Carcinogenic	SGP PTE (lb/hr) [1]	Screening EL (lb/hr)

[1] Model Scenario W3, 180,000 T/day Emissions

3.4 Modeling of TAP Emissions

To maintain consistency with the National Ambient Air Quality Standards (NAAQS) compliance analyses reviewed by IDEQ, the TAP modeling was performed using the same IDEQ-approved datasets and model versions described in the SOB from February 18, 2021. TAP modeling was conducted for the 14 modeling scenarios consistent with the NAAQS analyses. Scenario W5 was eliminated from the arsenic modeling, as discussed in Section 3.4.5.

3.4.1 Meteorological Data and Deposition

The meteorological dataset used for the TAP modeling was processed using EPA's Qian and Venkatram (Q&V) meteorological processing method. This method, which does not use the BULKRN keyword, is approved by EPA as a default method.

PRI00000598

REC 1938

As discussed in the PTC application, EPA evaluated the performance of the model with the Q&V processed meteorological dataset as part of its model approval determination. This evaluation quantified the bias between the modeled concentrations and the actual observed concentrations. The results of EPA's evaluation showed a conservative bias of the model to overpredict concentrations by a factor of 1.41 to 3.21 (Air Sciences 2020, A-8 of Attachment A). Therefore, the meteorological dataset used in the TAP modeling is expected to predict conservatively high concentrations.

The particulate deposition parameters used in the NAAQS compliance analysis were derived for PM_{10} and $PM_{2.5}$. See Tables 24 and 25 in the SOB from February 18, 2021. Dust-related metal TAP emissions include total particulates (all size fractions of PM up to PM_{30}). Therefore, the deposition parameters for PM were calculated using the same methodology and EPA references used for PM_{10} and $PM_{2.5}$ in the NAAQS compliance analysis. The PM deposition parameters are provided in Table 4.

Table 4. PM Deposition Parameters by Source Category

PRI00000603

REC 1943

3.4.3 Modeling Carcinogenic TAPs

The carcinogenic TAPs subject to the acceptable ambient concentrations for carcinogens (AACC) per IDAPA 58.01.01.586 were modeled using an emission inventory that includes the following T-RACT controls, long-term mining production limits, and other emission inventory refinements, as described below:

- Installing and operating dust collection systems on drilling rigs (T-RACT)
- Capping the haul roads that are outside of the pits and development rock storage facilities (DRSFs) with clean development rock (T-RACT)
- Limiting long-term mining production to 135,000 T/day (5-year rolling total)
- Constructing the Burntlog access road with offsite materials containing background level arsenic concentrations
- Updating the bulldozing emission factor using the SGP site-specific silt content.

The above emission inventory reductions are discussed in more detail in Section 5.0. The T-RACT analysis is provided in Section 6.0. A comparison of the 180,000 T/day TAP emissions shown in Table 3 and the T-RACT TAP emissions is shown in Table 7.

Table 7. Comparison of 180,000 T/day and T-RACT Emissions

CAS	TAP Name	Carcinogenic	180,000 T/day Emissions (lb/hr) [1]	T-RACT Emissions (lb/hr) [2]
7440-38-2	Arsenic	Yes	0.544	0.232
7440-41-7	Beryllium	Yes	0.00261	0.00185
7440-43-9	Cadmium	Yes	0.000435	0.000317
50-00-0	Formaldehyde	Yes	0.00189	0.00189
7440-02-0	Nickel	Yes	0.00169	0.00121

[1] Model Scenario W3 emissions from Table 3
[2] T-RACT emission levels for the demonstration of carcinogenic TAP compliance. See Table A-W3, T-RACT Emissions in Appendix A, pp. A-45 to A-49.

The maximum modeled concentration for each of the 14 modeling scenarios demonstrated compliance with the applicable AACC, as summarized in Table 8. The AACCs listed in Table 8 were increased by a factor of ten (10) per IDAPA 58.01.01.210.12(b); T-RACT adjustment. The SGP maximum concentrations were adjusted to account for the life-of-mine (LOM) production limits, which affect the lifetime exposure, and to account for the elimination of Modeling Scenario W5. See Sections 3.4.4 and 3.4.5 for more detail.

PRI00000604

REC 1944

Table 8. Compliance Demonstration for Carcinogenic TAPs

CAS	TAP Name	Model Scenario	SGP Maximum Lifetime Exposure Concentration (µg/m³) [1]	AACC (µg/m³) [2]	TAP Compliance

PRI00000606

REC 1946

3.4.4 Carcinogenic TAP Modeling Lifetime Exposure Adjustment

The AACCs provided in IDAPA 58.01.01.586 were developed *based on the probability of developing excess cancers over a seventy (70) year lifetime exposure to one (1) microgram per cubic meter (1 ug/m3) of a given carcinogen and expressed in terms of a screening emission level or an acceptable ambient concentration for a carcinogenic toxic air pollutant* (IDAPA 58.01.01.006.125). Therefore, the highest modeled annual carcinogenic TAP concentration from each of the 14 modeling scenarios was evaluated for lifetime exposure as follows:

$$Lifetime\ expsoure\ \left(\frac{\mu g}{m^3}\right) = \frac{Highest\ annual\ concentration\ \left(\frac{\mu g}{m^3}\right) \times 16\ (mine\ operation\ years)}{70\ (years, lifetime\ exposure)}$$

This equation conservatively assumes that the highest annual concentration from the 14 modeling scenarios is repeated for 16 years of mining operation. This is then averaged over 70 years to calculate the 70-year lifetime exposure.

Calculating lifetime exposure based on 16 years of mining operation is also conservative. The annual emissions for carcinogenic TAP modeling are based on 135,000 T/day (see Section 3.4.3) and 365 days per year. Over 16 years, this equates to a potential mining production of 788.4 million tons:

$$\frac{135{,}000\left(\frac{ton}{day}\right) \times 365\left(\frac{day}{year}\right) \times 16\ years}{1{,}000{,}000\left(\frac{ton}{million\ ton}\right)} = 788.4\ million\ tons$$

The actual LOM total production as described in the SGP Refined Proposed Action (ModPRO2) mine plan is only 402.86 million tons (Perpetua 2021a), which is 51.1% of the potential LOM production represented in the above equation and related emissions evaluations.

3.4.5 Arsenic Compliance Demonstration for Modeling Scenarios W1–W5

To demonstrate compliance with the AACC for arsenic, two addition operating limitations were applied:

- The removal of Modeling Scenario W5 as a potential operating scenario
- Limiting the West End pit's LOM potential mining production to 50% of the total LOM potential mining production of 788.4 million tons: 50% * 788.4 = 394.2 million tons

Perpetua Resources has determined that the West End DRSF will not be constructed. This change eliminated Modeling Scenario W5 from the arsenic modeling evaluation. The remaining four West End pit modeling scenarios (W1–W4) are evaluated using the 70-year lifetime exposure equation from Section 3.4.4 and adjusting for the proposed West End pit LOM production limit of 50% of the total production as follows:

PRI00000607

REC 1947

$$lifetime\ expsoure\ \left(\frac{\mu g}{m^3}\right) = \left(\frac{\left[Wi\left(\frac{\mu g}{m^3}\right)(50\%) + nonW\left(\frac{\mu g}{m^3}\right)(50\%)\right] \times 16\ (mine\ operation\ years)}{70\ (years, lifetime\ exposure)}\right)$$

Where:

$Wi = the\ modeled\ annual\ arsenic\ concentration\ from\ Scenario\ Wi;\ i = 1\ to\ 4$

$nonW = the\ modeled\ annual\ arsenic\ concentration\ of\ the\ highest\ nonW\ scenario;$

B1, B2, H1, H2, H3, H4, Y1, Y2, or Y3

The above equation was used to calculate the lifetime arsenic exposure from the West End pit scenarios (W1–W4) on a receptor-by-receptor basis. Combining the concentrations from Modeling Scenarios W1–W4 with the highest concentration from the remaining non-West End pit scenarios (B1, B2, H1, H2, H3, H4, Y1, Y2, or Y3) ensures that the maximum concentration is evaluated.

Calculating lifetime arsenic exposure based on the proposed West End pit LOM production limit of 50% of the total production is conservative. The actual LOM total production from the West End pit as described in the ModPRO2 mine plan is only 198.26 million tons (Perpetua 2021a), which is 50.3% of the proposed West End pit LOM production limit of 394.2 million tons.

PRI00000608

REC 1948

4.0 COMPARISON OF ACTUAL ARSENIC MODELING TO POTENTIAL ARSENIC MODELING

Additional analyses of arsenic emissions were prompted by public comments on the draft PTC. IDEQ requested that Perpetua Resources conduct an arsenic modeling analysis based on the actual mining operation and production described in the ModPRO2 mine plan. Those modeling results were submitted to IDEQ in a report on July 8, 2021, titled "Stibnite Gold Project Permit to Construct Application Arsenic Modeling Addendum" (Air Sciences 2021).

While that report provided an assessment of the actual arsenic concentrations expected from the actual mining operation and production over the life of the SGP ("actual analysis"), the analysis described in Section 3.0 above is based on potential operating scenarios ("potential analysis"). These analyses ensure that public health is protected under all operating conditions.

A comparison between the actual analysis and the potential analysis for the lifetime exposure of arsenic is summarized in Table 9.

Table 9. Actual Analysis vs. Potential Analysis for Arsenic Lifetime Exposure

Model Parameter	Actual Data	Potential Data	Actual Data Basis	Potential Data Basis
Process emissions (lb/hr)	0.004514	0.004514	Equipment design rate	Equipment design rate
Mining emissions (lb/hr); varies	Max: 0.0854 Min: 0.0058 Avg: 0.0451	Max: 0.232 Min: 0.061	ModPRO2 – 16 years of operation	14 potential worst-case scenarios
Emissions included in modeling (lb/yr)	100%	98%	Actual analysis of all emissions	Includes IDAPA 58.01.01.210.20
LOM production (million tons)	402.86	788.4	ModPRO2	135,000 ton/day * 365 day/yr * 16 years
Lifetime exposure modeling	Average concentration over 16 years of operation	Highest scenario concentration assumed for 16 years	Actual analysis	Potential worst-case analysis
Maximum modeled concentration ($\mu g/m^3$)	0.00015	0.00095	Actual analysis	Potential worst-case analysis
Applicable AACC ($\mu g/m^3$)	0.0023	0.0023	IDAPA 58.01.01. 210.12(b) and .586	IDAPA 58.01.01. 210.12(b) and .586

PRI00000609

REC 1949

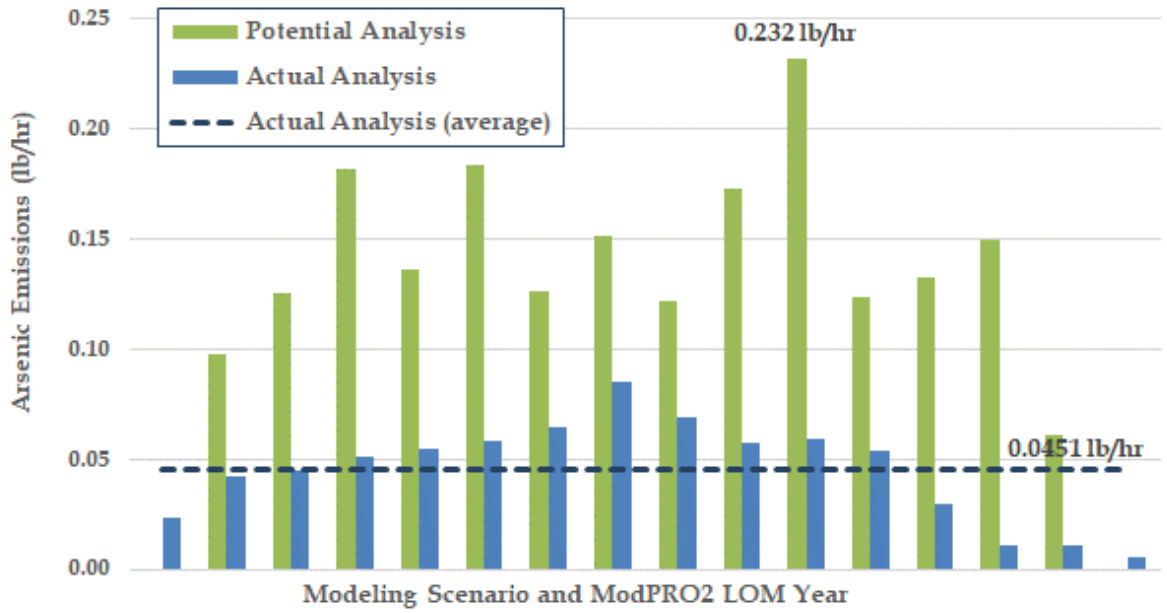
A brief discussion of Table 9 is provided below:

- AACC Results: In both the actual and potential analyses, the maximum modeled arsenic concentrations are below the AACC, demonstrating compliance with IDAPA 58.01.01.210.

- Process emissions: The process arsenic emissions in both analyses are identical. This is because both emission inventories were based on the maximum design rates of the process equipment.

- Mining emissions: The arsenic emissions in the actual analysis (0.0451 lb/hr average) are only 19% of the arsenic emissions in the potential analysis (0.232 lb/hr highest scenario). This is because the actual mining operation and production activities (e.g., drilling, blasting, material product, hauling miles, etc.) in ModPRO2 are far less than the potential mining (PTC) operating scenarios. Figure 3 compares the ModPRO2 arsenic emissions from mining for each year of operation (actual analysis) to the PTC arsenic emissions from mining for each worst-case operating scenario (potential analysis).

- In both analyses, all the arsenic emissions are included in the modeling, except emissions from covered or addressed sources, IDAPA 58.01.01210.20(a) and (b). See Section 3.1.



- The actual analysis LOM production of 402.86 million tons is 51.1% of the potential analysis production of 788.4 million tons.

- When modeling the lifetime arsenic exposure, the actual analysis is based on modeling each year of the ModPRO2 mine plan and then averaging the yearly results on a receptor-by-receptor basis. In addition to the lower actual arsenic emissions, the mining activity locations vary, which reduced the average arsenic concentration at any given location outside the operations boundary. In contrast, the potential analysis is based on higher (potential) emissions and the highest modeling scenario, which are assumed to occur for 16 consecutive years. This potential approach resulted in significantly higher and more conservative arsenic hot-spot concentrations.

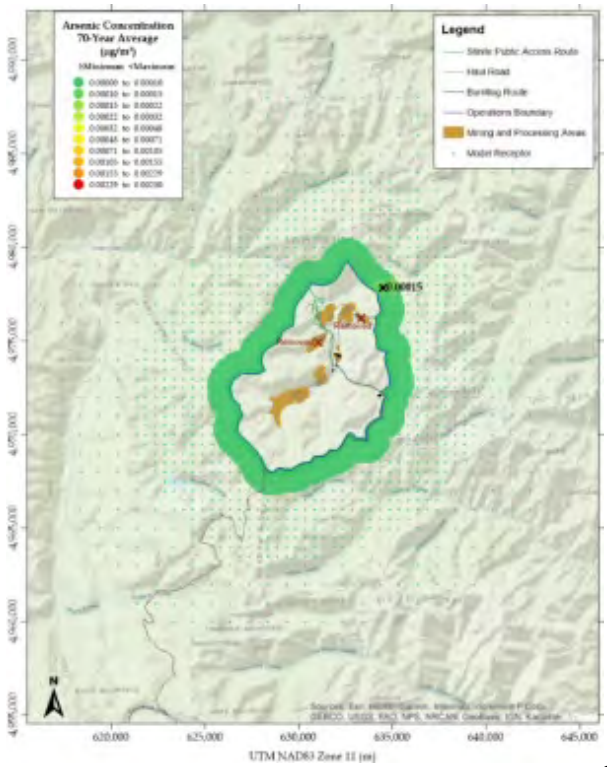
PRI00000610

REC 1950

Figure 3. Actual Arsenic Mining Emissions vs. Potential Arsenic Mining Emissions

The concentrations and maximum locations of the arsenic lifetime exposure (70 years) are presented in Figure 4 for the actual analysis and Figure 5 for the potential analysis. As shown in these figures, the maximum arsenic concentrations are below the applicable AACC per IDAPA 58.01.01.210.12(b) and 586.

Figure 4. Actual Arsenic Concentrations (µg/m³) and Maximum Location



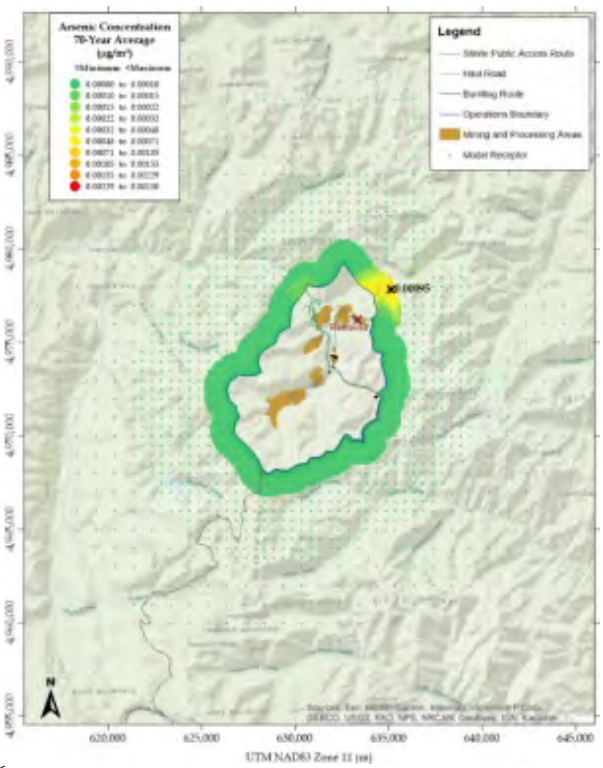


Figure 5. Potential Arsenic Concentrations (µg/m³) and Maximum Location

5.0 EMISSION INVENTORY FOR CARCINOGENIC TAPS

As discussed in Section 3.4.3, carcinogenic TAPs were modeled using an emission inventory adjusted for T-RACT controls, long-term mining production limits, and other refinements. These emission inventory changes are described in the following sections. The detailed emission calculations for the T-RACT emission inventory are provided in Appendix A (HAP/TAP Emission Calculations – Scenario W3, T-RACT Emissions).[8] The changes to these emission inventory inputs are highlighted on page A-41 of Appendix A.

5.1 Drilling Dust Control System

To reduce dust-related metal TAP emissions from drilling, Perpetua Resources will install and operate drilling rigs mounted with dust collection systems. *These systems have the ability to operate in various climates, i.e., they are not subject to freezing at lower temperatures as with the use of water, and they can be up to 99 percent efficient if properly maintained* (CDC 2012). The arsenic emissions inventory in Appendix A conservatively assumes a dust control efficiency of 90% for these systems.

5.2 Haul Road Capping

To reduce dust-related arsenic emissions from haul roads, Perpetua Resources will cap the haul roads that are outside of the pits and DRSFs with clean (low arsenic) development rock. Haul roads within the pits and DRSFs cannot be capped with this material because of steep grades and periodic road rerouting as mining areas develop. The median arsenic concentration of the clean development rock is 90 parts per million (ppm) (Perpetua 2021g).

5.3 Long-Term Mining Production Limits

To limit long-term dust-related metal TAP emissions, Perpetua Resources proposes limiting mining production to 135,000 T/day based on a 5-year rolling averaging period. This long-term mining production limit will be in addition to the current short-term daily limit of 180,000 T/day.

Limiting the long-term mining production limit to 135,000 T/day (5-year rolling average) is conservative. The highest 5-year rolling average mining production rate as described in ModPRO2 is only 95,700 T/day (Perpetua 2021a), which is 70.9% of the proposed limit.

[8] HAP/TAP Emission Calculations – Scenario W3, T-RACT: The HAP and TAP emissions based on T-RACT controls, a long-term mining production limit of 135,000 T/day (5-year rolling average), other refinements, and the highest emissions scenario (Modeling Scenario W3).

PRI00000612

REC 1952

5.4 Burntlog Access Road Refinement

To reduce dust-related arsenic emissions from vehicle travel on the Burntlog access road, Perpetua Resources will construct this road with borrow material located outside of the mine site ambient air boundary. Analyses of the borrow sites show low arsenic levels of 2.5 ppm (ALS 2018), which are consistent with the background soil levels (DHHS 2007).

5.5 Bulldozing Refinement

Perpetua Resources and Air Sciences conducted a thorough review of the SGP emissions inventory to identify any potential dust-related metal TAP emission control measures (as discussed in the previous sections) and emission factor refinements. The only emission factor refinement identified was changing the bulldozing emission factor silt content from the EPA default of 6.9% to the SGP site-specific silt content of 4.0% (Midas Gold 2015). EPA recommends the use of site-specific data when available.[9]

[9] *In using the equations to estimate emissions from sources found in a specific western surface mine, it is necessary that reliable values for correction parameters be determined for the specific sources of interest if the assigned quality ratings of the equations are to be applicable. For example, actual silt content of coal or overburden measured at a facility should be used instead of estimated values. In the event that site-specific values for correction parameters cannot be obtained, the appropriate geometric mean values from Table 11.9-3 may be used, but the assigned quality rating of each emission factor equation should be reduced by 1 level (e.g., A to B)* (EPA 1998).

PRI00000613

REC 1953

6.0 T-RACT ANALYSIS

Per IDAPA 58.01.01.210.14(a), this section documents the T-RACT control technologies.

6.1 Drilling Dust Control System

As discussed in Section 5.1, Perpetua Resources will install and operate drilling rigs mounted with dust collection systems. The following paragraphs evaluate this control as T-RACT:

Identification of all possible control technologies

Drilling operations create dust-related metal TAP emissions. The possible control technologies for these emissions are as follows:

- Applying best management practices
- Wet drilling with water injection
- Dry drilling with dust collectors

Best management practices include: (1) avoiding drilling operations during high dust conditions, and (2) shrouding drill areas to limit dust emissions.

Wet drilling includes injected water flows through the center of the drill and out though the drill bit to reduce dust emissions by 96% to 98%.[10]

Dry drilling includes rigs equipped with dust collection systems that shroud dust generated from the drilling area, capture, and remove dust through a dust collection system composed of an exhaust fan and filters that can achieve up to 99% control efficiency (CDC 2012).

Elimination of technologically infeasible or unreasonable technologies

Wet drilling at the SGP has the following disadvantages:

- It is subject to freezing at the low temperatures expected for the SGP location.
- It can result in drill bit plugging, drill rotation binding, and drill bit degradation.
- A wet drill hole can interfere with the blasting agent.

Based on the above disadvantages of wet drilling, it is considered an infeasible or unreasonable technology for the SGP.

[10] *Testing has demonstrated that dust control efficiencies of up to 98 percent can be obtained using the water separator sub while dust control efficiencies of wet drilling without the water separator sub were 96 percent* (CDC 2012).

PRI00000614

REC 1954

Ranking the remaining technologies by control effectiveness

The ranking of the possible control technologies for drilling by control effectiveness is as follows (highest to lowest):

1. Dry drilling with dust collectors – up to 99% control efficiency
2. Best management practices

Evaluation of the most effective control technology and selection of T-RACT

Perpetua Resources selects the top (most effective) control technology of dry drilling with dust collectors as T-RACT. Selecting the top control negates the need for considering economic, energy, and environmental impacts regarding the other control technologies.

6.2 Haul Road Dust and Arsenic Control

Dust emissions from unpaved roads are caused by vehicle traffic on these roads. Particles are lifted and dropped from the rolling wheels, and the turbulent wake behind the vehicles causes these particulates to become air borne. Dust control options include surface improvement (paving) or surface treatment (chemical suppressant application or watering).

As discussed in the SOB from February 18, 2021, Perpetua Resources will control dust emissions from haul roads by treating the surface with frequent watering and the periodic application of a chemical suppressant. Reducing dust emissions reduces dust-related metal TAP emissions. In addition, Perpetua Resources will reduce arsenic emissions by capping the haul roads outside of the pits and DRSFs with clean (low arsenic) development rock, as discussed in Section 5.2. The following sections evaluate these control measures as T-RACT.

6.2.1 Dust Control Technologies

Identification of all possible control technologies

Vehicle traffic on unpaved haul roads creates dust-related metal TAP emissions. The possible control technologies for these emissions are as follows:

- Paving
- Application of a chemical dust suppressant
- Watering

Paving: *The control efficiencies achievable by paving can be estimated by comparing emission factors for unpaved and paved road conditions* (EPA 2006). The particulate emission factor for a paved road with a silt loading of 0.2 g/m² (based on the EPA default value for the SGP average daily traffic of 500–5,000 trips per day) (EPA 2011a) and the SGP average vehicle weight of 182.6 tons is

PRI00000615

REC 1955

0.515 lb/VMT. The SGP unpaved road particulate emission factor is 14.43 lb/VMT (uncontrolled). Based on these emission factors, the estimated control efficiency of paving the haul roads is 96%.

Dust suppressant and watering: The SGP dust emissions from unpaved haul roads are calculated based on a surface treatment control efficiency of 90% (annual basis) for the application of a chemical dust suppressant supplemented with frequent watering. As discussed in the SGP Application, this control efficiency is supported by EPA's AP-42 13.2.2 referenced test reports, which show that a chemical dust suppressant alone can achieve 90% to 99% control efficiency and 98% for magnesium chloride in particular (Air Sciences 2020, Appendix A to Attachment A). A control efficiency of 90% is also supported by the control efficiency limits established under Reasonable Achievable Control Technology (RACT), Best Available Control Technology (BACT), and Lowest Achievable Emission Rate (LAER) determinations under EPA's New Source Review permitting program.

The EPA RACT/BACT/LAER Clearinghouse (RBLC) database contains case-specific information on the air pollution technologies required by major stationary sources seeking a permit under EPA's New Source Review (NSR) program. This database was queried for all listings of air pollution technologies for unpaved roads using chemical dust suppressants or a combination of chemical dust suppressants and watering. The results of the query identified 10 projects containing a control efficiency of 90% or greater for unpaved roads. These determinations are listed in Table 10.

Table 10. EPA RBLC Determinations for 90% or Greater Control Efficiency of Unpaved Roads

State	Facility Name	RBLC-ID	Dust Control	Dust Control Efficiency
AK	Donlin Gold Project	AK-0084	water/chem	90%
AR	Turk Power Plant	AR-0094	water/chem	90%
CO	Rio Grande Portland Cement Corp.	CO-0043	water/chem	90%
IN	Nucor Steel	IN-0034	chem	90%
LA	Nucor Steel Louisiana	LA-0239	water/chem	90%
MO	Lafarge Corp.	MO-0048	chem	90%
NV	Sloan Quarry	NV-0045	chem	98%
NV	Nellis Air Force Base	NV-0047	water/chem	90%
OH	Unlimited Concrete	OH-0126	water/chem	90%
OH	Unlimited Concrete	OH-0131	water/chem	90%

(EPA 2021)

Elimination of technologically infeasible or unreasonable technologies

Paving haul roads at the SGP has the following disadvantages:

- The paving of haul roads is not conventional practice at mining operations.
- Paved highway weight limits are only approximately 20,000 pounds (10 tons).
- Paving is costly.

The conventional practice for mining operations is to utilize unpaved haul roads with treated surfaces to control fugitive dust. Haul trucks are single axle vehicles with a gross loaded weight of 60 tons to 685 tons. The loaded weight range for the SGP haul trucks is 60 to 260 tons. These weights significantly exceed regulatory weight limits for paved highways of 10 tons. Furthermore, the SGP mining activity locations move as mining progresses. This requires haul roads to be rerouted as necessary. Due to the temporary nature of hauling routes and the heavy weight of haul trucks, paving is considered an infeasible or unreasonable technology for the SGP.

Ranking the remaining technologies by control effectiveness

The ranking of the possible control technologies for drilling by control effectiveness is as follows (highest to lowest):

1. Application of a chemical dust suppressant – 90% to 99% control efficiency

2. Watering – 75% to 95% control efficiency (EPA 2006, Figure 13.2.2-2)

Evaluation of the most effective control technology and selection of T-RACT

After eliminating paving as a viable control option, Perpetua Resources selects the next most effective control technologies of the application of a chemical dust suppressant supplemented with frequent watering as T-RACT.

6.2.2 Arsenic Control Technologies

After applying T-RACT for dust control, as discussed in Section 6.2.1, dust-related arsenic emissions can only be further reduced by capping the haul roads with clean (low-arsenic) development rock. The median arsenic concentration of the SPG onsite material is 667 ppm (Midas Gold 2017c). However, there are quartzite rock deposits at the West End pit that have significantly lower mineralization and, thus, lower arsenic levels. The median arsenic concentration of this quartzite rock is 90 ppm (Perpetua 2021g), and there is approximately 3 million tons of this material available. Figure 6 shows the locations of the quartzite rock deposits.

Figure 6. Quartzite Rock Areas

Perpetua Resources proposes capping the haul roads that are outside of the pits and DRSFs with clean (low-arsenic) development rock as a T-RACT work practice, in addition to the T-RACT dust control measures discussed in Section 6.2.1. Haul roads within the pits and DRSFs cannot be capped with this material because of steep grades and periodic road rerouting as mining areas develop.

REC 1958

7.0 PROPOSED PERMIT CONDITIONS FOR CARCINOGENIC TAP COMPLIANCE

IDEQ is required to establish limits and standards as part of the permit to construct to ensure compliance with the TAP provisions in accordance with IDAPA 58.01.01.210.12(d) and 14(e). Per these two rules, Perpetua Resources proposes the following permit conditions:

7.1 Conditions per IDAPA 58.01.01.210.12(d)

Per IDAPA 58.01.01.210.12(d), *[t]he Department shall include emission limits and other permit terms for the toxic air pollutant in the permit to construct that assure that the facility will be operated in the manner described in the preconstruction compliance demonstration*. As discussed in Section 5.2, Perpetua Resources is proposing long-term mining production limits to demonstrate compliance with carcinogenic TAPs. The following are proposed permit conditions to address this TAP provision:

- The permittee shall haul no more than 135,000 tons per day (T/day) of ore and rock, based on a 5-year rolling average.
    - Each year, the permittee shall monitor and record the amount of ore and rock transported on haul trucks in tons per year (T/yr), and calculate the 5-year rolling average (T/day) based on 365 days per year.
- The permittee shall haul no more than 788.4 million tons (MT) of ore and rock from all deposits over the life of the mine.
- The permittee shall haul no more than 394.2 MT of ore and rock from the West End deposit over the life of the mine.
    - Each year, the permittee shall monitor and record the amount of ore and rock transported on haul trucks (T/yr) from all deposits and the amount of ore and rock transported on haul trucks (T/yr) from the West End deposit, and calculate the life-of-mine rolling total (MT) for each.

7.2 Conditions per IDAPA 58.01.01.210.14(e)

Per IDAPA 58.01.01.210.14(e), *[i]f the Department determines that the applicant has proposed T-RACT, the Department shall determine which of the options, or combination of options, will result in the lowest emission of toxic air pollutants, develop the emission standards constituting T-RACT and incorporate the emission standards into the permit to construct.* As discussed in Section 6.2, Perpetua Resources is proposing T-RACT controls to demonstrate compliance with carcinogenic TAPs. The following are proposed permit conditions to address this TAP provision:

PRI00000619

REC 1959

- The permittee shall use drilling rigs equipped with dust collection systems. Control efficiency: 90%.
    - Within 60 days after startup, the permittee shall develop and maintain an Operation and Maintenance (O&M) manual. The O&M manual shall be a permittee-developed document based upon, but independent from, manufacturer-supplied operating manuals. The permittee shall operate the dust collection systems in accordance with the O&M manual at all times. The requirements in the O&M manual shall be incorporated by reference to this permit and shall be enforceable permit conditions. The O&M manual shall be submitted to DEQ within 60 days after initial startup.
- The permittee shall cap haul roads that are outside of the pits and DRSFs with low-arsenic material.
    - The permittee shall develop and maintain a plan that:
        - identifies the low-arsenic quartzite rock deposits in the West End pit based on core sample analyses,
        - requires periodic inspections (at least quarterly) of the capped haul roads and recapping as needed, and
        - includes record keeping of the inspections and any recapping of roads, noting the date and road section.
    - The permittee shall use the low-arsenic quartzite rock deposits from the West End pit, or other material with equal or lower arsenic concentration, as capping material.
        - If other material is used, it must be analyzed for arsenic concentration and a record of the median arsenic concentration shall be maintained.

The Draft PTC currently includes conditions for treating haul road surfaces with a chemical suppressant and water to control 90% of the dust (on an annual basis). See Conditions 1.2, 2.1–2.6, 2.8, 3.2, and 3.9. Therefore, no new conditions are needed or proposed for this dust control practice.

PRI00000620

REC 1960

8.0 MERCURY EMISSIONS ANALYSIS

A complete inventory of mercury emissions is provided in Appendix A, as discussed in Section 2.0. This section categorizes these emissions into mercury emissions covered or not covered by IDAPA 58.01.01.215. According to IDAPA 58.01.01.215:

No owner or operator may commence construction or modification of a stationary source or facility that results in an increase in annual potential emissions of mercury of twenty-five (25) pounds or more unless the owner or operator has obtained a permit to construct under Sections 200 through 228 of these rules. The permit to construct application shall include an MBACT analysis for the new source or sources for review and approval by the Department. A determination of applicability under Section 215 shall be based upon the best available information. Fugitive emissions shall not be included in a determination of applicability under Section 215.

01. Exemptions. New or modified stationary sources within a source category subject to 40 CFR Part 63 are exempt from the requirements of Section 215.

Table 11 summarizes the SGP mercury sources and potential emissions for the highest emissions year (Model Scenario W3, 180,000 T/day Emissions). This table also provides the mercury emissions without considering the above exemptions, the exemption criteria, and the non-exempt mercury emissions for each source. As shown in this table, under IDAPA 58.01.01.215.01, the total potential non-exempt mercury emissions are 5.40E-5 ton/yr (0.108 lb/yr), which is well below the 25 lb/yr emission threshold.

ORE CONCETRATION AND REFINING

Source Data

Source ID	Description	Subpart 7E Allowable Limit lb/yr[1]	Oper. hr/yr	% of Subpart 7E for Controlled Systems %		Controlled Hg Emissions lb/hr	ton/yr	lb/yr
AC	Autoclave	213.4	8,760	[2]		0.000023	0.00010	0.20
EW,MR,MF,CKD	Refinery Sources (C. Kiln, EW, Retort, Furr	16.8		20%	[3]	0.000384	0.00168	3.36
7439-97-6 Mercury	Total	230.2				0.000407	0.00178	3.56

[1] *Subpart 7E Limit - Ore Pretreatment Processes (CFR 2018b)*

84 lb / ~~MMton~~ × 2,540,400 ~~ton~~ / yr × ~~MMton~~ / 1.0E+6 ~~ton~~ = 213.4 lb / yr

[1] *Subpart 7E Limit - Carbon Processes with Mercury Retorts*

0.8 lb / ~~ton~~ × 21 ~~ton~~ / yr = 16.8 lb / yr

[2] *Controlled SysCAD modeled emissions from Autoclave:* 0.0105 g/hr 2.3E-05 lb/hr 0.20 lb/yr (M3 2019)

[3] *Based on similar source (but with much higher ore Hg content) Hg reporting levels provided below:*

Goldstrike Refinery (2015 & 2016 Hg Reports) *(NDEP 2015a) (NDEP 2016)*

28.79 lb / yr × yr / 251.00 ton = 0.11 lb / MMton × ton / 0.8 lb = 14.3%

Twin Creeks Refinery (2015 & 2016 Hg Reports) *(NDEP 2015a) (NDEP 2016)*

31.27 lb / yr × yr / 142.77 ton = 0.22 lb / MMton × ton / 0.8 lb = 27.4%

(1) *Hourly emissions are based on annual throughput for the carcinogenic annual risk TAPs and daily throughput for the non-carcinogenic 24-hr TAPs.*

(2) *(M3 2018) Median concentrations of SGP limestone material. Metals with medians below the detection limit (DL) are set to 1/2DL.*

(3) *Hg emissions from the Lime Kiln are conservatively estimated assuming 100% volatilization of all Hg in the limestone*

(4) *(EPA 1999b)*

Subject: Re: DEQ contacts

Ian,

Pao Baylon, DEQ's air modeler for the project, drafted the response to your questions as shown below. Pao is currently out of the office, so if you have additional questions on how modeling was performed and evaluated, please contact me at your convenience.

Regards,

Kevin Schilling

Kevin Schilling | Air Quality Dispersion Modeling Supervisor
Idaho Department of Environmental Quality

Our mission: To protect public health and the quality of Idaho's air, land, and water.

*****

I am unable to confirm the calculation of the maximum annual arsenic concentration proposed for comparison to the AAC. The value appears in cell M8 of Table C in Tab C of the IDEQ spreadsheet provided and also in the Midas Gold spreadsheet referenced in the T-RACT analysis attached to the Statement of Basis. The values on Line 8 are copied as values and apparently are derived through weighting calculations from Line 29. The maximum value in Line 29 is .00698 ug/m3, and is apparently adjusted to reflect mine operation life and other averaging manipulations to reach the .00095 ug/m3 on line 8, although the adjustment does not appear to be consistent for the various scenarios.

First, the value in cell M8 was compared to the T-RACT AACC, ***not the AAC***. AACC stands for Acceptable Ambient Concentration of a Carcinogen and pertains to carcinogens; AAC stands for Acceptable Ambient Concentration of a Non-Carcinogen and pertains to non-carcinogens. Arsenic is a carcinogen. T-RACT stands for Toxic Air Pollutant Reasonably Available Control Technology and allows the AACCs to be increased by a factor of ten per *Idaho Air Rules* Section 210.12(b).

Second, the value in cell M29 (0.00698 $\mu g/m^3$) is a model output (meaning, a concentration derived from running the model); no adjustments were applied to this value. The value in cell M8 (0.00095 $\mu g/m^3$) is an adjusted value that was calculated based on the value in cell M29 and the highest-impact non-W Scenario. Please refer to Section 5.8 of DEQ's *TAPs Addendum Modeling Review Attachment* for an explanation of the calculation adjustment method (or see discussion below). It is important to note that each adjustment was performed *at each receptor*.

The complexity and extensiveness of the dispersion modeling impact analyses necessitated using two groups of modeling runs: 1) West End Pit Scenarios (4 separate scenarios); 2) non-West End Pit Scenarios (9 separate scenarios). At each receptor, the maximum impact was determined from results of the West End Pit scenarios and results from the non-West End Pit scenarios. The results for all scenarios were modeled using a continual mine production level of 135,000 tons/day for a total life-of-mine production of 788.4 million tons. It was assumed that the worst-case West End Pit scenario could only be associated with 50% of the life-of-mine production and the other 50% would be associated with the worst-case of non-West End Pit scenarios. This is a very conservative approach because the maximum actual production from any of the scenarios is well below 50%. This merging of worst-case West End Pit scenarios and worst-case non-West End Pit scenarios (including the 50% adjustment to maintain a total life-of-mine production of 788.4 million tons) was performed in a post-modeling spreadsheet analysis.

As a reminder, the highest modeled arsenic concentration is predicted to occur for Modeling Scenario W2. When running Modeling

Scenario W2 *only*, the highest-impact concentration is 0.00700 µg/m^3, which is predicted to occur at four distinct receptors:

Easting (meters)	Northing (meters)	Max. Modeled Arsenic Concentration for Scenario W2 (in µg/m^3)
635,099.5	4,977,858.8	0.00700
635,124.5	4,977,858.8	0.00700
635,124.5	4,977,883.8	0.00700
635,099.5	4,977,883.8	0.00700

Note that the four West End Pit modeling scenarios (W1–W4) were evaluated using the 70-year lifetime exposure equation and adjusting for the proposed West End Pit life-of-mine production limit of 50% of the total production. The equation provided in Section 5.8 of DEQ's *TAPs Addendum Modeling Review Attachment* was used to calculate the lifetime arsenic exposure from the West End Pit scenarios (W1–W4) on *a receptor-by-receptor basis*. Combining the concentrations from Modeling Scenarios W1–W4 with the highest concentration from the remaining non-West End Pit scenarios (B1, B2, H1, H2, H3, H4, Y1, Y2, or Y3) conservatively ensures that the maximum potential impacts from applicable sources are evaluated and remain below T-RACT AACCs.

After adjusting for lifetime exposure and for the proposed West End Pit life-of-mine production limit of 50% of the total production of the mine (50% of 788.4 million tons), the maximum lifetime arsenic exposure (cell M8) is 0.00095 µg/m^3, which is predicted to occur at the one receptor listed below. The arsenic impact when running only Modeling Scenario W2 at this receptor is 0.00698 µg/m^3 (cell M29).

Easting (meters)	Northing (meters)	Modeled Arsenic Concentration for Scenario W2 (in µg/m^3)	Max. Modeled Arsenic Concentration for non-W Scenarios (in µg/m^3)	Max. Lifetime Arsenic Exposure for Comparison with T-RACT AACC (in µg/m^3)
635,124.5	4,977,833.8	0.00698	0.00129	0.00095

To summarize, the maximum lifetime arsenic exposure was calculated using this equation:

where *n* represents the receptor with Easting = 635,124.5 meters and Northing = 4,977,833.8 meters.

Finally, DEQ disagrees with the statement that "the adjustment does not appear to be consistent for the various scenarios." DEQ's Modeling Team performed additional analyses to verify the applicant's results and we can confirm that the adjustment was performed for ***ALL*** modeling scenarios. Therefore, the arsenic impact adjustment is consistent for all modeling scenarios.

The values in line 29 are also copied as values and I have been unable to find the original formulae for deriving these values or making the modification to the line 8 compliance assertion values. There are several confusing averaging modifications regarding mine life, 5 year running averages, potential versus LOM considerations, etc.

You can't find any formulae for deriving the values in Line 29 because these are the raw model outputs (although technically speaking, the equations governing dispersion, energy balance, and stable and convective boundary layer mixing are "formulae" that were employed to derive the Line 29 values, but these are formulae and equations already embedded in the air dispersion

model and are neither applicant-generated nor DEQ-generated). Again, no post-processing calculations were performed to derive the Line 29 values; these are values that were derived from the modeling output files. The modeling output files are available from DEQ's Content Manager (Record Number: 2021AAG1772); you may request these files through the public records request process. On the other hand, the value in Line 8 is an adjusted value that was calculated based on the value in Line 29 and the highest-impact non-W Scenario *at each receptor*. An explanation for the calculation method is provided in Section 5.8 of DEQ's *TAPs Addendum Modeling Review Attachment*.

There also seems to be confusing information regarding the genesis of the .00698 ug/m3 As value in cell M29. Is this the modeled variable or is it an adjusted post- AQ-modeling value derived from other As or particulate AQ model results?

The 0.00698 µg/m^3 value listed in cell M29 is a model output that was derived from running Modeling Scenario W2 alone. It is ***not*** a "modeled variable." It is ***not*** an "adjusted post-AQ-modeling value derived from other As or particulate AQ model results." It is a value that can be extracted from the modeling output files. You may request these files through the public records request process (DEQ Content Manager Record Number: 2021AAG1772).

In either case, what are the As emission rate inputs used in the model to generate these values?

This information is already provided in DEQ's *TAPs Addendum Modeling Review Attachment* and was highlighted by DEQ during the virtual meeting held on February 2, 2022. Please refer to column 3 of Table 3 of DEQ's *TAPs Addendum Modeling Review Attachment* for a complete list of modeled arsenic source-specific emission rates. Note that these modeled emission rates pertain only to Modeling Scenario W2, which is the highest-impact modeling scenario for arsenic. Modeled arsenic emission rates for all other modeling scenarios are provided by the applicant in Appendix B of the *Stibnite Gold Project (SGP) Permit to Construct Application TAP Addendum*. Modeled emission rates can also be extracted from the submitted modeling input files as described above (DEQ Content Manager Record Number: 2021AAG1772).

How are these values modified within the model and post model to generate these annual concentrations?

The modeled arsenic emission rates (in lb/hr) provided in column 3 of Table 3 of DEQ's *TAPs Addendum Modeling Review Attachment* were never "modified within the model and post model" because these are the actual emission rates that were used as inputs in the model. You are invited to review the modeling input files (DEQ Content Manager Record Number: 2021AAG1772). The modeled concentrations (meaning the model outputs in µg/m^3) for carcinogenic TAPs were adjusted to account for the life-of-mine production limits. You are invited to review the modeling output files (DEQ Content Manager Record Number: 2021AAG1772). Again, the modeled emission rates in lb/hr were not adjusted; the modeled output concentrations in µg/m^3 were adjusted according to the equation listed above to select worst-case scenarios, combine West End Pit scenario impacts with non-West End Pit scenario impacts, and adjust the combination for a total life-of-mine production of 788.4 million tons.

Details concerning calculation adjustments are provided in Sections 5.7 and 5.8 of DEQ's *TAPs Addendum Modeling Review Attachment*. The applicant has determined that the West End Development Rock Storage Facility (DRSF) will not be constructed. This change eliminated Modeling Scenario W5 from the arsenic modeling evaluation. The remaining four West End Pit modeling scenarios (W1–W4) were evaluated using the 70-year lifetime exposure equation and adjusting for the proposed West End Pit life-of-mine production limit of 50% of the total production. The equation provided in Section 5.8 of DEQ's *TAPs Addendum Modeling Review Attachment* was used to calculate the lifetime arsenic exposure from the West End Pit scenarios (W1–W4) on *a receptor-by-receptor basis*. Combining the concentrations from Modeling Scenarios W1–W4 with the highest concentration from the remaining non-West End Pit scenarios (B1, B2, H1, H2, H3, H4, Y1, Y2, or Y3) conservatively ensures that the maximum potential impacts from applicable sources are evaluated and remain below T-RACT AACCs.

The adjusted arsenic concentrations for Modeling Scenarios W1-W4 resulting from DEQ's verification analyses (0.000910 µg/m^3, 0.000945 µg/m^3, 0.000898 µg/m^3, and 0.000874 µg/m^3, respectively) match the values provided by Air Sciences in cells L8 (0.00091 µg/m^3), M8 (0.00095 µg/m^3), N8 (0.00090 µg/m^3), and O8 (0.00087 µg/m^3) of the worksheet that you referenced. The result for the highest-impact modeling scenario (Modeling Scenario W2 for arsenic) is reported in Table 6 of DEQ's *TAPs Addendum Modeling Review Attachment* and is compared with the T-RACT AACC.

Subject: RE: DEQ contacts

Thanks to DEQ for the opportunity to seek clarification on the approach and calculations in the Permit application and associated documents. As I am sure all of you are aware how complex and confounding these many calculations are, and it is not our intent for DEQ to do our homework for us. I have done my best to untangle the material, but have reached a stumbling point.

I am unable to confirm the calculation of the maximum annual arsenic concentration proposed for comparison to the AAC. The value appears in cell M8 of Table C in Tab C of the IDEQ spreadsheet provided and also in the Midas Gold spreadsheet referenced in the T-RACT analysis attached to the Statement of Basis. The values on Line 8 are copied as values and apparently are derived through weighting calculations from Line 29. The maximum value in Line 29 is .00698 ug/m3, and is apparently adjusted to reflect mine operation life and other averaging manipulations to reach the .00095 ug/m3 on line 8, although the adjustment does not appear to be consistent for the various scenarios. The values in line 29 are also copied as values and I have been unable to find the original formulae for deriving these values or making the modification to the line 8 compliance assertion values. There are several confusing averaging modifications regarding mine life, 5 year running averages, potential versus LOM considerations, etc.

There also seems to be confusing information regarding the genesis of the .00698 ug/m3 As value in cell M29. Is this the modeled variable or is it an adjusted post- AQ-modeling value derived from other As or particulate AQ model results? In either case, what are the As emission rate inputs used in the model to generate these values? How are these values modified within the model and post model to generate these annual concentrations?

Is it possible to confer with the appropriate staff member(s) to confirm this calculation, beginning with the emission inputs and associated assumptions used develop the annual average As concentration used to reach the conclusion that appropriate risk levels are met.

Thank you for your consideration. You can reach me via this email, or at 208 596 8577

Sincerely
Ian von Lindern

Ian,

Pao Baylon, DEQ's air modeler for the project, drafted the response to your questions as shown below. Pao is currently out of the office, so if you have additional questions on how modeling was performed and evaluated, please contact me at your convenience.

Regards,

Kevin Schilling

*****

I am unable to confirm the calculation of the maximum annual arsenic concentration proposed for comparison to the AAC. The value appears in cell M8 of Table C in Tab C of the IDEQ spreadsheet provided and also in the Midas Gold spreadsheet referenced in the T-RACT analysis attached to the Statement of Basis. The values on Line 8 are copied as values and apparently are derived through weighting calculations from Line 29. The maximum value in Line 29 is .00698 ug/m3, and is apparently adjusted to reflect mine operation life and other averaging manipulations to reach the .00095 ug/m3 on line 8, although the adjustment does not appear to be consistent for the various scenarios.

First, the value in cell M8 was compared to the T-RACT AACC, ***not the AAC***. AACC stands for Acceptable Ambient Concentration of a Carcinogen and pertains to carcinogens; AAC stands for Acceptable Ambient Concentration of a Non-Carcinogen and pertains to non-carcinogens. Arsenic is a carcinogen. T-RACT stands for Toxic Air Pollutant Reasonably Available Control Technology and allows the AACCs to be increased by a factor of ten per *Idaho Air Rules* Section 210.12(b).

Second, the value in cell M29 (0.00698 µg/m^3) is a model output (meaning, a concentration derived from running the model); no adjustments were applied to this value. The value in cell M8 (0.00095 µg/m^3) is an adjusted value that was calculated based on the value in cell M29 and the highest-impact non-W Scenario. Please refer to Section 5.8 of DEQ's *TAPs Addendum Modeling Review Attachment* for an explanation of the calculation adjustment method (or see discussion below). It is important to note that each adjustment was performed *at each receptor*.

The complexity and extensiveness of the dispersion modeling impact analyses necessitated using two groups of modeling runs: 1) West End Pit Scenarios (4 separate scenarios); 2) non-West End Pit Scenarios (9 separate scenarios). At each receptor, the

maximum impact was determined from results of the West End Pit scenarios and results from the non-West End Pit scenarios. The results for all scenarios were modeled using a continual mine production level of 135,000 tons/day for a total life-of-mine production of 788.4 million tons. It was assumed that the worst-case West End Pit scenario could only be associated with 50% of the life-of-mine production and the other 50% would be associated with the worst-case of non-West End Pit scenarios. This is a very conservative approach because the maximum actual production from any of the scenarios is well below 50%. This merging of worst-case West End Pit scenarios and worst-case non-West End Pit scenarios (including the 50% adjustment to maintain a total life-of-mine production of 788.4 million tons) was performed in a post-modeling spreadsheet analysis.

As a reminder, the highest modeled arsenic concentration is predicted to occur for Modeling Scenario W2. When running Modeling Scenario W2 *only*, the highest-impact concentration is 0.00700 µg/m^3, which is predicted to occur at four distinct receptors:

Easting (meters)	Northing (meters)	Max. Modeled Arsenic Concentration for Scenario W2 (in µg/m^3)
635,099.5	4,977,858.8	0.00700
635,124.5	4,977,858.8	0.00700
635,124.5	4,977,883.8	0.00700
635,099.5	4,977,883.8	0.00700

Note that the four West End Pit modeling scenarios (W1–W4) were evaluated using the 70-year lifetime exposure equation and adjusting for the proposed West End Pit life-of-mine production limit of 50% of the total production. The equation provided in Section 5.8 of DEQ's *TAPs Addendum Modeling Review Attachment* was used to calculate the lifetime arsenic exposure from the West End Pit scenarios (W1–W4) on *a receptor-by-receptor basis*. Combining the concentrations from Modeling Scenarios W1–W4 with the highest concentration from the remaining non-West End Pit scenarios (B1, B2, H1, H2, H3, H4, Y1, Y2, or Y3) conservatively ensures that the maximum potential impacts from applicable sources are evaluated and remain below T-RACT AACCs.

After adjusting for lifetime exposure and for the proposed West End Pit life-of-mine production limit of 50% of the total production of the mine (50% of 788.4 million tons), the maximum lifetime arsenic exposure (cell M8) is 0.00095 µg/m^3, which is predicted to occur at the one receptor listed below. The arsenic impact when running only Modeling Scenario W2 at this receptor is 0.00698 µg/m^3 (cell M29).

Easting (meters)	Northing (meters)	Modeled Arsenic Concentration for Scenario W2 (in µg/m^3)	Max. Modeled Arsenic Concentration for non-W Scenarios (in µg/m^3)	Max. Lifetime Arsenic Exposure for Comparison with T-RACT AACC (in µg/m^3)
635,124.5	4,977,833.8	0.00698	0.00129	0.00095

To summarize, the maximum lifetime arsenic exposure was calculated using this equation:

where *n* represents the receptor with Easting = 635,124.5 meters and Northing = 4,977,833.8 meters.

Finally, DEQ disagrees with the statement that "the adjustment does not appear to be consistent for the various scenarios." DEQ's Modeling Team performed additional analyses to verify the applicant's results and we can confirm that the adjustment was

performed for ***ALL*** modeling scenarios. Therefore, the arsenic impact adjustment is consistent for all modeling scenarios.

The values in line 29 are also copied as values and I have been unable to find the original formulae for deriving these values or making the modification to the line 8 compliance assertion values. There are several confusing averaging modifications regarding mine life, 5 year running averages, potential versus LOM considerations, etc.

You can't find any formulae for deriving the values in Line 29 because these are the raw model outputs (although technically speaking, the equations governing dispersion, energy balance, and stable and convective boundary layer mixing are "formulae" that were employed to derive the Line 29 values, but these are formulae and equations already embedded in the air dispersion model and are neither applicant-generated nor DEQ-generated). Again, no post-processing calculations were performed to derive the Line 29 values; these are values that were derived from the modeling output files. The modeling output files are available from DEQ's Content Manager (Record Number: 2021AAG1772); you may request these files through the public records request process. On the other hand, the value in Line 8 is an adjusted value that was calculated based on the value in Line 29 and the highest-impact non-W Scenario *at each receptor*. An explanation for the calculation method is provided in Section 5.8 of DEQ's *TAPs Addendum Modeling Review Attachment*.

There also seems to be confusing information regarding the genesis of the .00698 ug/m3 As value in cell M29. Is this the modeled variable or is it an adjusted post- AQ-modeling value derived from other As or particulate AQ model results?

The 0.00698 µg/m^3 value listed in cell M29 is a model output that was derived from running Modeling Scenario W2 alone. It is ***not*** a "modeled variable." It is ***not*** an "adjusted post-AQ-modeling value derived from other As or particulate AQ model results." It is a value that can be extracted from the modeling output files. You may request these files through the public records request process (DEQ Content Manager Record Number: 2021AAG1772).

In either case, what are the As emission rate inputs used in the model to generate these values?

This information is already provided in DEQ's *TAPs Addendum Modeling Review Attachment* and was highlighted by DEQ during the virtual meeting held on February 2, 2022. Please refer to column 3 of Table 3 of DEQ's *TAPs Addendum Modeling Review Attachment* for a complete list of modeled arsenic source-specific emission rates. Note that these modeled emission rates pertain only to Modeling Scenario W2, which is the highest-impact modeling scenario for arsenic. Modeled arsenic emission rates for all other modeling scenarios are provided by the applicant in Appendix B of the *Stibnite Gold Project (SGP) Permit to Construct Application TAP Addendum*. Modeled emission rates can also be extracted from the submitted modeling input files as described above (DEQ Content Manager Record Number: 2021AAG1772).

How are these values modified within the model and post model to generate these annual concentrations?

The modeled arsenic emission rates (in lb/hr) provided in column 3 of Table 3 of DEQ's *TAPs Addendum Modeling Review Attachment* were never "modified within the model and post model" because these are the actual emission rates that were used as inputs in the model. You are invited to review the modeling input files (DEQ Content Manager Record Number: 2021AAG1772). The modeled concentrations (meaning the model outputs in µg/m^3) for carcinogenic TAPs were adjusted to account for the life-of-mine production limits. You are invited to review the modeling output files (DEQ Content Manager Record Number: 2021AAG1772). Again, the modeled emission rates in lb/hr were not adjusted; the modeled output concentrations in µg/m^3 were adjusted according to the equation listed above to select worst-case scenarios, combine West End Pit scenario impacts with non-West End Pit scenario impacts, and adjust the combination for a total life-of-mine production of 788.4 million tons.

Details concerning calculation adjustments are provided in Sections 5.7 and 5.8 of DEQ's *TAPs Addendum Modeling Review Attachment*. The applicant has determined that the West End Development Rock Storage Facility (DRSF) will not be constructed. This change eliminated Modeling Scenario W5 from the arsenic modeling evaluation. The remaining four West End Pit modeling scenarios (W1–W4) were evaluated using the 70-year lifetime exposure equation and adjusting for the proposed West End Pit life-of-mine production limit of 50% of the total production. The equation provided in Section 5.8 of DEQ's *TAPs Addendum Modeling Review Attachment* was used to calculate the lifetime arsenic exposure from the West End Pit scenarios (W1–W4) on *a receptor-by-receptor basis*. Combining the concentrations from Modeling Scenarios W1–W4 with the highest concentration from the remaining non-West End Pit scenarios (B1, B2, H1, H2, H3, H4, Y1, Y2, or Y3) conservatively ensures that the maximum potential impacts from applicable sources are evaluated and remain below T-RACT AACCs.

The adjusted arsenic concentrations for Modeling Scenarios W1-W4 resulting from DEQ's verification analyses (0.000910 µg/m^3, 0.000945 µg/m^3, 0.000898 µg/m^3, and 0.000874 µg/m^3, respectively) match the values provided by Air Sciences in cells L8 (0.00091 µg/m^3), M8 (0.00095 µg/m^3), N8 (0.00090 µg/m^3), and O8 (0.00087 µg/m^3) of the worksheet that you referenced. The result for the

highest-impact modeling scenario (Modeling Scenario W2 for arsenic) is reported in Table 6 of DEQ's *TAPs Addendum Modeling Review Attachment* and is compared with the T-RACT AACC.

Subject: NPT and Midas

Hi Pao,

I spoke with Julie Simpson and Mary Fauci in air quality with the Nez Perce Tribe (NPT) today regarding questions on the public comment period for Midas Gold Idaho, Inc. They may also contact you with follow-up questions on the modeling analyses.

Beyond focusing on the fugitive dust section of the permit, a few of the other topics discussed:

- NPT expressed an interest in using deposition modeling to evaluate water quality impacts from air emissions. I indicated that Midas had performed deposition modeling, but that it may take work for them to adapt toward this purpose.
- NPT was interested in impacts on public roadways, including outside the facility boundary. I explained that Midas had used McCall background concentrations to account for an increase in traffic from current pristine conditions to try to address this concern.
- NPT was interested in the treatment of the public roadway inside the facility boundary. I explained that Midas stated that they would have authority to control access along this roadway, and that the public would either be escorted or monitored to allow for passage but to discourage extended stays.

Thanks,

1.0 INTRODUCTION

This addendum provides the Stibnite Gold Project (SGP) air quality analyses for the SGP Refined Proposed Action - ModPRO2 (Midas Gold 2020), a proposed refinement of Alternative 2 included in the SGP Draft Environmental Impact Statement (DEIS) (USDA-FS 2020). In addition, this addendum clarifies the differences between the ModPRO2 and the previously submitted emission inventories. This information was specifically requested in the Request for Additional Information (RFAI) 118 (Stantec 2021). The RFAI 118 questionnaire and responses are provided in Section 6.0.

Perpetua Resources (Perpetua), formerly Midas Gold Idaho, Inc., proposes to construct and operate the SGP in Valley County, Idaho. The SGP will consist of conventional open-pit mining operations and onsite ore preparation and gold extraction processes along with offsite infrastructure that includes a power transmission line and a site access road.

The SGP is a minor stationary source that is not subject to the Title V program or the Prevention of Significant Deterioration (PSD) regulations.

Perpetua conducted air quality analyses to evaluate SGP emissions to demonstrate compliance with the applicable ambient air quality standards and thresholds, and Air Quality Related Values (AQRV) required by coordinating agencies to satisfy the requirements of the National Environmental Policy Act (NEPA). The details and results of these air quality analyses (2018 AQ Report) were submitted to the United States Department of Agriculture, Forest Service (USDA-FS) in October 2018 (Air Sciences 2018). These analyses were based on the SGP plan of operations provided in Perpetua's Plan of Restoration and Operations (PRO) (Midas Gold 2016) and a modification of the PRO, referred to as the ModPRO (Brown and Caldwell 2019).

In December 2020, Perpetua proposed a refined SGP plan of operations, termed ModPRO2 (Midas Gold 2020). ModPRO2 presents a refined and improved project with a smaller footprint and reduced environmental impacts compared with PRO and ModPRO. No significant changes are made to the mining methods, ore processing, exploration activities, water management, and supporting features, including structures, access and haul roads, and infrastructure.

A revised AERMOD modeling was completed using ModPRO2 activities and emissions. The revised modeling analyses provided in this addendum demonstrate compliance with applicable ambient air quality standards and thresholds. Additional analysis was performed to demonstrate that the ModPRO2 changes are not expected to change the far-field analysis results significantly, and therefore, the far-field analysis provided in the 2018 AQ Report is considered representative of ModPRO2 and is not revised in this addendum.

PRI00000823

REC 2163

2.0 MODPRO2 BACKGROUND AND SUMMARY

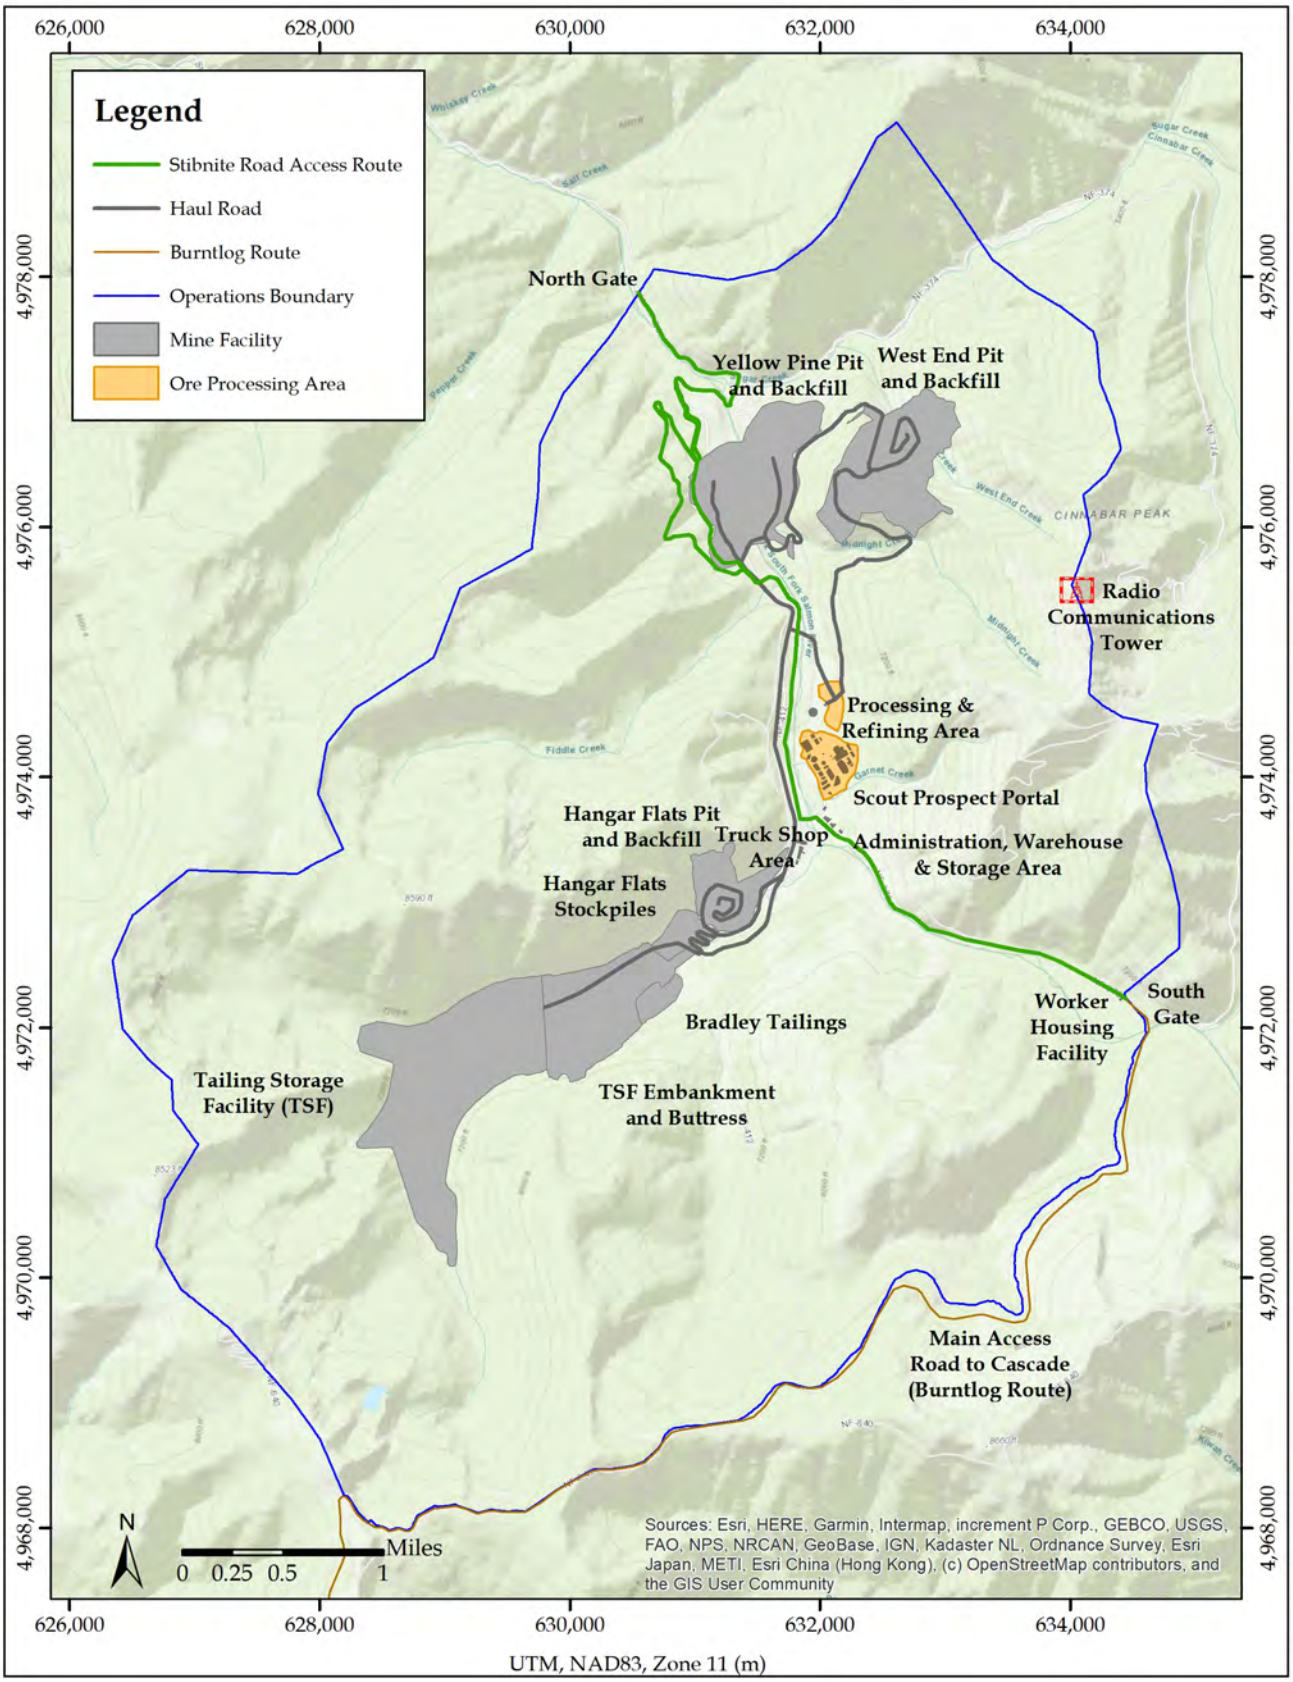
Before receiving this ModPRO2 analysis, USDA-FS received and reviewed air quality analyses for the proposed action and the lime kiln alternative (and alternative component of the ModPRO). These air quality analyses provided in the 2018 AQ Report (Air Sciences 2018) were evaluated and presented in the DEIS published by the USDA-FS in August 2020 (USDA-FS 2020), as Alternatives 1 (PRO) and 2 (ModPRO).

Perpetua continued to improve the mining and environmental performance of the SGP by evaluating additional data and conducting further analyses to identify "*project refinements that could reduce the overall project footprint, reduce associated wetland impacts, improve surface water and groundwater quality, reduce temperature impacts to surface water, reduce air emissions, improve fisheries and wildlife habitat, and improve upon reclamation and restoration design*" (Midas Gold 2020). The ModPRO2 reflects these refinements and was developed with updated data and analyses to further reduce the potential environmental impacts of the SGP by addressing agency and public comments received during the NEPA scoping and DEIS review processes.

Several aspects of the ModPRO2 refinements could potentially affect the SGP air quality impacts reviewed in the DEIS. Most refinements result in decreases in air quality effects. See parameters summarized in Table 1 with their resultant effect on air quality.

Table 1. ModPRO2 Summary of Changes

Parameters	Air Quality Effect
Reduced Production	Decrease
Reduced Surface Disturbance	Decrease
Reduced Haul Road Surface	Decrease
Smaller Trucks (more truck miles)	Increase
Fiddle DRSF Eliminated (more truck miles)	Increase
Reduced Fuel Use	Decrease
Reduced Blasting	Decrease
Reduced Blasted Area	Decrease
Reduced Drill Holes	Decrease
Reduced Blasting Agent Use	Decrease



This addendum provides the ModPRO2 air quality impact analysis for the USDA-FS to include and evaluate in the Final Environmental Impact Statement (FEIS). Perpetua requests that ModPRO2 be included in the FEIS as a refined Alternative 2, replacing the Alternative 2 in the DEIS.

The SGP site layout with the ModPRO2 refinements is presented in Figure 1.

3.0 AIR EMISSIONS INVENTORY

An air emissions inventory for ModPRO2 was calculated for each life of mine (LOM) year following the methodology, emission factors, and controls described in the 2018 AQ Report. The ModPRO2 detailed emissions calculations are provided in Appendix A. As shown below in Figure 2, and Tables 3 and 4 the overall ModPRO2 emissions are lower than the ModPRO emissions, except for volatile organic compounds (VOC), which are slightly higher for ModPRO2.

3.1 Pollutant Emissions

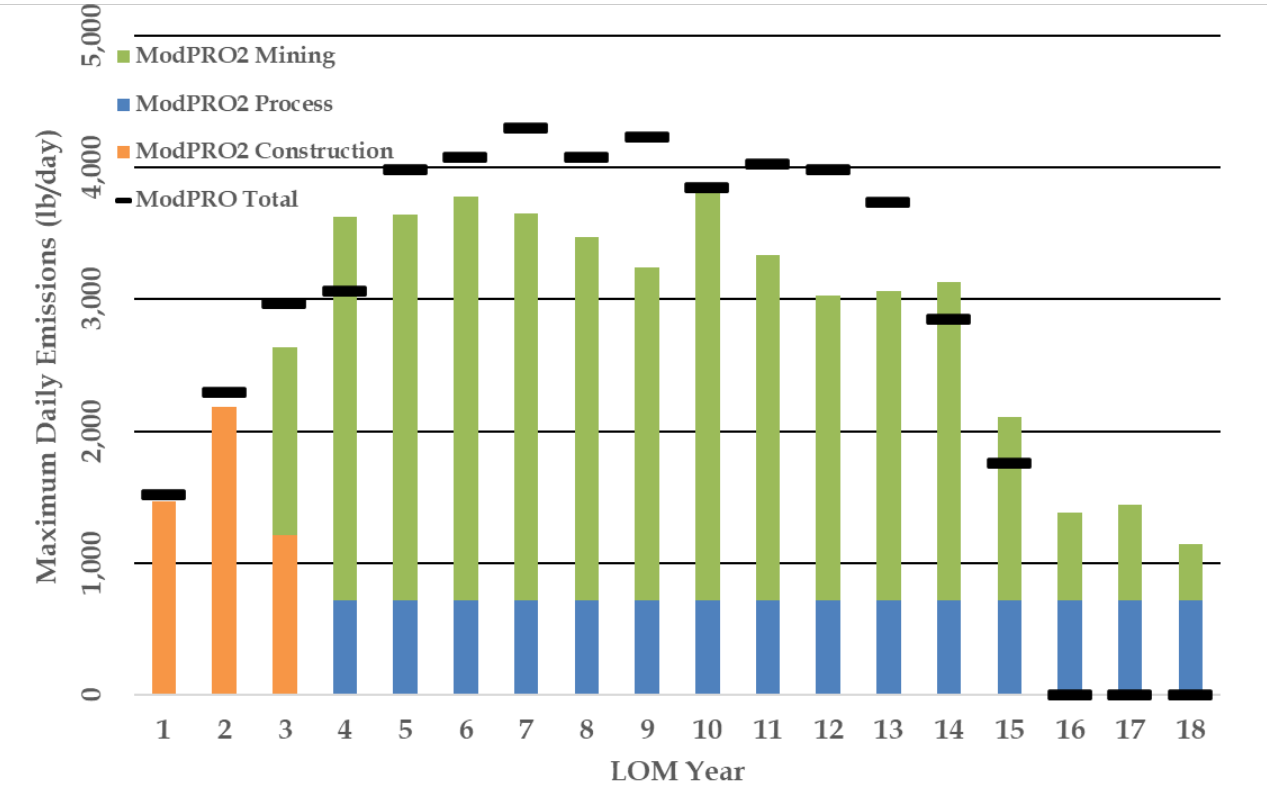

Figure 2 presents a comparison of the maximum daily combined emissions of nitrogen oxides (NO_X), particulate matter less than 10 microns (PM_{10}), sulfur dioxide (SO_2), and sulfuric acid (H_2SO_4) (pollutants considered for the Air Quality Related Values [AQRV] analyses) for each construction and operation year in pounds per day (lb/day) for ModPRO and ModPRO2. The black markers represent the total ModPRO AQRV emissions for each LOM year. The top of each bar represents the total ModPRO2 AQRV emissions for each LOM year.

The construction emissions occur in LOM Years 1, 2, and 3; the mining emissions occur during LOM Years 3 through 15; and the ore processing emissions occur in LOM Years 4 through 15 for ModPRO and Years 4 through 18 for ModPRO2. Emissions from certain mine construction components that continue during the mine operation years are included with the applicable LOM year mining emissions.

PRI00000826

REC 2166

Figure 2. Comparison of ModPRO and ModPRO2 Maximum Daily Combined NO_X, PM_{10}, SO_2, and H_2SO_4 Emissions by LOM Year (lb/day)

For ModPRO, the highest potential maximum daily combined emissions of the AQRV pollutants are approximately 4,300 lb/day, occurring during LOM Year 7 (black marker). For ModPRO2, the highest AQRV pollutant emissions are during LOM Year 10 at approximately 3,870 lb/day; 430 lb/day less than the highest ModPRO emissions.

This figure also shows that the ModPRO2 emissions are higher than ModPRO emissions for LOM Years 4, 14, and 15, but those emissions are still less than the highest ModPRO emissions occurring in LOM Year 7 that were evaluated in the 2018 AQ Report and demonstrated compliance with the applicable AQRV thresholds and standards.

Potential ore processing emissions (blue bars in Figure 2) do not vary over the life of the mine. This is because the ore processing emissions are calculated conservatively based on the maximum daily ore production rate of 25,000 ton/day, although LOM actual annual production rates will be less than the maximum rates. Specifically, the PRO, ModPRO, and ModPRO2 cite average daily production rates of 20,000 to 25,000 ton/day. The highest annual production (ore and waste) for ModPRO is 42.7 million tons, whereas for ModPRO2 the highest annual production is 36.3 million tons.

For air quality impact analyses (modeling) Perpetua identified the highest facility-wide emissions of each pollutant occurring during any LOM year, summarized in Table 2.

Table 2. LOM Years for Pollutant-Specific Maximum Annual Emissions

Pollutant	ModPRO LOM Year	ModPRO2 LOM Year
Carbon monoxide (CO)	7	6
NO_X	7	6
PM_{10}	7	10
Particulate matter less than 2.5 microns ($PM_{2.5}$)	7	10
SO_2	7	6
VOC	7	3
Hazardous air pollutants (HAP), total	7	10
Mercury (Hg)	7	10

As shown in Table 2, the maximum emissions for all pollutants coincidentally occur during the same year (LOM Year 7) for ModPRO. For ModPRO2, the highest PM, PM_{10}, $PM_{2.5}$, total HAP, and Hg emissions occur during LOM Year 10. The highest CO, NO_X, and SO_2 emissions occur during LOM Year 6, and the highest VOC emissions occur during LOM Year 3. The highest annual emissions from these LOM years (Table 2) are summarized in Tables 3 and 4 for ModPRO and ModPRO2, respectively. Hg emissions are provided in units of pounds per year (lb/yr); all other emissions are provided in units of ton/yr in Tables 3 and 4.

Table 3. Maximum Annual Emissions Summary – ModPRO LOM Year 7

Source Category	CO	NO_X	PM	PM_{10}	$PM_{2.5}$	SO_2	VOC	H_2SO_4	HAP	Hg
	(ton/yr)									(lb/yr)

PRI00000828

REC 2168

Tables 3 and 4 show that the overall ModPRO2 emissions are lower than the ModPRO emissions, except for VOC, which are slightly higher for ModPRO2. The ModPRO2 process source Hg emissions are significantly lower than the ModPRO emissions. This is a result of Perpetua's commitment to install additional Hg controls for the autoclave. This commitment was made after the 2018 AQ Report was submitted for DEIS.

The ModPRO2 maximum annual greenhouse gas emissions are 190,300 ton/yr as carbon dioxide equivalent (CO2e) compared to the ModPRO maximum CO2e emissions of 200,900 ton/yr. These CO2e emissions are calculated based on the 100-year global warming potential consistent with reporting under the United Nations Framework Convention on Climate Change (IPCC 2007) and Intergovernmental Panel on Climate Change (UNCC n.d.). Detailed greenhouse gas emission calculations are provided in Appendix A.

PRI00000829

REC 2169

4.0 NEAR-FIELD AIR QUALITY ANALYSES

This section provides the near-field (up to 50 kilometers [km] from the project) air quality analyses updated for ModPRO2.

The National Ambient Air Quality Standards (NAAQS) compliance demonstration for this analysis was completed using the revised CO, nitrogen dioxide (NO_2), ozone (O_3), and SO_2 background concentrations recommended by the Idaho Department of Environmental Quality (IDEQ 2019). The revised background concentrations in units of parts per billion (ppb) and micrograms per cubic meter ($\mu g/m^3$) are provided in Table 5.

Table 5. IDEQ-Recommended Gaseous Pollutant Background Concentrations for SGP

Pollutant	Averaging Time	Background Concentration		Reference
		(ppb)	($\mu g/m^3$)	
CO	8 hours	970	1,110	NW AIRQUEST, 2014-2017 design value
	1 hour	1,520	1,740	
NO_2	1 year	0.5	0.9	
	1 hour	2.3	4.3	
O_3	8 hours	60	117.7	
(for NO_2 modeling)	8 hours	55	107.9	
SO_2	3 hours	6.4	16.8	
	1 hour	4.7	12.3	

For NAAQS modeling inputs, Perpetua identified the highest emissions of each pollutant during any LOM year, provided in Table 2. For ModPRO the highest emissions for all criteria pollutants occur during LOM Year 7. For ModPRO2 the highest criteria pollutant emissions occur during two different years, LOM Year 6 (CO, NO_X, and SO_2) and LOM Year 10 ($PM_{2.5}$ and PM_{10}). Therefore, to capture the highest modeled concentration for each pollutant in the ModPRO2 scenario, separate modeling was performed for LOM Years 6 and 10 (i.e., two models).

The AERMOD dispersion modeling results for the ModPRO2 emissions and comparison with the applicable PSD increments and NAAQS are provided in Tables 6 and 7, respectively.

PRI00000830

REC 2170

Table 6. ModPRO2 Near-Field Class II PSD Increment Compliance Demonstration

Pollutant	Averaging Time	Maximum Modeled Concentration (µg/m³)	Maximum Allowable Increase (µg/m³)	PSD Increment Compliance
NO_2	1 year	19.8	25	Yes
$PM_{2.5}$[1]	1 year	1.1	4	Yes
	24 hours	3.3	9	Yes
PM_{10}	1 year	6.5	17	Yes
	24 hours	14.9	30	Yes
SO_2	1 year	0.2	20	Yes
	24 hours	0.7	91	Yes
	3 hours	1.8	512	Yes

[1] Includes secondary impacts provided in Section 4.1.

This table shows that the ModPRO2 maximum modeled concentrations comply with the Class II PSD increments. The results reflect the highest of the two modeled scenarios (LOM Years 6 and 10) and include the hotspot analysis for each pollutant-averaging time combination.

Table 7. ModPRO2 Near-Field NAAQS Compliance Demonstration

Pollutant	Averaging Time	Maximum Modeled Concentration (µg/m³)	Background Concentration (µg/m³)	Total Concentration (µg/m³)	NAAQS (µg/m³)	NAAQS Compliance
CO	8 hours	404.6	1,110	1,515	10,000	Yes
	1 hour	495.5	1,740	2,236	40,000	Yes
Lead (Pb)	Rolling 3 months	Not required[1]				
NO_2	1 year	19.8	0.9	20.7	100	Yes
	1 hour	129.8	4.3	134.1	188	Yes
O_3[2]	8 hours	3.0	117.7	120.7	137	Yes
$PM_{2.5}$[3]	1 year	1.1	3.5	4.6	12	Yes
	24 hours	2.7	15	17.7	35	Yes
PM_{10}	24 hours	15	37	51.9	150	Yes
SO_2	3 hours	1.8	16.8	18.6	1,300	Yes
	1 hour	3.0	12.3	15.3	196	Yes

[1] The SGP facility-wide potential Pb emissions are less than 10% of the Pb significant emission rate of 0.6 ton/yr (40 CFR 52.21(b)(23)) and thus less than the applicable "Below Regulatory Concern" defined in the Idaho rules.

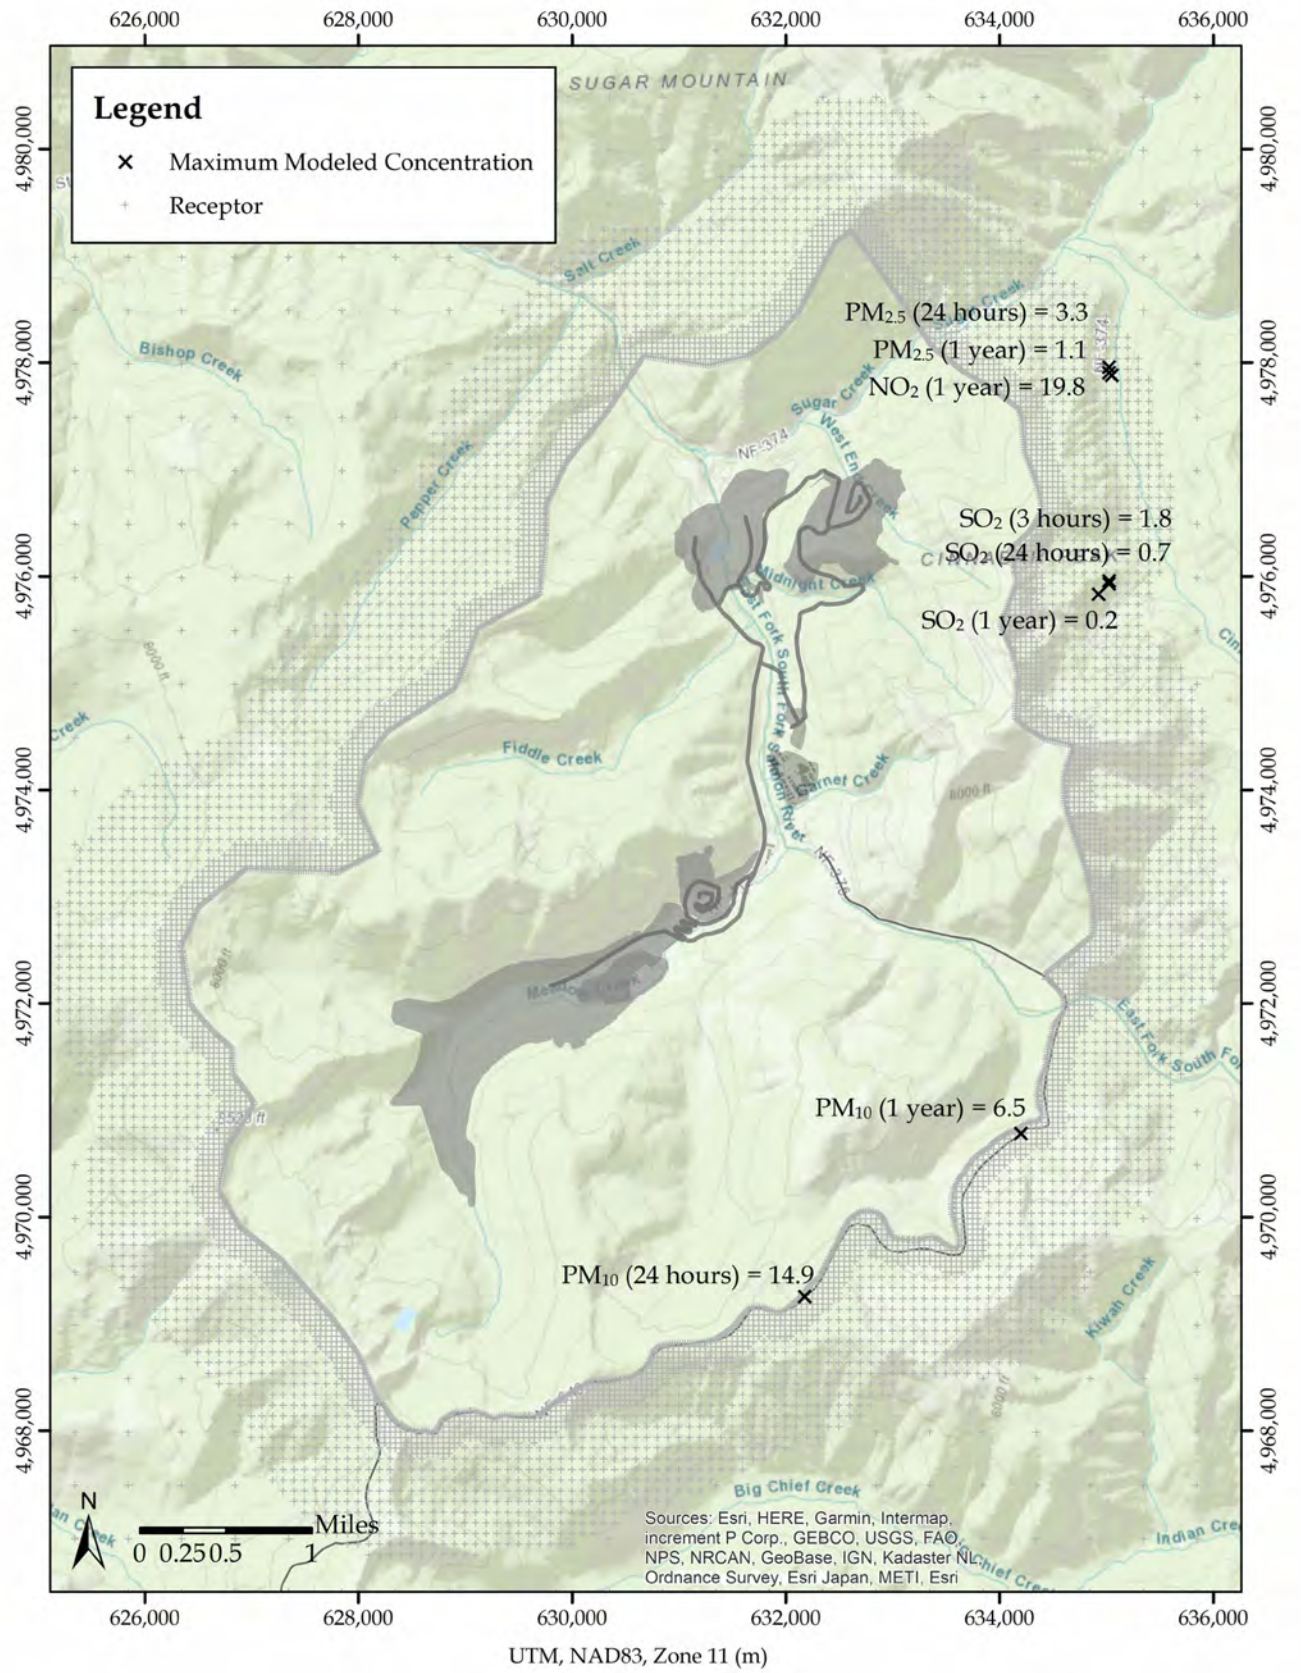
[2] See Section 4.1 for O_3 analysis.

[3] Includes the secondary impacts provided in Section 4.1.

PRI00000831

REC 2171

This table shows that the ModPRO2 maximum modeled total concentrations (SGP impact plus background) comply with the NAAQS. The results reflect the highest of the two modeled scenarios (LOM Years 6 and 10) and include the hotspot analysis for each pollutant-averaging time combination.



The locations of the maximum impacts for each pollutant and averaging time are shown in Figures 3 and 4 for Class II PSD increment and NAAQS compliance, respectively.

Electronic copies of the modeling files are provided in Appendix B.

4.1 O_3 and Secondary $PM_{2.5}$ Analyses

This section provides a revised ModPRO2 quantitative evaluation of the O_3 and secondary $PM_{2.5}$ impacts. These analyses were performed using the 2017 Guideline on Air Quality Models Tier 1 assessment methodology and the United States Environmental Protection Agency's modeled emission rates for precursors (MERPs) guidance (EPA 2016a) discussed in the 2018 AQ Report.

The estimated ModPRO2 O_3 impact is provided in Table 8. This table also shows the background and estimated total concentration compared to the 8-hour O_3 NAAQS.

Table 8. ModPRO2 O_3 Analysis

Pollutant	Averaging Time	Maximum Concentration (ppb)	Background Concentration (ppb)	Total Concentration (ppb)	NAAQS (ppb)	NAAQS Compliance
O_3	8 hours	1.4	60.0	61.4	70	Yes

As shown in Table 8, ModPRO2 shows compliance with the O_3 NAAQS.

The estimated ModPRO2 secondary $PM_{2.5}$ impacts are provided in Table 9. This table also shows the $PM_{2.5}$ annual and 24 hours background, primary, and estimated total concentrations compared with the NAAQS.

Table 9. ModPRO2 Primary and Secondary $PM_{2.5}$ Model Results

Pollutant	Averaging Time	Primary Conc. ($\mu g/m^3$)	Secondary Conc. ($\mu g/m^3$)	Background Conc. ($\mu g/m^3$)	Total Conc. ($\mu g/m^3$)	NAAQS ($\mu g/m^3$)	NAAQS Compliance
$PM_{2.5}$	1 year	1.1	0.01	3.5	4.6	12	Yes
	24 hours	2.6	0.15	15	17.7	35	Yes

As shown in Table 9, ModPRO2 shows compliance with the $PM_{2.5}$ NAAQS, even when conservatively adding maximum secondary $PM_{2.5}$ concentrations to its modeled direct $PM_{2.5}$ concentrations and ambient background concentrations.

PRI00000835

REC 2175

4.2 Screening Visibility Analysis

Perpetua submitted a revised ModPRO VISCREEN Analysis to the USDA-FS in October 2020 (2020 ModPRO VISCREEN Analysis) based on combined NO_X, PM, and soot emissions of 8,953 lb/day. The combined NO_X, PM, and soot emissions for ModPRO2 are 8,204 lb/day, approximately 8% less than those used in the 2020 ModPRO VISCREEN Analysis. Therefore, the 2020 ModPRO VISCREEN Analysis is conservatively representative of ModPRO2. Thus, the VISCREEN analysis is not revised.

The 2020 ModPRO VISCREEN Analysis is provided in Appendix C. Results of this analysis are summarized in Tables 10 and 11. Note that there are no regulatory standards or regulatory thresholds to compare to the results provided in these tables.

Table 10. Frequency of Modeled Visible Plumes – Screening Results for FCRNRW: Percent of Time when Perceptibility Threshold is Exceeded (2020 ModPRO VISCREEN Analysis)

Plume Parameter	Background	% Day Hours: 10°	% Night Hours: 10°	% Day Hours: 140°	% Night Hours: 140°
Plume Contrast (C)	Terrain	0	0	0	0
Color Contrast (ΔE)	Terrain	0.02	2.9	0	0
Plume Contrast (C)	Sky	0	0	0	0.38
Color Contrast (ΔE)	Sky	0	2.3	0	0

Table 11. Magnitude of Modeled Visible Plumes – Screening Results for FCRNRW: Ratio of Maximum Impact to Perceptibility Threshold (2020 ModPRO VISCREEN Analysis)

Plume Parameter	Background	Day (10°)	Night (10°)	Day (140°)	Night (140°)
Plume Contrast (C)	Terrain	--	--	--	--
Color Contrast (ΔE)	Terrain	1.0	2.2	--	--
Plume Contrast (C)	Sky	--	--	--	1.3
Color Contrast (ΔE)	Sky	--	1.9	--	--

4.3 Screening Mercury Deposition Analysis

As shown in Tables 3 and 4, ModPRO Hg emissions are 33.3 lb/yr, and ModPRO2 Hg emissions are 13.6 lb/yr. ModPRO2 Hg emissions are less than half of the ModPRO Hg

PRI00000836

REC 2176

emissions. Therefore, the ModPRO Hg deposition analysis is conservatively representative of ModPRO2 and thus not revised.

The ModPRO Hg deposition results from the 2018 AQ Report are provided in Table 12. Note that there are no regulatory standards or regulatory thresholds to compare to the results provided in this table.

Table 12. REMSAD and ModPRO AERMOD Screen Model Mercury Deposition Results

Hydrographic Subbasin	REMSAD Background (g/km^2-yr)	AERMOD Screen SGP Results (g/km^2-yr)	SGP Contribution to Existing Background
Subbasin west of SGP	13.9	0.056	0.40%
Subbasin northeast of SGP	13.6	0	0.00%
Subbasin southeast of SGP	12.7	0	0.00%

4.4 Screening Acid Deposition Analysis

The NO_X emissions for ModPRO are 366.5 tons/yr and for ModPRO2 are 335.2 ton/yr. The SO_2 emissions for ModPRO are 7.5 ton/yr and for ModPRO2 are 7.3 ton/yr. Emissions of both NO_X and SO_2 are lower for ModPRO2. These ModPRO2 emission reductions mean that the screening acid deposition analysis remains representative, and thus, it is not revised.

The ModPRO screening nitrogen and sulfur boundary deposition results from the 2018 AQ Report are provided in Table 13. Note that there are no regulatory standards or regulatory thresholds to compare to the results provided in this table.

Table 13. ModPRO Screening Nitrogen and Sulfur Boundary Deposition Results

Pollutant	Deposition (g/m^2-yr)
Nitrogen	0.00081 - 0.0039
Sulfur	0.00001 - 0.0043

4.5 Stibnite Public Access Route

The ModPRO2 NAAQS compliance demonstration for the 25-meter spacing receptors along the Stibnite Public Access Route (SPAR) is presented in Table 14.

PRI00000837

REC 2177

Table 14. ModPRO2 SPAR Receptor Results and NAAQS Compliance Demonstration

Pollutant	Averaging Time	Maximum Modeled Concentration (µg/m³)	Background Concentration (µg/m³)	Total Concentration (µg/m³)	NAAQS (µg/m³)	NAAQS Compliance
CO	8 hours	201.9	1,110	1,312	10,000	Yes
	1 hour	486.8	1,740	2,227	40,000	Yes
NO_2	1 year	39.0	0.9	39.9	100	Yes
	1 hour	124.4	4.3	128.7	188	Yes
$PM_{2.5}$[(1)]	1 year	5.3	3.5	8.8	12	Yes
	24 hours	12.2	15	27.2	35	Yes
PM_{10}	24 hours	65.3	37	102.3	150	Yes
SO_2	3 hours	6.0	16.8	22.8	1,300	Yes
	1 hour	13.6	12	25.9	196	Yes

(1) Includes secondary impacts provided in Section 4.1.

The results provided in Table 14 show compliance with NAAQS. The ModPRO2 SPAR results provided in Table 14 are the highest for the two modeled scenarios (LOM Years 6 and 10). The ModPRO2 SPAR modeling used the United States Environmental Protection Agency (EPA) default Qian and Venkatram (Q&V) method discussed in the 2018 AQ Report. This modeling method, which does not use the BULKRN option, is approved by EPA as one of the default modeling methodologies.

PRI00000838

REC 2178

5.0 FAR-FIELD AIR QUALITY ANALYSES

As shown in Section 3.1, the AQRV pollutant emissions for ModPRO2 are less than those for ModPRO. Therefore, ModPRO2 refinements are not expected to make any significant changes to the far-field analyses—50 km to 300 km from the project site provided in the 2018 AQ Report. To affirm this, additional AERMOD modeling was completed to estimate concentrations at receptors located on a 50-km radius ring around the project; the maximum approved range of AERMOD. The 50-km ring modeling was performed for the applicable AQRV pollutant-averaging time combinations. The 50-km ring modeling result comparison for ModPRO and ModPRO2 is provided in Table 15.

Table 15. 50-km Ring AERMOD Results for ModPRO and ModPRO2

Pollutant	Averaging Time	ModPRO Maximum Result ($\mu g/m^3$)	ModPRO2 Maximum Result ($\mu g/m^3$)
NO_2	1 year	0.53	0.50
$PM_{2.5}$	1 year	0.09	0.09
	24 hours	0.40	0.38
PM_{10}	1 year	0.14	0.11
	24 hours	0.51	0.57
SO_2	1 year	0.01	0.01
	24 hours	0.07	0.06
	3 hours	0.23	0.20

(1) Result includes background concentration.

Table 15 shows that the 50-km ring results are nearly identical for ModPRO and ModPRO2. The ModPRO2 results shown in Table 15 represent the highest concentrations for the two modeled scenarios (LOM Years 6 and 10).

The 50-km ring AERMOD analysis demonstrates that the ModPRO2 changes are not expected to affect the far-field analysis results, and therefore, the ModPRO far-field analyses are representative of ModPRO2 and not revised herein.

The ModPRO far-field impacts from the 2018 AQ Report are summarized in Table 16.

PRI00000839

6.0 RFAI 118 QUESTIONNAIRE AND RESPONSES

In February 2021, Perpetua received RFAI 118 related to the SGP emissions inventory and air quality analyses (Stantec 2021). RFAI 118 questions and Perpetua's responses are provided in Table 18.

Table 18. RFAI 118 Questions and Responses

Question	Response
Emissions Inventory	
Provide the updated emissions inventory for ModPRO2 (and any changes to other alternatives) for the EIS and IDEQ permitting submittals (in MS Excel format).	ModPRO2 detailed emissions inventory (EI) is provided in Appendix A to this addendum. An electronic copy of this EI in MS Excel format is provided in Appendix B. The IDEQ EI is also provided in Appendix B. Please note that the IDEQ EI required for New Source Review (NSR) permitting estimates SGP's potential to emit, a hypothetical emissions estimate based on continuous operations at maximum potential daily emission rates. Therefore, the IDEQ EI is not representative of the SGP actual operations covered by the NEPA effects analysis. For the NEPA effects analysis the ModPRO2 EI is the appropriate dataset to evaluate.
Modeling Inquiries	
Confirm that LOM year 7 represents the greatest air quality impact.	The LOM year 7 (production year 4) represents the greatest air quality impacts for ModPRO, described in the 2018 AQ Report, Section 4.2. Table 2 of this addendum provides the highest emission LOM years for ModPRO and ModPRO2.
Confirm when and where fugitive dust emissions from roads are included in the air quality model.	The road fugitive dust emissions were included in the 2018 AQ Report. The emission factors associated with the road fugitive dust (material hauling, water trucking, and grading) are provided in the 2018 AQ Report Table 6. The detailed road fugitive dust emission calculations for the lime kiln alternative are provided in the 2018 AQ Report Appendix B, pages 42-44, 54-56, and 59-60. The ModPRO2 road fugitive dust emissions are provided on pages 45-47, 57-59, and 62-63 in Appendix A to this addendum.
Confirm that EIS analyze throughputs are greater than IDEQ potentials/limits.	The mining activity rates used for the EIS analysis are not greater than those used for the IDEQ analysis. The EIS analysis uses the actual throughputs (maximum year) based on the SGP

PRI00000841

REC 2181

Question	Response
	plan of operations. The IDEQ analysis was performed using potential, maximum capacity throughput rates to present conservative assumptions for the NSR permit review process. Those rates are higher than the SGP plan of operations activity rates.
Provide locations of modelled PM10 exceedances with primary contributing sources.	The air dispersion modeling analysis provided in the 2018 AQ Report did not show any NAAQS exceedance, except for the Stibnite Access Road BULKRN results. This road is determined to be "not ambient air," and thus not subject to NAAQS. In addition, the IDEQ analysis also determined NAAQS compliance. The ModPRO2 NAAQS compliance demonstration is provided in Section 4.0 of this addendum.
Control Measures	
Provide a dust control plan with specific measures that are shown to achieve 90+% dust control efficiency.	A fugitive dust control plan (FDCP) will be developed in accordance with the IDEQ permit. The FDCP will address the following: • Procedures followed by Perpetua employees to control and minimize fugitive dust emissions • Trigger levels requiring corrective actions • Actions to bring fugitive dust emissions within acceptable ranges • Steps to demonstrate that appropriate corrective procedures are followed • Procedures to verify that Perpetua is controlling avoidable fugitive dust emissions
Provide any control measures included in the IDEQ permit application for HAP and mercury emissions.	The HAP and mercury control measures addressed in the IDEQ permit application are as follows: • Mining, general – reasonable controls, FDCP • Drilling – dust collection system • Haul roads – chemical dust suppressant/water application, clean rock capping • Burntlog access road – clean borrow material • Rock dumps and storage piles - reasonable controls, FDCP • Tailings and maintenance pond activities – chemical treatment, reasonable control, FDCP

PRI00000842

REC 2182

Question	Response
	• Ore processing – water sprays, moisture carryover, enclosures, reasonable controls, FDCP • Ore concentration and refining tanks – chemical treatment • Autoclave – venturi scrubber, vent gas cleaning tower, carbon filter • Electrowinning cells and pregnant solution tank – carbon filter • Mercury retort – carbon filter • Melting furnace – baghouse, carbon filter • Carbon kiln – wet scrubber, carbon filter • Limestone ball mill – baghouse • Parallel flow regenerative shaft lime kiln – baghouse • Lime mill crusher – baghouse • Lime slaker – wet scrubber • Storage silos – bin vents • Aggregate and concrete production – water sprays, moisture carryover, reasonable controls, FDCP • Fuel combustion – clean fuel • Emergency engines – EPA standard compliant • Gasoline storage – lids or gasketed seal, submerged filling • Diesel storage - lids
Provide any control measures included in the IDEQ permit application for fugitive mercury emissions.	The fugitive mercury control measures addressed in the IDEQ permit application are as follows: • Mining, general – reasonable controls, FDCP • Drilling – dust collection system • Haul roads – chemical dust suppressant/water application, clean rock capping • Burntlog access road – clean borrow material • Rock dumps and storage piles - reasonable controls, FDCP • Ore processing – water sprays, moisture carryover, enclosures, reasonable controls, FDCP • Aggregate and concrete production – water sprays, moisture carryover, reasonable controls, FDCP

Question	Response
Describe worker health & safety measures for winter-time air quality exposure.	This is not an ambient air quality issue and is not subject to NAAQS.
Assessment Inclusion Details	
Confirm that HAP and mercury emissions are complete (i.e., lime kiln).	The HAP and Hg emission calculations are complete and provided in the 2018 AQ Report Appendix B, pages 22-28 and 69-72 for ModPRO. The ModPRO2 HAP and Hg calculations are provided on pages 21-31 and 72-76 in Appendix A to this addendum.
Confirm that all arsenic and antimony sources have been included in HAP analysis.	The arsenic and antimony emissions are included in the HAP emission calculations provided in the 2018 AQ Report Appendix B, pages 22-28 and 69-72 for ModPRO. The ModPRO2 arsenic and antimony calculations are provided on pages 21-31 and 72-76 in Appendix A to this addendum.
Confirm that fugitive dust emissions (including lime kiln) are complete.	The fugitive dust emissions (including the lime processing) are complete and provided in the 2018 AQ Report Appendix B for ModPRO. The ModPRO2 fugitive dust emissions are provided in Appendix A to this addendum.
Confirm that fugitive dust and VOC emissions from landfarm are complete.	The potential for onsite landfarming to remediate petroleum-contaminated soils (PCS) encountered during construction and operation of the SGP is mentioned in Section 8.7.4 of Perpetua's PRO. Currently, Perpetua does not intend to conduct landfarming onsite; therefore, emissions from this activity were not included in the EIS analysis. If PCS are encountered during SGP operations and landfarming is determined to be an appropriate remedial strategy, it would be conducted in accordance with IDEQ's petroleum release response and corrective action policy (IDAPA 58.01.02.852) and following IDEQ's standard operating procedures for landfarming PCS (SOP WST-2017-02).
Confirm that the inclusion of metals in the fugitive dust under the ModPRO2 modification is complete.	Metal fugitive dust emissions are included in the ModPRO2 emissions inventory provided in Appendix A to this addendum.

ORE CONCETRATION AND REFINING

Source Data and Mercury Emissions

Source ID	Description	Subpart 7E Hg Emissions ton/yr[1]	% of Subpart 7E for Controlled Systems %		Controlled Hg Emissions lb/yr	Controlled Hg Emissions ton/yr	TAP Rule ton/yr	210.2 Exclusion
AC	Autoclave	0.107	[2]		0.20	0.00010	0.0001	No
CKD	Refinery Sources (Kiln, EW, Retort, Furnac	0.008	20.0%	[3]	3.36	0.00168	0.0017	No
Total		0.115			3.56	0.00178		

[1] *Subpart 7E Limit - Ore Pretreatment Processes (CFR 2018c)*

84 lb / ~~MMton~~ × 2,540,400 ~~ton~~ / yr × ~~MMton~~ / 1.0E+6 ~~ton~~ = 213.39 lb / yr × ton / 2,000 lb = 0.107 ton / yr

[1] *Subpart 7E Limit - Carbon Processes with Mercury Retorts*

0.8 lb / ~~ton~~ × 21 ~~ton~~ / yr = 16.8 lb / yr × ton / 2,000 lb = 0.008 ton / yr

[2] *Controlled SysCAD modeled emissions from Autoclave:* 0.01048 g/hr | 2.3E-05 lb/hr | 8,760 hr/yr | 0.20 lb/yr (M3 2019)

[3] *Based on similar source (but with much higher ore Hg content) Hg reporting levels provided below:*

Goldstrike Refinery (2015 & 2016 Hg Reports) (NDEP 2015a) (NDEP 2016)

28.79 lb / yr × yr / 251.00 ton = 0.11 lb / MMton × ton / 0.8 lb = 14.3%

Twin Creeks Refinery (2015 & 2016 Hg Reports) (NDEP 2015a) (NDEP 2016)

31.27 lb / yr × yr / 142.77 ton = 0.22 lb / MMton × ton / 0.8 lb = 27.4%

AIR EMISSION CALCULATIONS	SUBJECT: Mining Activity and Emissions	DATE: June 30, 2021

Mining Year 10

Wind Erosion - continued

Stockpile Surface Wind Erosion Event Emission Calculations - Notes

(1) u10 = wind speed at 10 meters reference height, m/s

(2) u10+ = fastest-mile wind speed, m/s
Based on hourly to fastest-mile wind speed conversion factor of 1.2 *(EPA 1994)*

(3) Pile: u* = friction velocity, m/s = (us/ur) × 0.1 × u10+ *AP-42, Sec. 13.2.5, Eqs. 6 & 7, 11/06*

Area ID	A	B	C
(us/ur)	0.9	0.6	0.2

AP-42, Page 13.2.5-10, 11/06

Flat surface:
u* = friction velocity, m/s = 0.053 × u10+ *AP-42, Sec. 13.2.5, Eq. 4, 11/06*

(4) Hours elapsed since previous wind erosion event

(5) Erodible surface area = hours elapsed since previous erosion event × hourly erodible surface area (acre) × surface regime area fraction Surface regime area fractions:

Area ID	A	B	C
% Surface	0.12	0.48	0.4

AP-42, Page 13.2.5-10, 11/06

(6) Erosion potential, g/m^2, = P = 58(u* - ut*)^2 + 25(u* - ut*); P = 0 for u* ≤ ut*
where, ut* = threshold friction velocity = 1.02 m/s *AP-42, Page 13.2.5-5 (overburden), 11/06*
P converted to lb/acre by multiplying with: 0.002205 lb/g and 4,046.86 m^2/acre
Solving u* = (us/ur) × 0.1 × u10+ for u10, when u* = ut* = 1.02 m/s and u10+ = u* × 1.2
yields the following minimum wind speeds to disturb the each stockpile surface regime:

ID-A	9.44 m/s
ID-B	14.17 m/s
ID-C	42.50 m/s

The threshold wind speed to disturbe flat surfaces is 1.02/0.053/1.2

Flat surface	16.04 m/s

The maximum hourly wind speed in the onsite data is 10.4 m/s, which is less than the threshold wind speeds to cause a disturbance of stockpile regimes ID-B and ID-C, and flat surfaces.

(7) PM emissions, lb = P (lb/acre) × erodible surface area (acre)

(8) Total PM emissions, lb = PM (ID-A), lb + PM (ID-B), lb + PM(ID-C), lb

(9) Total PM10 emissions, lb = total PM emissions, lb × PM10 scaling factors of 0.5 *AP-42, Page 13.2.5-3, 11/06*

(10) Total PM2.5 emissions, lb = total PM emissions, lb × PM2.5 scaling factors of 0.075 *AP-42, Page 13.2.5-3, 11/06*

Heavy Trucks	Cat CT660 (8X6)	10.1	34.5	22.3	476,691	

(1) *(Caterpillar 2016c)/Manufacturer specifications*

Total vehicle miles traveled (VMT) 821,472 VMT/yr *Excluding grader*

Emission Factors

Emission factor equation $E = k(s/12)^a (W/3)^b [(365-P)/365]$

s = Surface material silt content	4	%			*(Midas Gold 2015)*
W = Mean vehicle weight	18	ton			*Weighted average weight, excluding grader*
P = Days/year with ≥0.01 in precip.	120	day/yr			

	PM	PM10	PM2.5		
k = Size-specific empirical constant	4.9	1.5	0.15		*AP-42, Tab. 13.2.2-2, Eqs. 1a and 2, 11/06*
a = Size-specific empirical constant	0.7	0.9	0.9		*AP-42, Tab. 13.2.2-2, Eqs. 1a and 2, 11/06*
b = Size-specific empirical constant	0.45	0.45	0.45		*AP-42, Tab. 13.2.2-2, Eqs. 1a and 2, 11/06*
E = Size-specific emission factor	3.43	0.84	0.08	lb/VMT	

Emission Controls

Periodic application of water and chemical dust suppressant

Control efficiency 90% *See Onsite Hauling*

Vehicle Travel Dust Emissions

SGP VISCREEN ANALYSES AND REVISED 2020 MODELING

PREPARED FOR:	Midas Gold Idaho, Inc.
PREPARED BY:	Air Sciences Inc.
PROJECT NO.:	335-20-2
DATE:	September 1, 2020

Introduction

Air Sciences Inc. (Air Sciences) has conducted several VISCREEN modeling analyses in support of the National Environmental Policy Act (NEPA) process for the Midas Gold Idaho, Inc. (Midas Gold) Stibnite Gold Project (SGP). The original modeling was provided to the U.S. Forest Service (USFS) for review in July of 2018. The final modeling was submitted in March of 2019. This modeling was incorporated into the Draft Environmental Impact Statement (DEIS) dated August 2020.

Between the July 2018 and March 2019 VISCREEN modeling, the USFS requested several input changes to the model to increase its conservatism, and Midas Gold agreed to incorporate these changes. These changes are as follows:

1. Adding non-point source emissions
2. Adding mobile equipment emissions
3. Increasing the background visual range to 270 kilometers (km)
4. Adding large-diameter particulate matter emissions
5. Adding nighttime hours

As stated in the DEIS, VISCREEN is viewed as an inherently conservative model, and the use of the abovementioned inputs has further increased its conservativism. As a result, the March 2019 VISCREEN plume blight predictions may be overly conservative and misleading. These results have led to a conclusion in the DEIS that plume visibility impacts are "likely" in the Frank Church–River of No Return Wilderness (FCRNRW). The original July 2018 VISCREEN modeling predicted that the plumes resulting from the SGP in the FCRNRW are not likely to be visible to a casual observer.

The purpose of this memorandum is to:

1) provide a technical discussion of the conservatism added to the model by the abovementioned model input changes, and

2) provide a revised 2020 modeling analysis that incorporates most of the USFS changes while revising two of these inputs to increase the representativeness of the model.

Conservatism of Model Input Changes

As previously discussed, the use of the abovementioned model inputs may have resulted in overly conservative and misleading plume blight predictions. This conclusion is based on a comparison of the VISCREEN and CALPUFF model results. VISCREEN was rerun for the area within the FCRNRW that is 50 km from the SGP (the nearest distance modeled by CALPUFF). These results were then compared to the CALPUFF model visible impact results for the same location (the FCRNRW area 50 km from the SGP). This comparison shows that VISCREEN significantly overpredicts visibility impacts. At the 50-km common distance, CALPUFF predicted insignificant visibility impacts (less than the 5% extinction threshold), while VISCREEN predicted a visible plume 38% of the time, even though both models used the same Alternate 1 EIS inventory.

A technical discussion of the model input changes incorporated into the March 2019 VISCREEN modeling is provided in the following subsections.

Adding Non-Point Source and Mobile Equipment Emissions

In the July 2018 VISCREEN modeling, the maximum daily emissions from all process and auxiliary point sources (crushers, conveyors, generators, stacks, and other stationary point sources) were included in the model. These sources are located within the process area of the mine site and were conservatively assumed to form a single overlapping, coherent plume. (VISCREEN can only model a single plume.)

In the March 2019 VISCREEN modeling, the maximum daily emissions from non-point fugitive sources (drilling, blasting, material handling, dozing, grading, wind erosion, and transportation), mobile tailpipes, and the Burntlog Route were added to the model. The non-point fugitive and mobile tailpipe sources are spread out over several miles within the mine site and the Burntlog Route extends 38 miles from the mine site. The treatment of these dispersed sources as a single point source emitting a single coherent plume is not representative of realistic conditions, is highly conservative, and creates uncertainty in the modeling prediction.

A theoretical single-point plume origin correction distance of 17.8 km was introduced into the model to help account for the dispersed nature of the fugitive, mobile tailpipe, and Burntlog

Route sources added by request of the USFS. This model adjustment is not discussed in the *Workbook for Plume Visual Impact Screening and Analysis* (VISCREEN User's Guide).[1] Additionally, the VISCREEN and CALPUFF results comparison demonstrates that the theoretical correction did not provide an adequate model adjustment.

Increasing the Background Visual Range to 270 km

In the July 2018 VISCREEN modeling, a background visual range of 60 km was used. This range was obtained from the regional visual range map provided in the VISCREEN User's Guide for the SGP location. In the March 2019 VISCREEN modeling, the background visual range was increased to 270 km. This visual range represents a high estimate of the theoretical visual range for the four nearest Class I areas under natural conditions (conditions estimated to have occurred before human-caused pollution). The median visual ranges (natural conditions) for these Class I areas are between 248 to 266 km.

The FCRNRW is a Class II area. Using a visual range of 270 km for the FCRNRW area is highly conservative because a higher background visual range increases VISCREEN predictions of plume blight. The actual median background visual range is expected to be significantly lower.

Adding Large-Diameter Particulate Matter Emissions

In the July 2018 VISCREEN modeling only PM_{10} (particulate matter less than 10 microns) emissions were included, as these particulates are the major contributor to light scattering and plume blight. The VISCREEN default median particle diameter of 2 microns was used. This is a conservative assumption for PM_{10} emissions because smaller diameter particles result in higher plume blight predictions.

In the March 2019 VISCREEN modeling, large-diameter particulate matter (>10 microns) emissions were added to the model, but the median diameter was left at 2 microns. With the inclusion of the large-diameter particulate matter, 70% of the total particulate modeled was larger than 10 microns. Therefore, modeling the total particulate at 2 microns significantly increased the conservatism of the model.

Adding Nighttime Hours

In the July 2018 VISCREEN modeling, only daytime hours were evaluated for the Level 2 analysis because any plume that occurs at night would not have sunlight to illuminate it. In the March 2019 VISCREEN modeling, nighttime hours were added, which significantly increased

[1] EPA 1992. Workbook for Plume Visual Impact Screening and Analysis (Revised). United States Environmental Protection Agency. Office of Air Quality Planning and Standards. EPA-454/R-92-023. October 1992.

plume blight predictions because nighttime hours typically have lower wind speeds and higher stability classes.

Revised 2020 Model Inputs and Results

As stated in the Introduction, the use of the conservative inputs into an already inherently conservative model results in overly conservative plume blight predictions that are unrepresentative of expected conditions. Revising only two of these inputs increases the representativeness of the model while maintaining a reasonable level of conservatism:

1) Revising the background visual range to 60 km per Figure 9 of the VISCREEN User's Guide.

2) Revising the median particulate diameter to 10 microns. The VISCREEN model limits the maximum particulate diameter input to 10 microns. Therefore, modeling at 10 microns is conservative because more than half of the total particulate modeled (70%) is greater than 10 microns.

The results from the revised 2020 VISCREEN model inputs are provided in the tables below:

Table 1. Frequency of Modeled Visible Plumes – Screening Results for FCRNRW: Percent of Time when Perceptibility Threshold is Exceeded

Plume Parameter	Background	% Day Hours: 10 Degrees	% Night Hours: 10 Degrees	% Day Hours: 140 Degrees	% Night Hours: 140 Degrees
Plume Contrast (C)	Terrain	0	0	0	0
Color Contrast (ΔE)	Terrain	0.02	2.9	0	0
Plume Contrast (C)	Sky	0	0	0	0.38
Color Contrast (ΔE)	Sky	0	2.3	0	0

Table 2. Magnitude of Modeled Visible Plumes – Screening Results for FCRNRW: Ratio of Maximum Impact to Perceptibility Threshold

Plume Parameter	Background	Day (10 Degrees)	Night (10 Degrees)	Day (140 Degrees)	Night (140 Degrees)
Plume Contrast (C)	Terrain	--	--	--	--
Color Contrast (ΔE)	Terrain	1.0	2.2	--	--
Plume Contrast (C)	Sky	--	--	--	1.3
Color Contrast (ΔE)	Sky	--	1.9	--	--

Table 1 shows that the revised 2020 VISCREEN model predicts that 0.02% (1 hour) of the annual daytime hours and 2.9% (107 hours) of the annual nighttime hours may experience a visible plume within the FCRNRW area. Table 2 provides the highest magnitude of the predicted visible plumes.

2020 VISCREEN Results by Viewing Condition

Each VISCREEN run evaluates potential plume blight for a variety of viewing conditions. The two plume blight parameters estimated by VISCREEN are color contrast (ΔE) and contrast (C). VISCREEN calculates these values at two different solar angles: 10 degrees and 140 degrees. Each of these estimates is performed for two different viewing backgrounds: terrain and sky. The SGP VISCREEN results are summarized for the following eight viewing conditions:

1. Color contrast: terrain as background and 10 degrees solar angle (ΔE-Terrain-10)
2. Color contrast: sky as background and 10 degrees solar angle (ΔE-Sky-10)
3. Color contrast: terrain as background and 140 degrees solar angle (ΔE-Terrain-140)
4. Color contrast: sky as background and 140 degrees solar angle (ΔE-Sky-140)
5. Contrast: terrain as background and 10 degrees solar angle (C-Terrain-10)
6. Contrast: sky as background and 10 degrees solar angle (C-Sky-10)
7. Contrast: terrain as background and 140 degrees solar angle (C-Terrain-140)
8. Contrast: sky as background and 140 degrees solar angle (C-Sky-140)

The following sections provide four tables for each of the eight viewing conditions:

1. Number of visible plume hours during daytime
2. Number of visible plume hours during nighttime
3. Maximum VISCREEN results during daytime hours
4. Maximum VISCREEN results during nighttime hours

Will,

I spoke with Air Quality and at this time there are no other records that are responsive to this request.

Will – I only review records that could potentially be withheld. I don't review every record and therefore do not know what records exist that are responsive. It is certainly possible that there wasn't a written response to the email you received – I can only guess. But the email you did receive was not subject to the attorney client privilege – or any other exemption – which is why you received it.

If you seek additional information, you may of course submit a PRR.

Hannah

Subject: Re: Public Records Request #221273—ambient air quality monitoring and air permitting documents

Hannah,

Thank you for your response. It has provided the clarity I was seeking. ICL will be evaluating the stated exemption and reserves the right to appeal.

In the meantime, the one email provided to me included correspondence between 3 IDEQ staffers, none of whom are attorneys. Assuming a written response to Mr. Simon was given, I would like to inquire why it was not also provided? Is this because the attorney client privilege exemption cited extends to any written response given to Mr. Simon? If not, I would like to be provided with any and all responses given to Mr. Simon (or others in regard to the same email). If necessary I will submit a formal PRR.

Thank you.

On Tue, Jul 12, 2022 at 11:19 AM Hannah Young <Hannah.Young@deq.idaho.gov> wrote:
Will –

One document was withheld pursuant to Idaho Code 74-104(1), which allows DEQ to withhold documents if they are otherwise exempt from disclosure pursuant to state law. As Whitney indicated, state law protects records that are subject to the attorney

client privilege. In the recent Ada County District Court case *Idaho Press Club v. McGeachin*, the Judge explained how the attorney client privilege was protected under state law and therefore documents subject to the privilege can be withheld from disclosure in a public records request. I'm copying the relevant portions of his decision in that case here, as he explains it well:

> The attorney-client privilege in Idaho is codified at I.C. 9-203, which provides that because "[t]here are particular relations in which it is the policy of the law to encourage confidence [a]n attorney cannot, without the consent of his client, be examined as to any communication made by the client to him, or his advice given thereon in the course of professional employment." LC. 9-203(2). "Communications between attorney and client made in the course of professional employment are protected by the attorney-client privilege." State v. Iwakiri, 106 Idaho 618, 621, 682 P.2d 571, 574 (1984) (citing LC. 9-203). Idaho Rule of Evidence 502 further specifies the contours of the attorney-client privilege in Idaho. For the attorney-client privilege to apply, the communication must be (1) confidential within the meaning of the rule, (2) made between persons described in the rule, and (3) for the purpose of facilitating the rendition of professional legal services to the client. IRE 502(b). "A communication is 'confidential' if not intended to be disclosed to third persons other than those to whom disclosure is made in furtherance of the rendition of professional legal services to the client or those reasonably necessary for the transmission of the communication." IRE 502(a)(5).

In regards to your request below, the Idaho Public Records Act states that when an agency denies part of a request, it must notify the requester of the denial. Section 103(5) then states:

> (5) The notice of denial or partial denial shall state that the attorney for the public agency has reviewed the request or shall state that the public agency has had an opportunity to consult with an attorney regarding the request for examination or copying of a record and has chosen not to do so. The notice of denial or partial denial also shall indicate the statutory authority for the denial and indicate clearly the person's right to appeal the denial or partial denial and the time periods for doing so.

The notice of denial you received (1) notified you that the Attorney General's Office reviewed the request, (2) provided the statutory authority for the denial (Idaho Code 74-104(1), and then the attorney client privilege), and (3) you had the right to appeal and the time period for doing so.

I'm not sure how to answer your question of "how it specifically provides a PRR exemption in regards to the documents I have requested," except to say that the document was exempted pursuant to Idaho Code 74-104(1) as it was protected by the attorney client privilege.

Deputy Attorney General Young,

As per the below emails, it is your assertion that my PRR be partially denied as per Idaho Code 74-104(1):

"(1)Any public record exempt from disclosure by federal or state law or federal regulations to the extent specifically provided for by such law or regulation."

However, neither the partial denial letter nor your follow up response cite the specific federal or state law/regulation and how it specifically provides a PRR exemption in regards to the documents I have requested. I respectfully request that you please do so.

Thank you

Hi Will,

Hannah Young said the citation in the partial denial letter was for records withheld that were subject to attorney-client privilege.

I attached the email we had where all your three requests were combined into the initial request.

Thanks,
Whitney

Subject: Perpetua Ambient Monitor
Steve:

In reading the public comments received on the proposed Perpetua PTC, including EPA10, we are in fact talking about a request for a post construction ambient air PM10 monitor. In talking with you earlier today, that sounded like a BAM.

Could you help us in providing a list of requirements (high level) that DEQ would need to consider/evaluate if we were to require a post construction ambient air monitor for this facility. Also, what would be the resource impact to DEQ if we had this monitor in the permit ?

Given the comments are asking for an ambient air monitor for PM-10 , I don't think we are going to consider an on-site monitor (within fence-line) given the complexities and time it would present to derive permit conditions that wouldn't address public concerns anyway.

Thx, Mike

Mike,

On Page 13 under the paragraph titled "The use of representative precipitation data" it says that Petitioners "speculate that the precipitation data used to model fugitive PM emissions from the ore haul roads is not representative of actual precipitation at the SGP." The Petitioners' support is listed as the Guideline for Performing Air Quality Impact Analysis. There seems to be a misunderstanding by the Petitioners (and it was not caught by this motion) in that the precip data is not used in the dispersion modeling of fugitive dust. It is only used in the calculation of emission quantities. Therefore, the modeling guideline does not directly affect emission calculation beyond statements that emissions should represent potential/allowable rates. It may be beneficial to chat with Kelli and Pao how the precip was used in the emission calculation that went into the model for the 24-hour impact analysis.

TABLE OF CONTENTS

INTRODUCTION 1

ARGUMENT 2

I. PETITIONERS HAVE STANDING. 2

A. Petitioners' Standing Declarations. 2

B. Petitioners Will Suffer Injury in Fact From Increases in Air Pollution. 5

C. Petitioners' Injuries Are Fairly Traceable to DEQ's Issuance of the Permit, and a Favorable Decision Will Redress These Injuries. 9

II. EXCLUDING THE STIBNITE ROAD ACCESS ROUTE FROM AMBIENT AIR PROTECTIONS IS UNLAWFUL. 13

III. DEQ'(S) DETERMINATION THAT THE PROJECT WILL COMPLY WITH PM_{10} AND ARSENIC LIMITS IS ARBITRARY AND VIOLATES THE RULES 17

A. DEQ's Assumption that Perpetua Will Prevent 93.3% of Fugitive Dust Emissions Is Unreasonable and Violates the Air Rules Because the Permit Fails to Include Conditions Needed to Achieve This. 17

1. DEQ's determination that a combination of chemical dust suppressants and water would achieve the required dust control efficiency was arbitrary and capricious, and not supported by the permit record. 19

2. The permit lacks enforceable limits on how the dust control efficiency will be achieved to ensure compliance with PM_{10} NAAQS and arsenic AACC. 21

B. DEQ's Use of a "Surrogate Production Limits" in the Permit is Unreasonable and Does Not Ensure Compliance with PM_{10} NAAQS and Arsenic AACC. 24

C. DEQ Failed to Use Representative Precipitation Data. 27

IV. DEQ'S RELIANCE ON FUTURE PLANS TO BE PREPARED BY PERPETUA OUTSIDE OF THE PTC PROCESS VIOLATES THE AIR RULES AND THE CLEAN AIR ACT 27

V. DEQ MUST REQUIRE AMBIENT AIR MONITORING 34

VI. DEQ FAILED TO ANALYZE ECONOMIC INFORMATION AND ENVIRONMENTAL IMPACTS IN THE ARSENIC T-TRACT 36

VII. DEQ'S DETERMINATION THAT THE PROJECT WILL EMIT LESS THAT THE ARSENIC AACC HAS NO RATIONAL BASIS..... 40

CONCLUSION..... 46

INTRODUCTION

In their Cross Motions for Summary Judgment, the Idaho Department of Environmental Quality ("DEQ") and Perpetua Resources Idaho, Inc. ("Perpetua") (collectively, "Respondents") first assert that Petitioners lack standing to challenge DEQ's issuance of the permit to construct ("Permit"). The Permit authorizes the construction and operation of a mine which will emit coarse particulate matter ("PM_{10}") and arsenic for 16 years: pollutants known to adversely affect human health and the environment. Yet, Respondents argue that neither the Nez Perce Tribe (whose exclusive aboriginal home and treaty rights area includes the Stibnite Gold Project site and its surrounds), the Idaho Conservation League (the state's largest conservation organization), nor Save the South Fork Salmon (a group formed by locals specifically around concerns about the Project's impacts on the South Fork Salmon River watershed) have standing. Petitioners are submitting several declarations herewith attesting to the many ways that they are injured by DEQ's errors in issuing the defective Permit, confirming their standing. Moreover, Respondents' standing arguments would conflict with precedent, and create insurmountable hurdles to bringing contested cases. The Hearing Officer must reject these arguments.

Turning to the merits, Respondents' briefs repeatedly point to DEQ's "discretion" and "expertise" to excuse the errors DEQ made when it issued the Permit. However, in many of these instances DEQ neither has discretion nor the expertise implicated, as discussed below. Even in those instances where DEQ has discretion or relevant expertise, these are not valid excuses for making arbitrary or capricious decisions, nor do they allow DEQ to deviate from the Air Rules (IDAPA 58.01.01), and other governing authorities, as it did here. The Hearing Officer should grant summary judgment for Petitioners, set aside the Permit, and remand to DEQ to correct these errors.

ARGUMENT

I. PETITIONERS HAVE STANDING.

A. Petitioners' Standing Declarations.

"Th[e Idaho Supreme] Court has adopted the federal justiciability standard. 'When deciding whether a party has standing, [the Idaho Supreme Court has] looked to decisions of the United States Supreme Court for guidance.'" *Radford v. Van Orden*, 168 Idaho 287, 299 (2021) (quoting *Koch v. Canyon Cnty.*, 145 Idaho 158, 161 (2008) (internal citations omitted)). An organization has "standing to bring suit on behalf of its members when its members would otherwise have standing to sue in their own right, the interests at stake are germane to the organization's purpose, and neither the claim asserted, nor the relief requested requires the participation of individual members in the lawsuit." *Friends of the Earth v. Laidlaw Env't Servs. (TOC)*, 528 U.S. 167, 169 (2000). For a member to have standing in their own right: (1) the member must suffer an "injury in fact" that is "(a) concrete and particularized and (b) actual or imminent, not conjectural or hypothetical;" (2) the injury must be "fairly traceable to the challenged action;" and (3) it must be "likely, as opposed to merely speculative, that the injury will be redressed by a favorable decision." *Friends of the Earth*, 528 U.S. at 180–81.

Petitioners Nez Perce Tribe (the "Tribe"), Idaho Conservation League ("ICL"), and Save the South Fork Salmon ("SSFS") each have standing to challenge DEQ's issuance of the Permit to Perpetua. The Permit authorizes 16 years of air pollution from the Stibnite Gold Project ("Project"), including coarse particulate matter ("PM_{10}") pollution and arsenic pollution. Eliminating or minimizing air pollution is germane to each Petitioners' purpose and directly harms their members' health, cultural, recreational, aesthetic, and other interests, as was alleged

in the Petition for Contested Case and is confirmed by the declarations from members of each Petitioner organization submitted herewith.

ICL submits standing declarations from its members Jonathan Oppenheimer, Allison Fowle, and Asa Menlove. Mr. Oppenheimer has worked at ICL since 2002, and has been an ICL member for even longer. Oppenheimer Decl. ¶ 2. Founded in 1973, ICL is Idaho's largest state-based conservation organization. *Id.* ¶ 3. Advocating for responsible mining practices, including by engaging in agency permitting processes, is central to ICL's mission to protect the air Idahoan's breathe, the water they drink, and the land and wildlife they love. *Id.* ¶¶ 3–4.

As Exhibit A to Mr. Oppenheimer's declaration shows, EPA has found that there is a no-threshold relationship between PM exposure and several adverse health effects, meaning any increase in PM can have negative health effects. *See id.* ¶ 15 & Ex. A. Exhibit B to Mr. Oppenheimer's declaration is a study titled, "Health Effects Associated with Inhalation of Airborne Arsenic Arising from Mining Operations," which links the inhalation of arsenic-bearing dusts to increased arsenic uptake and adverse carcinogenic and non-carcinogenic health outcomes. *See id.* ¶ 16 & Ex. B.

ICL's declarants have each regularly visited the South Fork Salmon River ("SFSR") watershed, including in the East Fork SFSR drainage, and intend to continue doing so, including specific plans to visit this year and/or next. Oppenheimer Decl. ¶¶ 9–13; Fowle Decl. ¶¶ 3–6, 9–10; Menlove Decl. ¶¶ 7, 9–10. Because of the Project's dust and arsenic emissions, ICL's declarants will suffer health risks when they visit these areas; will suffer degradation of their recreational, environmental, and aesthetic interests; and/or will no longer visit these areas. Oppenheimer Decl. ¶¶ 15–18; Fowle Decl. ¶¶ 7–8, 11; Menlove Decl. ¶¶ 7–11.

SSFS submits standing declarations from its members Zak Sears and Drew Hollenback. SSFS's mission is to protect and preserve the biological resources of the SFSR watershed, including from the threats posed by the Project. Sears Decl. ¶ 2; Hollenback Decl. ¶ 2. SSFS's declarants have each regularly visited the SFSR watershed, including in the East Fork SFSR drainage, and intend to continue doing so, including specific plans to visit this year and beyond. Sears Decl. ¶¶ 5–12; Hollenback Decl. ¶¶ 4–9. Because of the Project's dust and arsenic emissions, SSFS's declarants will suffer health risks when they visit these areas; will suffer degradation of their recreational, environmental, and aesthetic interests; and/or will no longer visit these areas. Sears Decl. ¶¶ 12–21; Hollenback Decl. ¶¶ 10–14.

The Tribe submits the declarations of Joseph Oatman and Emmit Taylor Jr. Mr. Taylor is an enrolled member of the Tribe and is Director of the Tribe's Department of Fisheries and Resources Management ("DFRM"), Watershed Division. Taylor Decl. ¶ 2. Mr. Oatman is an enrolled member of the Tribe and is DFRM's Deputy Program Manager. Oatman Decl. ¶ 2. As Mr. Oatman states:

> Since time immemorial, the Nez Perce people, the Nimiipuu, exclusively occupied over 13 million acres encompassing a large part of what is today Idaho, Washington, and Oregon—stretching from the Bitterroot Mountains to the Blue Mountains. Nez Perce also traveled far beyond this homeland to fish, hunt, gather and pasture—frequently going east to buffalo country, in what is today Montana, and west along the Snake and Columbia Rivers. In 1855, to preserve its way of life and the foods we depend upon, the Tribe entered into a treaty with the United States reserving to itself, among other guarantees, "the right of taking fish at all usual and accustomed places in common with the citizens of the Territory." Treaty with the Nez Perces, June 11, 1855 (12 Stat. 957). Since that time, the Tribe has continued to exercise its treaty-reserved fishing, hunting, gathering, and pasturing rights. It is essential for tribal members to maintain connection with the rivers, lands, and fish that are critical to supporting our culture and livelihoods. Nez Perce Tribal members, pursuant to the Tribe's Treaty-reserved rights, continue to fish, hunt, gather and pasture across the Tribe's vast aboriginal homeland at traditional places, including areas within and surrounding the proposed Stibnite Gold Project ("SGP") area and in waters directly downstream.

Id. ¶ 4. The Tribe has one of the largest fisheries programs in the United States, and DFRM's goal is to recover and restore all populations and species of anadromous and resident fish that are important to exercising the Tribe's treaty-reserved rights and way of life. *Id.* ¶ 8. To that end, DFRM works extensively throughout the SFSR watershed, including moving some Chinook salmon above the "Glory Hole" legacy mine pit at the Project site that blocks salmon from migrating to their spawning grounds farther upstream in the East Fork SFSR. *Id.* ¶ 9.

Mr. Taylor and Mr. Oatman have engaged in treaty fishing within the Project's boundaries and intend to do so in the future. Mr. Taylor and Mr. Oatman and their families also regularly visit the SFSR watershed, including Johnson Creek and the East Fork SFSR drainage, as their families have for generations, and as they plan to continue doing, to gather, hunt, fish, express their culture and identity, and connect to their history, their ancestors, and the land and rivers. Taylor Decl. ¶¶ 5–9; Oatman Decl. ¶¶ 5–7. Because of the Project's dust and arsenic emissions, the Tribe's declarants will suffer health risks when they visit these areas, and will suffer degradation of their subsistence, cultural, spiritual, and economic interests. Taylor Decl. ¶ 9; Oatman Decl. ¶ 7.

B. Petitioners Will Suffer Injury in Fact from Increases in Air Pollution.

"The alleged injury need not be large: an actual and genuine loss, even if a trifle, will suffice for standing purposes." *Waste Action Proj. v. Draper Valley Holdings LLC*, 49 F. Supp. 3d 799, 802 (W.D. Wash. 2014). "[N]othing necessitates a showing of existing environmental harm." *Ocean Advocs. v. U.S. Army Corps of Eng'rs*, 402 F.3d 846, 860 (9th Cir. 2005). Rather, "an increased risk of harm can itself be injury in fact for standing." *Id.*; *see also In re*

Zappos.com, Inc., 888 F.3d 1020, 1026–29 (9th Cir. 2018) (finding sufficient risk of future harm).

DEQ argues that Petitioners have not shown injury in fact because they cannot distinguish themselves from the general public. *See* DEQ Resp. at 8–9.[1] This is wrong. As shown in the declarations described above, Petitioners—unlike the general public—regularly visit the area in and around the Project site on the East Fork SFSR, and will be directly harmed by breathing air with increased concentrations of PM_{10} and arsenic when they visit the area in the future if the Permit remains in effect as approved by DEQ.

Moreover, the U.S. Supreme Court rejected the same argument fifty years ago, stating:

> Aesthetic and environmental well-being, like economic well-being, are important ingredients of the quality of life in our society, and the fact that particular environmental interests are shared by the many rather than the few does not make them less deserving of legal protection through the judicial process.

United States v. Students Challenging Regul. Agency Procs., 412 U.S. 669, 687 (1973) (quoting *Sierra Club v. Morton*, 405 U.S. 727, 734 (1972)). "Consequently, neither the fact that the appellees here claimed only a harm to their use and enjoyment of the natural resources of the Washington area, nor the fact that all those who use those resources suffered the same harm, deprives them of standing." *Id.* at 686–87. "To deny standing to persons who are in fact injured simply because many others are also injured, would mean that the most injurious and widespread Government actions could be questioned by nobody." *Id.* at 688; *see also Summers v. Earth*

[1] DEQ's Response to Petitioners' Motion for Summary Judgment and Brief in Support of Cross Motion for Summary Judgment is abbreviated as "DEQ Resp" followed by the page number. Perpetua's Memorandum in Support of Intervenor-Respondent's Motion for Summary Judgment and in Opposition to Petitioners' Motion for Summary Judgment is abbreviated as "Perpetua Opp'n" followed by the page number. Petitioners' Opening Summary Judgment Brief is abbreviated as "Pet'rs' Mot. Summ. J." followed by the page number.

Island Inst., 555 U.S. 488, 494 (2009) ("While generalized harm to the forest or the environment will not alone support standing, if that harm in fact affects the recreational or even the mere esthetic interest of the plaintiff, that will suffice.").

Federal courts consistently find health, aesthetic, and recreational risks from pollution sufficient to confer standing. *See Friends of the Earth*, 528 U.S. at 183–84 (injury from observing pollutants discharged into water and from alterations of behavior as a result of pollution risk); *Sierra Club v. EPA*, 972 F.3d 290, 299 (3d Cir. 2020) (injury to members whose health, recreational, aesthetic, and economic interests were affected by ozone pollution); *Covington v. Jefferson Cnty.*, 358 F.3d 626, 641 (9th Cir. 2004) (injury to plaintiff's property from RCRA-covered leaking substances caused by a failure to follow Clean Air Act procedures); *Sierra Club v. EPA*, 762 F.3d 971, 977 (9th Cir. 2014) (injury to members with existing respiratory problems and other members who fear the pollution caused by a permit issued to a power company would impact their health); *Ass'n of Irritated Residents v. EPA*, 10 F.4th 937, 943 (9th Cir. 2021) (injury where members' recreational, aesthetic, and health interests were affected by the approval of an inadequate state implementation plan); *Nat. Res. Def. Council v. EPA*, 489 F.3d 1364, 1370–71 (D.C. Cir. 2007) (injury where members "use[d] or live[d] in areas affected by the [pollutant] sources"); *Cal. Cmtys. Against Toxics v. EPA*, 928 F.3d 1041, 1049 (D.C. Cir. 2019) (injury where members lived, commuted, worked, and recreated near a pollution source and would "spend less time outdoors," or have diminished ability to enjoy the outdoors because of fear of health and environmental harms); *Sierra Club v. EPA*, 755 F.3d 968, 974 (D.C. Cir. 2014) (injury resulting in "behavioral changes" from fear of hazardous waste exposure); *WildEarth Guardians v. BLM*, 8 F. Supp. 3d 17, 28 (D.D.C. 2014) (injury from "increase in pollution" that would diminish member's aesthetic, recreational enjoyment).

DEQ's reliance on *Selkirk-Priest Basin Ass'n v. State ex rel. Batt*, 128 Idaho 831 (1996) ("*SPBA*"), and the Board of Environmental Quality order in *In re Simmons Sanitation*, Docket No. 0106-05-01 (Sept. 26, 2005), is misplaced. *See* DEQ Resp. at 6–7. In both matters, the organizations failed to provide the types of detailed, specific information Petitioners provide here in their member declarations attesting to their regular use and enjoyment of specific places that will have increased air pollution, their specific plans to return to these areas, the specific ways in which their experiences will be degraded, and (for some) their concern that they might have to alter their behavior and avoid these places. And in neither case did members show direct health risks to themselves from exposure to increased pollution, like every one of Petitioners' members has attested to here.

In *In re Section 401 Water Quality Certification for Relicensing of the C.J. Strike Hydroelectric Facility*, Docket No. 0102-01-06, at 14 (2002), the Board found Idaho Rivers United established representational standing based on members affidavits stating that they hiked, camped, boated, bird watched, and mountain biked in the area but avoided fishing and swimming in the water because of water quality concerns. Similarly here, Petitioners' members have documented their recreational, aesthetic, and environmental interests in the Project site and nearby areas in the East Fork SFSR drainage, the injuries they will suffer as the members might avoid these activities due to air quality concerns, or if they do still engage in these activities, their experiences will be degraded. Additionally, by continuing to engage in activities in these areas, their health will suffer from increased PM_{10} and arsenic inhalation, further conferring standing beyond what sufficed in *C.J. Strike*.

C. Petitioners' Injuries Are Fairly Traceable to DEQ's Issuance of the Permit, and a Favorable Decision Will Redress These Injuries.

In addition to suffering injury in fact, Petitioners satisfy the remaining elements of standing, because each of their injuries are "fairly traceable" to DEQ's issuance of the Permit, and a favorable decision setting aside and/or remanding the Permit to DEQ to correct errors identified by Petitioners would redress these injuries.

To be "fairly traceable," the causal connection between the injury and the challenged action cannot be too speculative or the result of the independent action of some third party not before the court. *Bennett v. Spear*, 520 U.S. 154, 167 (1997). There is nothing speculative about Petitioners' injuries, which are obviously caused by DEQ's issuance of the Permit, which is required for Perpetua to construct and operate the Project. But for DEQ's issuance of the Permit, Perpetua cannot construct and operate the Project. And there is no dispute that constructing and operating the Project will generate air pollutants—as DEQ's own modeling confirms. This increase in air pollutants will cause the injuries asserted in the declarations submitted by Petitioners' members.

Traceability does not require an absolute certainty, *see Ass'n of Irritated Residents*, 10 F.4th at 944, or a "scientific certainty" that the defendant's actions caused the petitioner's harm. *See Idaho Conservation League v. Atlanta Gold Corp.*, 844 F. Supp. 2d 1116, 1130 (D. Idaho 2012) (quoting *Nat. Res. Def. Council v. Sw. Marine, Inc.*, 236 F.3d 985, 995 (9th Cir. 2000)). Rather, petitioners need only establish that the challenged action has a reasonable probability of threatening a member's concrete interest. *Hall v. Norton*, 266 F.3d 969, 977 (9th Cir. 2001). Petitioners also do not need to show that DEQ's approval of the Permit is the "sole source" of its members' injuries and "need not eliminate any other contributing causes to

establish its standing." *Barnum Timber Co. v. EPA*, 633 F.3d 894, 901 (9th Cir. 2011). *See also Ocean Advocs.*, 402 F.3d at 860 (finding causation even though other factors also caused plaintiffs' injury). Members of Petitioners organizations assert that they will be harmed when they encounter increased air pollution.

DEQ's reliance on *Rebound v. Idaho Dept. of Health & Welfare*, Docket No. 0101-99-07 (Jan. 19, 2002) is misplaced. *See* DEQ Resp. at 9-10. There, the Board held that Rebound (a trade union group) failed to establish standing to challenge a permit modification to add additional equipment to a power plant. *Rebound* at 2. To try to establish organizational standing, Rebound relied on another trade union group and fellow petitioner, IBEW Local, as an organizational member, and relied on affidavits from IBEW local members and other area residents. *Id.* at 3–4. The Board held that Rebound failed to establish standing for many reasons, including because: IBEW Local's mission did not have anything to do with environmental advocacy; Rebound failed to show how IBEW Local members gave it standing; it was unclear whether the area residents who submitted affidavits were actual Rebound members; and the affidavits failed to identify any specific injury, so it was not possible to establish a direct link between increased emissions from the modification and the asserted general injuries. *Id.* Petitioners' declarations here are far more specific, direct, and factual in establishing each Petitioner's interests and injuries caused by the Permit.

DEQ also relies on *Solomon v. IDEQ*, Docket No. 0101-03-01 (2003), DEQ Resp. at 10, where, similar to *Rebound*, petitioners failed to provide sufficient evidence in their affidavits establishing an injury in fact that was caused by DEQ's issuance of two permits instead of one for a facility. *See Solomon* at 6. And DEQ relies on *Rickards v. Idaho Dept. of Health & Welfare*, Docket No. 0101-92-12 (Dec. 18, 1992), *see* DEQ Resp. at 10, where the Board found that the

pro se petitioner failed to establish standing because his injury—driving past the proposed emitting source—was too speculative and failed to make a connection to the challenged action due to his failure in providing affidavits or other certified documentation supporting his contentions. *See Rickards* at 2–4, 11.

By contrast, here (as already discussed), environmental advocacy—including specifically in the SFSR watershed—are central to the missions of Petitioners' organizations; every declarant is a member of one of the organizations; and the declarants point to specific, direct injuries they will suffer from the increased air pollution—including the health risks of breathing in PM_{10} and arsenic—that will occur from the construction and operation of mine, as approved by DEQ. This satisfies causation.

To satisfy redressability, Petitioners must allege that "it is likely, as opposed to merely speculative," that their injuries "will be redressed by a favorable decision." *Friends of the Earth*, 528 U.S. at 181. A plaintiff meets the redressability requirement if it is likely, even if not necessarily certain or inevitable, that the injury can be redressed by a favorable decision. *See Bonnichsen v. United States*, 367 F.3d 864, 873 (9th Cir. 2004); *Beno v. Shalala*, 30 F.3d 1057, 1065 (9th Cir. 1994). It is sufficient to show that the requested remedy would "slow or reduce" the harm. *Massachusetts v. EPA*, 549 U.S. 497, 525 (2007). For procedural injuries, Petitioners need only show that the agency "could reach a different conclusion" if required to reconsider their decisions. *Ctr. for Biological Diversity v. EPA*, 861 F.3d 174, 185 (D.C. Cir. 2017). "Causation and redressability typically 'overlap as two sides of a causation coin'" because "if a government action causes an injury, enjoining the action usually will redress that injury." *Carpenters Indus. Council v. Zinke*, 854 F.3d 1, 6 n.1 (D.C. Cir. 2017).

If the Hearing Officer sets aside the Permit (as Petitioners have requested), this will unquestionably redress Petitioners' injuries because the Project (and the air pollution it will cause) cannot commence without a permit to construct ("PTC"). Additionally, remanding the Permit to DEQ to reconsider and correct any of the errors Petitioners have alleged (as Petitioners have requested) will also redress Petitioners' injuries. Correcting the ambient air boundary so that the Stibnite Road Access Route ("Route") is no longer considered part of the mine site will require Perpetua to further reduce its emissions in order to meet air quality standards, thereby lowering the air pollution Petitioners members will experience when they use the Route. *See infra* Part II. Developing and including in the Permit more robust and specific conditions and limits to ensure Perpetua achieves PM_{10} and arsenic emissions control levels will slow or reduce air pollution emissions, and will better ensure projected emissions levels are indeed met throughout the life of the Project and, if not, that any violations can be more readily enforced. *See infra* Parts III, V–VI. Removing the 16/70 allowance in arsenic concentrations DEQ approved in the Permit will require Perpetua to reduce its arsenic emissions. *See infra* Part VII. Finally, requiring Perpetua to submit to DEQ its "work plans" as part of the public permitting process, instead of letting Perpetua submit them later, will allow for public comments and more robust review by DEQ, which could result in a different decision. *See infra* Part IV. Petitioners, thus, satisfy redressability for both their substantive and procedural claims because they adequately alleged their members could get "at least some" relief. *Tozzi v. U.S. Dep't of Health & Hum. Servs.*, 271 F.3d 301, 310 (D.C. Cir. 2001).

In sum, Petitioners have adequately alleged—and documented through their member declarations—all elements of standing based on the harm the Project's air emissions will cause to

their members' health, aesthetic, recreational, environmental, and other interests within and surrounding the Project area.[2]

II. EXCLUDING THE STIBNITE ROAD ACCESS ROUTE FROM AMBIENT AIR PROTECTIONS IS UNLAWFUL.

Under the current Permit, the Route will be open to the Tribe and general public and the air above it will be excluded from ambient air protections. *See* PET 310.[3] In other words, it will be polluted with undisclosed and unregulated amounts of PM_{10} and arsenic, and other criteria, toxic, or hazardous air pollutants as the health-based limits established under the Clean Air Act ("CAA") and the Idaho Air Rules will not apply.[4] As stated in Perpetua's brief, "the boundary of the project's 'ambient air' is important," and the Route is particularly important to local residents who have used the existing road through the mine site to access high-value recreational and

[2] Respondents also argue Petitioners have failed to show DEQ's issuance of the Permit prejudices their substantial rights under I.C. § 67-5279(4). *See* DEQ Resp. at 13–14, 17; Perpetua Opp'n at 10, 27. First, this requirement only applies to the relief courts can grant when reviewing agency decisions, and does not apply to this contested case. Second, for the same reasons Petitioners have standing, they also show DEQ's decision prejudices their substantial rights, including by jeopardizing their health and well-being, as well as their recreational, cultural, aesthetic, and environmental interests, and by depriving Petitioners of the ability to meaningfully participate in DEQ's permitting process. *See Citizens Against Linscott/Interstate Asphalt Plant v. Bonner Cnty. Bd. of Comm'rs*, 168 Idaho 705, 716 (2021) ("A right is substantial if it could impact the outcome of the litigation."). Finally, the cases cited by DEQ involve land use decisions governed by the Idaho Local Land Use and Planning Act, Idaho Code § 67-6501 *et. seq.*, that has specific provisions defining who is an "affected person," *id.* § 67-6521(1), under which the substantial right inquiry is reviewed. *See* DEQ Resp. at 14, 17 (citing *Noble v. Kootenai Cnty. ex rel. Kootenai Cnty. Bd. of Comm'rs*, 148 Idaho 937 (2010)).

[3] "PET" followed by a Bates number corresponds to Petitioners' exhibits; "PRI" followed by a Bates number corresponds to Perpetua's exhibits.

[4] DEQ states that "[i]t is unclear from the Petitioners' argument exactly how far from the Route the 'ambient air' boundary should extend from either side of the road." DEQ Resp. at 22. However, that determination is not Petitioners' responsibility, but DEQ's responsibility as the permitting agency.

cultural sites on public lands, and who intend to continue to do so. Perpetua's Opp'n at 6; *see supra* Part I.

DEQ's arbitrary and unsupported determination that Perpetua has the ability to *preclude* tribal and public access and then to label the general public traveling on the Route as "guests of the mine," *see* PET 570, to avoid either of two undesirable outcomes—prohibiting tribal and public access to the Route or ensuring the air above the Route complies with air quality standards—is not within the agency's technical expertise, is not entitled to deference, and is wrong.[5] *See* DEQ Resp. at 22; Perpetua Opp'n at 16. The Hearing Officer should vacate the Permit and remand it to DEQ to fix this error.

First, DEQ's assertion that Perpetua has the "legal authority to prohibit access by the 'general public'" is incorrect. DEQ Resp. at 23. According to EPA's Revised Policy on Exclusions from "Ambient Air," there are two policy conditions that determine whether the general public has access: "whether the general public has access in a *legal* sense" and "whether the general public has access in a *practical or physical* sense."[6] PET 774, 776. In this case,

[5] Perpetua mistakenly relies on *Resisting Environmental Destruction on Indigenous Lands, REDOIL v. EPA*, 716 F.3d 1155 (9th Cir. 2013). Perpetua Opp'n at 18–19. The issue there was whether it was reasonable for EPA to apply the ambient air exclusion policy to the area over water versus land. *REDOIL*, 716 F.3d at 1165. Contrary to Perpetua's assertion, the *REDOIL* case did not involve an "air boundary exemption" that allowed the public to access non-ambient air such as what Perpetua is trying to do here. *See* Perpetua Opp'n at 21; *REDOIL*, 716 F.3d at 1159 (stating that in addition to the U.S. Coast Guard's "establishment of an effective safety zone that *prohibits* members of the public from entering the area[,] Shell must also develop and implement a public access control program to [ ] notify the general public of the *prohibition* on entering the safety zone . . . .") (emphasis added).

[6] DEQ argues that in the application of its definition of ambient air, it does not need to be consistent with EPA's policy, DEQ Resp. at 22; Perpetua, however, argues that DEQ "followed EPA guidance," Perpetua Opp'n at 16. Regardless, under the CAA and its regulations which are incorporated into IDAPA 58.01.01 ("Idaho Air Rules") Section 107.03.c, "the air agency must still determine, based on the administrative record for the permit, that the *general public does not*

although Respondents argue that Perpetua can preclude public access in the practical or physical sense by using "security escort vehicles, manned guardhouses, locked gates, barriers, warning signs, and registration of" those accessing the Route, DEQ Resp. at 23, it cannot reasonably determine that the Tribe and public do not have access in a legal sense.

Indeed, the mine plan that is in front of the U.S. Forest Service for review and approval requires that "public access through the site would be provided by" the new Route. PET 957. *See also* PET 905 (indicating that during operations "public access" will be provided "through the Operations Area Boundary [ ] by constructing new road through Yellow Pine pit and below mine haul road to link Stibnite Road (FR 50412) to Thunder Mountain Road (FR 50375)"); PET 964 ("The 2021 [Modified Mine Plan] would include a 12-foot-wide gravel road to provide public access from Stibnite Road (FR 50412) to Thunder Mountain Road (FR 50375) through the SGP."); PET 838 (same). Additionally, the Route will be open seasonally to the public, as it is now, and Perpetua can only temporarily prohibit public access when there are "concerns related to public or employee health and safety, such as during blasting, mining in the immediate area of the road and other similar operations." PET 838. *See also id.* ("During operations, the public access road would be used to travel through the mine site and would provide seasonal use, open to all vehicles."); PET 1240 ("The public access road would not be plowed in the winter (current county maintenance standards) and signs would inform the public of seasonal and *temporary* closures.") (emphasis added); *id.* ("The through-site public access would be seasonal, similar to current conditions."). Thus, although Perpetua may have the ability to exclude the public "in a

have access to the property in order to exclude an area from ambient air." PET 773 (emphasis added) (footnote omitted).

practical or physical sense" (though this is questionable),[7] it does not, under the mining plan submitted to the U.S. Forest Service, have "the right to preclude the general public's access." PET 776.

Second, it was unreasonable to label the Tribe or public traveling on the Route as "guests of the mine." *See* PET 839 (stating that DEQ's approach to excluding the Route from ambient air protections was that "people traveling on the road would be considered 'guests of the mine.'"). Nothing in the Idaho Air Rules, DEQ's guidance, or EPA policy suggests that, because "access for all guests will be carefully managed," the Tribe or the public are not afforded the protections of ambient air under the CAA. *See* DEQ Resp. at 23; *see also* Perpetua Opp'n at 21 ("Those that seek access must be required to register at the access gate and will be informed that they are proceeding as guests of Perpetua rather than members of the public."). Notably, Respondents do not point to a single case where DEQ has allowed the general public to travel through a facility where the route is exempt from ambient air protections.

DEQ's reference to "business invitees" in EPA's Revised Policy only hurts its case. *See* DEQ Resp. at 23. There, EPA made the distinction between the general public and true "guests of the mine"—others who may have legal and practical access to a site but who would not be afforded air quality protections, such as "employees of the owner or operator who work at the site, or 'business invitees,' such as contractors or delivery persons." PET 776. Respondents cannot reasonably argue that the Tribe or its members traveling to or through the mine site to

[7] It is also questionable whether Perpetua can exclude the public, consistent with EPA's policy, in a practical sense. Although the public traveling to access the road might have to comply with stated safety procedures by stopping at the gate, registering, and following a pilot car, there is no apparent ability for Perpetua to physically exclude the public from accessing the Route if they comply with these procedures.

exercise Treaty-reserved rights, or for the general public to travel through the site to access public lands, who have not been invited by Perpetua, who are not doing business with Perpetua, and who will not be allowed to deviate off of the Route are nonetheless "guests of the mine."

The record thus does not, and cannot, demonstrate that Perpetua may legally or practically preclude Tribal or public access to the Route, and DEQ's determination to the contrary was unreasonable, as was its decision to label the public as "guests of the mine." DEQ's determination was not well-reasoned, and is inconsistent with the Idaho Air Rules, the CAA, and EPA policy. The Hearing Officer should vacate the permit and remand it back to DEQ for further review.

III. DEQ'S DETERMINATION THAT THE PROJECT WILL COMPLY WITH PM_{10} AND ARSENIC LIMITS IS ARBITRARY AND VIOLATES THE AIR RULES.

Even using DEQ's ambient air boundary, DEQ's determination that the Project's potential to emit will not cause or contribute to an exceedance of the PM_{10} National Ambient Air Quality Standards ("NAAQS") and the arsenic acceptable ambient concentrations for carcinogens ("AACC")—as required under Section 203 of the Air Rules prior to issuing a PTC—are arbitrary and capricious, violate the Air Rules, and must be set aside and remanded. *See* Pet'rs' Mot. Summ. J. at 19–28.

A. DEQ's Assumption that Perpetua Will Prevent 93.3% of Fugitive Dust Emissions Is Unreasonable and Violates the Air Rules Because the Permit Fails to Include Conditions Needed to Achieve This.

There is no dispute that a critical factor affecting fugitive dust emissions, and therefore whether the Project will comply with the PM_{10} NAAQS and arsenic AACC limits, is the degree to which Perpetua can effectively control dust from haul roads. It is evident from the permit record that in order for this mine to extract, haul, and process the 180,000 tons of ore per day

needed to meet Perpetua's desired production capacity—a capacity allowed under the Permit conditions—and still comply with PM_{10} NAAQS and arsenic AACC, Perpetua must control the dust to a 93.3% efficiency. *See* Pet'rs' Mot. Summ. J. 19–23. Nothing less will suffice. *See* PET 275 ("[I]t is critical for NAAQS compliance that this high level of control be achieved."); *see also* PET 325 (same), PET 328 (same); PET 325–26 (finding that cutting operations with only 90% dust control would still cause exceedances of the PM_{10} 24-hour NAAQS).

As explained in Petitioners' Opening Brief, the record shows that 93.3% is a very high and aggressive level of control; EPA and other commenters questioned whether this was even achievable by applying chemicals and water as Perpetua plans to do. Pet'rs' Mot. Summ. J. at 19–20. DEQ itself recognized that it will be "challenging to consistently and continuously achieve the targeted level of fugitive dust control." PET 065. Later in the Statement of Basis ("SOB"), DEQ admitted that meeting 93.3% was based on an "assumption" that Perpetua would appropriately apply water and magnesium chloride, "vigilant inspection and monitoring" would be required, and additional measures—not in the Permit—would be necessary in the Fugitive Dust Control Plan ("FDCP") Perpetua will develop later. PET 090. Accordingly, DEQ failed to reasonably determine that 93.3% dust control efficiency was achievable either by the chemical/water method, or by the particular means of application.

Respondents first argue that the record shows 93.3% is achievable. *See* Perpetua Opp'n at 22–23. It does not. Moreover, and addressed more below, Petitioners emphasized that this largely misses the point. Again, DEQ admits that 93.3% is a high, aggressive, and a "challenging" level to achieve. PET 065, 263, 325. Instead of resting on an "assumption" that Perpetua will be "vigilant" and implement the necessary control procedures (procedures that remain unspecified and for future development in various "plans"), DEQ should have developed

and included in the Permit the limits and conditions necessary to ensure 93.3% will be achieved. DEQ modeling staff "recommend[ed] that the permit require an aggressive implementation of measures to achieve above 93% control efficiency for fugitive particulate emissions from roadways." PET 328. Because DEQ did not include such limits and conditions in the Permit, it was arbitrary and capricious to assume this high 93.3% would be achieved, and that the Project would comply with the PM_{10} NAAQS and arsenic AACC, as discussed in more detail below.

1. DEQ's determination that a combination of chemical dust suppressants and water would achieve the required dust control efficiency was arbitrary and capricious, and not supported by the permit record.

Perpetua argues that its technical memorandum demonstrates that chemical dust suppressants applied to unpaved industrial roads can have a dust control efficiency of 90-99% for PM_{10}. Perpetua Opp'n at 22–23 (citing PET 546). It also points out that watering alone, according to AP-42, can reach a control efficiency of 95%. *Id.* at 22 n.9 (citing PET 808). Perpetua, however, misses the mark, and fails to address Petitioners' argument that there is no evidence for, and no rationale provided, that supports a finding that Perpetua will be able to achieve 93.3% dust control efficiency by using a *combination* of chemical dust suppressants and water.

Notably, the evidence that Perpetua points to in its brief contradicts that such a high control efficiency can be achieved with a combination of chemicals and water. *See id.* at 23. The EPA RACT/BACT/LAER Clearinghouse database (reproduced in DEQ's SOB) shows that out of seven sites reviewed that used a combination of chemicals and water to control dust, *none* of them were able to achieve higher than 90% control efficiency. PET 547. Moreover, the permit record demonstrates that, for the studies that it does cite, DEQ never compared the site-specific

conditions of those mines to determine whether the studies were applicable to Perpetua's site; what application methods were used to achieve the stated dust control efficiencies; and come to a conclusion whether the methods and application of dust control was reasonably achievable in this case. *See generally* PET 044–548.

Furthermore, the lack of record support is confirmed by EPA's comment on the final draft permit, stating that "the permit record does not demonstrate that [93.3%] efficienc[y is] achievable based on the site-specific conditions at the Perpetua mine." PET 669. EPA pointed out that "IDEQ's permitting record does not appear to provide support for a 93.3% control efficiency applicable to fugitive dust emissions resulting from mining excavation operations and haul roads[ ]" and that "IDEQ's permitting record does not provide any technical studies showing that the supplementing of magnesium chloride with watering will improve the control efficiency of magnesium chloride." PET 670. Yet, DEQ's response to these comments was a blanket statement that it "has confirmed based on a review of test studies that [93.3% dust control efficiency] can be achieved using water and magnesium chloride dust suppressants," and points to a yet to be seen FDCP to specify the "minimum and substantive requirements" that will not be subject to public review. *See* PET 551, 555, 557.

The questionable capability of achieving 93.3% dust control efficiency is perhaps why DEQ's modeling team recommended "aggressive implementation of measures to achieve above 93% control efficiency." PET 328. Yet the Permit, as discussed below, does nothing to dictate the enforceable limits that would indicate what the aggressive measures will be, or ensure that they are "aggressive[ly] implement[ed]." *Id.*

DEQ's determination that Perpetua would be able to achieve sufficient dust control efficiency such that it would comply with PM_{10} NAAQS and arsenic AACC was thus arbitrary and capricious.

2. The permit lacks enforceable limits on how the dust control efficiency will be achieved to ensure compliance with PM_{10} NAAQS and arsenic AACC.

Respondents argue that because the permit requires Perpetua to generally control dust by using chemical dust suppressants and water, it is legally and practically enforceable. *See* Perpetua Opp'n at 23–26; DEQ at 15–16; PET 008–10 (Permit Conditions 2.1–2.6). It is notable that Perpetua argues that the permit cannot contain details of how dust will be controlled because it is "impractical" to "establish specific numeric limits to control efficiency variables." Perpetua Opp'n at 26. Yet, DEQ relies on a yet-to-be drafted FDCP, which will not be subject to public review, to establish those detailed conditions and limits—unknown measures that will "require an aggressive implementation . . . to achieve above 93.3% control efficiency." PET 328; *see also* PET 009 (Permit Condition 2.5 stating that dust control measures must be applied "on a frequency" to ensure emissions do not exceed a certain threshold); PET 010 (Permit Condition 2.6 requiring the FDCP to "[d]evelop specific criteria to determine what frequency and type (water and/or chemical) of dust suppressant must be applied, and appropriate suppressant application rates."). At bottom, without any actual, meaningful, and enforceable limits in the Permit, DEQ cannot ensure that the Project will be in compliance with PM_{10} NAAQS and arsenic AACC.

Perpetua argues that there is "no legal authority" that requires DEQ to include legally and practically enforceable permit conditions. Perpetua Opp'n at 23–24. However, the Air Rules Section 107.03.c incorporates 40 C.F.R. Part 52 of the CAA regulations that define the "potential

to emit," and state that physical or operational limitations are part of the facility's design "if the limitation or the effect it would have on emissions *is state or federally enforceable*." Air Rules Section 006.36 (emphasis added); *see also* 40 C.F.R. 52.21(b) (definition of potential to emit).

"EPA's longstanding position is that a permit limitation can legally restrict a source's [potential to emit] if it" is practically enforceable—meaning that the limitation is technically accurate; there is a time period specified for the limitation; and there is a method to determine compliance. PET 664 (footnote omitted). Perpetua argues that the Permit Conditions establish that the 93.3% control efficiency meets the criteria to be practically enforceable. Perpetua Opp'n at 24. It is wrong for multiple reasons.

First, there is no technically accurate limitation for achieving the required 93.3% dust control efficiency. For instance, DEQ states that the 93.3% control efficiency is "supported by assuming appropriate application of water and magnesium chloride," PET 090, but neither the permit record, nor the Permit itself, specifies the limitations on how much chemical dust suppressant and/or water should be applied, under what operational or atmospheric conditions, and at what frequency. *See* PET 008–10 (Permit Conditions 2.1–2.6); *see also* PET 670 (EPA stating that "[t]o make the [potential to emit] limitations enforceable as a practical matter, the permit should include the parameters and assumptions used to develop the fugitive dust emission factors estimates for the haul roads and access roads."). Second, there is no time period specified for the limitation. Finally, the monitoring requirements that Perpetua highlights hardly can be considered a method that will determine compliance. For example, Permit Condition 2.2 requires Perpetua to record the frequency and methods used to control fugitive dust, but does not require any actual monitoring or record keeping to demonstrate that those methods are effective. PET 008. Permit Condition 2.4 requires facility-wide inspections of potential sources of fugitive

emissions, but there is no actual requirement to monitor whether the potential source is complying with the limitations or whether, if fugitive emissions were observed, those emissions exceed the PM_{10} NAAQS or arsenic AACC. *Id.* Finally, Permit Condition 2.5 requires that the "visible emissions from vehicle traffic on a haul road do not exceed 10% opacity," but there is no actual requirement to monitor opacity at certain time intervals and under what operational or site-specific conditions, or keep records documenting when opacity requirements were not being met. PET 009. Moreover, nothing in the permit record establishes that a 10% opacity correlates with a 93.3% dust control efficiency, and therefore ensures compliance with the PM_{10} NAAQS or arsenic AACC.

Third, Perpetua asserts that the "FDCP itself ensures compliance with fugitive dust requirements," and since it will contain substantive requirements and is incorporated into the Permit, this demonstrates that the Permit Conditions will "achieve the expected control efficiency." Perpetua Opp'n at 25–26. But Perpetua cannot make that claim when the provisions of the FDCP are unknown as the document does not exist. Moreover, as discussed below, the FDCP which purportedly will contain enforceable permit conditions, will not be available for review and public comment.

Finally, Perpetua complains that the Permit is already more stringent than other permits, and "requires a more comprehensive and detailed FDCP than in any other minor source permit DEQ has issued." *Id.* But here, DEQ's past practice highlights a pervasive approach to air quality permitting that is less vigorous in protecting public health than it should be. *See, e.g.*, PET 842 (stating that a review of synthetic minor source permits "found that many of the permit limitations did not adhere to EPA's guidance" and that many "permit limits did not have sufficient information within the permit or the permit's supporting documentation to determine

whether the limits were technically accurate."). Respondents make no claim that prior, more lenient permits were similar to the present one that requires "aggressive level[s] of control" and "aggressive implementation" that, if not met, would exceed the PM_{10} NAAQS or arsenic AACCs and threaten public health. PET 325, 328.

In summary, DEQ failed to include in the Permit enforceable limitations, as required under the Idaho Air Rules, that it admitted are necessary to ensure Perpetua achieves the "aggressive" 93.3% level of dust control. The Permit should therefore be vacated and remanded to DEQ to fix these deficiencies.

B. DEQ's Use of a "Surrogate Production Limits" in the Permit is Unreasonable, Does Not Ensure Compliance with PM_{10} NAAQS and Arsenic AACC, and the Permit Limit is Not Enforceable.

Variables, such as daily vehicle miles traveled, truck weight, and speed limit are important parameters that are used in developing fugitive dust emission factors for haul roads of any mine, including this one. *See, e.g.*, PET 798, 800; *see also* PET 062. Although there is no specific authority *requiring* DEQ to include those parameters as specific, enforceable permit limitations, *see* Perpetua Opp'n at 27, it was unreasonable in this case for DEQ not to consider these variables given that they were "critical" in calculating fugitive dust emissions and ensuring that PM_{10} NAAQS and arsenic AACC are met. *See, e.g.*, PET 062 ("[I]t was recognized that accurate determination of site-specific parameters characterizing road conditions and vehicle traffic was critical to estimating particulate matter emissions and ambient air impacts."); *see also* PET 275 ("However, it is critical for NAAQS compliance that this high level of [dust] control be achieved."). DEQ's decision to use a production limit as a "surrogate" for these critical variables

to ensure compliance with the PM_{10} NAAQS and arsenic AACC is not supported by the permit record, and is arbitrary and capricious.[8]

Perpetua asserts that a surrogate "production limit" of 180,000 tons of ore hauled per day is sufficient to ensure compliance with PM_{10} NAAQS and arsenic AACC. Perpetua Opp'n at 28. Yet nothing in the permit record demonstrates that a daily production limit is equivalent to providing enforceable limits on the variables that were so critical to demonstrating compliance with air quality standards. For example, Perpetua's citation to DEQ's response to comments only discuss how daily production limits are sufficient in wintertime conditions to ensure compliance, but does not discuss whether production limits alone are sufficient for drier seasons when fugitive dust will be more problematic. *Id.* at 26 (citing PET 629–630).

Simply put, daily production limits do not constrain all the variables that went into the calculation of fugitive dust emissions, and nothing in the permit record indicates that DEQ understood or demonstrated that a daily production limit would be equivalent to more specific permit limits addressing these critical variables. *See generally* PET 044-548. For example, Perpetua can haul the same amount of ore by using all larger trucks driving less miles, or using all smaller trucks driving more miles. But by using only a production limit in the Permit, there exists a legal and plausible operating scenario where more fugitive dust is generated such that it would exceed PM_{10} NAAQS and arsenic AACC. *See* PET 670 (EPA stating that "[t]o make the [potential to emit] limitations enforceable as a practical matter, the permit should include the parameters and assumptions used to develop the fugitive dust emissions factors estimates for the

[8] Silt content is just one variable that is taken into account when calculating fugitive dust emissions. The fact that there may be permit limits on silt content does not fix the lack of permit limits concerning the other critical variables used to calculate fugitive dust emissions. *See* Perpetua Opp'n at 28–29.

haul roads and access roads."). But it is unknown to DEQ and from the permit record whether that is the case, rendering arbitrary and capricious the use of its surrogate limit to ensure compliance. Thus, this is not a "technically accurate" limitation and inconsistent with EPA's guidance on practically enforceable permit limitations. *See* PET 791; Perpetua Opp'n at 32–34.

Relying on past permits that do not include such permit limits does not help DEQ's case as there is no indication that, first, the variables such as truck weight and vehicle miles were "critical" to compliance, and second, if they were, that a surrogate production limit was shown to ensure compliance with air quality standards. *See* Perpetua Opp'n at 28.

What is more, the actual permit limitation found in Permit condition 3.5 does not have any associated monitoring or recordkeeping requirements to ensure compliance, and defers to a yet-to-be created Operation and Maintenance Manual ("O&M Manual") plan that will not be available for review by the public. PET 019; *see* Perpetua Opp'n at 29, 32–34. And Perpetua's contention that the peak production rate modeled will actually be lower, and thus emissions will be lower, is beside the point because the Permit gives Perpetua the legal authority to produce up to the production limit even if it would exceed air quality standards.

DEQ did not demonstrate that a surrogate production limit would ensure compliance with air quality standards. Its decision to substitute this for limits to the critical variables it actually used to calculate fugitive dust emissions is not supported by the record and is arbitrary and capricious. Even more, the surrogate limit it did include in the Permit is not an enforceable limit. The Hearing Officer must vacate the Permit and remand it back to DEQ for further consideration.

C. DEQ Failed to Use Representative Precipitation Data.

Perpetua's argument that Petitioners are wrong to assume "that the use of local precipitation data would have resulted in higher fugitive dust emissions" not only misses the point, but it still uses the wrong precipitation data to try and make its point. Perpetua Opp'n at 31. Petitioners' point is that, as is pervasive throughout the Permit, DEQ did not use available local data that are more accurate and consistent with its own guidance, but opted to use a default, generalized data to perform its calculations. Pet'rs' Open. Mot. Summ. J. at 25-26. Here, Perpetua argues that local data indicates that the conditions are wetter than EPA's default data. But it only looks at a single year. *Id.* Underestimation of the true site conditions when the data is available calls the emissions calculations and results into question. The Hearing Officer should vacate the Permit and remand it back to DEQ for further review.

IV. DEQ'S RELIANCE ON FUTURE PLANS TO BE PREPARED BY PERPETUA OUTSIDE OF THE PERMIT PROCESS VIOLATES THE AIR RULES AND THE CLEAN AIR ACT.

There is no dispute that the Permit calls for four "work plans"—Access Management Plan ("AMP"), FDCP, Haul Road Capping Plan ("HRCP"), and O&M Manual—to be developed by Perpetua later and submitted to DEQ. Petitioners' Opening Brief showed that, by relying on these future plans, DEQ bypassed the requirements of the PTC permitting process, including public comment, and issued what is essentially a partial, incomplete PTC, in violation of the Air Rules and CAA. Pet'rs' Mot. Summ. J. at 28–31. Only later will DEQ issue a complete, final PTC, after Perpetua develops and submits to DEQ additional plans, information, and conditions through the AMP, FDCP, HRCP, and O&M Manual, shielded from public review and outside the normal PTC process required by the Air Rules.

In its Response, Perpetua asserts that "work plans" are "not required by any express provision of Idaho Air Rules (nor the CAA) to be included in the application, the Final Permit, or any part of the public comment process." Perpetua Opp'n at 38. Perpetua is wrong.[9]

Under the Air Rules, DEQ must provide an opportunity for public comment. Air Rules Section 209.01.c. During public comment, the "Department's proposed action, together with the information submitted by the applicant and the Department's analysis of the information, *will* be made available to the public . . . ." Air Rules Section 209.01.c.i. (emphasis added). A PTC application "must . . . be accompanied by all information necessary to perform any analysis or make any determination required under Sections 200 through 227," which includes the requirement to determine whether the facility will cause or contribute to a violation of the NAAQS. Air Rules Section 202. "Required Information" that the applicant must provide includes: "Site information, *plans*, descriptions, specifications, and drawings showing the design of the . . . facility, . . . the nature and amount of emissions . . . , and the manner in which it will be operated and controlled." Air Rules Section 202.01.a.i (emphasis added).

Through the "work plans," DEQ is allowing Perpetua to submit Section 202.01.a.i information later, and allowing itself to review that information later. But Air Rules Section 209.01.c.i requires the "information submitted by the applicant" and DEQ's "analysis of the

[9] Perpetua also argues that Petitioners cannot rely on DEQ violations of the CAA or the CAA regulations at 40 C.F.R. Part 51 to challenge the Permit here. Perpetua Opp'n at 14. But Idaho's Air Rules are EPA-approved CAA rules, which EPA found to satisfy the minimum requirements of the CAA and the CAA Part 51 regulations; therefore, the content of the CAA, the Part 51 regulations, and the federal precedent and guidance under them are persuasive authority in considering DEQ's compliance with the Air Rules and whether DEQ was arbitrary and capricious in approving the Permit under them. *See*, *e.g.*, *Powder River Basin Res. Council v. Wyo. Dep't of Env't Quality*, 226 P.3d 809, 813 (Wyo. 2010) ("[B]ecause the state program is intended to be compatible with, and at least as stringent as, the federal Clean Air Act, federal precedent and regulatory guidance is persuasive authority in Wyoming air quality cases.").

information, will be made available to the public" for comment. DEQ's use of these future work plans, thus, violates the Air Rules.

In its Response, DEQ does not even argue that the work plans comply with the Air Rules; rather, DEQ asserts that relying on work plans is a common DEQ practice and that this practice makes things easier for the permittee and for DEQ. DEQ Resp. at 24. But these points have no bearing on whether DEQ complied with the Air Rules, which it did not. No provisions in the Air Rules authorize DEQ to save pieces of a PTC to be developed later, outside the normal PTC permitting process and without public comment.

DEQ rationalizes its use of post-permit work plans as allowing "the permittee to prepare a specific plan or manual based on the actual equipment purchased and installed, the manufacturer's instructions and recommendations, as well as the operational characteristics of the facility after construction is completed." *Id.* at 24 (quoting Simon Decl. ¶ 10). But the work plans for this Project go way beyond waiting for these types of final and relatively insignificant details.

For example, Permit Condition 3.13 requires that the HRCP include a sampling plan for analyzing arsenic concentrations of materials Perpetua uses, a silt content sampling plan, and information about the frequency with which Perpetua will inspect haul roads, among other similar requirements. PET 019–20. It is entirely feasible for Perpetua to provide, and DEQ to review, these types of sampling plans and road inspection details during the public PTC permitting process. These plans do not depend on final details of actual equipment Perpetua purchases or the characteristics of the facility after it is complete. Many, if not all, of these details can and should have been developed during the PTC process and submitted to the public for comment.

Likewise, Permit Condition 2.6 requires the FDCP to include "specific criteria to determine what frequency and type (water and/or chemical) of dust suppressant must be applied, and appropriate suppressant application rates." PET 010. Why couldn't Perpetua provide details on the "specific criteria" it will use "to determine" the frequency, type, and application rates of suppressants to DEQ for review during the public PTC process? Petitioners and the EPA raised serious concerns about Perpetua's ability to achieve 93.3% dust control; DEQ itself admitted this was an "aggressive" level of control that would require vigilant monitoring and aggressive requirements in the permit, and admitted that achieving 93.3% control is critical to ensuring the NAAQS are met. *See supra* Part III.A. Yet, the Permit does not require 93.3% dust control, and details about how Perpetua will control dust are to be developed later in the FDCP, without public comment.

Similarly, Permit Condition 2.7 requires the AMP to specify the "measures to be used to discourage public access to the facility." PET 010. Again, what does this have to do with the equipment Perpetua actually purchases, and why could these measures not be submitted by Perpetua and reviewed by DEQ during the public PTC process? Access management is a critical issue that generated controversy during public comment. EPA warned in its comments: "Given the unique situation with a public access road traversing the mine site, the key assumptions, parameters, and methodologies used to preclude public access from the mine site must be fully disclosed in the permit record and the necessary requirements be included in the permit and available for public review and comment." PET 569. But DEQ is letting Perpetua decide important details about access management later, outside of public review.

Thus, DEQ is not relying on the work plans to merely account for small, final details related to equipment actually purchased or final characteristics of the facility, which might be

reasonable or practically necessary for some information. Here, the work plans will include all manner of important details bearing on disputed issues about whether the Project will comply with air quality standards and whether DEQ set the right ambient air boundary. These types of information, plans, and details bearing on whether the Project will comply with standards have to be submitted by the applicant under Air Rules Section 202.01.a.i, and that information, along with DEQ's review of the information, are required to be made available to the public under Air Rules Section 209.01.c.i. DEQ does not have a good excuse, or practical necessity, to deviate from these requirements.

DEQ also congratulates itself for what it describes as "the extraordinary and unprecedented three-year collaboration that proceeded" issuing the Permit. DEQ Resp. at 24. In truth, DEQ tried to issue the Permit much faster, but twice after the public alerted DEQ to errors, DEQ had to gather additional information, perform more analysis, take additional comment, and ultimately correct numerous errors. *See* PET 052–54. DEQ's errors and the important role the public played over the three-year permitting process thus confirm the critical role of public comment on all important aspects of the Permit, including on the work plans DEQ is shielding from public review.

Moreover, the Project is a large, complex mine, and permitting it is complicated and time-consuming. To this day, the Permit issued by DEQ is the first and only major permit Perpetua has secured for the Project. Perpetua has yet to receive required authorizations from the Forest Service, U.S. Army Corps of Engineers, NOAA Fisheries, U.S. Fish and Wildlife Service, and other agencies. Perpetua also has yet to receive several other major DEQ permits, including an ore processing by cyanidation permit, an Idaho Pollutant Discharge Elimination System ("IPDES") permit, a point of compliance permit, and a 401 water quality certification. The only

thing "extraordinary" about DEQ's issuance of the Permit in three years, is that it issued this Permit to Perpetua before any other DEQ permit and earlier than any other agency did, while the proposed Project was still in its infancy and before many important details of the Project had even been decided.

Perpetua also criticizes Petitioners for relying on two Clean Water Act ("CWA") cases, instead of any Air Rule or CAA cases, for the proposition that agencies cannot hide important permit-related information from required public review. Perpetua Opp'n at 37. But Perpetua does not point to any Air Rule or CAA cases holding that it is okay to exclude important information from the public during CAA permitting processes. And these CWA cases are relevant.

As Perpetua explained: "in *Environmental Defense Center v. EPA*, the Ninth Circuit held that Notices of Intent ("NOI") are functional equivalents to permits under the Clean Water Act's general permit option, and EPA's failure to require review of NOIs available to the public contravened the express requirements of the Clean Water Act." Perpetua Opp'n at 37 (citing *Env't Def. Ctr., Inc. v. EPA*, 344 F.3d 832, 858 (9th Cir. 2003)). Indeed, the Ninth Circuit found that the NOI at issue "establishes what the discharger will do to reduce discharges to the 'maximum extent practicable,' the [] NOI crosses the threshold from being an item of procedural correspondence to being a substantive component of a regulatory regime." *Env't Def. Ctr.*, 344 F.3d at 853. Similarly here, the "work plans" are not mere procedural correspondence; as already discussed, each plan will establish what Perpetua will do to reduce emissions, to set enforceable permit limits, and to otherwise comply with "substantive components" of the Air Rules.

The work plans are also similar to the Nutrient Management Plans ("NMP") at issue in *Waterkeeper Alliance, Inc. v. EPA*, 399 F.3d 486, 503 (2d Cir. 2005), where the Second Circuit held that EPA "deprive[d] the public of the opportunity for the sort of regulatory participation

that the [CWA] guarantees because the Rule [at issue] effectively shields the nutrient management plans from public scrutiny and comment." Perpetua tries to downplay this case, asserting that the Second Circuit reached this conclusion because the NMPs were "effluent limitations," and the CWA specifically requires public participation in developing effluent limitations. Perpetua Opp'n at 37. Perpetua misleadingly fails to mention that the Second Circuit's decision did not end there, but went farther:

> *And even assuming, arguendo, that the nutrient management plans did not themselves constitute effluent limitations, we would still hold that the CAFO Rule violates the Act's public participation requirements*. Nutrient management plans are . . . a critical indispensable feature of the "plan, or program established by the Administrator or any State" in order to regulate Large CAFO land application discharges. 33 U.S.C. § 1251(e). The EPA itself has stated in the Preamble to the Rule that "the only way to ensure that non-permitted point source discharges of manure, litter, or process wastewaters from CAFOs do not occur is to require ... [land application] in accordance with site specific nutrient management practices."

399 F.3d at 504 (emphasis added).

Like the NMPs in *Waterkeeper*, the work plans here are critical, indispensable features of the Permit. And like the EPA in *Waterkeeper*, DEQ here has acknowledged that details in these work plans are critical to ensuring the Project meets air quality standards. For example, DEQ modeling staff stating "it is *critical* for NAAQS compliance that this high level of control [(93.3% dust control)] be achieved." PET 275 (emphasis added); *see also* PET 325 (same). DEQ staff thus "recommend[ed] that the permit require an aggressive implementation of measures to achieve above 93% control efficiency for fugitive particulate emissions from roadways." PET 328. But the Permit does not include these implementation measures; instead, specific measures for achieving 93.3% dust control will be developed in the FDCP, shielded from public view. Similarly, DEQ admitted in the Statement of Basis "accurate determination of site-specific parameters characterizing road conditions and vehicle traffic was *critical* to estimating

particulate matter emissions and ambient air impacts," PET 062 (emphasis added), but the Permit does not include these site-specific parameters, which will be developed later (if at all) by Perpetua in the HRCP and FDCP without public comment. Likewise, DEQ asserted "[c]ompliance is assured by complying with the [O&M Manual] monitoring and recordkeeping requirements," but again, the Permit does not include monitoring and recordkeeping requirements; Perpetua will develop those later, without public involvement.

Finally, Perpetua cites *Train v. NRDC*, 421 U.S. 60, 79 (1975) for the proposition that "CAA jurisprudence affords broad discretion to states to develop permit conditions." Perpetua Opp'n at 37. Petitioners do not dispute that states have broad discretion to develop permit conditions. The problem here is that DEQ has *not* developed a number of important permit conditions and is letting Perpetua develop them later, outside of the Air Rules PTC process, and without public review. Thus, *Train*, *Environmental Defense Center*, and *Waterkeeper* all underscore that DEQ's use of work plans here to leave numerous details and conditions to be decided later, outside the PTC permitting and public comment processes, violates the Air Rules Section 209.01 public participating requirements.

The Hearing Officer must set aside and remand the Permit to correct these errors.

V. DEQ MUST REQUIRE AMBIENT AIR MONITORING.

As shown in the Opening Brief: DEQ has authority under the Air Rules Section 211.01.d to require Perpetua to monitor ambient air quality while the Project is underway; ICL, SSFS, and the EPA all urged DEQ to require such monitoring to verify whether Perpetua does actually comply with the PM_{10} NAAQS in light of the assumptions and uncertainties surrounding the Project's emissions; but DEQ declined. Pet'rs' Mot. Summ. J. at 31–32. DEQ failed to even respond to this issue. *See generally* DEQ Resp. Perpetua admits that DEQ has authority to

require ambient air monitoring, but after pointing to DEQ's responses to comments argues that in "DEQ's analysis and judgment, there was no reason to impose ambient air monitoring." Perpetua Opp'n at 41. DEQ's reasons for refusing to require ambient air monitoring, however, were arbitrary and capricious.

In response to comments, DEQ suggested that there is no need for ambient air monitoring since the Project area is remote. PET 559. But, as shown in Petitioners' standing declarations, members of the Tribe, ICL, and SSFS visit locations near the ambient air boundary set by DEQ, including staying overnight and engaging in strenuous activities.

DEQ also asserted in response to comments that ambient air monitoring "is not considered unless DEQ lacks a satisfactory confidence of NAAQS or toxic air pollutant ("TAP") increment compliance . . . without such monitoring," PET 562, and that here, DEQ is "reasonably confident" that impacts to ambient air will be below applicable standards, PET 559. To support this, DEQ points out that the Permit includes "extensive fugitive dust control measures," PET 560, "includes limits on operational levels and key parameters" and "includes monitoring and recordkeeping requirements to ensure compliance," PET 561. But the Permit does not include such measures, as discussed in the preceding section, and DEQ, thus, does not have a reasonable basis for being confident the Project will comply with the NAAQS and AACCs. *See supra* Part IV.

Again, as EPA commented: "Given the high level of uncertainty in the assumptions and requirements to ensure compliance with the PM_{10} 24-hr NAAQS, the addition of post-construction ambient monitoring requirements is highly prudent." PET 561. Again, Perpetua aims to achieve what DEQ admitted elsewhere is a "high" and "aggressive" level of dust control, which DEQ modelers recommended requiring aggressive implementation conditions in the

Permit. PET 275, 325, 328. And again, the Permit does not include such measures, leaving it highly uncertain whether the PM_{10} NAAQS will be met.

VI. DEQ FAILED TO ANALYZE ECONOMIC INFORMATION AND ENVIRONMENTAL IMPACTS IN THE ARSENIC T-RACT.

As set forth in the Opening Brief, DEQ granted Perpetua's arsenic "T-RACT demonstration," granting Perpetua a 10-times increase in allowable concentrations of TAP AACCs during operations. *See* Pet'rs' Mot. Summ. J. at 32–34. Air Rules Section 210.14 dictates a specific process with specific requirements for DEQ's review and approval of an applicant's T-RACT, including consideration of technical and economic feasibility and environmental impacts—factors DEQ failed to consider. *Id.* In response, neither DEQ nor Perpetua disputes Petitioners' showing that DEQ failed to consider these factors when it approved Perpetua's T-RACT. Rather, they argue that DEQ did not need to consider these factors. They are wrong.

In response, DEQ makes the absurd argument that it has discretion to do whatever it reasonably wants—whether or not doing so actually complies with the Air Rules. DEQ points to the first sentence in Section 210, which states that a permit applicant shall "demonstrate preconstruction compliance with Section 161[(toxics standards)] *to the satisfaction of the Department*" and argues "[w]hether DEQ is satisfied is a matter of discretion." DEQ Resp. at 18 (emphasis by DEQ). The "to the satisfaction of the Department" language is superfluous and meaningless. How would the provision be any different if it omitted the "to the satisfaction of Department" phrase and instead said the applicant must "demonstrate preconstruction compliance with Section 161"? Even without the "to the satisfaction of the Department" phrase, this provision of the Air Rules would require DEQ to make a determination (to its satisfaction—

not to someone else's satisfaction) that the applicant demonstrated preconstruction compliance. Anytime DEQ is required to make any determination under the Air Rules, it must make that determination to its "satisfaction." And when it does so, DEQ's determination cannot be arbitrary, capricious, an abuse of discretion, unsupported by substantial evidence, contrary to law, or in excess of authority.

DEQ also argues that, because Section 210.14 of the Air Rules states that DEQ is to determine T-RACT on a "case-by-case basis," this somehow gives it free reign to ignore the specific requirements set forth in Section 210.14. DEQ Resp. at 19. Again, DEQ does not have discretion to ignore applicable provisions of the Air Rules. Moreover, what the Air Rules actually say (which DEQ misleadingly omitted from its "case-by-case basis" quote) is: "T-RACT shall be determined on a case-by-case basis by the Department as follows:". Air Rules Section 210.14 (emphasis added). After "as follows", the Air Rules list specific requirements in Sections 210.14.a through 210.14.f for how DEQ is to make this case-by-case determination, including among other requirements:

> **c.** The technological feasibility of a control technology or other requirements for a particular source *will* be determined considering several factors including, but not limited to:
>
> i. Process and operating procedures, raw materials and physical plant layout.
>
> ii. The environmental impacts caused by the control technology that cannot be mitigated, including, but not limited to, water pollution and the production of solid wastes.
>
> . . .
>
> **d.** The economic feasibility of a control technology or other requirement, including the costs of necessary mitigation measures, for a particular source *will* be determined considering several factors including, but not limited to:
>
> i. Capital costs.
>
> ii. Cost effectiveness, which is the annualized cost of the control technology divided by the amount of emission reductions.

iii. The difference in costs between the particular source and other similar sources, if any, that have implemented emissions reductions.

Air Rules Section 210.14 (emphases added). Thus, the Air Rules explicitly require that DEQ "will" consider "technological feasibility," including "environmental impacts," and "will" consider "economic feasibility." *Id.* DEQ cannot simply ignore these explicit requirements for its review of T-RACT.

Perpetua argues that these requirements in 210.14 to consider technological and economic feasibility and environmental impacts apply only when DEQ is considering a new RACT, and argues that "[n]othing in Section 210.1[4] [*sic*] requires DEQ to reevaluate the technological and economic feasibility of established control measures." Perpetua Opp'n at 44. This is wrong. Again, Section 210.14 requires DEQ to determine T-RACT "on a *case-by-case basis*" and prescribes specifically how DEQ is to do this. First, Air Rules Section 210.14.a requires: "[T]he applicant must submit information to the Department identifying and documenting which control technologies or other requirements the applicant believes to be T-RACT." Perpetua did that here. *See* PET 543–48 (SOB, App'x G, "T-RACT Analysis"). Next, Air Rules Section 210.14.b requires: "The Department will review the information submitted by the applicant and determine whether the applicant has proposed T-RACT." DEQ did that here. *See* PET 070 (SOB). Next, when making that determination, Air Rules Sections 210.14.c and d requires that DEQ "will" consider technological feasibility, including environmental impacts, and economic feasibility. Furthermore, parts c and d require DEQ to consider factors that are specific to a particular facility (not factors that are general to the control technology itself), such as "[p]rocess and operating procedures, raw materials and physical plant layout" and the "difference in cost between the particular source and other similar sources."

Nowhere in the Air Rules does it say that these requirements are limited to new control technologies. And nowhere does it say that when DEQ conducts its case-by-case review under Section 210.14 of an applicant's submission of a T-RACT proposal (as occurred here), DEQ can skip the mandatory requirements of 210.14.c and d if the control technology has been used or evaluated in the past, as Perpetua argues it has. Rather, as set forth above, the Air Rules requires DEQ to consider these factors in every case. But, again, DEQ did not do so here.

Perpetua's argument that applying chemical dust suppressant and watering have been used and approved before for other projects ignores the important and unique considerations at issue here. As Petitioners warned in their comments, applying large amounts of magnesium chloride to roads to control dust can cause the accumulation of toxic concentrations of these substances in trees and soils and can degrade water quality and harm aquatic life. PET 596, 612. Additionally, "frequent watering" may cause environmental harm because the water that will be used to supplement dust control measures will be from sources that already have elevated arsenic levels. PET 612. These concerns are especially important here since the mine site is made up of narrow mountain valleys where haul roads are located primarily right next to rivers and streams. *See* Pet'rs' Open. Mot. Summ. J. at 15 (map). These concerns are especially important here also because Perpetua will have to use "aggressive" measures—presumably meaning more chemical suppressants and more water than is typical—to achieve the high 93.3% control level on the haul roads. Just because DEQ has approved other projects to use similar dust control measures does not relieve the agency of its responsibility under Section 210.14.c.ii that it "will" consider water pollution and other environmental impacts caused by Perpetua's "aggressive" dust control efforts in this unique Project site and for this particular case.

Similarly, DEQ must consider technological feasibility by considering the "[p]rocess and operating procedures, raw materials and physical plant layout" for this Project. Air Rules Section 210.14.c.i. The fact that DEQ has in the past considered chemical dust suppressants at other facilities, which employ different processes and operating procedures, which use different materials, and which have different layouts, does not satisfy this requirement.

And DEQ must consider economic feasibility by considering the "difference in cost between the particular source and other similar sources." Air Rules Section 210.14.d.iii. The fact that DEQ has approved chemical dust suppressants for past projects from similar sources does not satisfy this requirement to compare the difference in cost between this "particular source" and other similar sources.

The Hearing Officer should set aside and remand the Permit, and order DEQ to follow the requirements of Section 210.14 to review Perpetua's T-RACT application.

VII. DEQ'S DETERMINATION THAT THE PROJECT WILL EMIT LESS THAN THE ARSENIC AACC HAS NO RATIONAL BASIS.

As shown in Petitioners' Opening Brief, DEQ not only granted Perpetua's T-RACT demonstration (giving Perpetua a 10-times increase in allowable arsenic concentrations), but it went further and effectively diluted the apparent concentration of arsenic the Project will emit by spreading it out over a human lifetime. *See* Pet'rs' Mot. Summ. J. at 34–37. Instead of using the average annual concentration of arsenic emitted for the Project to determine compliance with the AACC under the Idaho Air Rules, DEQ diluted the Project's arsenic concentration by spreading the Project's 16 years of emissions over a 70-year human lifetime. *See id.* Thus, instead of comparing the actual annual arsenic concentration that will be emitted and present in the air while the Project is operating and that people recreating at the point of compliance (the ambient

air boundary) will breathe, DEQ created a fiction by finding that only a fraction (16/70)—a mere 23 percent of the true concentration—will be present in any given year. *Id.*

DEQ does not argue that the 16/70 averaging is allowed under any provision of the Idaho Air Rules (which it is not). Instead, DEQ appears to assert a rationale of why it allowed a 10-fold increase in the arsenic AACC:

> [This] approach to modeling TAP compliance employed the Short-Term Source Factor rule (Section 210.15) by analogue. This section allows an impact of 10 times the AACC for projects having an operational lifetime of no greater than five years. DEQ simply used this general approach to develop a project-specific adjustment factor for the [Stibnite Gold Project], using the 16-year maximum life of the project.

DEQ Resp. at 21 (quoting Schilling Decl. 11–12) (internal citations omitted). DEQ, thus, admits that it applied the "general approach" of a specific Air Rules provision—a provision which purposefully and narrowly addresses "short-term" sources—to a long-term project to fabricate and grant to Perpetua a new AACC adjustment. An adjustment found nowhere in the Air Rules. DEQ never presented this rationale in its response to draft Permit public comments; it is simply post-hoc rationalization. Furthermore, although requested as part of the Petitioners' Discovery, DEQ was unable to produce any previously established guidance, procedural memorandum, or permitting example which rationalizes or justifies the use of this 16/70 averaging tactic. Regardless, its new rationale does not provide any basis for inventing a permitting tactic completely outside the bounds of the Air Rules and arbitrarily and capriciously diluted annual arsenic concentrations beyond the life of a project.

DEQ goes on to assert that "Petitioners . . . offer absolutely no evidence that multi-year averaging presents a public health risk." DEQ Resp. at 21. But that is not Petitioners' responsibility, it is DEQ's. Whether or not DEQ had a reason to use its 16/70 tactic, it cannot ignore the Air Rules, and it needs to provide a rational basis for why its approach does not create

a public health risk. The Air Rules use a one-year average concentration for the arsenic AACC (not a life of the project over an entire lifetime average, as DEQ did). Air Rules Section 586. The Air Rules include explicit exceptions to meeting the normal AACCs, allowing less stringent AACCs either where: a project is five years or less; or where a T-RACT demonstration is done. Air Rules Sections 210.12, 210.15. There are no other exceptions in the Air Rules.

Here, Perpetua's T-RACT demonstration was granted (using Section 210.12), already giving it significant leniency (a 10 times increase in allowable arsenic concentrations). But DEQ chose to give Perpetua even more leniency by creating a new exception—again, not found in the Air Rules—by using the 16/70 approach. DEQ does not have discretion to deviate from the Air Rules and make up new exceptions to the meeting the AACCs. The Hearing Officer must, therefore, set aside and remand the Permit to comply with the Air Rules.

Perpetua's arguments fare no better.[10]

First, as stated above, there is nothing in the Idaho Air rules or the permit record that supports the "normaliz[ation]" of emissions by spreading them out over a time period longer than the project lifetime to assess cancer risk. *See* Perpetua Opp'n at 48. What this "normaliz[ation]" does is unreasonably assume that higher concentrations of arsenic for shorter periods of time (16 years) is equivalent in terms of cancer risk to lower concentrations of arsenic over longer periods of time (70 years). *See id.* ("[DEQ] evaluated the maximum modeled arsenic emissions

[10] To start, Perpetua mischaracterizes Petitioners' arguments, claiming that Petitioners ignore Section 210 methods of compliance and only focus on the Section 586 standards. Perpetua Opp'n at 45–46, 48. Petitioners do not challenge DEQ's use of Section 210.12 as a method for demonstrating compliance with the arsenic AACC; they challenge the way that DEQ determined the amount of arsenic emitted—using unsupported and unvalidated assumptions that have no basis in the Air Rules—to ensure that the emissions would be less than the T-RACT adjusted AACC and thus allow DEQ to claim that emissions would not create a health risk under Section 161. *See* Pet'rs' Mot. Summ. J. at 36–37.

from the Project during the operational period and then evaluated whether that would exceed the AACC over 70 years, demonstrating that the cancer risk was less than one in one hundred thousand."). But there is no support in the permit record nor in the Air Rules for this "normaliz[ation]." Granted, the Air Rules allow an assumption of a linear relationship *between cancer risk and pollutant concentration*—a 10-fold increase in the AACC is equivalent to a 10-fold increase in cancer risk probability. Air Rules Section 210.12.b. There is no comparable equivalency in the Air Rules, however, to allow for the dilution of emissions over a much longer period of time.[11]

In its response to comments, DEQ states:

> The acceptability criteria is that a facility not pose a cancer risk greater than 1-in-1,000,000 or 1-in-100,000 if T-RACT is used. The annual value of the AACC is provided under the assumption that a facility will emit *at such a level* on a permanent basis. Since the criteria of Idaho's TAP rules is the risk associated with the project, *the time over which that risk is spread is immaterial*.

PET 597 (emphasis added). DEQ's assertion means that it can apparently choose any time frame to "spread" out the risk of exposure to arsenic (or any other carcinogenic pollutant) so that it falls below the T-RACT adjusted AACC and thus it is not a cancer risk anymore. Moreover, if the "criteria of the TAP rules is the risk associated with the project," *id.*, the Project's emissions will occur only for 16 years; there is no risk from the Project for the subsequent 54 years. Although

[11] Perpetua argues that Section 125 of the Air Rules provide the rationale for diluting 16 years of arsenic emissions over 70 years. Perpetua Opp'n at 47. First, Perpetua is referring to the definition of "Toxic Air Pollutant Carcinogenic Increments" which is found in the 2020 version of the Air Rules, but has been removed from the current version. Second, the definition refers to 70 years as the timeframe that cancer risk probability is assessed, but it in no way indicates that a facility's emissions can be diluted by a timeframe less than that during which pollutants will be emitted.

this "refined" approach makes it easier to permit a polluting facility, it makes absolutely no sense in terms of assessing cancer risk, as required under Section 161 of the Air Rules.

Case in point, the time over which the risk is spread from 16 to 70 years is very material; one time (16 years) demonstrates that the emissions from the Project are greater than the T-RACT adjusted AACC, while the other (70 years) falsely concludes that the emissions are much lower than the T-RACT adjusted AACC. DEQ's dilution method to assess cancer risk does not account for the fact that for 16 years during the life of the mine, Tribal members such as Emmit Taylor and Joe Oatman, who exercise Treaty rights in and around the ambient air boundary and intend to do so in the future, and Zak Sears, who recreates in and around the ambient air boundary several times a year, will be exposed to close to three times above the level of the T-RACT adjusted AACC for the next 16 years. *See* Taylor Decl. ¶ 9; Oatman Decl. ¶ 7; Sears Decl. ¶ 6. Young children more susceptible to air pollutants, like those of Drew Hollenback, will be breathing in 16 years of arsenic that will be well-above the 1-in-100,000 cancer risk, as provided by the T-RACT adjusted AACC. *See* Hollenback Decl. ¶¶ 4, 6–7. To be sure, Air Rules Section 210.12.c does provide for the potential for "further procedures" to demonstrate that the cancer risk is acceptable under Section 161 when the emissions exceed the T-RACT adjusted AACC. Nevertheless, DEQ did not conduct any further procedures, but instead and without any reasoned or scientific basis, assumed the cancer risk probability from high dose/short-term exposure was equivalent to low dose/long term exposure. *See* Perpetua Opp'n at 48.

EPA noted similar concerns:

> The EPA continues to have concern that the arsenic screening analysis underestimates cumulative impacts of airborne arsenic to the environment in the vicinity of the project. The results presented on page 4-46 of the [draft supplemental environmental impact statement], and Table 4.3-13 are compared to an annual acceptable ambient concentration for a carcinogen (AACC), the Idaho toxics

> screening threshold. However, this screening threshold is not necessarily intended to be compared against a 70-year lifetime scenario where 57 years of the period assumes zero exposure. The threshold is an annual average used for screening, prescribed as a de-minimus value based on lifetime risk. Under IDEQ's hazardous air pollutant program, in practice, project impacts from the maximum year of emissions would typically be compared to the annual average AACC for arsenic.

PET 667.

Next, Perpetua contends that "set[ting] the life-of-mine hauling and excavating limit" is what is important because it is the total arsenic emissions that matter, not the concentration of arsenic and not how long the mine will operate. Perpetua Opp'n at 49 n.19. Yet, neither Perpetua nor DEQ cite any provision in the Air Rules that allows or even supports using "total" emissions to assess cancer risk probability. *See* Air Rules Section 586 (discussing annual averages for AACC); *id.* at Section 210.12.b (allowing a 10-fold increase in the *annual* AACC).

Third, Perpetua argues that the "arsenic emissions produced from the actual operating analysis are only 19% of the worst-case scenario." Perpetua Opp'n at 49. This fact, if it be true, is inconsequential because the permit allows Perpetua to operate at a higher level, and there are no enforceable permit conditions to ensure that the mine operates at a level of reduced emissions and thus actually emits less than the T-RACT adjusted AACC.

Finally, though Respondents were quick to point to prior (undisclosed) permits that had less stringent approaches than what is the case here, by contrast, they cannot point to a single permit where TAPs concentrations were spread out over the human lifetime or any other time, rather than the life of the facility. DEQ's determination that the Project's arsenic emissions demonstrates preconstruction compliance with the Air Rules Section 210.12 requirements is unreasonable, arbitrary and capricious, and unsupported by the record. The Hearing Officer must vacate the permit and remand it back to DEQ to fix these errors.

CONCLUSION

A permit issued by DEQ under the auspices of the Clean Air Act signals to the Tribe and public that this Project is emitting air pollutants, but doing so in a legal way to protect the ambient air—"that portion of the atmosphere . . .to which the general public has access"—and thus public health. PET 772. DEQ's failure, then, to lawfully and reasonably address the fugitive dust emissions is particularly troubling given that these legal and logical failures (esoteric to the general public) now presented to this reviewing body solely on paper will result in real world impacts to public health.

Yet, throughout their briefs, Respondents largely attempt to hide behind the cloak of agency discretion and deference to agency technical expertise. But that discretion is not unreviewable; that deference is not absolute. *See Laurino v. Bd. of Pro. Discipline of Idaho State Bd. of Med.*, 137 Idaho 596, 602 (2002) ("The Board, however, may not use its expertise as a substitute for evidence in the record, since the requirement for administrative decisions based on substantial evidence and reasoned findings—which provide the basis for effective judicial review—would become meaningless if material facts known to or relied upon by the agency did not appear in the record.") (footnote omitted).

As discussed above, there are many instances in this Permit where DEQ made decisions that are unexplained, unreasonable, and unsupported by the permit record. The aggressive and unsupported dust control efficiency. The mathematical distortion of arsenic concentrations. The leniency or lack of enforceable limits and monitoring. And each unexplained, unreasonable, and unsupported decision involves fugitive dust emissions from haul roads, therefore compounding the potential that arsenic and PM_{10} pollution outside of the ambient air boundary where Tribal

members use and the public recreates will exceed levels permitted by the law. This Permit, thus, cannot stand. Hence, the Hearing Officer should vacate the Permit and remand to DEQ for further review.

Attorneys for Nez Perce Tribe and Idaho Conservation League

BEFORE THE OFFICE OF ADMINISTRATIVE HEARINGS
STATE OF IDAHO

IN THE MATTER OF AIR QUALITY PERMIT TO CONSTRUCT P-2019.0047	)	Agency Case No. 0101-2201
	)	OAH Case No. 23-245-01
NEZ PERCE TRIBE, IDAHO CONSERVATION LEAGUE, and SAVE THE SOUTH FORK SALMON,	)	**DECLARATION OF ALLISON FOWLE**
Petitioners,	)	
v.	)	
IDAHO DEPARTMENT OF ENVIRONMENTAL QUALITY,	)	
Respondent,	)	
and	)	
PERPETUA RESOURCES IDAHO, INC.	)	
Intervenor.	)	

I, ALLISON FOWLE, state and declare as follows:

1. My name is Allison Fowle. I live in Boise, Idaho, and am over 18 years of age. The following statements are based on my personal knowledge, and if called as a witness, I would and could testify thereto.

2. I am a member of the Idaho Conservation League ("ICL"). I have been an ICL member for about five years. One reason I am a member of ICL is because of ICL's advocacy around the Stibnite Gold Project ("SGP").

3. I visit the SGP area several times each year to hike, backpack, and flyfish. While there's no shortage of recreation options that are closer to home, there is something quite special about the South Fork Salmon River ("SFSR") watershed, and the Stibnite area in particular contains a unique combination of cultural history, rugged terrain, and solitude**.**

4. One of my favorite access points for the Frank Church–River of No Return Wilderness is the trailhead at Monumental Creek, which is only accessible by traveling directly through the SGP site. When I'm on Monumental Creek, I feel as though I've traveled back in time—the night sky is dark and alive with visible stars, the creek crossings are impossibly cold, and the air is fresh and clear. During my visits, I also enjoy pulling my truck over on the Stibnite Road and trekking down to the East Fork of the SFSR, which offers this same experience of solitude; though the road is close, its sound is easily drowned by the river's whitewater.

5. I first visited the SGP area in 2018 when I backpacked from the Monumental Creek Trailhead to Big Creek**.** Since then, I have returned to the area at least ten times, including in August 2019, as shown in Figure 1 below. Among recent visits, in September of 2022 I visited the area to hike Parks Peak and Williams Peak, both of which offered expansive views of the area as well as a reprieve from wildfire smoke back home in Boise.

Fig 1. *My dog and I entering the Frank Church–River of No Return Wilderness at Monumental Creek to fly fish in August 2019.*

6. I plan to continue visiting the area each year to hike, backpack, and flyfish. This month (June 2023), I plan to backpack Rainbow Ridge with friends. I have also always wanted to backpack a long loop through the Frank Church starting and ending at the Lookout Mountain Trailhead near Thunder Mountain. I hope to do this in August or September this year.

7. I am concerned about the way these special places would change if the SGP moves forward. My understanding, based on ICL's filings and comments, is that mine construction and operation would generate dust, including dust with arsenic. Dust will obscure the clear night skies and mountain views I so enjoy when I visit the area. Dust and arsenic are also unhealthy to breathe, and I worry about the effects of passing through and spending time

outside in the area while the mine is operating. I am also concerned that dust and arsenic can settle in lakes and streams and harm fish and other life.

8. It makes me sad to think about these ways that my visits would be diminished if the SGP proceeds, as approved in the Idaho Department of Environmental Quality ("DEQ") air permit. It makes me even more sad to consider that I might not visit these special places as frequently as I would like because of air pollution from the mine. My understanding is that the Stibnite Road through the SGP area—which I have used many times—is considered by DEQ to be within the SGP boundary and will not meet air quality standards that apply outside the project boundary if the mine proceeds, even though Perpetua has indicated that the Stibnite Road will still be useable to people like me. It is also my understanding that many details about how the SGP will be conducted have not yet been decided, or are not specified in DEQ's air permit, and will be decided later. I also understand that DEQ is not requiring monitoring at the SGP boundaries to verify the actual levels of air pollution once the SGP is underway.

9. In addition to my regular personal visits, I have visited the area as a high school teacher. I have brought two groups of high school students to Yellow Pine and Stibnite in the past five years. The area is a perfect classroom in which to study ecology, geology, hydrology, and environmental policy, and I intend to continue bringing students to the area for years to come. In the fall of 2023 or 2024, I intend to bring students to the area for a course on land management.

10. On these trips, we spent up to four days camping in the area and often engaged in fairly vigorous exercise, taking full-day hikes close off of the East Fork road, Profile Road, and Stibnite Road. Figures 2, 3, and 4 below show students on the trip I led in September 2019. These trips have been rich and productive learning opportunities and, for some students, have

been life-changing. Alumni of these trips have gone on to study biology, geology, and science education in college, as well as to work as wildland firefighters, river guides, and seasonal staff for agencies like the Forest Service.

Fig. 2. *High school students studying geology at the confluence of Johnson Creek and the East Fork of the SFSR in September 2019.*

Fig. 3. *High school students observing spawning Bull Trout in Sugar Creek in September 2019.*

Fig. 4. *September 2019. High school students engaged in field journaling on the banks of the SFSR.*

11. As a sensitive population for whom I am responsible, I am concerned about risks to the health of my students from air pollution if mining begins, and I worry that I will no longer be able to take students on these trips. Because air quality standards would not be met on the Stibnite Road through the SGP site, I would no longer feel comfortable taking students to visit Sugar Creek. Because of the uncertainties surrounding air pollution from the SGP and the lack of monitoring at the SGP boundary, I am concerned that I should not take students to other locations we have visited in the past outside of, but near, the mine area.

I declare under of penalty of perjury that the foregoing is true and correct.

Dated this 4th day of June 2023, at Boise, Idaho.

Attorney for Save the South Fork Salmon

BEFORE THE OFFICE OF ADMINISTRATIVE HEARINGS
STATE OF IDAHO

IN THE MATTER OF AIR QUALITY PERMIT TO CONSTRUCT P-2019.0047	Agency Case No. 0101-2201 OAH Case No. 23-245-01
NEZ PERCE TRIBE, IDAHO CONSERVATION LEAGUE, and SAVE THE SOUTH FORK SALMON, *Petitioners*, v. IDAHO DEPARTMENT OF ENVIRONMENTAL QUALITY, *Respondent*, and PERPETUA RESOURCES IDAHO, INC., *Intervenor*.	**DECLARATION OF DREW HOLLENBACK**

I, DREW HOLLENBACK, state and declare as follows:

1. My name is Drew Hollenback, and I am a resident of Valley County Idaho.

2. I have been a supporter of Save the South Fork Salmon ("SSFS") since 2016. I became interested in SSFS because of its work to protect the South Fork Salmon River watershed from the impacts of the Stibnite Gold Project proposed by Perpetua Resources Idaho, Inc. I continue to support SSFS's work because I support its mission to protect and preserve the South Fork Salmon River watershed and its natural resources. I have met with Board members of SSFS a few times to discuss the potential impacts of the proposed Stibnite Gold Project. I have donated a substantial amount of money to SSFS through my business, Tenkara Rod Company.

3. I started my company, Tenkara Rod Company, with my business partner in 2010. Tenkara Rod Company sells high quality fishing rods designed with simplicity for the new fly fisher, as well as quality for the seasoned fisherman. I started the company because I believe that fishing gives people a chance to get out and appreciate the beauty of nature and become stewards of our rivers. I talk with customers about places to go fishing, and have discussed the East Fork of the South Fork Salmon River ("East Fork") and the proposed Stibnite Gold Project to try to educate my customers about what is being planned in the area. In 2013, I created a YouTube video to raise awareness of the area as a spectacular place to fish.

4. I have significant interest and a deep personal connection to the South Fork Salmon River watershed, and the rivers in the area, including those around the proposed Stibnite Gold Project area. I personally recreate in the South Fork Salmon River watershed, including in and around the site of the proposed gold mine. I have fished in the Yellow Pine pit where bull trout pool up as they attempt to migrate up the East Fork, and on Salt Creek, Sugar Creek, Profile Creek and many of the other creeks and rivers in the area. I take my family, including my two

daughters (8 and 10 years old) camping off of Sugar Creek. I also occasionally do backcountry motorcycle trips in the area.

5. I have reviewed Perpetua's map that depicts the proposed mine site and the ambient air boundary. A true and correct copy is attached as Exhibit 1. I have recreated and fished in the rivers and creeks both within the blue line that depicts the ambient air boundary, and just outside of that boundary. I have also traveled on the existing road through the proposed mine site to access recreational sites, which corresponds roughly to the green line on the map.

6. I first visited the South Fork Salmon River watershed areas about 10 years ago when I went for a fishing trip. I did a loop trip that took me to Lick Creek, the Secesh River, and to the East Fork. I fell in love with the area's beauty. I was amazed by the changing fall colors and the presence of wildlife. There was an abundance of fish to catch. On this trip alone, I saw a mountain line, a bald eagle, and a black bear. This area felt very wild and very natural, and there was little human traffic. I believe that this area continues to have the best bull trout fisheries in the United States in both quantity of fish and size. This area continues to be a part of my life since my first visit.

7. I spend about 2 to 3 weeks every year fishing, camping with my family, and taking motorcycle trips with friends in and around the Stibnite area. I have taken my two daughters (8 and 10 years old) out to this area since they were babies. We often camp around Sugar Creek, upstream of the East Fork, where daughters swim and snorkel in the rivers, including the East Fork. We were there last year, in 2022, and I intend to return with my daughters this summer and into the future as long as we are able.

8. I have traveled on the road through the mine site to access public lands for recreation. I've driven to the overlook in the mine area so that I can view the salmon in the

Yellow Pine pit. My motorcycle trips also take me into the area. I have ridden the Idaho backcountry discovery route, which goes through Yellow Pine, to Profile Summit, and then drops down to Elk City.

9. I intend to continue to visit these areas yearly in the South Fork Salmon River watershed, including in and around the proposed Stibnite Gold Project, to camp, fish, ride, and enjoy the wildlife, scenery, and beauty of the area, and give these same experiences to my family.

10. I understand that in June 2022, the Idaho Department of Environmental Quality ("DEQ") issued Perpetua Resources an air permit for the proposed Stibnite Gold Project, called a Permit to Construct, under the authority of the Clean Air Act. I understand that the proposed mining operations will emit significant amounts of air pollutants, such as particulate matter, and cancer-causing air pollutants, such as arsenic. I also understand that inside the ambient air boundary line and including over the public road going through the mine site, the impacts to air quality from the emission of air pollutants is not analyzed or regulated. I also understand that outside of the ambient air boundary, the air quality is supposed to meet certain standards, and that these are health-based standards set to protect the public health.

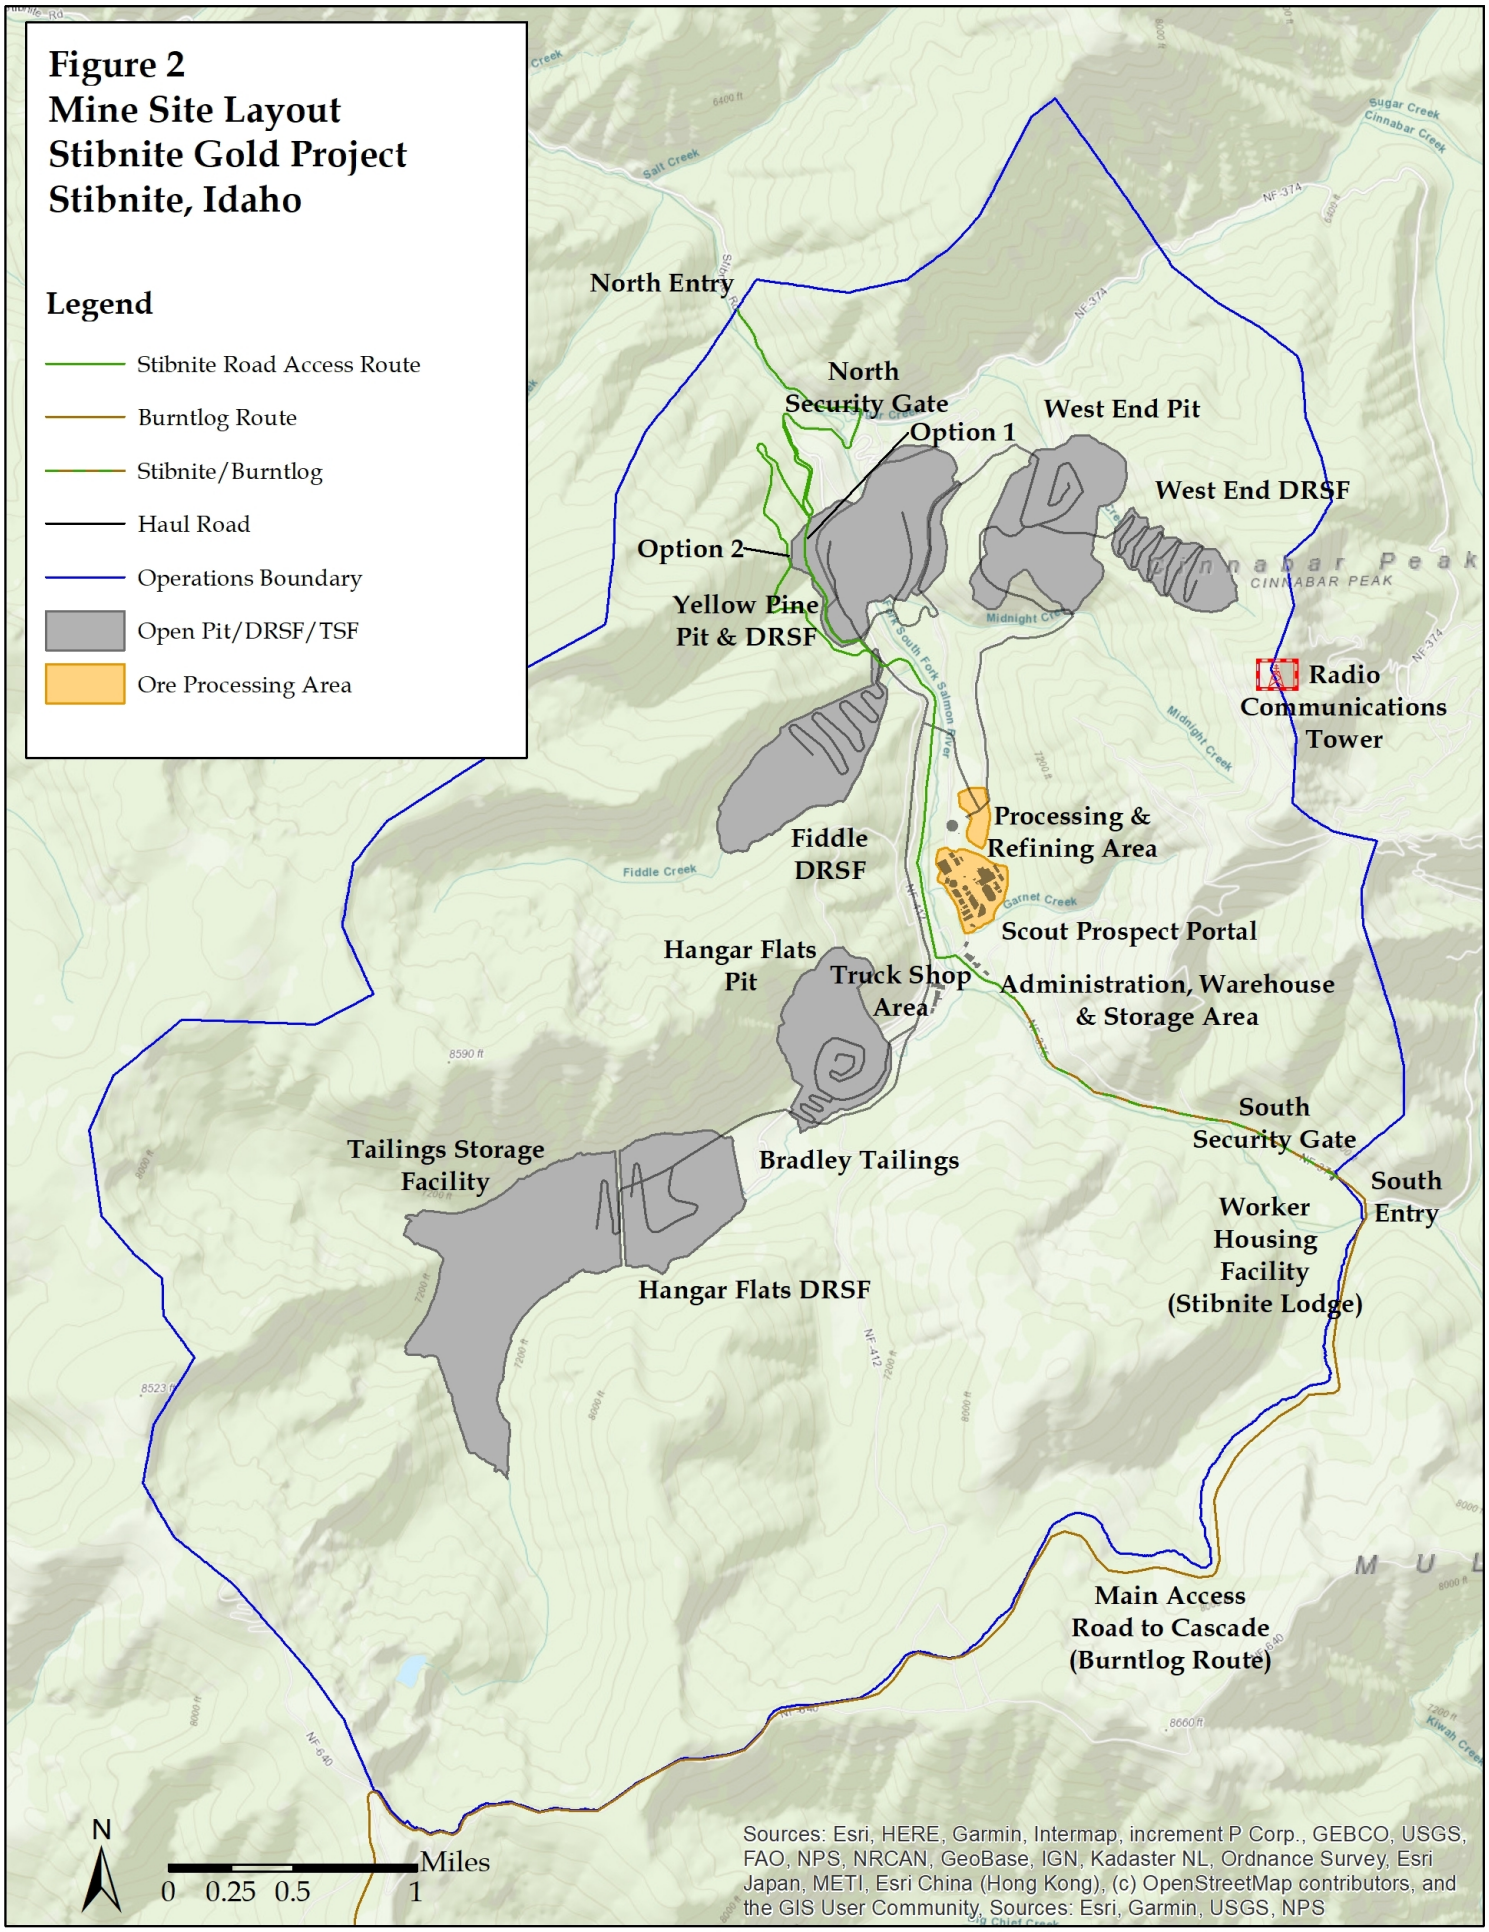
11. I am concerned that the air permit that DEQ issued to Perpetua for the proposed mine will not protect the air quality as is required under the Clean Air Act and under the Idaho rules and regulations. I am concerned that the air permit does not ensure that the air quality outside the ambient air boundary where I recreate will meet the criteria necessary to comply with the laws and regulations.

12. I am greatly concerned about the air quality both on the road that goes through the mine site, and about the air quality outside of the ambient air boundary where I have recreated and plan to recreate in the future. I am concerned in particular about excess arsenic in the air,

which is a carcinogen that can have a negative impact on my health. I am also concerned that the road will not have any air quality protections, and will be unregulated. I am particularly concerned about potentially exposing my daughters to both particulate matter and arsenic in the air at such a young age.

13. I am also concerned that if the arsenic emitted in the air falls to the ground and further pollutes the water it may impact the fisheries over time. I am concerned that the amount of fish would decrease, and fishing would be less enjoyable for both me and my family.

14. I would like to continue to recreate in the South Fork Salmon River watershed, and in the Stibnite area, but if the air quality is degraded by air pollutants emitted from the mine, my recreational activities will be harmed and will be greatly impacted. I will be very concerned about how the air will impact my health and the health of my family. As a result, I personally will think twice about fishing in the areas even outside of the ambient air boundary. I probably would no longer camp, and if I did fish, I would significantly reduce the amount of time I spend there. I would not take my daughters to camp, swim, and snorkel there anymore. We would lose the ability to enjoy the area's natural abundance, and would not be able to continue our family tradition of experiencing the area's natural beauty, amazing rivers, and abundant wildlife.



15. It is my understanding that the Clean Air Act and the rules or regulations that DEQ follow in issuing an air permit are designed to protect air quality by imposing pollution limits, best management practices, and restrictions on how the mine can operate, and that DEQ may impose monitoring and reporting requirements to ensure that ambient air quality is maintained. Therefore, a decision from the Office of Administrative Hearings and/or the Board of Environmental Quality that finds that the air permit is in compliance with all laws and regulations will help redress these harms. I would feel better recreating in the area and taking my

family to the area if the air permit could ensure that the amount of air pollutants emitted from the mine do not exceed air quality standards at the ambient air boundary.

Pursuant to Idaho Code 18-5409, I declare under penalty of perjury that the foregoing is true and correct.

Executed this 9th day of June 2023, at Valley County, Idaho.

Attorneys for Nez Perce Tribe and Idaho Conservation League

BEFORE THE OFFICE OF ADMINISTRATIVE HEARINGS
STATE OF IDAHO

IN THE MATTER OF AIR QUALITY PERMIT TO CONSTRUCT P-2019.0047	Agency Case No. 0101-2201 OAH Case No. 23-245-01
NEZ PERCE TRIBE, IDAHO CONSERVATION LEAGUE, and SAVE THE SOUTH FORK SALMON, *Petitioners,* *v.* IDAHO DEPARTMENT OF ENVIRONMENTAL QUALITY, *Respondent,* and PERPETUA RESOURCES IDAHO, INC. *Intervenor*.	**DECLARATION OF ASA MENLOVE**

I, ASA MENLOVE, state and declare as follows:

1. My name is Asa Menlove. I live in Stanley, Idaho and am over 18 years of age. The following statements are based on my personal knowledge, and if called as a witness, I would and could testify thereto.

2. I have been an Idaho Conservation League (ICL) member and supporter since about 2019. I worked to found ICL's Youth Salmon Protectors, which is a coalition of young people in the Pacific Northwest dedicated to saving wild Snake River salmon and steelhead. In this role, I have organized rallies, led comment writing workshops, and helped inform thousands on the issues facing these wild fish like the Stibnite Gold Project (SGP). As part of my work with the ICL Youth Salmon Protectors, I have organized multiple comment writing workshops in defense of these salmon and steelhead and in opposition to the SGP's permitting.

3. I support and volunteer with ICL and the Youth Salmon Protectors because I care for the land, water, and air that exists in Idaho, and I have a vested interest in its protection. ICL has been able to take action on my behalf and in defense of the land, water, and air here.

4. ICL's work on the SGP is very dear to me. I am a fly fisherman, river guide, kayaker, backpacker, and lover of the area affected by the SGP. Over the last few years, I have made multiple trips to the SGP site and surrounding areas each season to recreate in and connect with the magnificent ecology and landscapes that exist here.

5. During the summers, I live in Stanley, Idaho, where I work as a full time river guide on the Middle Fork of the Salmon River. Though I spend most of my time in the summers on the Middle Fork, when I have time off from working I find myself making the drive to its sister river, the South Fork of the Salmon. The South Fork and its tributaries are every bit as remote, ecologically complex, beautiful, and mystifying as the Middle Fork, though they have

not been afforded the same level of protection and developmental regulation. This is evident by the obvious effects of historical mining in the Yellow Pine pit, as well as the much higher content level of in-stream contaminants like cyanide and arsenic, much of which has found its way into the streams via dust particulate collected during runoff.

6. The first time I visited the SGP area and its surrounding landscapes was in the fall of 2019, during my senior year of high school. I was there with a dozen or so classmates and a few teachers to study the place and the effects of historical mining practices on the ecological and cultural history. We spent time at the Yellow Pine pit on a tour led by then Midas Gold employees, as well as exploring the surrounding area on our own. The most impactful experience of the trip, and the one that has inspired me to return year after year, was watching critically endangered Bull Trout spawn in the highest reaches of Sugar Creek, a tributary of the East Fork of the South Fork that converges just below the Yellow Pine pit. My classmates and I gathered on the river bank and sat in silence, watching these fish perform a dance and tradition which has been repeated in these streams for thousands upon thousands of years. I had never been able to observe fish as wild, as large, and as beautiful as these ones at such close distance, and they were seemingly unbothered by our presence. Being an angler and lover of wild fish at heart, I knew that I wanted to come back in the summer when they weren't spawning and try to connect with one of these residents.

7. And so, each summer since, I have been back to fish, to pick morel mushrooms, to camp, to explore, and to connect with the greater South Fork Salmon ecosystem. My ability to do all of these things in healthy and enjoyable ways will be negatively affected if the air quality is made worse by the proposed Stibnite Gold Project.

8. On a physical level, I rely on clean and fresh air in my lungs when I am exerting myself in hiking around in exploration of a place. Should the air around the SGP be allowed to be dirtied, I worry that breathing increased dust, and arsenic particulates, will adversely affect my health. On an emotional level, I rely on the health of the landscapes which I love so dearly. The time I spend with this ecology is fundamentally connected to my mental health, and I value this connection in ways that are difficult to articulate. Should the dust levels in the air be increased, so too will the level of contaminants in the waterways, in the soil, in the trees, in every aspect of the ecology of this place. This is an unacceptable risk for myself and thousands of other people who share my connections with this place, and it is a damning risk for the many species who call this place home, including bull trout, Chinook salmon, and steelhead, which are all listed as "threatened" under the federal Endangered Species Act.

9. I am concerned that when it issued the Permit to Construct, the Idaho Department of Environmental Quality (DEQ) did not include the Stibnite Road through the SGP area as part of the "ambient air" that is required to meet air quality standards. I have been on the Stibnite Road to access Sugar Creek, and I would like to return. However, because of the levels of particulate and arsenic pollution allowed under the Permit, I will either be putting my health at risk or will have to make the decision not to go to Sugar Creek.

10. I am also concerned that when it issued the Permit, DEQ made a number of assumptions about how the SGP will operate and reduce its emissions, but that the Permit does not require all such operations and reductions to occur. I am also concerned that DEQ did not require any air quality monitoring surrounding the SGP area boundary. Without all necessary Permit requirements and without monitoring while the mine is built and operated, I am concerned about unknown and potentially higher than expected air pollution levels outside of the

SGP area, which also threaten my health and the health of the environment in the South Fork. Because of these risks, I might avoid visiting places I would like to visit near the mine site.

11. With these points made, I have a very strong interest in ensuring that the air pollution as a result of mining operations be limited to the smallest amounts possible. The South Fork of the Salmon River ecosystem is invaluable to my physical, mental, and emotional well-being, and I sincerely hope that the quality of the air, waterways, and soil here will remain unburdened by deadly air pollution in perpetuity.

I declare under of penalty of perjury that the foregoing is true and correct.

Dated this 7th day of June 2023, at Stanley, Idaho.

Attorneys for Nez Perce Tribe and Idaho Conservation League

BEFORE THE OFFICE OF ADMINISTRATIVE HEARINGS
STATE OF IDAHO

IN THE MATTER OF AIR QUALITY PERMIT TO CONSTRUCT P-2019.0047	)	Agency Case No. 0101-2201
	)	OAH Case No. 23-245-01
NEZ PERCE TRIBE, IDAHO CONSERVATION LEAGUE, and SAVE THE SOUTH FORK SALMON,	)	**DECLARATION OF JOSEPH OATMAN**
Petitioners,	)	
v.	)	
IDAHO DEPARTMENT OF ENVIORNMENTAL QUALITY,	)	
Respondent,	)	
and	)	
PERPETUA RESOURCES IDAHO, INC.	)	
Intervenor.	)	

I, JOSEPH OATMAN state and declare as follows:

1. My name is Joseph Oatman. I am a resident of Pendleton, Oregon, and am over 18 years of age. The following statements are based on my personal knowledge, and if called as a witness, I would and could testify thereto.

2. I am an enrolled member of the Nez Perce Tribe ("Tribe"), a federally recognized tribe. I am a descendent of Chief Looking Glass, a principal chief who signed the Treaty of 1855 with the United States. I have a Bachelor of Science in Fishery Resources from the University of Idaho and a Masters of Natural Resources from the University of Idaho. From 2001 to 2004 I worked for the Nez Perce Tribe's Department of Fisheries Resource Management ("DFRM") as a harvest biologist. Since 2007, I have served as DFRM's Deputy Program Manager. My responsibilities include overseeing the Harvest Division and assisting the program manager in administering DFRM's many anadromous and resident fish restoration projects and activities.

3. I grew up on the Nez Perce Reservation in north-central Idaho.

4. Since time immemorial, the Nez Perce people, the Nimiipuu, exclusively occupied over 13 million acres encompassing a large part of what is today Idaho, Washington, and Oregon—stretching from the Bitterroot Mountains to the Blue Mountains. Nez Perce also traveled far beyond this homeland to fish, hunt, gather and pasture—frequently going east to buffalo country, in what is today Montana, and west along the Snake and Columbia Rivers. In 1855, to preserve its way of life and the foods we depend upon, the Tribe entered into a treaty with the United States reserving to itself, among other guarantees, "the right of taking fish at all usual and accustomed places in common with the citizens of the Territory." Treaty with the Nez Perces, June 11, 1855 (12 Stat. 957). Since that time, the Tribe has continued to exercise its treaty-reserved fishing, hunting, gathering, and pasturing rights. It is essential for tribal members to maintain connection with the rivers, lands, and fish that are critical to supporting

our culture and livelihoods. Nez Perce Tribal members, pursuant to the Tribe's Treaty-reserved rights, continue to fish, hunt, gather and pasture across the Tribe's vast aboriginal homeland at traditional places, including areas within and surrounding the proposed Stibnite Gold Project ("SGP") area and in waters directly downstream.

5. My family has strong ties to and has used the resources in the Snake River basin, including the South Fork Salmon River ("SFSR") for hundreds of years. I, like my family, have maintained those same strong ties to that area and the culturally-significant resources within it my whole life. Since childhood, I have fished with my family for salmon, steelhead, and bull trout in the SFSR watershed. We go to these same locations when fish are available to harvest them for subsistence, cultural, and other needs. In addition to engaging in treaty fishing, my family and I also engage in other cultural activities in the SFSR. This place is so important to us that when we lose loved ones, we leave rocks with their names inscribed on them to remember the camping, fishing, and enjoyment this area brought to us and those who have passed on. As we carry on our activities and use of this area, we can look up on the hillside where those rocks are placed to remember those who are no longer with us.

6. The South Fork Salmon River watershed is one part of the four major areas of the Snake Basin where we catch most of our spring/summer Chinook on an annual basis. As such, this is a critical area where tribal members can catch fish to meet their ceremonial, subsistence, and commercial needs. Tribal members and their families who use this area, such as my family, often do so as a multi-generational family unit. It is common to see two to four generations within a family traveling, camping, fishing, and using the area. There can be infants/toddlers up to the eldest member of a family that are present and involved in the daily life and activities in the SFSR. The ability to maintain our connection and relationship to each other and to the land, rivers, and fish, can be impacted by conditions or activities occurring in the area that could lead to unsafe or dangerous conditions that could limit, impede

or interfere with our ability to exercise our treaty-rights and gather our foods. Our responsibility is to ensure that all members of our family—from our youngest to our oldest—are safe and protected from anything or activity that could possibly bring harm to them.

7. I have personally engaged in treaty fishing for steelhead and bull trout within the boundaries of the proposed Stibnite Gold Project ("SGP"). My family and I plan to engage in treaty fishing and gathering within and adjacent to the proposed SGP area in the future. I am deeply concerned, however, that Idaho Department of Environmental Quality's ("DEQ") issuance of the air permit for the proposed SGP will injure my family and me by adversely affecting our ability safely exercise our treaty rights in and use and enjoy the area. My understanding from written comments provided by the Tribe to DEQ is that the SGP would create air pollutants, including dust with arsenic, in and adjacent to the SGP area. This air pollution is unhealthy to breathe and could impact our ability to fish which is a physically-demanding and strenuous activity. Air pollution also diminishes visibility that can affect our ability to see fish in the waterways, and may harm waterways, fish, wildlife, and flora, in the area. Injury to our health or to any of these resources caused by DEQ's air permit would adversely affect my ability to safely exercise our treaty rights and to use and enjoy the area within and adjacent to the SGP for subsistence, cultural, spiritual, and economic purposes.

8. In addition to my personal and familial connections to and use of the area, I also have the honor and privilege of serving my Tribe and the Nez Perce people through my professional work as the Tribe's DFRM Deputy Program Manager. The Tribe has one of the largest fisheries program of any tribe in the United States. The goal of DFRM is to recover and restore all populations and all species of anadromous and resident fish that are important to the exercise of the Tribe's treaty-reserved rights and way of life. DFRM headquarters is in Lapwai on the Nez Perce Reservation in Idaho, and DFRM has offices in Powell, Red River, Grangeville, Orofino, McCall, and Sweetwater, Idaho, and Joseph,

Oregon. The program has over 180 employees and operates on a budget of $24 million annually. DFRM has six divisions, which collectively provide administrative, technical, research, and enforcement services related to native resident and anadromous fish management activities in the Columbia and Snake River basins.

9. DFRM works extensively throughout the SFSR watershed, expending approximately $2.79 million annually on fisheries supplementation, harvest management, research, and watershed restoration work, as part of the broader Columbia River Basin salmon restoration efforts. This work includes moving some Chinook salmon above the "Glory Hole"—a legacy mine pit at the proposed SGP that blocks salmon from migrating up to the East Fork SFSR to their spawning grounds.

10. Due to the Tribe's Treaty-reserved rights and resources within and around the proposed SGP, and the Tribe's substantial fishery restoration work in the SFSR watershed, the Tribe has invested substantial time and resources in reviewing the proposed SGP. The Tribe has submitted numerous written comments, including comments to DEQ on the air permit. The Tribe has also participated in staff-to-staff meetings with federal and state permitting agencies, and government-to-government consultations with federal permitting agencies.

I declare under penalty of perjury that the foregoing is true and correct.

Executed this 6th day of June 2023, at Lapwai, Idaho.

Attorneys for Nez Perce Tribe and Idaho Conservation League

BEFORE THE OFFICE OF ADMINISTRATIVE HEARINGS
STATE OF IDAHO

IN THE MATTER OF AIR QUALITY PERMIT TO CONSTRUCT P-2019.0047	Agency Case No. 0101-2201 OAH Case No. 23-245-01
NEZ PERCE TRIBE, IDAHO CONSERVATION LEAGUE, and SAVE THE SOUTH FORK SALMON, *Petitioners,* *v.* IDAHO DEPARTMENT OF ENVIRONMENTAL QUALITY, *Respondent,* and PERPETUA RESOURCES IDAHO, INC. *Intervenor*.	**DECLARATION OF JONATHAN OPPENHEIMER**

I, JONATHAN OPPENHEIMER, state and declare as follows:

1. My name is Jonathan Oppenheimer. I live in Boise, Idaho and am over 18 years of age. The following statements are based on my personal knowledge, and if called as a witness, I would and could testify thereto.

2. I have worked at Idaho Conservation League (ICL) since April 2002. I currently work as External Relations Director at ICL. I have also been a member of ICL, since at least 2001, before joining the staff of the organization.

3. Since 1973, ICL has worked to protect Idaho's environment. ICL is Idaho's largest state-based conservation organization with over 25,000 supporters. ICL's mission is to create a conservation community and pragmatic, enduring solutions that protect and restore the air you breathe, the water you drink, and the land and wildlife you love. ICL's main office is in Boise. ICL has field offices in Sandpoint, McCall, and Ketchum.

4. Since ICL's founding, advocating for responsible mining practices has been central to ICL's mission. As part of our work at ICL, my colleagues and I regularly review and evaluate mining proposals and permits for consistency with federal, state, and local regulations and laws. We submit comments on state and federal mining proposals, reclamation plans, administrative rules, and during associated public input opportunities. We have been involved in efforts to promote restoration of abandoned mines, have developed cooperative restoration and mitigation proposals with mining companies, and have engaged in litigation to ensure compliance with existing laws and regulations in order to minimize the negative impacts associated with mining.

5. Of all the things I work on, I feel that mining is one of the most important because of the large-scale, lasting impact it can have on the landscape, water quality, air quality, fish,

wildlife, and communities. One of the primary ways we work to achieve our mission is through participating in the public review and comment process for mining and mineral exploration projects on National Forest lands and other public lands, such as the Stibnite Gold Project.

6. ICL has been engaged in the Stibnite Gold Project for over a decade, since Perpetua's predecessor Midas Gold was conducting exploration at the site. ICL has remained engaged in the Stibnite Gold Project, which has become an organizational priority and is of great concern to our members. Among other activities, ICL has regularly met with Midas Gold and Perpetua staff, contractors, and investors, as well as with state and federal agency officials, tribal members, and journalists concerning the Project. ICL has engaged in public processes for the Project's permitting, including by submitting comments to the Forest Service.

7. ICL has also been engaged in Idaho DEQ's air permitting process for the Stibnite Gold Project. Among other activities, ICL submitted comments to DEQ in October and November of 2020, March of 2021, and March of 2022. These comments have been instrumental in correcting permitting errors within draft permits.

8. Not only is the Stibnite Gold Project important to me professionally; it also important to me personally.

9. My family and I regularly visit the South Fork Salmon River (SFSR) drainage, including the East Fork of the SFSR. I have visited and recreated in and near the East Fork SFSR drainage every summer for more than a decade. My daughters love and appreciate the East Fork SFSR so much that they developed a song about the river. I have explored the surrounding areas, including Riordan Lake, which we visited as a family. I have also camped at Riordan Lake on my own in the past and look forward to returning. We have also rented and stayed at the Johnson Creek Guard Station, where we have adventured into the surrounding mountains.

10. Among other visits to the area, in 2021, I hiked up Sugar Creek with my dogs, off Forest Road #374. I parked near the junction of Sugar Creek and the main Stibnite Road, and I enjoyed visiting the site, picnicking along the creek, walking with my dogs, and birdwatching.

11. During the summer of 2022 my wife, one of my daughters, and I camped in the Old East Fork Road campground, just downstream of Yellow Pine. On that trip, we visited the East Fork SFSR area and enjoyed swimming, hiking, huckleberry picking, and watching wildlife.

12. The East Fork SFSR drainage is special to me and my family, and we look forward to returning every year and enjoying the fresh air, public lands, clean waters, and environment of the area.

13. This summer, we plan to visit the East Fork SFSR drainage. Once again, we plan to camp at the Old East Fork Road Campground and stay at the Johnson Creek Guard Station. I look forward to exploring the area with my family, fishing in Johnson Creek and the East Fork SFSR, and visiting the Stibnite area.

14. I have reviewed the Permit to Construct DEQ issued to Perpetua for the Stibnite Gold Project as well as DEQ's Statement of Basis, ICL's public comments, and Petitioners' filings in this contested case.

15. I am concerned about the air pollution the proposed gold mine would emit and the adverse health effects to my family and me. I have suffered from allergy and exercise induced asthma since I was a child. I regularly use an albuterol inhaler to manage my asthma. Any amount of additional particulate matter (PM) makes air less healthy to breathe. Recent studies on the nature of PM concentrations and their health effects back up previous studies and provide support for a no-threshold relationship between PM exposure and several respiratory and

cardiovascular effects, and mortality, meaning any concentration of PM can have negative health effects.[1] These health risks from increased particulates are even more significant for people like me, with asthma or other respiratory ailments.[2]

16. I am also concerned about arsenic air pollution from the Project. Inhalation of arsenic-bearing dusts have been definitively linked to increased systemic uptake, as well as carcinogenic and non-carcinogenic health outcomes.[3]

17. I am also concerned about particulate and arsenic pollution settling out from the air and into water. The East Fork SFSR is inhabited by native and threatened species, including Chinook salmon, steelhead trout, and bull trout. Atmospheric deposition from elevated heavy metal concentrations has been well studied to increase concentrations in nearby water-ways.

18. The Stibnite Gold Project will degrade the clean air we breathe, the fish and bird life we enjoy, and the public lands we love when my family and I (and other ICL members) visit the SFSR watershed, especially in the East Fork. If the Stibnite Gold Project is approved, traveling through and recreating in the area will harm me and my family by exposing us to increased levels of PM and arsenic in the air, putting our health at risk. I am concerned that we will not enjoy the area as we have in the past, including because I will have to restrict my activities due to the heightened health risks I face with exercise-induced asthma. I also worry that the environment will be degraded by this increased air pollution. And I worry that we may not be able to visit the area at all in order to protect our health.

CHAPTER 1 INTEGRATED SYNTHESIS ___ 1-1

1.1 Introduction ___ 1-1
1.1.1 Purpose ___ 1-1
1.1.2 Organization of the ISA ___ 1-2
1.2 From Emissions Sources to Exposure to PM ___ 1-3
1.2.1 Emission Sources and Distribution of Ambient Concentrations ___ 1-4
1.2.1.1 Sources and Emissions of PM ___ 1-5
1.2.1.2 Atmospheric Processes and PM Formation ___ 1-7
1.2.1.3 Monitoring and Modeling of PM ___ 1-8
1.2.1.4 National PM Concentrations ___ 1-9

1.2.1.5 Spatial and Temporal Variability in PM Concentrations 1-10
1.2.1.6 Summary 1-12
1.2.2 Assessment of Human Exposure 1-13
1.3 Dosimetry of PM 1-17
1.4 Evaluation of the Health Effects of PM 1-19
1.4.1 Health Effects of $PM_{2.5}$ 1-21
1.4.1.1 Respiratory Effects 1-21
1.4.1.1.1 Respiratory Effects Associated with Short-Term $PM_{2.5}$ Exposure 1-21
1.4.1.1.2 Respiratory Effects Associated with Long-Term $PM_{2.5}$ Exposure 1-22
1.4.1.2 Cardiovascular Effects 1-24
1.4.1.2.1 Cardiovascular Effects Associated with Short-Term $PM_{2.5}$ Exposure 1-24
1.4.1.2.2 Cardiovascular Effects Associated with Long-Term $PM_{2.5}$ Exposure 1-25
1.4.1.3 Nervous System Effects 1-27
1.4.1.3.1 Nervous System Effects Associated with Long-Term $PM_{2.5}$ Exposure 1-27
1.4.1.4 Cancer 1-29
1.4.1.4.1 Cancer Associated with Long-Term $PM_{2.5}$ Exposure 1-29
1.4.1.5 Mortality 1-30
1.4.1.5.1 Mortality Associated with Short-Term $PM_{2.5}$ Exposure 1-30
1.4.1.5.2 Mortality Associated with Long-Term $PM_{2.5}$ Exposure 1-31
1.4.2 Health Effects of $PM_{10-2.5}$ 1-41
1.4.3 Health Effects of UFPs 1-41
1.5 Policy-Relevant Considerations 1-42
1.5.1 Potential Copollutant Confounding 1-43
1.5.1.1 Short-Term $PM_{2.5}$ Exposure 1-43
1.5.1.2 Long-Term $PM_{2.5}$ Exposure 1-45
1.5.2 Timing of Effects 1-46
1.5.2.1 Averaging Time 1-46
1.5.2.2 Lag Structure of Associations 1-47
1.5.3 Concentration-Response Relationship 1-48
1.5.3.1 Short-Term Exposure 1-48
1.5.3.2 Long-Term Exposure 1-49
1.5.4 PM Components and Sources 1-50
1.5.4.1 Respiratory Effects 1-51
1.5.4.2 Cardiovascular Effects 1-51
1.5.4.3 Mortality 1-52
1.5.5 Populations and Lifestages at Potentially Increased Risk of a PM-Related Health Effect 1-53
1.6 Welfare Effects of PM 1-56
1.6.1 Visibility Impairment 1-56
1.6.2 Climate Effects 1-57
1.6.3 Materials Effects 1-57
1.7 Summary of Causality Determinations for Health and Welfare Effects 1-59
1.7.1 Health Effects Evidence: Key Findings 1-61
1.7.1.1 *Causal* and *Likely to be Causal Relationship* 1-61
1.7.1.1.1 Epidemiologic Evidence 1-61
1.7.1.1.2 Experimental Evidence 1-62
1.7.1.1.3 Policy-Relevant Considerations 1-62
1.7.1.2 *Suggestive of, but not Sufficient to Infer, a Causal Relationship* 1-63
1.7.1.2.1 Epidemiologic Evidence 1-63

1.7.1.2.2 Experimental Evidence 1-64
1.7.1.3 *Inadequate to Infer the Presence or Absence of a Causal Relationship* 1-64
1.7.1.3.1 Epidemiologic Evidence 1-64
1.7.1.3.2 Experimental Evidence 1-65
1.7.2 Welfare Effects Evidence: Key Findings 1-65
1.7.3 Comparison of Causality Determinations from 2009 PM ISA and Current PM ISA 1-66
1.8 References 1-70

CHAPTER 2 SOURCES, ATMOSPHERIC CHEMISTRY, AND AMBIENT CONCENTRATIONS 2-1

2.1 Summary Overview 2-1
2.2 Atmospheric Size Distributions 2-2
2.3 Primary Sources and Atmospheric Formation 2-5
2.3.1 Primary $PM_{2.5}$ Emissions 2-7
2.3.1.1 National-Scale Emissions 2-7
2.3.1.2 Urban-Scale Emissions 2-9
2.3.2 Secondary $PM_{2.5}$ Formation 2-12
2.3.2.1 Precursor Emissions 2-13
2.3.2.2 Secondary Inorganic Aerosols 2-15
2.3.2.3 Secondary Organic Aerosols 2-17
2.3.3 Primary $PM_{10-2.5}$ Emissions 2-19
2.3.4 Ultrafine Particles 2-20
2.3.4.1 Primary Sources 2-24
2.3.4.2 New Particle Formation 2-25
2.4 Measurement, Monitoring, and Modeling 2-26
2.4.1 $PM_{2.5}$ and PM_{10} 2-26
2.4.2 $PM_{10-2.5}$ 2-27
2.4.3 Ultrafine Particles: Number, Surface Area, Mass 2-29
2.4.3.1 Particle Number and Number Distribution 2-29
2.4.3.2 Surface Area 2-32
2.4.3.3 Mass 2-33
2.4.4 Chemical Components 2-35
2.4.5 Satellite Remote Sensing 2-35
2.4.6 Monitoring Networks 2-38
2.4.7 Chemical Transport Models 2-41
2.5 Ambient Concentrations 2-44
2.5.1 Spatial Distribution 2-44
2.5.1.1 Variability Across the U.S. 2-44
2.5.1.1.1 $PM_{2.5}$ 2-44
2.5.1.1.2 PM_{10} 2-48
2.5.1.1.3 $PM_{10-2.5}$ 2-51
2.5.1.1.4 $PM_{2.5}$:PM_{10} 2-54
2.5.1.1.5 Ultrafine Particles 2-56
2.5.1.1.6 $PM_{2.5}$ Components 2-59
2.5.1.1.7 $PM_{10-2.5}$ Components 2-62
2.5.1.1.8 Ultrafine Particle Components 2-63
2.5.1.1.9 Reactive Oxygen Species 2-64
2.5.1.2 Urban and Neighborhood-Scale Variability 2-65
2.5.1.2.1 $PM_{2.5}$ 2-65

2.5.1.2.2 PM_{10} 2-66
2.5.1.2.3 $PM_{10-2.5}$ 2-66
2.5.1.2.4 Ultrafine Particles 2-67
2.5.1.2.5 Chemical Components 2-68
2.5.2 Temporal Variability 2-69
2.5.2.1 Regional Trends 2-69
2.5.2.1.1 $PM_{2.5}$ 2-69
2.5.2.1.2 PM_{10} 2-72
2.5.2.1.3 $PM_{10-2.5}$ 2-74
2.5.2.1.4 Ultrafine Particles 2-75
2.5.2.1.5 Chemical Components 2-75
2.5.2.2 Seasonal Variations 2-79
2.5.2.2.1 $PM_{2.5}$ 2-79
2.5.2.2.2 $PM_{10-2.5}$ 2-80
2.5.2.2.3 Ultrafine Particles 2-83
2.5.2.2.4 Particulate Matter (PM) Components 2-83
2.5.2.3 Hourly and Weekday-Weekend Variability 2-85
2.5.3 Common Patterns of Particulate Matter Characteristics in the U.S. 2-86
2.5.4 Background Particulate Matter 2-90
2.5.4.1 Natural Background 2-91
2.5.4.2 Intercontinental Transport 2-92
2.6 Summary 2-94
2.7 References 2-97

CHAPTER 3 EXPOSURE TO AMBIENT PARTICULATE MATTER 3-1

3.1 Introduction 3-1
3.2 Conceptual Overview of Human Exposure 3-2
3.2.1 Exposure Terminology 3-2
3.2.2 Conceptual Model of Total Personal Exposure 3-5
3.2.3 Exposure Considerations Specific to Particulate Matter 3-7
3.3 Methodological Considerations for Use of Exposure Data and Models 3-8
3.3.1 Surface Measurement 3-10
3.3.1.1 Ambient Monitoring 3-11
3.3.1.2 Personal Monitoring 3-11
3.3.2 Modeling 3-15
3.3.2.1 Data Averaging 3-17
3.3.2.2 Spatial Interpolation Methods 3-19
3.3.2.3 Land Use Regression and Spatiotemporal Modeling 3-20
3.3.2.3.1 Land Use Regression 3-21
3.3.2.3.2 Spatiotemporal Modeling 3-24
3.3.2.4 Mechanistic Models 3-25
3.3.2.4.1 Chemical Transport Model Applications for Exposure Estimation 3-25
3.3.2.4.2 Dispersion Modeling Applications for Exposure Estimation 3-28
3.3.2.4.3 Hybrid Approaches 3-31
3.3.3 Satellite-Based Methods for Exposure Estimation 3-35
3.3.4 Microenvironmental Exposure Modeling 3-40
3.3.5 Exposure Assignment Methods in Epidemiologic Studies 3-42

3.4 Exposure Assessment and Interpretation of Epidemiologic Study Results 3-53
3.4.1 Relationships Influencing Exposure 3-53
3.4.1.1 Air Exchange Rate and Infiltration 3-53
3.4.1.2 Indoor-Outdoor Concentration Relationships 3-57
3.4.1.3 Personal-Ambient Concentration Relationships 3-61
3.4.2 Factors Contributing to Error in Estimating Exposure to Particulate Matter 3-65
3.4.2.1 Time-Activity Patterns 3-66
3.4.2.2 Spatial Variability in Concentrations 3-71
3.4.2.3 Instrument Accuracy and Precision 3-74
3.4.2.4 Model Accuracy and Precision 3-75
3.4.3 Costressor Relationships 3-77
3.4.3.1 Temporal Relationships among Ambient Particulate Matter and Copollutant Exposures 3-78
3.4.3.2 Spatial Relationships among Ambient Particulate Matter and Copollutant Exposures 3-88
3.4.3.3 Personal and Indoor Relationships between Particular Matter and Copollutant Exposures 3-88
3.4.3.4 Traffic-Related Noise 3-93
3.4.4 Particulate Matter Composition and Exposure Assessment 3-94
3.4.4.1 Composition 3-95
3.4.4.2 Reactive Oxygen Species 3-103
3.4.5 Influence of Exposure Errors on Results from Epidemiologic Studies of Different Designs 3-106
3.4.5.1 Short-Term Exposure Studies 3-107
3.4.5.1.1 Time-Series Studies 3-107
3.4.5.1.2 Panel Studies 3-111
3.4.5.2 Long-Term Exposure Cohort Studies 3-112
3.5 Summary 3-118
3.6 References 3-122

CHAPTER 4 DOSIMETRY OF PARTICULATE MATTER 4-1

4.1 Introduction 4-1
4.1.1 Size Characterization of Inhaled Particles 4-3
4.1.2 Structure and Function of the Respiratory Tract 4-4
4.1.2.1 Anatomy 4-4
4.1.2.2 Breathing Rates 4-6
4.1.2.3 Epithelial Lining Fluid 4-8
4.1.3 Route of Breathing 4-10
4.1.4 Ventilation Distribution 4-12
4.1.5 Particle Inhalability 4-13
4.1.6 Thoracic and Respirable Particles 4-14
4.1.7 Dose and Dose Metrics 4-19
4.2 Particle Deposition 4-21
4.2.1 Mechanisms of Deposition 4-22
4.2.2 Deposition Patterns 4-24
4.2.2.1 Total Respiratory Tract Deposition 4-26
4.2.2.2 Extrathoracic Region 4-27
4.2.2.3 Tracheobronchial and Alveolar Region 4-33
4.2.2.4 Sites of Localized Deposition 4-33
4.2.3 Interspecies Patterns of Deposition 4-34
4.2.4 Factors Modulating Deposition 4-36
4.2.4.1 Physical Activity 4-36

4.2.4.2 Age 4-39
4.2.4.3 Sex 4-41
4.2.4.4 Body Mass Index 4-41
4.2.4.5 Anatomical Variability 4-42
4.2.4.6 Ventilation Distribution 4-43
4.2.4.7 Respiratory Tract Disease 4-44
4.2.4.8 Particle Hygroscopicity 4-46
4.2.5 Summary 4-48
4.3 Particle Clearance 4-49
4.3.1 Clearance Mechanisms 4-50
4.3.1.1 Extrathoracic Region 4-50
4.3.1.2 Tracheobronchial Region 4-50
4.3.1.3 Alveolar Region 4-52
4.3.2 Interspecies Clearance and Retention 4-54
4.3.3 Particle Translocation 4-55
4.3.3.1 Olfactory Delivery 4-56
4.3.3.2 Pulmonary Delivery 4-60
4.3.3.2.1 Membrane Translocation 4-60
4.3.3.2.2 Extrapulmonary Distribution 4-61
4.3.3.3 Transplacental Barrier Transport 4-66
4.3.4 Factors Modulating Particle Clearance 4-67
4.3.4.1 Age 4-67
4.3.4.2 Sex 4-68
4.3.4.3 Respiratory Tract Disease 4-68
4.3.4.4 Particle Overload 4-70
4.3.5 Summary 4-70
4.4 References 4-72

CHAPTER 5 RESPIRATORY EFFECTS 5-1

5.1 Short-Term $PM_{2.5}$ Exposure and Respiratory Effects 5-1
5.1.1 Biological Plausibility 5-3
5.1.1.1 Injury, Inflammation, and Oxidative Stress 5-4
5.1.1.2 Activation of Sensory Nerves 5-6
5.1.1.3 Summary 5-7
5.1.2 Asthma Exacerbation 5-7
5.1.2.1 Hospital Admissions and Emergency Department (ED) Visits 5-8
5.1.2.1.1 Hospital Admissions 5-19
5.1.2.1.2 Emergency Department (ED) Visits 5-20
5.1.2.1.3 Summary of Asthma Hospital Admissions and Emergency Department (ED) Visits 5-21
5.1.2.2 Respiratory Symptoms and Asthma Medication Use in Populations with Asthma 5-22
5.1.2.2.1 Children 5-22
5.1.2.2.2 Adults 5-27
5.1.2.3 Lung Function Changes in Populations with Asthma 5-28
5.1.2.3.1 Children 5-28
5.1.2.3.2 Adults 5-33
5.1.2.3.3 Controlled Human Exposure Studies 5-34
5.1.2.3.4 Animal Toxicological Studies 5-35

5.1.2.3.5 Summary of Lung Function in Populations with Asthma 5-35
5.1.2.4 Subclinical Effects Underlying Asthma Exacerbation 5-35
5.1.2.4.1 Children 5-35
5.1.2.4.2 Adults 5-42
5.1.2.4.3 Controlled Human Exposure Studies 5-43
5.1.2.4.4 Animal Toxicological Studies 5-43
5.1.2.4.5 Summary of Subclinical Effects Underlying Asthma Exacerbation 5-46
5.1.2.5 Summary of Asthma Exacerbations 5-46
5.1.3 Allergy Exacerbation 5-47
5.1.4 Chronic Obstructive Pulmonary Disease (COPD) Exacerbation 5-48
5.1.4.1 Hospital Admissions and Emergency Department (ED) Visits 5-49
5.1.4.1.1 Hospital Admissions 5-55
5.1.4.1.2 Emergency Department (ED) Visits 5-56
5.1.4.1.3 Summary of Chronic Obstructive Pulmonary Disease (COPD) Hospital Admissions and Emergency Department (ED) Visits 5-56
5.1.4.2 Respiratory Symptoms and Medication Use 5-57
5.1.4.3 Lung Function Changes in Adults with Chronic Obstructive Pulmonary Disease (COPD) 5-61
5.1.4.3.1 Epidemiologic Studies 5-61
5.1.4.3.2 Controlled Human Exposure Studies 5-61
5.1.4.4 Subclinical Effects Underlying Exacerbation of Chronic Obstructive Pulmonary Disease (COPD) 5-61
5.1.4.4.1 Epidemiologic Studies 5-61
5.1.4.4.2 Controlled Human Exposure Studies 5-62
5.1.4.4.3 Animal Toxicological Studies 5-62
5.1.4.5 Summary of Exacerbation of Chronic Obstructive Pulmonary Disease (COPD) 5-63
5.1.5 Respiratory Infection 5-63
5.1.5.1 Hospital Admissions and Emergency Department (ED) Visits 5-64
5.1.5.1.1 Hospital Admissions 5-71
5.1.5.1.2 Emergency Department (ED) Visits 5-72
5.1.5.2 Outpatient and Physician Visit Studies 5-73
5.1.5.3 Subclinical Effects Underlying Respiratory Infection 5-73
5.1.5.4 Summary of Respiratory Infection 5-73
5.1.6 Combinations of Respiratory-Related Hospital Admissions and Emergency Department (ED) Visits 5-74
5.1.6.1 Hospital Admissions 5-83
5.1.6.2 Emergency Department (ED) Visits 5-84
5.1.6.3 Summary of Respiratory-Related Hospital Admissions and Emergency Department (ED) Visits 5-85
5.1.7 Respiratory Effects in Healthy Populations 5-86
5.1.7.1 Epidemiologic Studies 5-86
5.1.7.1.1 Respiratory Symptoms 5-87
5.1.7.1.2 Lung Function Changes 5-87
5.1.7.1.3 Subclinical Effects 5-88
5.1.7.2 Controlled Human Exposure Studies 5-93
5.1.7.3 Animal Toxicological Studies 5-94
5.1.7.3.1 Lung Function 5-94
5.1.7.3.2 Respiratory Tract Injury 5-99

5.1.7.3.3 Respiratory Tract Oxidative Stress 5-99
5.1.7.3.4 Respiratory Tract Inflammation 5-100
5.1.7.3.5 Morphology 5-102
5.1.7.3.6 Allergic Sensitization 5-102
5.1.7.3.7 Pathways Related to Otitis Media 5-103
5.1.7.4 Summary of Respiratory Effects in Healthy Populations 5-103
5.1.8 Respiratory Effects in Populations with Cardiovascular Disease 5-104
5.1.9 Respiratory Mortality 5-106
5.1.10 Policy-Relevant Considerations 5-107
5.1.10.1 Examination of Potential Copollutant Confounding 5-108
5.1.10.1.1 $PM_{2.5}$ within the Multipollutant Mixture 5-113
5.1.10.2 Model Specification 5-116
5.1.10.3 Lag Structure 5-118
5.1.10.4 The Role of Season and Temperature on $PM_{2.5}$ Associations 5-123
5.1.10.4.1 Season 5-123
5.1.10.4.2 Temperature 5-127
5.1.10.5 Averaging Time of $PM_{2.5}$ Concentrations 5-128
5.1.10.6 Concentration-Response Relationship and Threshold Analyses 5-130
5.1.11 Short-term exposure to $PM_{2.5}$ Components and Sources and Respiratory Effects 5-137
5.1.11.1 Elemental and Black Carbon 5-139
5.1.11.2 Organic Carbon 5-142
5.1.11.3 Secondary $PM_{2.5}$—Sulfate, Nitrate, Ammonium 5-143
5.1.11.4 Metals 5-144
5.1.11.5 Other $PM_{2.5}$ components 5-146
5.1.11.6 Sources of $PM_{2.5}$ 5-146
5.1.11.7 Summary 5-148
5.1.12 Summary and Causality Determination 5-148
5.2 Long-Term $PM_{2.5}$ Exposure and Respiratory Effects 5-155
5.2.1 Biological Plausibility 5-156
5.2.2 Lung Function and Development 5-159
5.2.2.1 Lung Development 5-160
5.2.2.1.1 Epidemiologic Studies 5-160
5.2.2.1.2 Animal Toxicological Studies 5-166
5.2.2.2 Lung Function 5-167
5.2.2.2.1 Children 5-167
5.2.2.2.2 Adults 5-174
5.2.2.3 Summary of Lung Function and Development 5-176
5.2.3 Development of Asthma 5-176
5.2.3.1 Asthma in Children 5-177
5.2.3.1.1 Copollutant Confounding 5-182
5.2.3.1.2 Concentration-Response Relationship 5-183
5.2.3.2 Asthma in Adults 5-184
5.2.3.3 Subclinical Effects Underlying Development of Asthma 5-188
5.2.3.3.1 Epidemiologic Studies 5-188
5.2.3.3.2 Animal Toxicological Study 5-188
5.2.4 Development of Allergic Disease 5-189
5.2.5 Development of Chronic Obstructive Pulmonary Disease (COPD) 5-191
5.2.6 Respiratory Infection 5-193

5.2.7 Severity of Respiratory Disease 5-195
5.2.7.1 Epidemiologic Studies 5-196
5.2.7.2 Animal Toxicological Study 5-196
5.2.8 Subclinical Effects in Healthy Populations 5-197
5.2.8.1 Respiratory Tract Oxidative Stress 5-199
5.2.8.2 Respiratory Tract Inflammation 5-200
5.2.8.3 Morphological Effects 5-201
5.2.8.4 Summary of Subclinical Effects in Healthy Populations 5-201
5.2.9 Subclinical Effects in Populations with Cardiovascular Disease 5-202
5.2.10 Respiratory Mortality 5-204
5.2.10.1 Potential Copollutant Confounding of the $PM_{2.5}$-Mortality Relationship 5-206
5.2.11 Respiratory Effects and Declining $PM_{2.5}$ Concentrations 5-208
5.2.11.1 Bronchitis 5-208
5.2.11.2 Pulmonary Function 5-209
5.2.11.3 Summary 5-210
5.2.12 Associations between Long-Term Exposure to $PM_{2.5}$ Components and Sources and Respiratory Effects 5-211
5.2.12.1 Elemental Carbon, Black Carbon, and Organic Carbon 5-213
5.2.12.2 Metals 5-214
5.2.12.3 Oxidative Potential 5-214
5.2.12.4 Summary 5-215
5.2.13 Summary and Causality Determination 5-215
5.3 Short-Term $PM_{10-2.5}$ Exposure and Respiratory Effects 5-220
5.3.1 Biological Plausibility 5-221
5.3.1.1 Injury, Inflammation, and Oxidative Stress 5-222
5.3.1.2 Activation of Sensory Nerves 5-223
5.3.1.3 Summary 5-224
5.3.2 Asthma Exacerbation 5-224
5.3.2.1 Hospital Admissions and Emergency Department (ED) Visits 5-225
5.3.2.1.1 Concentration-Response Relationship 5-231
5.3.2.2 Respiratory Symptoms and Medication Use 5-232
5.3.2.3 Lung Function 5-233
5.3.2.4 Subclinical Effects Underlying Asthma Exacerbation 5-234
5.3.2.4.1 Epidemiologic Studies 5-234
5.3.2.4.2 Controlled Human Exposure Studies 5-235
5.3.2.4.3 Animal Toxicological Studies 5-236
5.3.2.5 Summary of Asthma Exacerbation 5-236
5.3.3 Chronic Obstructive Pulmonary Disease (COPD) Exacerbation 5-237
5.3.3.1 Hospital Admissions and Emergency Department (ED) Visits 5-242
5.3.3.1.1 Hospital Admissions 5-242
5.3.3.1.2 Emergency Department (ED) Visits 5-242
5.3.3.2 Other Epidemiologic Studies 5-243
5.3.3.3 Summary of Exacerbation of Chronic Obstructive Pulmonary Disease (COPD) 5-243
5.3.4 Respiratory Infection 5-243
5.3.4.1 Hospital Admissions and Emergency Department (ED) Visits 5-244
5.3.4.2 Outpatient and Physician Visit Studies 5-248
5.3.4.3 Summary of Respiratory Infection 5-248
5.3.5 Combinations of Respiratory-Related Hospital Admissions and Emergency Department (ED) Visits 5-249
5.3.6 Respiratory Effects in Healthy Populations 5-257

CHAPTER 6 CARDIOVASCULAR EFFECTS 6-1

6.1 Short-Term $PM_{2.5}$ Exposure and Cardiovascular Effects 6-1
6.1.1 Biological Plausibility 6-3
6.1.2 Ischemic Heart Disease and Myocardial Infarction 6-7
6.1.2.1 Emergency Department (ED) Visits and Hospital Admissions 6-7
6.1.2.1.1 Acute Myocardial Infarction (MI) and Angina Pectoris 6-12
6.1.2.2 Epidemiologic Studies of ST Segment Depression 6-14
6.1.3 Heart Failure and Impaired Heart Function 6-16
6.1.3.1 Emergency Department (ED) Visits and Hospital Admissions 6-16
6.1.3.2 Controlled Human Exposure Studies of Impaired Heart Function 6-21
6.1.3.3 Toxicological Studies of Impaired Heart Function 6-21
6.1.4 Ventricular Depolarization, Repolarization, and Arrhythmia 6-22
6.1.4.1 Emergency Department (ED) Visits and Hospital Admissions for Arrhythmia and Out-of-Hospital Cardiac Arrest 6-23
6.1.4.1.1 Arrhythmias 6-23
6.1.4.1.2 Out-of-Hospital Cardiac Arrest 6-27
6.1.4.2 Epidemiologic Studies of Arrhythmia and Conduction Abnormalities 6-30
6.1.4.2.1 Conduction Abnormalities 6-36
6.1.4.3 Controlled Human Exposure Studies for Arrhythmia and Conduction Abnormalities 6-38
6.1.4.4 Toxicological Studies for Arrhythmia and Conduction Abnormalities 6-40
6.1.5 Cerebrovascular Disease and Stroke 6-41
6.1.5.1 Emergency Department (ED) Visits and Hospital Admissions 6-42
6.1.5.1.1 Emergency Department (ED) Visits and Hospital Admissions Visits for Stroke Subtypes 6-46
6.1.6 Blood Pressure and Hypertension 6-47
6.1.6.1 Emergency Department (ED) Visits and Hospital Admissions 6-48
6.1.6.2 Epidemiologic Studies of Changes in Blood Pressure (BP) 6-51
6.1.6.3 Controlled Human Exposure Studies of Changes in Blood Pressure (BP) 6-57
6.1.6.4 Toxicological Studies of Changes in Blood Pressure (BP) 6-59
6.1.6.4.1 Renin-Angiotensin System 6-60
6.1.7 Venous Thromboembolism Disease and Pulmonary Embolism 6-61
6.1.7.1 Emergency Department (ED) Visits and Hospital Admissions 6-62
6.1.8 Combinations of Cardiovascular-Related Emergency Department (ED) Visits and Hospital Admissions 6-66
6.1.9 Cardiovascular Mortality 6-72
6.1.10 Heart Rate (HR) and Heart Rate Variability (HRV) 6-73
6.1.10.1 Epidemiologic Studies of Heart Rate (HR) and Heart Rate Variability (HRV) 6-74
6.1.10.2 Controlled Human Exposure Studies of Heart Rate (HR) and Heart Rate Variability (HRV) 6-80
6.1.10.3 Toxicological Studies of Heart Rate (HR) and Heart Rate Variability (HRV) 6-83
6.1.10.3.1 Heart Rate Variability (HRV) 6-83
6.1.11 Systemic Inflammation, Oxidative Stress, and Blood Lipids 6-85
6.1.11.1 Epidemiologic Studies of Systemic Inflammation and Oxidative Stress 6-85
6.1.11.2 Controlled Human Exposure Studies of Short-Term $PM_{2.5}$ Exposure and Systemic Inflammation, Oxidative Stress, and Blood Lipids 6-89
6.1.11.2.1 Systemic Inflammation 6-89
6.1.11.2.2 Oxidative Stress 6-90
6.1.11.2.3 Blood Lipids 6-90

6.1.11.3 Toxicological Studies of Systemic Inflammation, Oxidative Stress, and Blood Lipids 6-92
6.1.11.3.1 Systemic Inflammation 6-92
6.1.11.3.1 Oxidative Stress 6-94
6.1.11.3.2 Blood Lipids 6-94
6.1.12 Coagulation 6-94
6.1.12.1 Epidemiologic Studies of Coagulation 6-95
6.1.12.2 Controlled Human Exposure Studies of Coagulation 6-97
6.1.12.3 Toxicological Studies of Coagulation and Thrombosis 6-99
6.1.13 Endothelial Dysfunction and Arterial Stiffness 6-100
6.1.13.1 Epidemiologic Studies of Impaired Vascular Function 6-101
6.1.13.1.1 Digital Vascular Function 6-101
6.1.13.1.2 Arterial Stiffness 6-102
6.1.13.1.3 Biomarkers of Endothelial Injury 6-102
6.1.13.2 Controlled Human Exposure Studies of Short-Term $PM_{2.5}$ Exposure and Impaired Vascular Function 6-106
6.1.13.2.1 Arterial Stiffness 6-108
6.1.13.3 Toxicological Studies of Impaired Vascular Function 6-110
6.1.14 Policy-Relevant Considerations 6-111
6.1.14.1 Examination of Potential Copollutant Confounding 6-111
6.1.14.1.1 $PM_{2.5}$ within the Multipollutant Mixture 6-117
6.1.14.2 The Role of Season and Temperature on $PM_{2.5}$ Associations 6-117
6.1.14.3 Lag Structure 6-119
6.1.15 Associations between $PM_{2.5}$ Components and Sources and Cardiovascular Effects 6-122
6.1.15.1 Elemental and Black Carbon 6-124
6.1.15.2 Organic Carbon 6-126
6.1.15.3 Secondary $PM_{2.5}$—Sulfate, Nitrate, Ammonium 6-127
6.1.15.4 Metals 6-127
6.1.15.5 Other $PM_{2.5}$ components 6-128
6.1.15.6 Sources of $PM_{2.5}$ 6-128
6.1.15.7 Associations between $PM_{2.5}$ Components and Sources and Effects in People with Diabetes 6-130
6.1.15.8 Toxicological Studies of Individual Components and Sources as Part of the Particulate Matter (PM) Mixture 6-131
6.1.16 Summary and Causality Determination 6-136
6.2 Long-Term $PM_{2.5}$ Exposure and Cardiovascular Effects 6-140
6.2.1 Biological Plausibility 6-142
6.2.2 Ischemic Heart Disease and Myocardial Infarction 6-145
6.2.2.1 Epidemiologic Studies 6-146
6.2.3 Cerebrovascular Disease and Stroke 6-152
6.2.3.1 Epidemiologic Studies 6-152
6.2.3.1.1 Subclinical Cerebrovascular Disease 6-158
6.2.4 Atherosclerosis 6-159
6.2.4.1 Epidemiologic Studies 6-160
6.2.4.2 Toxicological Studies of Atherosclerosis 6-164
6.2.5 Heart Failure and Impaired Heart Function 6-166
6.2.5.1 Epidemiologic Studies 6-166
6.2.5.2 Toxicological Studies of Impaired Heart Function 6-170
6.2.6 Ventricular Depolarization, Repolarization, and Arrhythmia 6-172
6.2.6.1 Epidemiologic Studies 6-172
6.2.7 Blood Pressure and Hypertension 6-174

6.2.7.1 Epidemiologic Studies 6-174
6.2.7.1.1 Blood Pressure 6-174
6.2.7.1.2 Hypertension 6-180
6.2.7.1.3 Gestational Hypertension and Pre-eclampsia 6-182
6.2.7.1.4 Renal Function 6-182
6.2.7.2 Toxicological Studies of Changes in Blood Pressure (BP) 6-182
6.2.7.2.1 Renin-Angiotensin System 6-183
6.2.8 Venous Thromboembolism Disease and Pulmonary Embolism 6-184
6.2.8.1 Epidemiologic Studies 6-185
6.2.9 Combinations of Cardiovascular-Related Outcomes 6-187
6.2.10 Long-Term $PM_{2.5}$ Exposure and Cardiovascular Mortality 6-189
6.2.11 Heart Rate (HR) and Heart Rate Variability (HRV) 6-192
6.2.11.1 Epidemiologic Studies of Heart Rate Variability (HRV) 6-192
6.2.11.2 Toxicological Studies of Heart Rate (HR) and Heart Rate Variability (HRV) 6-193
6.2.12 Systemic Inflammation, Oxidative Stress, and Blood Lipids 6-194
6.2.12.1 Epidemiologic Studies 6-194
6.2.12.1.1 Systemic Inflammation 6-194
6.2.12.1.2 Blood Lipids 6-195
6.2.12.2 Toxicological Studies 6-195
6.2.12.2.1 Systemic Inflammation 6-196
6.2.12.2.2 Oxidative Stress 6-196
6.2.12.2.3 Blood Lipids 6-197
6.2.13 Coagulation 6-198
6.2.13.1 Epidemiologic Studies 6-198
6.2.14 Impaired Vascular Function and Arterial Stiffness 6-199
6.2.14.1 Epidemiologic Studies 6-199
6.2.14.2 Toxicological Studies 6-200
6.2.15 Copollutant Confounding 6-201
6.2.16 Concentration-Response Relationship 6-206
6.2.17 Associations between $PM_{2.5}$ Components and Sources and Cardiovascular Effects 6-214
6.2.17.1 Toxicological Studies of Individual Components and Sources as Part of a Particulate Matter Mixture 6-217
6.2.18 Summary and Causality Determination 6-219
6.3 Short-Term $PM_{10-2.5}$ Exposure and Cardiovascular Effects 6-224
6.3.1 Biological Plausibility 6-225
6.3.2 Ischemic Heart Disease and Myocardial Infarction 6-227
6.3.2.1 Emergency Department (ED) Visits and Hospital Admissions 6-228
6.3.3 Heart Failure and Impaired Heart Function 6-229
6.3.3.1 Emergency Department (ED) Visits and Hospital Admissions 6-229
6.3.3.2 Toxicological Studies of Impaired Heart Function 6-230
6.3.4 Ventricular Depolarization, Repolarization, and Arrhythmia 6-230
6.3.4.1 Emergency Department (ED) Visits and Hospital Admissions for Arrhythmia and Out-of-Hospital Cardiac Arrest 6-231
6.3.4.1.1 Out-of-Hospital Cardiac Arrest 6-231
6.3.4.2 Epidemiologic Studies for Arrhythmia and Conduction Abnormalities 6-232
6.3.5 Cerebrovascular Disease and Stroke 6-232
6.3.5.1 Emergency Department (ED) Visits and Hospital Admissions 6-232
6.3.6 Blood Pressure and Hypertension 6-233
6.3.6.1 Epidemiologic Studies of Changes in Blood Pressure (BP) 6-234
6.3.6.2 Controlled Human Exposure Studies of Changes in Blood Pressure (BP) 6-234

6.3.6.3 Toxicological Studies of Changes in Blood Pressure (BP) 6-235
6.3.7 Combinations of Cardiovascular-Related Emergency Department (ED) Visits and Hospital Admissions 6-236
6.3.8 Cardiovascular Mortality 6-239
6.3.8.1 Characterizing the $PM_{10-2.5}$ Cardiovascular Mortality Relationship 6-240
6.3.8.2 Copollutant Confounding 6-240
6.3.8.3 Lag Structure of Associations 6-243
6.3.8.4 Effect Modification 6-244
6.3.8.4.1 Season 6-244
6.3.8.4.2 Temperature 6-245
6.3.9 Heart Rate (HR) and Heart Rate Variability (HRV) 6-245
6.3.9.1 Epidemiologic Studies of Heart Rate (HR) and Heart Rate Variability (HRV) 6-245
6.3.9.2 Controlled Human Exposure Studies of Heart Rate (HR) and Heart Rate Variability (HRV) 6-245
6.3.10 Systemic Inflammation and Oxidative Stress 6-246
6.3.10.1 Epidemiologic Studies of Systemic Inflammation and Oxidative Stress 6-247
6.3.10.2 Controlled Human Exposure Studies of Systemic Inflammation and Oxidative Stress 6-247
6.3.11 Coagulation 6-249
6.3.11.1 Epidemiologic Studies of Coagulation 6-250
6.3.11.2 Controlled Human Exposure Studies of Coagulation and Thrombosis 6-250
6.3.12 Endothelial Dysfunction and Arterial Stiffness 6-250
6.3.12.1 Controlled Human Exposure Studies of Impaired Vascular Function 6-251
6.3.13 Summary and Causality Determination 6-252
6.4 Long-Term $PM_{10-2.5}$ Exposure and Cardiovascular Effects 6-256
6.4.1 Biological Plausibility 6-256
6.4.2 Ischemic Heart Disease and Myocardial Infarction 6-258
6.4.3 Heart Failure and Impaired Heart Function 6-262
6.4.3.1 Epidemiologic Studies 6-263
6.4.3.2 Toxicological Studies of Impaired Heart Function 6-264
6.4.4 Cerebrovascular Disease and Stroke 6-265
6.4.5 Atherosclerosis 6-269
6.4.6 Blood Pressure and Hypertension 6-271
6.4.6.1 Epidemiologic Studies 6-271
6.4.6.2 Toxicological Studies of Changes in Blood Pressure (BP) 6-271
6.4.7 Peripheral Vascular Disease (PVD), Venous Thromboembolism, Pulmonary Embolism 6-272
6.4.8 Cardiovascular Mortality 6-273
6.4.9 Systemic Inflammation and Oxidative Stress 6-275
6.4.9.1 Epidemiologic Studies 6-275
6.4.9.2 Toxicological Studies 6-275
6.4.10 Summary and Causality Determination 6-276
6.5 Short-Term UFP Exposure and Cardiovascular Effects 6-278
6.5.1 Biological Plausibility 6-279
6.5.2 Ischemic Heart Disease and Myocardial infarction 6-282
6.5.2.1 Emergency Department (ED) Visits and Hospital Admissions 6-282
6.5.2.2 Epidemiologic Studies of ST Segment Depression 6-283
6.5.3 Heart Failure and Impaired Heart Function 6-283
6.5.3.1 Emergency Department (ED) Visits and Hospital Admissions 6-283
6.5.3.2 Toxicological Studies of Impaired Heart Function 6-283
6.5.4 Ventricular Depolarization, Repolarization, and Arrhythmia 6-284

6.5.4.1 Emergency Department (ED) Visits and Hospital Admissions for Arrhythmia and Out-of-Hospital Cardiac Arrest 6-284
6.5.4.2 Epidemiologic Studies for Arrhythmia and Conduction Abnormalities 6-285
6.5.4.3 Controlled Human Exposure Studies for Arrhythmia and Conduction Abnormalities 6-286
6.5.4.4 Toxicological Studies for Arrhythmia and Conduction Abnormalities 6-286
6.5.5 Cerebrovascular Disease and Stroke 6-287
6.5.5.1 Emergency Department (ED) Visits and Hospital Admissions 6-287
6.5.6 Blood Pressure and Hypertension 6-288
6.5.6.1 Emergency Department (ED) Visits and Hospital Admissions 6-288
6.5.6.2 Epidemiologic Studies of Changes in Blood Pressure (BP) 6-288
6.5.6.3 Controlled Human Exposure Toxicology Studies of Changes in Blood Pressure (BP) 6-289

CHAPTER 7 METABOLIC EFFECTS 7-1

7.1 Short-Term $PM_{2.5}$ Exposure and Metabolic Effects 7-1
7.1.1 Biological Plausibility 7-2
7.1.2 Glucose and Insulin Homeostasis 7-4
7.1.2.1 Epidemiologic Studies 7-5
7.1.2.2 Toxicological Studies 7-7
7.1.2.3 Summary 7-9

7.1.3 Other Indicators of Metabolic Function 7-9
7.1.3.1 Inflammation 7-9
7.1.3.2 Liver Function 7-10
7.1.4 Summary and Causality Determination 7-11
7.2 Long-Term $PM_{2.5}$ Exposure and Metabolic Effects 7-12
7.2.1 Biological Plausibility 7-13
7.2.2 Metabolic Syndrome 7-16
7.2.3 Glucose and Insulin Homeostasis 7-18
7.2.3.1 Epidemiologic Studies 7-18
7.2.3.2 Toxicological Studies 7-24
7.2.3.3 Summary 7-27
7.2.4 Type 2 Diabetes Mellitus 7-28
7.2.4.1 Epidemiologic Studies of Type 2 Diabetes Mellitus 7-28
7.2.4.2 Summary 7-33
7.2.5 Other Indicators of Metabolic Function 7-34
7.2.5.1 Inflammation 7-34
7.2.5.2 Liver Function 7-39
7.2.5.2.1 Epidemiologic Studies 7-39
7.2.5.2.2 Toxicological Studies 7-40
7.2.5.3 Endocrine Hormones 7-41
7.2.5.4 Adiposity and Weight Gain 7-41
7.2.5.4.1 Epidemiologic Studies 7-41
7.2.5.4.2 Toxicological Studies 7-42
7.2.5.5 Gestational Diabetes 7-43
7.2.6 Age of Onset of Type 1 Diabetes 7-43
7.2.6.1 Epidemiologic Studies 7-43
7.2.6.2 Toxicological Studies 7-44
7.2.6.3 Summary 7-44
7.2.7 Associations between $PM_{2.5}$ Components and Sources and Metabolic Effects 7-44
7.2.8 Copollutant Confounding 7-45
7.2.9 Metabolic Disease Mortality 7-46
7.2.10 Summary and Causality Determination 7-48
7.3 Short-Term $PM_{10-2.5}$ Exposure and Metabolic Effects 7-52
7.4 Long-Term $PM_{10-2.5}$ Exposure and Metabolic Effects 7-53
7.4.1 Biological Plausibility 7-53
7.4.2 Type 2 Diabetes Mellitus 7-54
7.4.3 Summary and Causal Determination 7-56
7.5 Short-Term UFP Exposure and Metabolic Effects 7-58
7.6 Long-Term UFP Exposure and Metabolic Effects 7-58
7.7 References 7-60

CHAPTER 8 NERVOUS SYSTEM EFFECTS 8-1

8.1 Short-Term $PM_{2.5}$ Exposure and Nervous System Effects 8-1
8.1.1 Biological Plausibility 8-2
8.1.1.1 Activation of Sensory Nerves and Modulation of the Autonomic Nervous System (ANS) 8-4
8.1.1.2 Inflammation 8-5
8.1.1.3 Summary of Biological Plausibility 8-6
8.1.2 Activation of the Sympathetic Nervous System and the Hypothalamic-Pituitary-Adrenal (HPA) Stress Axis 8-6
8.1.2.1 Controlled Human Exposure Study 8-6

8.1.2.2 Animal Toxicological Studies 8-7
8.1.3 Brain Inflammation and Oxidative Stress 8-9
8.1.3.1 Controlled Human Exposure Study 8-9
8.1.3.2 Animal Toxicological Studies 8-10
8.1.4 Diseases of the Nervous System and Depression 8-12
8.1.5 Components and Sources of $PM_{2.5}$ 8-14
8.1.6 Summary and Causality Determination 8-15
8.2 Long-Term $PM_{2.5}$ Exposure and Nervous System Effects 8-17
8.2.1 Biological Plausibility 8-18
8.2.1.1 Upregulation of the Renin-Angiotensin (RAS) and Activation of the Sympathetic Nervous System (SNS) 8-20
8.2.1.2 Inflammation 8-20
8.2.1.3 Summary of Biological Plausibility 8-21
8.2.2 Activation of the Sympathetic Nervous System and the Hypothalamic-Pituitary-Adrenal (HPA) Stress Axis 8-22
8.2.3 Brain Inflammation and Oxidative Stress 8-23
8.2.4 Morphologic Changes in the Brain 8-27
8.2.4.1 Epidemiologic Studies 8-28
8.2.4.2 Animal Toxicological Studies 8-29
8.2.5 Cognitive and Behavioral Effects 8-30
8.2.5.1 Animal Toxicological Studies 8-31
8.2.5.2 Epidemiologic Studies 8-32
8.2.5.2.1 Anxiety and Depression 8-39
8.2.6 Neurodegenerative Diseases 8-41
8.2.7 Neurodevelopmental Effects 8-45
8.2.7.1 Cognitive and Behavioral Effects 8-49
8.2.7.2 Autism 8-49
8.2.7.2.1 Epidemiologic Studies 8-49
8.2.7.2.2 Animal Toxicological Studies 8-53
8.2.8 Components and Sources of $PM_{2.5}$ 8-54
8.2.9 Summary and Causality Determination 8-57
8.3 Short-Term $PM_{10-2.5}$ Exposure and Nervous System Effects 8-61
8.3.1 Biological Plausibility 8-62
8.3.1.1 Summary of Biological Plausibility 8-64
8.3.2 Activation of the Sympathetic Nervous System and the Hypothalamic-Pituitary-Adrenal (HPA) Stress Axis 8-64
8.3.3 Brain Inflammation and Oxidative Stress 8-65
8.3.4 Summary and Causality Determination 8-66
8.4 Long-Term $PM_{10-2.5}$ Exposure and Nervous System Effects 8-67
8.4.1 Biological Plausibility 8-68
8.4.2 Brain Inflammation and Oxidative Stress 8-69
8.4.3 Cognitive and Behavioral Effects in Adults 8-70
8.4.4 Neurodevelopmental Effects 8-73
8.4.5 Summary and Causality Determination 8-73
8.5 Short-Term UFP Exposure and Nervous System Effects 8-75
8.5.1 Biological Plausibility 8-75
8.5.1.1 Activation of Sensory Nerves and Modulation of the Autonomic Nervous System (ANS) 8-77
8.5.1.2 Inflammation 8-78
8.5.1.3 Summary of Biological Plausibility 8-78
8.5.2 Activation of the Sympathetic Nervous System and the Hypothalamic-Pituitary-Adrenal (HPA) Stress Axis 8-79

8.5.2.1 Controlled Human Exposure Study 8-79
8.5.2.2 Animal Toxicological Study 8-80
8.5.3 Brain Inflammation and Oxidative Stress 8-80
8.5.4 Cognitive and Behavioral Effects 8-83
8.5.4.1 Epidemiologic Studies 8-83
8.5.4.2 Animal Toxicological Studies 8-83
8.5.5 Summary and Causality Determination 8-84
8.6 Long-Term UFP Exposure and Nervous System Effects 8-86
8.6.1 Biological Plausibility 8-86
8.6.1.1 Inflammation 8-88
8.6.1.2 Summary of Biological Plausibility 8-89
8.6.2 Activation of the Sympathetic Nervous System and the Hypothalamic-Pituitary-Adrenal (HPA) Stress Axis 8-89
8.6.3 Brain Inflammation and Oxidative Stress 8-90
8.6.4 Morphologic Changes 8-93
8.6.5 Cognitive and Behavioral Effects 8-94
8.6.6 Neurodevelopmental Effects 8-95
8.6.6.1 Epidemiologic Studies 8-95
8.6.6.2 Animal Toxicological Studies 8-96
8.6.7 Summary and Causality Determination 8-100
8.7 References 8-103

CHAPTER 9 REPRODUCTIVE AND DEVELOPMENTAL EFFECTS 9-1

9.1 $PM_{2.5}$ Exposure and Reproductive and Developmental Effects 9-2
9.1.1 Male and Female Reproduction and Fertility 9-3
9.1.1.1 Biological Plausibility 9-3
9.1.1.2 Male Reproduction 9-6
9.1.1.2.1 Epidemiologic Studies 9-6
9.1.1.2.2 Animal Toxicological Studies 9-6
9.1.1.3 Female Reproduction 9-8
9.1.1.3.1 Epidemiologic Studies 9-8
9.1.1.3.2 Animal Toxicological Studies 9-9
9.1.2 Pregnancy and Birth Outcomes 9-10
9.1.2.1 Biological Plausibility 9-10
9.1.2.2 Maternal Health during Pregnancy 9-13
9.1.2.2.1 Epidemiologic Studies 9-13
9.1.2.2.2 Animal Toxicological Studies 9-14
9.1.2.3 Fetal Growth, Birth Weight, and Body Length at Birth 9-16
9.1.2.3.1 Epidemiologic Studies 9-18
9.1.2.3.2 Animal Toxicological Studies 9-22
9.1.2.3.3 Animal Toxicological Studies for Changes in Anogenital Distance 9-24
9.1.2.3.4 Animal Toxicological Studies for Altered Sex Ratio in Litters at Birth 9-24
9.1.2.4 Preterm Birth 9-24
9.1.2.4.1 Epidemiologic Studies 9-25
9.1.2.4.2 Animal Toxicological Studies 9-32
9.1.2.5 Birth Defects 9-32
9.1.2.5.1 Epidemiologic Studies 9-33
9.1.2.5.2 Animal Toxicological Studies 9-33
9.1.2.6 Fetal and Infant Mortality 9-34

9.1.3 Developmental Effects 9-35
9.1.3.1 Respiratory Developmental Effects 9-36
9.1.3.1.1 Epidemiologic Studies 9-36
9.1.3.1.2 Animal Toxicological Studies 9-37
9.1.3.2 Neurodevelopmental Effects 9-37
9.1.3.2.1 Epidemiologic Studies 9-37
9.1.3.2.2 Animal Toxicological Studies 9-38
9.1.3.3 Cardiovascular Developmental Effects 9-38
9.1.3.3.1 Animal Toxicological Studies 9-38
9.1.3.4 Postnatal Growth and Development 9-39
9.1.4 Associations between $PM_{2.5}$ Components and Sources and Reproductive and Developmental Effects 9-39
9.1.5 Summary and Causality Determination 9-41
9.1.5.1 Male and Female Fertility and Reproduction 9-41
9.1.5.2 Pregnancy and Birth Outcomes 9-43
9.1.5.3 Developmental Outcomes 9-46
9.2 $PM_{10-2.5}$ Exposure and Reproductive and Developmental Effects 9-46
9.2.1 Male and Female Reproduction and Fertility 9-46
9.2.1.1 Biological Plausibility 9-46
9.2.1.2 Male and Female Reproduction and Fertility 9-47
9.2.2 Pregnancy and Birth Outcomes 9-47
9.2.2.1 Biological Plausibility 9-47
9.2.2.2 Pregnancy and Birth Outcomes 9-47
9.2.3 Developmental Effects 9-51
9.2.4 Summary and Causality Determination 9-51
9.2.4.1 Male and Female Fertility and Reproduction 9-51
9.2.4.2 Pregnancy and Birth Outcomes 9-54
9.3 UFP Exposure and Reproductive and Developmental Effects 9-56
9.3.1 Male and Female Reproduction and Fertility 9-56
9.3.1.1 Biological Plausibility 9-56
9.3.1.2 Male Reproductive Function 9-58
9.3.1.3 Female Reproduction and Fertility 9-59
9.3.2 Pregnancy and Birth Outcomes 9-60
9.3.2.1 Biological Plausibility 9-60
9.3.2.2 Pregnancy and Birth Outcomes 9-60
9.3.3 Developmental Effects 9-61
9.3.3.1 Neurodevelopmental Effects 9-62
9.3.3.1.1 Neurobehavioral Effects 9-62
9.3.3.1.2 Changes in Brain Structure 9-62
9.3.4 Summary and Causality Determination 9-63
9.3.4.1 Male and Female Fertility and Reproduction 9-63
9.3.4.2 Pregnancy and Birth Outcomes 9-65
9.4 References 9-67

CHAPTER 10 CANCER 10-1

10.1 Introduction 10-1
10.1.1 Evaluation of the Relationship between Long-Term PM Exposure and Cancer 10-1
10.1.2 Carcinogens and the Development of Cancer 10-2
10.2 $PM_{2.5}$ Exposure and Cancer 10-3
10.2.1 Biological Plausibility 10-4

10.2.1.1 Genotoxicity 10-6
10.2.1.2 Epigenetic Effects 10-8
10.2.1.3 Carcinogenic Potential 10-8
10.2.1.4 Characteristics of Carcinogens and Hallmarks of Cancer 10-9
10.2.1.5 Summary of Biological Plausibility 10-9
10.2.2 Genotoxicity 10-9
10.2.2.1 Mutagenicity 10-10
10.2.2.2 DNA Damage 10-14
10.2.2.2.1 Toxicological Studies 10-14
10.2.2.2.2 Controlled Human Exposure Studies 10-18
10.2.2.2.3 Epidemiologic Studies 10-19
10.2.2.2.4 Summary 10-21
10.2.2.3 Cytogenetic Endpoints 10-21
10.2.2.3.1 Toxicological Studies 10-21
10.2.2.3.2 Epidemiologic Studies 10-21
10.2.2.3.3 Summary 10-24
10.2.2.4 Other Markers 10-24
10.2.2.4.1 Toxicological Studies 10-24
10.2.2.4.2 Controlled Human Exposure Studies 10-25
10.2.2.4.3 Epidemiologic Studies 10-26
10.2.2.4.4 Summary 10-26
10.2.2.5 Summary of Genotoxicity 10-26
10.2.3 Epigenetic Effects 10-27
10.2.3.1 Methylation of Promoters of Tumor Suppressor Genes 10-28
10.2.3.2 Methylation of Repetitive Line Elements 10-29
10.2.3.2.1 Toxicological Studies 10-29
10.2.3.2.2 Epidemiologic Studies 10-31
10.2.3.3 Noncoding Microribonucleic Acids (miRNAs) 10-33
10.2.3.4 Summary of Epigenetic Effects 10-34
10.2.4 Carcinogenic Potential 10-34
10.2.5 Cancer Incidence, Mortality, and Survival 10-36
10.2.5.1 Lung Cancer 10-36
10.2.5.1.1 Lung Cancer Mortality 10-45
10.2.5.1.2 Lung Cancer Incidence 10-50
10.2.5.1.3 Copollutant Models 10-54
10.2.5.1.4 Concentration-Response Relationship 10-55
10.2.5.1.5 Summary 10-60
10.2.5.2 Other Cancers 10-61
10.2.5.2.1 Breast Cancer 10-64
10.2.5.2.2 Brain Cancer 10-65
10.2.5.2.3 Liver Cancer 10-65
10.2.5.2.4 Leukemia 10-66
10.2.5.2.5 Multiple Cancers 10-66
10.2.5.2.6 Summary 10-67
10.2.5.3 Cancer Survival 10-67
10.2.6 Associations between $PM_{2.5}$ Sources and Components and Cancer 10-72

10.2.7 Summary and Causality Determination 10-73
10.3 $PM_{10-2.5}$ Exposure and Cancer 10-77
10.3.1 Biological Plausibility 10-78
10.3.1.1 Genotoxicity 10-79
10.3.1.2 Summary of Biological Plausibility 10-80
10.3.2 Genotoxicity 10-81
10.3.2.1 Toxicological Studies 10-81
10.3.2.2 Controlled Human Exposure Studies 10-83
10.3.2.3 Epidemiologic Studies 10-83
10.3.2.4 Summary of Genotoxicity 10-84
10.3.3 Cancer Incidence and Mortality 10-84
10.3.3.1 Lung Cancer 10-84
10.3.3.2 Other Cancers 10-86
10.3.3.3 Summary 10-86
10.3.4 Summary and Causality Determination 10-86
10.4 UFP Exposure and Cancer 10-88
10.4.1 Biological Plausibility 10-89
10.4.1.1 Genotoxicity 10-90
10.4.1.2 Summary of Biological Plausibility 10-91
10.4.2 Genotoxicity 10-92
10.4.2.1 Toxicological Studies 10-92
10.4.2.2 Controlled Human Exposure Studies 10-93
10.4.2.3 Summary of Genotoxicity 10-94
10.4.3 Cancer Incidence and Mortality 10-94
10.4.4 Summary and Causality Determination 10-94
10.5 References 10-96

CHAPTER 11 MORTALITY 11-1

11.1 Short-Term $PM_{2.5}$ Exposure and Total Mortality 11-1
11.1.1 Biological Plausibility for Short-Term $PM_{2.5}$ Exposure and Total (Nonaccidental) Mortality 11-8
11.1.2 Associations between Short-Term $PM_{2.5}$ Exposure and Total (Nonaccidental) Mortality in All-Year Analyses 11-9
11.1.2.1 Examination of $PM_{2.5}$-Mortality Relationship through Causal Modeling Methods 11-10
11.1.3 Associations between Short-Term $PM_{2.5}$ and Cause-Specific Mortality in All-Year Analyses 11-13
11.1.4 Potential Copollutant Confounding of the $PM_{2.5}$-Mortality Relationship 11-14
11.1.5 Other Potential Confounders of the $PM_{2.5}$-Mortality Relationship 11-16
11.1.5.1 Long-Term Temporal Trends and Weather 11-16
11.1.5.2 Influence of Long-Term $PM_{2.5}$ Concentrations on Short-Term $PM_{2.5}$ Associations 11-19
11.1.6 Effect Modification of the $PM_{2.5}$-Mortality Relationship 11-19
11.1.6.1 Season 11-20
11.1.6.2 Temperature 11-21
11.1.6.3 City and Regional Characteristics 11-24
11.1.6.3.1 Composition/Mixtures 11-24
11.1.6.3.2 Exposure Factors 11-28
11.1.7 Evaluation of Exposure Assessment Techniques 11-31
11.1.7.1 Monitor Representativeness 11-31
11.1.7.2 Urban versus Rural Locations 11-33
11.1.8 Timing of Effects and Exposure Metrics 11-34
11.1.8.1 Lag Structure of Associations 11-34

11.1.8.2 24-Hour Average versus Subdaily (Peak) Exposures 11-36
11.1.9 Alternative PM Size Fractions and Exposure Metrics 11-37
11.1.10 Concentration-Response Relationship and Threshold Analyses 11-37
11.1.11 Associations between $PM_{2.5}$ Sources and Components and Mortality 11-41
11.1.11.1 $PM_{2.5}$ Components 11-42
11.1.11.1.1 Single Component Models 11-46
11.1.11.1.2 Additional $PM_{2.5}$ Component Analyses 11-50
11.1.11.1.3 Summary 11-51
11.1.11.2 Sources 11-51
11.1.12 Summary and Causality Determination 11-53
11.2 Long-Term $PM_{2.5}$ Exposure and Total Mortality 11-58
11.2.1 Biological Plausibility for Long-Term $PM_{2.5}$ Exposure and Total Mortality 11-66
11.2.2 Associations between Long-Term $PM_{2.5}$ Exposure and Mortality 11-66
11.2.2.1 Results of American Cancer Society and Harvard Six Cities Cohort Studies 11-66
11.2.2.1 Results of Other North American Cohort Studies 11-69
11.2.2.2 Cardiovascular Mortality 11-77
11.2.2.3 Respiratory Mortality 11-78
11.2.2.4 Studies with Analyses that Inform Causal Inference 11-78
11.2.2.5 Studies of Temporal Trends and Life Expectancy 11-80
11.2.3 Potential Copollutant Confounding of the $PM_{2.5}$-Mortality Relationship 11-81
11.2.4 Concentration-Response Relationship 11-84
11.2.5 Evaluation of Factors That May Influence $PM_{2.5}$ Associations 11-90
11.2.5.1 Comparison of Exposure Assessment Techniques 11-90
11.2.5.2 Comparison of Statistical Techniques 11-91
11.2.5.3 Effects of Different Long-Term Exposure Windows 11-92
11.2.6 Associations between $PM_{2.5}$ Sources and Components and Mortality 11-93
11.2.7 Summary and Causality Determination 11-96
11.3 Short-Term $PM_{10-2.5}$ Exposure and Total Mortality 11-102
11.3.1 Biological Plausibility for Short-Term $PM_{10-2.5}$ Exposure and Total Mortality 11-105
11.3.2 Associations between Short-Term $PM_{10-2.5}$ Exposure and Total (Nonaccidental) Mortality in All-Year Analyses 11-106
11.3.3 Associations between Short-Term $PM_{10-2.5}$ Exposure and Cause-Specific Mortality in All-Year Analyses 11-107
11.3.4 Potential Confounding of the $PM_{10-2.5}$-Mortality Relationship 11-109
11.3.4.1 Copollutants 11-109
11.3.4.2 Long-Term Temporal Trends and Weather 11-111
11.3.5 Effect Modification of the $PM_{10-2.5}$-Mortality Relationship 11-112
11.3.5.1 Season and Temperature 11-113
11.3.5.2 Role of Exposure Assignment and Exposure Misclassification 11-113
11.3.6 Concentration-Response Relationship and Related Issues 11-114
11.3.6.1 Lag Structure of Associations 11-114
11.3.6.2 Concentration-Response Relationship and Threshold Analyses 11-115
11.3.6.2.1 Summary 11-115
11.3.7 Summary and Causality Determination 11-116
11.4 Long-Term $PM_{10-2.5}$ Exposure and Total Mortality 11-120
11.4.1 Biological Plausibility for Long-Term $PM_{10-2.5}$ Exposure and Total Mortality 11-120
11.4.2 Associations between Long-Term $PM_{10-2.5}$ Exposure and Mortality 11-121
11.4.3 Summary and Causality Determination 11-124
11.5 Short-Term UFP Exposure and Total Mortality 11-127
11.5.1 Biological Plausibility for Short-Term UFP Exposure and Total Mortality 11-133
11.5.2 Associations between Short-Term UFP Exposure and Total Mortality in Multicity Studies 11-133

11.5.3 Associations between Short-Term UFP Exposure and Total Mortality in Single-City Studies 11-135
11.5.4 Summary and Causality Determination 11-138
11.6 Long-Term UFP Exposure and Total Mortality 11-141
11.6.1 Biological Plausibility for Long-Term UFP Exposure and Total Mortality 11-141
11.6.2 Associations between Long-Term UFP Exposure and Total Mortality 11-142
11.6.3 Summary and Causality Determination 11-142
11.7 References 11-144

CHAPTER 12 POPULATIONS AND LIFESTAGES POTENTIALLY AT INCREASED RISK OF A PARTICULATE MATTER-RELATED HEALTH EFFECT 12-1

12.1 Introduction 12-1
12.2 Approach to Evaluating and Characterizing the Evidence for Populations or Lifestages Potentially at Increased Risk 12-2
12.3 Pre-existing Diseases/Conditions 12-5
12.3.1 Cardiovascular Disease 12-7
12.3.2 Pre-existing Diabetes and Metabolic Syndrome 12-10
12.3.3 Obesity 12-13
12.3.4 Elevated Cholesterol 12-16
12.3.5 Pre-existing Respiratory Disease 12-18
12.3.5.1 Asthma 12-18
12.3.5.2 Chronic Obstructive Pulmonary Disease (COPD) 12-19
12.4 Genetic Factors 12-20
12.5 Sociodemographic Factors 12-22
12.5.1 Lifestage 12-22
12.5.1.1 Children 12-23
12.5.1.2 Older Adults 12-25
12.5.2 Sex 12-29
12.5.3 Socioeconomic Status 12-31
12.5.4 Race 12-34
12.5.5 Residential Location 12-39
12.5.5.1 Urban/Rural Residential Locations 12-39
12.5.5.2 Residential Proximity to Traffic 12-41
12.6 Behavioral and Other Factors 12-43
12.6.1 Smoking 12-43
12.6.2 Diet 12-44
12.7 Conclusions 12-47
12.8 References 12-52

CHAPTER 13 WELFARE EFFECTS 13-1

13.1 Introduction 13-1
13.2 Effects on Visibility 13-2
13.2.1 Introduction 13-2
13.2.2 Visibility Impairment 13-4
13.2.2.1 Visibility Metrics 13-4
13.2.2.2 Monitoring of Visibility Impairment 13-6
13.2.3 Relationship between Particulate Matter and Visibility Impairment 13-10
13.2.3.1 Estimated Mass Extinction 13-12
13.2.3.2 Hygroscopic Growth 13-15
13.2.3.3 Reconstructing b_{ext} from Particulate Matter Speciation Data 13-16
13.2.4 Seasonal and Spatial Patterns of Visibility Impairment 13-17
13.2.4.1 Seasonal and Spatial Light Extinction $PM_{2.5}$ Species Contributions 13-20

13.2.4.2 Long-Term Trends 13-37
13.2.4.3 Characteristic Fine Particulate Mass Light Scattering Efficiencies 13-41
13.2.5 Human Perception of Haze and Landscape Features 13-42
13.2.6 Summary and Causality Determination 13-44
13.3 Effects on Climate 13-45
13.3.1 Introduction 13-45
13.3.2 Overview of the Physics of Climate Change and Radiative Forcing 13-46
13.3.2.1 Observed Recent Climate Change: Detection and Attribution 13-47
13.3.2.2 Metrics of Climate Change, Including Radiative Forcing 13-48
13.3.3 Effects of Particulate Matter on Radiative Forcing: Mechanisms 13-52
13.3.3.1 Interactions of Particulate Matter with Radiation 13-52
13.3.3.2 Interactions of Particulate Matter with Clouds 13-53
13.3.3.3 Effects of Absorbing Particulate Matter on Snow and Ice Albedo 13-54
13.3.3.4 Effect of Particle Size on the Interactions of Particulate Matter with Climate 13-54
13.3.4 Estimates of Radiative Forcing from Total Particulate Matter 13-55
13.3.4.1 Forcing Due to Interactions of Particulate Matter with Radiation 13-57
13.3.4.2 Forcing Due to Interactions of Particulate Matter with Clouds 13-60
13.3.4.3 Total Radiative Forcing Due to Interactions of Particulate Matter with Clouds and Radiation 13-60
13.3.4.4 Forcing Due to the Effects of Absorbing Particulate Matter on Albedo 13-60
13.3.4.5 Recent Trends in Particulate Matter Forcing 13-61
13.3.5 Effects of Particulate Matter on Climate by Species 13-64
13.3.5.1 Sulfate 13-65
13.3.5.2 Nitrate 13-66
13.3.5.3 Organic Carbon, Including Brown Carbon 13-66
13.3.5.4 Black Carbon 13-67
13.3.5.5 Dust 13-68
13.3.6 Climate Response to Changing Particulate Matter, Including Feedbacks 13-68
13.3.7 Effect of Particulate Matter on U.S. Regional Climate 13-70
13.3.8 Uncertainties in Estimates of Particulate Matter Effects on Radiative Forcing and Climate: Summary 13-74
13.3.9 Summary and Causality Determination 13-76
13.4 Effects on Materials 13-77
13.4.1 Introduction 13-77
13.4.2 Soiling and Corrosion 13-78
13.4.3 Dose-Response Relationships 13-81
13.4.4 Damage Functions 13-85
13.4.5 Summary and Causality Determination 13-87
13.5 References 13-88

APPENDIX DEVELOPMENT OF THE INTEGRATED SCIENCE ASSESSMENT A-1

A.1 Introduction A-1
A.2 Literature Search and Initial Screen A-3
A.2.1 Literature Search Techniques A-3
A.2.2 Initial Screening of Studies from Literature Search A-4
A.2.3 Documentation A-5
A.3 Full Evaluation of Studies A-6
A.3.1 Scope A-6
A.3.2 Individual Study Quality A-9
A.3.2.1 Health Approach A-9
A.3.2.2 Nonecological Welfare Effects Approach A-17
A.3.2.3 Other Approaches A-17

A.4 Peer Review and Public Participation A-18
A.4.1 Call for Information A-18
A.4.2 Integrated Review Plan A-19
A.4.3 Peer Input A-19
A.4.4 Internal Technical Review A-20
A.4.5 Clean Air Scientific Advisory Committee (CASAC) Peer Review A-20
A.5 Quality Assurance A-22
A.6 Conclusion A-23
A.7 References A-24

ACRONYMNS AND ABBREVIATIONS

Acronym/Abbreviation	Meaning
3B-HSD	3-beta-hydroxysteroid dehydrogenase
5hmC	5-hydroxymethylcytosine
5mC	5-methylcytosine
5mdC	5-methyl-2′-deoxycytidine
8-OHdG	8-hydroxy-2′-deoxyguanosine
99mTc	technicium-99m
AARP	American Association of Retired Persons
ABI	ankle-brachial index
AC	air conditioning
ACCMIP	Atmospheric Chemistry and Climate Model Intercomparison Project
ACE	angiotensin-converting enzyme
ACGIH	American Conference of Governmental Industrial Hygienists
aci	aerosol cloud interactions
ACL	Americans Changing Lives
ACS	American Cancer Society
Acta1	alpha skeletal actin
ADHD	attention deficit, hyperreactive disorder
ADI	Autism Diagnostic Interview
ADMS	Atmospheric Dispersion Modelling System
ADOS	Autism Diagnostic Observation Schedule
Adrb2	adrenergic beta 2
AER	air exchange rate
AERMOD	American Meteorological Society/U.S. EPA Regulatory Model
AeroCom	Aerosol Comparisons between Observations and Models
AERONET	Aerosol Robotic Network
AF	atrial fibrillation
AGD	anogenital distance
AhR	aryl hydrocarbon receptor

Acronym/Abbreviation	Meaning
AHR	airway hyperresponsiveness
AHS	Agricultural Health Study
AHSMOG	Adventist Health and Smog
AI	augmentation index
AIC	Akaike's information criterion
ALT	alanine transaminase
Ang	angiotensin
ANS	autonomic nervous system
AOD	aerosol optical depth
APC	antigen presenting cell(s)
APEX	Air Pollutants Exposure model
ApoE	apolipoprotein E
AQCD	Air Quality Criteria Document
AQHI	Air Quality Health Index
AQI	Air Quality Index
AQS	Air Quality System
AR4	Fourth Assessment Report from the IPCC
AR5	Fifth Assessment Report from the IPCC
ari/ARI	aerosol radiation interactions; acute respiratory infection
ARIES	Aerosol Research and Inhalation Epidemiology Study
ASD	autism spectrum disorder
AST	aspartate aminotransferase
At1r	angiotensin 1 receptor
ATPase	adenosine triphosphatase
ATSDR	Agency for Toxic Substances and Disease Registry
avg	average
B1r	bradykinin type 1 receptor
BACE	beta-site APP-cleaving enzyme
BAD	bronchial artery diameter
BAL	bronchoalveolar lavage
BALB	albino inbred mouse strain
BALF	bronchoalveolar lavage fluid

Acronym/Abbreviation	Meaning
BAMSE	Children, Allergy, Milieu, Stockholm, Epidemiological Survey
bap	absorption by particles coefficient
BC	black carbon
bext	light extinction coefficient
BG	background
bhp	brake horsepower
BIC	Bayesian information criterion
BMC	Boston Medical Center
BME	Bayesian maximum entropy
BMI	body mass index
BNP	B-type natriuretic peptide
BP	blood pressure
BPDE	benzo[a]pyrene 7,8-diol-9,10-epoxide
BrC	brown carbon
bsg	scattering by gases coefficient
BSID	Bayley Scale of Infant Development
bsp	sum of light scattering by (aerosol) particles coefficient
BTEX	benzene, toluene, ethylbenzene, xylene
BVAIT	B-Vitamin Atherosclerosis Intervention Trial
BW	bronchial wash
BWGA	birth weight for gestational age
BWHS	Black Women's Health Study
C57BL	wild type c57 black mouse
C_6H_6	benzene
CA	California
CA SEER	California Surveillance Epidemiology and End Results cancer registry
Ca^{2+}	calcium
CAA	Clean Air Act
CAAA	1977 Clean Air Act Amendments
CAC	coronary artery calcification
$CaCO_3$	calcium carbonate

Acronym/Abbreviation	Meaning
CAD	coronary artery disease
CALINE	California LINE (source dispersion model)
CALINE4	California Line Source Dispersion Model 4
CALIPSO	Cloud Aerosol Lidar and Infrared Pathfinder Satellite Observation
CalNex	California Nexus Study
CAMx	Comprehensive Air Quality Model with Extensions
CanCHEC	Canadian Census Health and Environment Cohort
CAPES	China Air Pollution and Health Effects Study
CAPPS	Canadian Asthma Primary Preventions Study
CAPs	concentrated ambient particles
CASAC	Clean Air Scientific Advisory Committee
CBSA	core-based statistical area
CBVD	cerebrovascular disease
CC	corpus callosum
CC16	club cell secretory protein
CCHS	Canadian Community Health Survey
CCR	California Cancer Registry
CDC	Centers for Disease Control and Prevention
CEN	European Committee for Standardization
CERAD	Consortium to Establish a Registry for Alzheimer's Disease
CESD	Center for Epidemiological Studies Depression Scale
CESD-R	Center for Epidemiological Studies Depression Scale Revised
CF	cystic fibrosis
CFD	computational fluid dynamics
CFR	Code of Federal Regulations
CHAD	Consolidated Human Activity Database

Acronym/Abbreviation	Meaning
CHARGE	Childhood Autism Risks from Genetics and the Environment
CHD	coronary heart disease
CHE	controlled human exposure
CHF	congestive heart failure
CHIMERE	multiscale chemical transport model for atmospheric composition analysis and forecast
CHS	Children's Health Study
CI	confidence interval
cIMT	carotid intimal-medial thickness
cm	centimeter(s)
cm^2	square centimeters
cm^3	cubic centimeter(s)
CMAQ	Community Multiscale Air Quality (model)
CNBSS	Canadian National Breast Screening Study
CNS	central nervous system
CO	carbon monoxide
CO^2	carbon dioxide
COD	coefficient of divergence
COGNAC	Cognition and Air Pollution in Children
Col3a1	collagen type 3 alpha
COM	combustion
COPD	chronic obstructive pulmonary disease
COX	cyclooxygenase
COX-1	cyclooxygenase-1
COX-2	cyclooxygenase-2
CPC	condensation particle counter
CPS	Cancer Prevention Study
Cr	Koschmieder relationship
C-R	concentration-response (relationship)
CRH	corticotropin-releasing hormone
CRP	C-reactive protein
CSF	cerebrospinal fluid
CSN	Chemical Speciation Network
CTM	chemical transport model
CTS	California Teachers Study
CuZn	copper zinc
CV	coefficient of variation; cardiovascular
C-V	cross-validation
CVD	cardiovascular disease(s)
CXCR3	chemokine receptor 3
DA	diacetate
d_{ae}	aerodynamic diameter of a particle
DASH	Denver Aerosol Sources and Health
DBA	dibenz[a,h]anthracene
DBP	diastolic blood pressure
DCFH	2′,7′-dicholorfluorescein
DCH	Diet, Cancer, and Health Study
DDST	Denver Developmental Screening Test
DE	diesel exhaust
DEARS	Detroit Exposure and Aerosol Research Study
Dec	December
DEE	diesel engine exhaust
DEP	diesel exhaust particle
df	degrees of freedom
DF	deposition fraction
dg	decigram(s)
DG	dentate gyrus
dL	deciliter(s)
DL	distributed lag
DLCO	diffusing capacity of the lung for carbon monoxide
DM	diabetes mellitus
DMSO	dimethylsulfoxide
DNA	deoxyribonucleic acid
DNC	Danish Nurse Cohort
Dp	physical diameter of a particle
DTPA	diethylenetriaminepentaacetate

Acronym/Abbreviation	Meaning
DTT	dithiothreitol
dv	deciview(s)
DVT	deep vein thromboses
EC	elemental carbon
ECG	electrocardiogram
ECRHS	European Community Respiratory Health Survey
ED	emergency department
EF	ejection fraction
EFAD	early onset familial Alzheimer disease
EFFECT	Enhanced Feedback for Effective Cardiac Treatment
EGU	electricity-generating unit
ELF	epithelial lining fluid
ELITE	Early Versus Late Intervention Trial with Estradiol
eNO	exhaled nitric oxide
ENVIRONAGE	ENVIRonmental influence ON early AGEing
EOM	extracted organic material
EP	entire pregnancy
EPCs	endothelial progenitor cells
ER	endoplasmic reticulum
ERF	effective radiative forcing
ERFaci	effective radiative forcing due to aerosol-cloud interactions
ERFari	effective radiative forcing due to aerosol-radiation interactions
ERK	extracellular signal-regulated kinase
ESCAPE	European Study of Cohorts for Air Pollution Effects
ET	extrathoracic
ET-1	endothelin-1
ETA	endothelin A
EU	European Union
EURAD	European Air Pollution Dispersion
f	breathing frequency
F344	Fischer 344 rat strain
FA	filtered air; fatty acid
FBG	fasting blood glucose
Fe_2O_3	iron (III) oxide
$FEF_{25–75}$	forced expiratory flow between 25 and 75% of forced vital capacity
FEM	Federal Equivalent Method
FeNO	fractional exhaled nitric oxide
FeO	iron (II) oxide
FEV_1	forced expiratory volume in 1 second
F_{inf}	infiltration factors
FINRISK	Finland Risk
FMD	flow-mediated dilation
fmsYFP	yellow fluorescent protein
FO	fish oil
FOXp3	forkhead box P3
FPG	formamidopyrimidine DNA glycosylase
FR	*Federal Register*
FRC	functional residual capacity
FRM	Federal Reference Method
FSH	follicle stimulating hormone
FSIGT	frequently sampled intravenous glucose tolerance (test)
FSIQ	Full Scale Intelligence Quotient
FVB	Friend leukemia virus B
FVC	forced vital capacity
FXII	coagulation factor XII
g	gram(s)
GABA	gamma-aminobutryic acid
GALA	Genes-Environments and Admixture in Latino Americans
GAM	generalized additive model
GASP	Genetics and Environment: Prospective Study on Infancy in Italy
GC	gas chromatograph
GCLC	glutamate cysteine ligase catalytic subunit
GCLM	glutamate cysteine ligase modifier subunit

Acronym/Abbreviation	Meaning
GD	gestation day
GDI	gasoline direct injection
GDM	gestational diabetes mellitus
GE	gasoline exhaust
GEE	gasoline engine exhaust
GEM	gaseous elemental mercury
GEOS	Goddard Earth Observing System
GEOS-Chem	Goddard Earth Observing System with global chemical transport model
GFAP	glial fibrillary acidic protein
GGT	gamma glutamyltransferase
GI	gastrointestinal
GINI	German Infant Nutrition Intervention
GINIplus	German Infant Nutrition Intervention plus environmental and genetic influences
GIS	geographic information system
GISS	Goddard Institute for Space Studies
GLM	generalize linear model
GLuA1	glutamatergic receptor protein subunit A1
GLuA2	glutamatergic receptor protein subunit A2
GPS	global positioning system
GSD	geometric standard deviation
GSHPx	glutathione peroxidase
GSS	glutathione synthetase gene
GST	glutathione S-transferase
GSTM1	glutathione S-transferase mu 1
GSTP1	glutathion S-transferase pi 1
GTP	global temperature potential
GTT	glucose tolerance test
GWP	global warming potential
GWR	geographically weighted regression
h	hour(s)
H^+	hydrogen ion
H_2O_2	hydrogen peroxide
H_2SO_4	sulfuric acid
HA	hospital admission
HAED	hospital admission or emergency department
HAPEM	Hazardous Air Pollutant Exposure Model
HbA1c	glycated hemoglobin
HBM	Hierarchical Bayesian Model
HD-DE	high-dose diesel exhaust
HDL	high-density lipoprotein
HEI	Health Effects Institute
HEPA	high-efficiency particulate air (filter)
HERO	Health and Environmental Research Online database
HF	heart failure; high frequency domain of HRV
HFD	high fat diet
HNE	hydroxynonenal
HNO_3	nitric acid
HNR	Heinz Nixdorf Recall (study)
HO-1	heme oxidase 1
HOMA	Homeostatic Model Assessment
HOMA-IR	Homeostatic Model Assessment of Insulin Resistance
HPA	hypothalamic-pituitary-adrenal
HPFU	Health Professionals Follow-Up
HPLC	high-performance liquid chromatography
HPMEC	human pulmonary microvasculature endothelial
HR	heart rate; hazard ratio
HRS	Health and Retirement Survey
HRV	heart rate variability
HS	hemorrhagic stroke
HSC	Harvard Six Cities (study)
hs-CRP	high sensitivity C-reactive protein

Acronym/Abbreviation	Meaning
IARC	International Agency for Research on Cancer
IBA-1	ionized calcium binding adaptor molecule
IBG	impaired blood glucose
ICAM-1	intercellular adhesion molecule 1
ICD	International Classification of Disease
ICD10	International Classification of Disease version 10
ICD9	International Classification of Disease version 9
ICR	Institute of Cancer Research
ICRP	International Commission on Radiological Protection
ICS	inhaled corticosteroid
ICU	intensive care unit
IDW	inverse-distance weighting
IFN	interferon
IgE	immunoglobulin E
IgG1	immunoglobulin G1
IGM	impaired glucose metabolism
IGT	impaired glucose tolerance
IHD	ischemic heart disease
IKK	inhibitor of nuclear factor-κB kinase
IL	interleukin
IL1β	interleukin-1 beta
IL-4	interleukin-4
IL-6	interleukin-6
IMPROVE	Interagency Monitoring of Protected Visual Environments
INMA	*INfancia y Medio Ambiente*—(Environment and Childhood)
iNOS	inducible nitric oxide synthase
IO	iodine monoxide
IOM	institutes of medicine
IPCC	Intergovernmental Panel on Climate Change
IQ	intelligence quotient
IQR	interquartile range
IR	insulin resistance
IRP	Integrated Review Plan
ISA	Integrated Science Assessment
ISO	International Organization for Standardization
ITT	insulin tolerance test
IUGR	Intra-uterine growth restriction
IVF	in vitro fertilization
K	potassium
KC	keratinocyte-derived chemokine
kg	kilogram(s)
km	kilometer(s)
km^2	square kilometer(s)
KORA	*Kooperative Gesundheitsforschung in der Region Augsburg* (Cooperative Health Research in the Region of Augsburg)
LAC	light-absorbing carbon
LAVI	left atrial volume index
LBL	Lawrence Berkeley Laboratory
LBW	low birth weight
LDH	lactate dehydrogenase
LDL	low-density lipoprotein
$Ldlr^{-/-}$	low-density lipoprotein receptor null
LDSA	lung deposited surface area
LF	low frequency
LH	luteinizing hormone
LHID2000	Longitudinal Health Insurance Database for 2000
LINE-1	long interspersed nucleotide element-1
LISA	Lifestyle Factors on the Development of the Immune System and Asthma
LISAplus	Lifestyle Factors on the Development of the Immune System and Asthma plus Air Pollution and Genetics on Allergy Development

Acronym/Abbreviation	Meaning
lnSDNN	natural log of the standard deviation of all normal-to-normal intervals
LOOCV	leave-one-out cross validation
LOX	lysyl oxidase
LPR	liver-to-phantom ratio
LRI	lower respiratory infection
LRTI	lower respiratory tract infection
LTE4	leukotriene E4
LUR	land use regression
LUR-BME	land use regression—Bayesian maximum entropy
LV	left ventricular
LVDP	left ventricular developed pressure
LVMI	left ventricular mass index
m	meter(s)
m^2	square meters
m^3	cubic meters
MAAS	Manchester Asthma and Allergy Study
MAP	mean arterial pressure
max	maximum
MC	mass concentration
MCAPS	Medicare Air Pollution Study
MCDI	McArthur Communicative Development Inventory
MCI	mild cognitive impairment
MCP	monocyte chemoattractant protein
MCP-1	monocyte chemoattractant protein-1
MCT	mucoid connective tissue
MDA	malondialdehyde
MDL	method detection limit
MED-PARTICLES	particles size and composition in Mediterranean countries: geographical variability and short-term health effects
MEF	midexpiratory flow
MESA	Multi-Ethnic Study of Atherosclerosis
mg	milligram(s)
MI	myocardial infarction
MIDI	Minnesota Infant Development Inventory
min	minute(s)
MINAP	Myocardial Ischaemia National Audit Project
MIP	macrophage inflammatory protein
MISR	Multiangle Imaging Spectroradiometer
mL	milliliter(s)
MMAD	mass median aerodynamic diameter
MMD	mass median diameter
MMEF	maximum midexpiratory flow
mm Hg	millimeters of mercury
MMP	mitochondria membrane potential
MMP-9	matrix metallopeptidase 9
MMT	million metric tons
MnSOD	manganese superoxide dismutase
mo	month(s)
Mo	molybdenum
MOBILIZE	Maintenance of Balance, Independent Living, Intellect, and Zest in the Elderly
MODIS	MODerate Resolution Imaging Spectroradiometer
MOUDI	micro-orifice uniform deposit impactor
MPPD	Multi-Path Particle Dosimetry (model)
MRI	magnetic resonance imaging
mRNA	messenger ribonucleic acid
MSA	metropolitan statistical area
MSE	mean-squared error
Muc5AC	mucin 5AC, oligomeric mucus/gel-forming
MV	minute volume
MVE	motor vehicle exhaust
Na^+	sodium ion
Na_2O	sodium oxide

Acronym/Abbreviation	Meaning
NAAQS	National Ambient Air Quality Standards
NADPH	nicotinamide adenine dinucleotide phosphate hydrogen
NAEPP	National Asthma Education and Prevention Program
NAFLD	nonalcoholic fatty liver disease
NALF	nasal airway lavage fluid
NAPCA	National Air Pollution Control Administration
NAS	Normative Aging Study
NASA	National Aeronautics and Space Administration
NC	number concentration
NCLS-Air	Netherlands Cohort Study on Diet and Cancer
NCore	National Core (multipollutant monitoring network)
NC_{total}	total number concentration
ND	not detected
NECSS	National Enhanced Cancer Surveillance System
NEI	National Emissions Inventory
NFkB	nuclear factor kappa B
ng	nanogram(s)
NH_3	ammonia
NH_4	ammonium
NH_4^+	ammonium ion
NH_4NO_3	ammonium nitrate
NHANES	National Health and Nutrition Examination Survey
NHID	National Health Insurance Database
NHIS	National Health Interview Survey
NHLBI	National Heart, Lung, and Blood Institute
NHS	Nurses' Health Study
NIH	National Institutes of Health
NIH-AARP	National Institutes of Health—American Association of Retired Persons (diet and health cohort)
NIST	National Institute of Standards and Technology
NLCS	Netherlands Cohort Study on Diet and Cancer
nm	nanometer(s)
NMBF	normalized mean bias factor
NME	normalized mean error
NMMAPS	National Morbidity, Mortality, and Air Pollution Study
NMSE	normalized mean squared error
NO	nitric oxide
NO_2	nitrogen dioxide
NO_3^-	nitrate
NO_X	oxides of nitrogen ($NO + NO_2$)
$NOX2^{-/-}$	NADPH oxidase 2 null
NPACT	National Particle Component Toxicity Initiative
NPF	new particle formation
NQO1	NADPH-quinone oxidoreductase 1
NR	not reported
NR-DE	nanoparticle rich diesel exhaust
Nrf2	nuclear factor erythroid 2-related factor
NRPB	National Radiological Protection Board
NTP	nitroprusside
O_2	oxygen gas
O_3	ozone
OAQPS	Office of Air Quality Planning and Standards
OC	organic carbon
OCM	organic carbon matter
oGTT	oral glucose tolerance test
OH	hydroxide
OHCA	out-of-hospital cardiac arrest
OM	organic matter
OO	olive oil
OP	oxidative potential
OR	odds ratio
OTH	other primary sources

Acronym/Abbreviation	Meaning
OVA	ovalbumin
oxoG	oxoguanine
p	probability value
PACF	partial autocorrelation function
PAGE	Parkinson's Genes and Environment (study)
PAH	polycyclic aromatic hydrocarbon(s)
PAI-1	plasminogen activator inhibitor 1
PAPC	1-palmitoyl-2-arachidonoyl-sn-phosphatidylcholine
PARP1	poly (ADP-ribose) polymerase-1
Pb	lead
PBAP	primary biological aerosol particle
PBR	peripheral-type benzodiazepine receptor
PD	Parkinson's disease
PE	phenylephrine; postexposure; pulmonary embolism
PEF	peak expiratory flow
PEFR	peak expiratory flow rate
Penh	enhanced pause
PFI	port fuel injection
PI	posterior interval
PI3K	phosphoinositide 3-kinases
PIAMA	Prevention and Incidence of Asthma and Mite Allergy
PM	particulate matter
PM_{10}	particulate matter with a nominal mean aerodynamic diameter less than or equal to 10 μm.[1]
$PM_{10-2.5}$	particulate matter with a nominal mean aerodynamic diameter greater than 2.5 μm and less than or equal to 10 μm.[2]
$PM_{2.5}$	particulate matter with a nominal mean aerodynamic diameter less than or equal to 2.5 μm.[3]
PM25abs	$PM_{2.5}$ light absorption coefficient
PMF	positive matrix factorization
PMN	polymorphonuclear leukocyte
PN	particle number
PNC	particle number count
PND	postnatal day
pNN50	mean number of times per hour in which change in consecutive normal sinus (NN) intervals exceeds 50 milliseconds
POA	primary organic aerosol (PM from fossil fuel and biofuel)
POC	primary organic carbon
POM	particulate organic matter
PP	pulse pressure

[1] A measurement of thoracic particles (i.e., that subset of inhalable particles thought small enough to penetrate beyond the larynx into the thoracic region of the respiratory tract). In regulatory terms, particles with an upper 50% cut-point of 10 ± 0.5 μm aerodynamic diameter (the 50% cut point diameter is the diameter at which the sampler collects 50% of the particles and rejects 50% of the particles) and a penetration curve as measured by a reference method based on Appendix J of 40 CFR Part 50 and designated in accordance with 40 CFR Part 53 or by an equivalent method designated in accordance with 40 CFR Part 53.

[2] A measurement of thoracic coarse particulate matter or the coarse fraction of PM_{10}. In regulatory terms, particles with an upper 50% cut-point of 10 μm aerodynamic diameter and a lower 50% cut-point of 2.5 μm aerodynamic diameter (the 50% cut point diameter is the diameter at which the sampler collects 50% of the particles and rejects 50% of the particles) as measured by a reference method based on Appendix O of 40 CFR Part 50 and designated in accordance with 40 CFR Part 53 or by an equivalent method designated in accordance with 40 CFR Part 53.

[3] A measurement of fine particles. In regulatory terms, particles with an upper 50% cut-point of 2.5 μm aerodynamic diameter (the 50% cut point diameter is the diameter at which the sampler collects 50% of the particles and rejects 50% of the particles) and a penetration curve as measured by a reference method based on Appendix L of 40 CFR Part 50 and designated in accordance with 40 CFR Part 53, by an equivalent method designated in accordance with 40 CFR Part 53, or by an approved regional method designated in accordance with Appendix C of 40 CFR Part 58.

Acronym/Abbreviation	Meaning
ppb	parts per billion
ppm	parts per million
PR	time interval between the beginning of the P wave to the peak of the R wave
PROM	premature rupture of membranes
PSD	postsynaptic density protein
PSD-95	postsynaptic density protein 95
PTB	preterm birth
PU	pulmonary
PVD	peripheral vascular disease
PWV	pulse wave velocity
Q	flow
QRS	time interval between the beginning of the Q wave and the peak of the S wave
QT	time interval between from beginning of the Q wave to end of the T wave
QTc	corrected QT interval
r	correlation coefficient
R^2	coefficient of determination
RAS	renin-angiotensin system
RCT	randomized control trial
redox	reduction-oxidation
REGARDS	REasons for Geographic and Racial Differences in Stroke
REGICOR	*Registre Gironí del Cor* (Girona Heart Registry)
REM-Calgrid	Regional Eulerian Model—California Grid Model
RESPIRA	Italian acronym for *Rischio ESPosizione Inquinamento aRia Atmosferica* study
REVEAL-HBV	Risk Evaluation of Viral Load Elevation and Associated Liver Disease/Cancer-Hepatitis B Virus
RF	radiative forcing
RFaci	radiative forcing due to aerosol-cloud interactions
RFari	radiative forcing due to aerosol-radiation interactions
RH	relative humidity
RHI	Reactive Hyperemia Index
RIOPA	Relationship among Indoor, Outdoor, and Personal Air
RMSE	root-mean-squared error
RNA	ribonucleic acid
RoLS	Rome Longitudinal Study
ROS	reactive oxygen species
RR	relative risk; rate ratio; risk ratio
RS	remote sensing
RSV	respiratory syncytial virus
RTp	time interval between the beginning of R wave and peak of the T wave
RTP	Research Triangle Park
RVM	Right Ventricular Mass
s	second(s)
SAGE	Study of Asthma, Genes, and the Environment
SALIA	Study on the influence of Air pollution on Lung function, Inflammation, and Aging; Study on the Influence of Air Pollution on the Lung
SAPALDIA	Swiss study on Air Pollution and Lung Diseases in Adults
SBP	systolic blood pressure
SC	surface area concentration
SCQ	social communication questionnaire
SD	standard deviation
S-D	Sprague-Dawley
SDNN	standard deviation of normal-to-normal intervals
SE	standard error
SEARCH	Southeastern Aerosol Research and Characterization
SEM	standard error of the mean
SES	socioeconononomic status; sample equilibration system
SETIL	population-based CC study of childhood cancer in Italy
SGA	small for gestational age

Acronym/Abbreviation	Meaning
SH	spontaneously hypertensive
SHEDS	Stochastic Human Exposure and Dose Simulation (model)
SHR	spontaneously hypertensive rats
SHS	second-hand smoke
sICAM	soluble intercellular adhesion molecule 1
SIDS	sudden infant death syndrome
SiO_2	silica
SIS	six item screener
SLAMS	State and Local Air Monitoring Stations
SMPS	scanning mobility particle sizer
SNP	sodium nitroprusside
SNPs	single nucleotide polymorphisms
SNS	sympathetic nervous system
SO_2	sulfur dioxide
SO_4	sulfate
SO_4^{2-}	sulfate
SOA	secondary organic aerosol
SOC	secondary organic carbon
SOD	superoxide dismutase
SOPHIA	Study of Particles and Health in Atlanta
SO_X	sulfur oxides
SPMSQ	Short Portable Mental Status Questionnaire
SR-B1	scavenger receptor-B1
SRM	standard reference material
SRS	Social Responsiveness Scale
StAR	steroidogenic acute regulatory
STEMI	ST segment elevation myocardial infarction
sTNF	soluble tumor necrosis factor
sVCAM-1	soluble vascular cell adhesion molecule-1
SVE	supraventricular ectopy
T1D	type 1 diabetes
T2D	type 2 diabetes
TAG	Traffic, Asthma, and Genetics (study)
TAPES	Taipei Air Pollution Exposure System for Health Effects
TB	tracheobronchial
TBARS	thiobarbituric acid reactive substances
TC	total carbon
TCHS	Taiwan Children's Health Study
TEOM	tapered element oscillating microbalance
TF	tissue factor
Tg	teragram(s)
TG	triglyceride
TGF	transforming growth factor
Th1	T helper type 1
Th17	T helper type 17
Th2	T helper type 2
Ti	titanium
TIA	transient ischemic attack
TICS	Telephone Interview of Cognitive Status
TiO_2	titanium dioxide
TLR	toll-like receptor
TLR4	toll-like receptor 4
TNF	tumor necrosis factor
TOA	top of the atmosphere
tPA	tissue plasminogen activator

PREFACE

The Preface to the Integrated Science Assessment for Particulate Matter (PM ISA) outlines the legislative requirements of a National Ambient Air Quality Standard (NAAQS) review and the history of the PM NAAQS. This information provides an understanding of the function of the ISA, and in terms of providing a starting point for this PM ISA, presents the basis for the decisions that supported the previous PM NAAQS review. In addition, the Preface details the purpose of the ISA as well as specific issues pertinent to evaluating the scientific evidence within this ISA, including the scope of the ISA and discipline-specific decisions that governed parts of the review.

P.1. Legislative Requirements for the Review of the National Ambient Air Quality Standards

Two sections of the Clean Air Act (CAA) govern the establishment, review, and revision of the National Ambient Air Quality Standards (NAAQS). Section 108 [42 U.S. Code (U.S.C.) 7408] directs the Administrator to identify and list certain air pollutants and then to issue air quality criteria for those pollutants. The Administrator is to list those air pollutants that in their "judgment, cause or contribute to air pollution which may reasonably be anticipated to endanger public health or welfare," "the presence of which in the ambient air results from numerous or diverse mobile or stationary sources," and "for which …[the Administrator] plans to issue air quality criteria…" [42 U.S.C. 7408(a)(1) (CAA, 1990a)]. Air quality criteria are intended to "accurately reflect the latest scientific knowledge useful in indicating the kind and extent of all identifiable effects on public health or welfare, which may be expected from the presence of [a] pollutant in the ambient air…" [42 U.S.C. 7408(b)]. Section 109 [42 U.S.C. 7409 (CAA, 1990b)] directs the Administrator to propose and promulgate "primary" and "secondary" NAAQS for pollutants for which air quality criteria are issued. Section 109(b)(1) defines a primary standard as one "the attainment and maintenance of which in the judgment of the Administrator, based on such criteria and allowing an adequate margin of safety, are requisite to protect the public health."[4] A secondary standard, as defined in Section 109(b)(2), must "specify a level of air quality the attainment and maintenance of which, in the judgment of the Administrator, based on such criteria, is requisite to protect

[4] The legislative history of Section 109 indicates that a primary standard is to be set at "…the maximum permissible ambient air level…which will protect the health of any [sensitive] group of the population," and that for this purpose "reference should be made to a representative sample of persons comprising the sensitive group rather than to a single person in such a group" S. Rep. No. 91:1196, 91st Cong., 2d Sess. 10 (1970).

the public welfare from any known or anticipated adverse effects associated with the presence of [the] air pollutant in the ambient air."[5]

The requirement that primary standards provide an adequate margin of safety was intended to address uncertainties associated with inconclusive scientific and technical information available at the time of standard setting. It was also intended to provide a reasonable degree of protection against hazards that research has not yet identified.[6] Both kinds of uncertainty are components of the risk associated with pollution at levels below those at which human health effects can be said to occur with reasonable scientific certainty. Thus, in selecting primary standards that provide an adequate margin of safety, the Administrator is seeking not only to prevent pollution levels that have been demonstrated to be harmful but also to prevent lower pollutant levels that may pose an unacceptable risk of harm, even if the risk is not precisely identified as to nature or degree. The CAA does not require the Administrator to establish a primary NAAQS at a zero-risk level or at background concentration levels, but rather at a level that reduces risk sufficiently so as to protect public health with an adequate margin of safety.[7] In so doing, protection is provided for both the population as a whole and those groups and lifestages potentially at increased risk for health effects from exposure to the air pollutant for which each NAAQS is set.

In addressing the requirement for an adequate margin of safety, the U.S. Environmental Protection Agency (U.S. EPA) considers such factors as the nature and severity of the health effects involved, the size of the sensitive group(s), and the kind and degree of the uncertainties. The selection of any particular approach to providing an adequate margin of safety is a policy choice left specifically to the Administrator's judgment.[8]

In setting standards that are "requisite" to protect public health and welfare as provided in Section 109(b), the U.S. EPA's task is to establish standards that are neither more nor less stringent than necessary for these purposes. In so doing, the U.S. EPA may not consider the costs of implementing the standards.[9] Likewise, "[a]ttainability and technological feasibility are not relevant considerations in the promulgation of national ambient air quality standards."[10]

Section 109(d)(1) requires that "not later than December 31, 1980, and at 5-year intervals thereafter, the Administrator shall complete a thorough review of the criteria published under Section 108

---

[5] Section 302(h) of the Act [42 U.S.C. 7602(h)] provides that all language referring to effects on welfare includes, but is not limited to, "effects on soils, water, crops, vegetation, man-made materials, animals, wildlife, weather, visibility and climate, damage to and deterioration of property, and hazards to transportation, as well as effects on economic values and on personal comfort and well-being…" (CAA, 2005).

and the national ambient air quality standards…and shall make such revisions in such criteria and standards and promulgate such new standards as may be appropriate….” Section 109(d)(2) requires that an independent scientific review committee “shall complete a review of the criteria…and the national primary and secondary ambient air quality standards…and shall recommend to the Administrator any new…standards and revisions of existing criteria and standards as may be appropriate….” Since the early 1980s, this independent review function has been performed by the Clean Air Scientific Advisory Committee (CASAC).[11]

P.1.1. Overview and History of the Reviews of the Primary and Secondary National Ambient Air Quality Standard for Particulate Matter

NAAQS are defined by four basic elements: indicator, averaging time, level, and form. The indicator defines the pollutant to be measured in the ambient air for the purpose of determining compliance with the standard. The averaging time defines the time period over which air quality measurements are to be obtained and averaged or cumulated, considering evidence of effects associated with various time periods of exposure. The level of a standard defines the air quality concentration used (i.e., an ambient concentration of the indicator pollutant) in determining whether the standard is achieved. The form of the standard defines the air quality statistic that is compared with the level of the standard in determining whether an area attains the standard. For example, the form of the current primary annual fine particulate matter ($PM_{2.5}$) standard is the annual mean averaged over 3 years. The Administrator considers these four elements collectively in evaluating the protection to public health provided by the primary NAAQS.

Particulate matter (PM) is the generic term for a broad class of chemically and physically diverse substances that exist as discrete particles (liquid droplets or solids) over a wide range of sizes. Particles originate from a variety of anthropogenic stationary and mobile sources, as well as from natural sources. Particles may be emitted directly or formed in the atmosphere by transformations of gaseous emissions such as sulfur oxides (SO_X), oxides of nitrogen (NO_X), ammonia (NH_3) and volatile organic compounds (VOCs). Examples of secondary particle formation include: (1) the conversion of SO_2 to sulfuric acid (H_2SO_4) vapor that nucleates new particles or condenses on existing particles and further reacts with NH_3 to form various inorganic salts (e.g., ammonium sulfate, $[NH_4]_2SO_4$, or ammonium bisulfate, NH_4HSO_4); (2) the conversion of nitrogen dioxide (NO_2) to nitric acid (HNO_3) vapor that condenses onto existing particles and reacts further with ammonia to form ammonium nitrate (NH_4NO_3); and (3) reactions involving gaseous VOCs yielding organic compounds with low vapor pressures that nucleate or condense on existing particles to form secondary organic particulate matter [SOPM; U.S. EPA (2004)]. The chemical and physical properties of PM vary greatly with time, region, meteorology, and source category,

[11] Additional information on CASAC is available at: https://yosemite.epa.gov/sab/sabpeople.nsf/WebCommittees/CASAC.

thus complicating the assessment of health and welfare effects. These reviews are briefly described below, and further details are provided in the Integrated Review Plan (U.S. EPA, 2016).

The U.S. EPA first established NAAQS for PM in 1971 (36 FR 8186, April 30, 1971), based on the original criteria document (NAPCA, 1969).[12] The Federal Reference Method (FRM) specified for determining attainment of the original standards was the high-volume sampler, which collects PM up to a nominal size of 25 to 45 micrometers (μm; referred to as total suspended particulates or TSP). The primary standards were at 260 μg/m^3, 24-hour avg, not to be exceeded more than once per year, and 75 μg/m^3, annual geometric mean. The secondary standards were 150 μg/m^3, 24-hour avg, not to be exceeded more than once per year, and 60 μg/m^3, annual geometric mean. Since then, the Agency has completed multiple reviews of the air quality criteria and standards, as summarized in Table P-1.

Table P-1 History of the National Ambient Air Quality Standards (NAAQS) for particulate matter, 1971−2012.

Final Rule/Decision	Indicator	Averaging Time	Level (μg/m^3)	Form
1971 36 FR 8186 April 30, 1971	TSP	24 h	260 (primary) 150 (secondary)	Not to be exceeded more than once per year
		Annual	75 (primary) 60 (secondary)	Annual geometric mean
1987 52 FR 24634 July 1, 1987	PM_{10}	24 h	150	Not to be exceeded more than once per year on average over a 3-yr period
		Annual	50	Annual arithmetic mean, averaged over 3 yr
1997 62 FR 38652 July 18, 1997	$PM_{2.5}$	24 h	65	98th percentile, averaged over 3 yr
		Annual	15	Annual arithmetic mean, averaged over 3 yr[a]
	PM_{10}	24 h	150	Initially promulgated 99th percentile, averaged over 3 yr; when 1997 standards were vacated in 1999, the form of 1987 standards remained in place (not to be exceeded more than once per yr on average over a 3-yr period)
		Annual	50	Annual arithmetic mean, averaged over 3 yr

[12] Prior to the review initiated in 2007 (see below), the AQCD provided the scientific basis for the NAAQS.

Table P-1 (Continued): History of the National Ambient Air Quality Standards (NAAQS) for particulate matter, 1971−2012.

Final Rule/Decision	Indicator	Averaging Time	Level (μg/m^3)	Form
2006 71 FR 61144 October 17, 2006	$PM_{2.5}$	24 h	35	98th percentile, averaged over 3 yr
		Annual	15	Annual arithmetic mean, averaged over 3 yr[a]
	PM_{10}	24 h	150	Not to be exceeded more than once per year on average over a 3-yr period
2012 78 FR 3085 January 15, 2013	$PM_{2.5}$	24 h	35	98th percentile, averaged over 3-yr[b]
		Annual	12 (primary) 15 (secondary)	Annual arithmetic mean, averaged over 3-yr[c]
	PM_{10}[d]	24 h	150	Not to be exceeded more than once per year on average over 3-yr

FR = *Federal Register*; h = hour; μg/m^3 = micrograms per cubic meter; PM = particulate matter; $PM_{2.5}$ = particulate matter with a nominal mean aerodynamic diameter less than or equal to 2.5 μm; PM_{10} = particulate matter with a nominal mean aerodynamic diameter less than or equal to 10 μm; TSP = total suspended particles; yr = year.

Note: When not specified, primary and secondary standards are identical.

[a]The level of the 1997 annual $PM_{2.5}$ standard was to be compared with measurements made at the community-oriented monitoring site recording the highest level, or, if specific constraints were met, measurements from multiple community-oriented monitoring sites could be averaged ("spatial averaging"). This approach was judged to be consistent with the short-term exposure epidemiologic studies on which the annual $PM_{2.5}$ standard was primarily based, in which air quality data were generally averaged across multiple monitors in an area or were taken from a single monitor that was selected to represent community-wide exposures, not localized "hot spots" (62 FR 38672). These criteria and constraints were intended to ensure that spatial averaging would not result in inequities in the level of protection afforded by the $PM_{2.5}$ standards. Community-oriented monitoring sites were specified to be consistent with the intent that a spatially averaged annual standard provide protection for persons living in smaller communities, as well as those in larger population centers.

[b]The level of the 24-h standard is defined as an integer (zero decimal places) as determined by rounding. For example, a 3-yr avg 98th percentile concentration of 35.49 μg/m^3 would round to 35 μg/m^3 and thus meet the 24-h standard and a 3-yr avg of 35.50 μg/m^3 would round to 36 and, hence, violate the 24-h standard (40 Code of Federal Regulations Part 50 Appendix N).

[c]In the revisions to the PM NAAQS finalized in 2006, U.S. EPA tightened the constraints on the spatial averaging criteria by further limiting the conditions under which some areas may average measurements from multiple community-oriented monitors to determine compliance (71 FR 61165-61167, October 17, 2006).

[d]The U.S. EPA revoked the annual PM_{10} NAAQS in 2006.

In October 1979 (44 FR 56730, October 2, 1979), the U.S. EPA announced the first periodic review of the air quality criteria and NAAQS for PM. Revised primary and secondary standards were promulgated in 1987 (52 FR 24634, July 1, 1987). In the 1987 decision, the U.S. EPA changed the indicator for particles from TSP to PM_{10}, in order to focus on the subset of inhalable particles small enough to penetrate to the thoracic region of the respiratory tract (including the tracheobronchial and alveolar regions), referred to as thoracic particles.[13] The level of the 24-hour standards (primary and secondary) was set at 150 μg/m^3, and the form was one expected exceedance per year, on average over

[13] PM_{10} refers to particles with a nominal mean aerodynamic diameter less than or equal to 10 μm. More specifically, 10 μm is the aerodynamic diameter for which the efficiency of particle collection is 50%. Larger particles are not excluded altogether but are collected with substantially decreasing efficiency while smaller particles are collected with increasing efficiency.

3 years. The level of the annual standards (primary and secondary) was set at 50 μg/m^3, and the form was annual arithmetic mean, averaged over 3 years.

In April 1994, the U.S. EPA announced its plans for the second periodic review of the air quality criteria and NAAQS for PM, and in 1997 the U.S. EPA promulgated revisions to the NAAQS (62 FR 38652, July 18, 1997). In the 1997 decision, the U.S. EPA determined that the fine and coarse fractions of PM_{10} should be considered separately. This determination was based on evidence that serious health effects were associated with short- and long-term exposures to fine particles in areas that met the existing PM_{10} standards. The U.S. EPA added new standards, using $PM_{2.5}$ as the indicator for fine particles (with $PM_{2.5}$ referring to particles with a nominal mean aerodynamic diameter less than or equal to 2.5 μm). These new standards were as follows: (1) an annual standard with a level of 15.0 μg/m^3, based on the 3-year avg of annual arithmetic mean $PM_{2.5}$ concentrations from single or multiple community-oriented monitors[14] and (2) a 24-hour standard with a level of 65 μg/m^3, based on the 3-year avg of the 98th percentile of 24-hour $PM_{2.5}$ concentrations at each monitor within an area. Also, the U.S. EPA established a new reference method for measuring $PM_{2.5}$ in the ambient air and adopted rules for determining attainment of the new standards. To continue to address the coarse fraction of PM_{10} (referred to as thoracic coarse particles or $PM_{10–2.5}$; generally including particles with a nominal mean aerodynamic diameter greater than 2.5 μm and less than or equal to 10 μm), the U.S. EPA retained the annual PM_{10} standard and revised the form of the 24-hour PM_{10} standard to be based on the 99th percentile of 24-hour PM_{10} concentrations at each monitor in an area. The U.S. EPA revised the secondary standards by setting them equal in all respects to the primary standards.

Following promulgation of the 1997 PM NAAQS, petitions for review were filed by a large number of parties, addressing a broad range of issues. In May 1999, the U.S. Court of Appeals for the District of Columbia Circuit (D.C. Circuit) upheld the U.S. EPA's decision to establish fine particle standards, holding that "the growing empirical evidence demonstrating a relationship between fine particle pollution and adverse health effects amply justifies establishment of new fine particle standards.[15]" The D.C. Circuit also found "ample support" for the U.S. EPA's decision to regulate coarse particle pollution, but vacated the 1997 PM_{10} standards, concluding that the U.S. EPA had not provided a reasonable explanation justifying use of PM_{10} as an indicator for coarse particles. Pursuant to the D.C. Circuit's decision, the U.S. EPA removed the vacated 1997 PM_{10} standards, and the pre-existing 1987 PM_{10} standards remained in place (65 FR 80776, December 22, 2000). The D.C. Circuit also upheld the

[14] The level of the 1997 annual $PM_{2.5}$ standard was to be compared with measurements made at the community-oriented monitoring site recording the highest concentration or, if specific constraints were met, measurements from multiple community-oriented monitoring sites could be averaged (i.e., "spatial averaging"). In the last review (completed in 2012) the U.S. EPA replaced the term "community-oriented" monitor with the term "area-wide" monitor. Area-wide monitors are those sited at the neighborhood scale or larger, as well as those monitors sited at micro- or middle scales that are representative of many such locations in the same CBSA (78 FR 3236, January 15, 2013).

[15] *American Trucking Associations v. U.S. EPA*, 175 F. 3d 1027, 1055−56 (D.C. Cir. 1999).

U.S. EPA's determination not to establish more stringent secondary standards for fine particles to address effects on visibility.

The D.C. Circuit also addressed more general issues related to the NAAQS, including issues related to the consideration of costs in setting NAAQS and the U.S. EPA's approach to establishing the levels of NAAQS. Regarding the cost issue, the court reaffirmed prior rulings holding that in setting NAAQS the U.S. EPA is "not permitted to consider the cost of implementing those standards." Regarding the levels of NAAQS, the court held that the U.S. EPA's approach to establishing the level of the standards in 1997 (i.e., both for PM and for the ozone NAAQS promulgated on the same day) effected "an unconstitutional delegation of legislative authority." Although the court stated that "the factors U.S. EPA uses in determining the degree of public health concern associated with different levels of ozone and PM are reasonable," it remanded the rule to the U.S. EPA, stating that when the U.S. EPA considers these factors for potential non-threshold pollutants "what U.S. EPA lacks is any determinate criterion for drawing lines" to determine where the standards should be set.

The D.C. Circuit's holding on the cost and constitutional issues were appealed to the U.S. Supreme Court. In February 2001, the Supreme Court issued a unanimous decision upholding the U.S. EPA's position on both the cost and constitutional issues.[16] On the constitutional issue, the Court held that the statutory requirement that NAAQS be "requisite" to protect public health with an adequate margin of safety sufficiently guided the U.S. EPA's discretion, affirming the U.S. EPA's approach of setting standards that are neither more nor less stringent than necessary.[17]

In October 1997, the U.S. EPA published its plans for the third periodic review of the air quality criteria and NAAQS for PM (62 FR 55201, October 23, 1997). After the CASAC and public review of several drafts, the U.S. EPA's NCEA finalized the Air Quality Criteria Document (AQCD) in October 2004 (U.S. EPA, 2004). The U.S. EPA's OAQPS finalized a Risk Assessment and Staff Paper in December of 2005 (Abt, 2005; U.S. EPA, 2005).[18] On December 20, 2005, the U.S. EPA announced its proposed decision to revise the NAAQS for PM, and solicited comment on a broad range of options (71 FR 2620, January 17, 2006). On September 21, 2006, the U.S. EPA announced its final decisions to revise the primary and secondary NAAQS for PM to provide increased protection of public health and welfare, respectively (71 FR 61144, October 17, 2006). With regard to the primary and secondary standards for fine particles, the U.S. EPA revised the level of the 24-hour $PM_{2.5}$ standards to 35 $\mu g/m^3$, retained the level of the annual $PM_{2.5}$ standards at 15.0 $\mu g/m^3$, and revised the form of the annual $PM_{2.5}$

[16] *Whitman v. American Trucking Associations*, 531 U.S. 457, 464, 475−76.

[17] The Supreme Court remanded the case to the Court of Appeals for resolution of any remaining issues that had not been addressed in that court's earlier rulings. Id. at 475−76. In a March 2002 decision, the Court of Appeals rejected all remaining challenges to the standards, holding that the U.S. EPA's $PM_{2.5}$ standards were reasonably supported by the administrative record and were not "arbitrary and capricious" *American Trucking Associations v. EPA*, 283 F. 3d 355, 369-72 (D.C. Cir. 2002).

[18] Prior to the review initiated in 2007, the Staff Paper, rather than the PA, presented the U.S. EPA staff's considerations and conclusions regarding the adequacy of existing NAAQS and, when appropriate, the potential alternative standards that could be supported by the evidence and information.

standards by narrowing the constraints on the optional use of spatial averaging. For the primary and secondary standards for PM_{10}, the U.S. EPA retained the 24-hour standards, with levels at 150 $\mu g/m^3$, and revoked the annual standards.[19] The Administrator judged that the available evidence generally did not suggest a link between long-term exposure to existing ambient levels of coarse particles and health or welfare effects. In addition, a new reference method was added for measuring $PM_{10-2.5}$ in the ambient air to provide a basis for approving Federal Equivalent Methods (FEMs) and to promote the gathering of scientific data to support future reviews of the PM NAAQS.

Several parties filed petitions for review following promulgation of the revised PM NAAQS in 2006. These petitions addressed the following issues: (1) selecting the level of the primary annual $PM_{2.5}$ standard; (2) retaining PM_{10} as the indicator of a standard for thoracic coarse particles, retaining the level and form of the 24-hour PM_{10} standard, and revoking the PM_{10} annual standard; and (3) setting the secondary $PM_{2.5}$ standards identical to the primary standards. On February 24, 2009, the U.S. Court of Appeals for the District of Columbia Circuit issued its opinion in the case American Farm Bureau Federation v. U.S. EPA. The court remanded the primary annual $PM_{2.5}$ NAAQS to U.S. EPA because U.S. EPA failed to adequately explain why the standards provided the requisite protection from both short- and long-term exposures to fine particles, including protection for at-risk populations.[20] Regarding the standards for PM_{10}, the court upheld U.S. EPA's decisions to retain the 24-hour PM_{10} standard to provide protection from thoracic coarse particle exposures and to revoke the annual PM_{10} standard. For the secondary $PM_{2.5}$ standards, the court remanded the standards to U.S. EPA because the Agency failed to adequately explain why setting the secondary PM standards identical to the primary standards provided the required protection for public welfare, including protection from visibility impairment. The U.S. EPA responded to the court's remands as part of the next review of the PM NAAQS, which was initiated in 2007 (discussed below).

In June 2007, the U.S. EPA initiated the fourth periodic review of the air quality criteria and the PM NAAQS by issuing a call for information in the *Federal Register* (72 FR 35462, June 28, 2007). Based on the NAAQS review process, as revised in 2008 and again in 2009,[21] the U.S. EPA held science/policy issue workshops on the primary and secondary PM NAAQS (72 FR 34003, June 20, 2007; 72 FR 34005, June 20, 2007), and prepared and released the planning and assessment documents that comprise the review process [i.e., IRP (U.S. EPA, 2008), ISA (U.S. EPA, 2009a)], REA planning

[19] In the 2006 proposal, the U.S. EPA proposed to revise the 24-hour PM_{10} standard in part by establishing a new $PM_{10-2.5}$ indicator for thoracic coarse particles (i.e., particles generally between 2.5 and 10 μm in diameter). The U.S. EPA proposed to include any ambient mix of $PM_{10-2.5}$ that was dominated by resuspended dust from high-density traffic on paved roads and by PM from industrial sources and construction sources. The U.S. EPA proposed to exclude any ambient mix of $PM_{10-2.5}$ that was dominated by rural windblown dust and soils and by PM generated from agricultural and mining sources. In the final decision, the existing PM_{10} standard was retained, in part due to an "inability…to effectively and precisely identify which ambient mixes are included in the [$PM_{10-2.5}$] indicator and which are not" (71 FR 61197, October 17, 2006).

[20] *American Farm Bureau Federation v. U.S. EPA*, 559 F. 3d 512, 520−27 (D.C. Cir. 2009).

[21] The history of the NAAQS review process, including revisions to the process, is discussed at https://www.epa.gov/naaqs.

documents for health and welfare (Office of Air and Radiation, 2009; U.S. EPA, 2009b), a quantitative health risk assessment (U.S. EPA, 2010b)[22] and an urban-focused visibility assessment (U.S. EPA, 2010a),[23] and PA (U.S. EPA, 2011)]. In June 2012, the U.S. EPA announced its proposed decision to revise the NAAQS for PM (77 FR 38890, June 29, 2012).

In December 2012, the U.S. EPA announced its final decisions to revise the primary NAAQS for PM to provide increased protection of public health (78 FR 3086, January 15, 2013). Regarding primary standards for $PM_{2.5}$, the U.S. EPA revised the level of the annual $PM_{2.5}$ standard[24] to 12.0 $\mu g/m^3$ and retained the 24-hour $PM_{2.5}$ standard, with its level of 35 $\mu g/m^3$. For the primary PM_{10} standard, the U.S. EPA retained the 24-hour standard, with its level of 150 $\mu g/m^3$, to continue to provide protection against effects associated with short-term exposure to thoracic coarse particles (i.e., $PM_{10-2.5}$). Regarding the secondary PM standards, the U.S. EPA generally retained the 24-hour and annual $PM_{2.5}$ standards[25] and the 24-hour PM_{10} standard to address visibility and nonvisibility welfare effects. On judicial review, the revised standards were upheld in all respects.[26]

P.2. Purpose and Overview of the Integrated Science Assessment

The Integrated Science Assessment (ISA) is a comprehensive evaluation and synthesis of the policy-relevant science "useful in indicating the kind and extent of identifiable effects on public health or welfare which may be expected from the presence of [a] pollutant in ambient air," as described in Section 108 of the Clean Air Act (CAA, 1990a). This ISA communicates critical science judgments of the health and welfare criteria for particulate matter (PM), and serves as the scientific foundation for the review of the current primary (health-based) and secondary (welfare-based) National Ambient Air Quality Standards (NAAQS) for PM. For evaluating the welfare-based evidence, the PM ISA focuses specifically on the nonecological effects of PM (i.e., visibility, materials effects, and climate) because the ecological effects are assessed in the ISA for Oxides of Nitrogen, Oxides of Sulfur, and Particulate Matter—Ecological Criteria as a result of these criteria pollutants being interrelated through complex

[22] The quantitative assessment of health risks conducted in the last review was presented in the Quantitative Health Risk Assessment for Particulate Matter (U.S. EPA, 2010b). In the current review, quantitative assessments for health-related exposures and risks, if warranted, would be presented in the Health Risk and Exposure Assessment (HREA). For consistency with the documents developed under the current NAAQS process, the Quantitative Health Risk Assessment for Particulate Matter (U.S. EPA, 2010b) from the last review will be referenced in this document as the 2010 HREA.

[23] The quantitative assessment of welfare effects conducted in the last review was presented, in part, in the Urban-Focused Visibility Assessment (U.S. EPA, 2010a). In the current review, quantitative assessments for welfare effects, if warranted, would be presented in the Welfare Risk and Exposure Assessment (WREA). The Urban-Focused Visibility Assessment (U.S. EPA, 2010a) from the last review will be referenced in this document as the 2010 UFVA.

[24] The U.S. EPA also eliminated the option for spatial averaging.

[25] Consistent with the primary standard, the U.S. EPA eliminated the option for spatial averaging with the annual standard.

[26] *NAM v U.S. EPA*, 750 F.3d 921 (D.C. Cir. 2014).

chemical and physical atmospheric processes and all contributing to nitrogen (N) and sulfur (S) deposition (U.S. EPA, 2016). While the focus of the evaluation of the visibility and climate evidence is on PM, for materials effects, as detailed in the Integrated Review Plan (IRP), the PM ISA summarizes soiling and deterioration of materials attributable to PM and related N and S components because of the difficulty associated with isolating the effects of gaseous and particulate N and S dry and wet deposition and because the ISA for Oxides of Nitrogen, Oxides of Sulfur, and Particulate Matter—Ecological Criteria focuses only on ecological effects (U.S. EPA, 2016).

This ISA evaluates relevant scientific literature published since the 2009 PM ISA (U.S. EPA, 2009a), integrating key information and judgments contained in the 2009 PM ISA and previous assessments of PM, i.e., 2004 AQCD for PM (U.S. EPA, 2004), 1996 AQCD for PM (U.S. EPA, 1996), 1982 AQCD for PM and Sulfur Oxides (U.S. EPA, 1982) and its Addendum (U.S. EPA, 1986), and the 1969 AQCD for PM (NAPCA, 1969). Thus, this ISA updates the state of the science that was available for the 2009 PM ISA, which informed decisions on the primary and secondary PM NAAQS in the review completed in 2012. In 2012, the U.S. EPA lowered the annual $PM_{2.5}$ standard to a mean of 12 $\mu g/m^3$, which is based on the annual mean averaged over 3 years, while retaining the 24-hour $PM_{2.5}$ standard of 35 $\mu g/m^3$, which is based on the 98th percentile averaged over 3 years (78 FR 3086). As part of the primary annual $PM_{2.5}$ standard, the U.S. EPA eliminated the spatial averaging provision to avoid disproportionate impacts on susceptible populations (i.e., populations potentially at increased risk of a PM-related health effect). The $PM_{2.5}$ standards are meant to provide increased protection for children, older adults, and people with pre-existing heart and lung disease as well as other potentially susceptible populations against an array of $PM_{2.5}$-related health effects, including premature mortality, increased hospital admissions and emergency department (ED) visits, and the development of chronic respiratory disease. Additionally, the U.S. EPA retained the current primary 24-hour PM_{10} standard at a level of 150 $\mu g/m^3$, which is not to be exceeded more than once per year over 3 years, to protect against health effects due to short-term exposure to thoracic coarse particles ($PM_{10–2.5}$) including premature mortality and increased hospital admissions and ED visits (78 FR 3086).

For the secondary PM standards, the U.S. EPA retained the annual $PM_{2.5}$ standard at 15 $\mu g/m^3$ as well as the 24-hour $PM_{2.5}$ standard of 35 $\mu g/m^3$ and the 24-hour PM_{10} standard of 150 $\mu g/m^3$ (78 FR 3086). However, the form of the annual secondary $PM_{2.5}$ standard was changed to remove the option of spatial averaging. These secondary standards protect against nonvisibility welfare effects including ecological effects, effects on materials, and climate effects. To protect against PM-related visibility impairment, the U.S. EPA identified a target degree of protection defined as a $PM_{2.5}$ visibility index of 30 deciviews (dv), which is based on the 90th percentile of 24-hour avg $PM_{2.5}$ concentrations over 3 years (78 FR 3086). However, a U.S. EPA analysis determined that the current secondary 24-hour $PM_{2.5}$ standard would provide sufficient protection, and in some cases greater protection, therefore a distinct secondary standard was not needed to provide requisite protection for both visibility and nonvisibility related welfare effects.

This new review of the primary and secondary PM NAAQS is guided by several policy-relevant questions that are identified in The Integrated Review Plan for the National Ambient Air Quality Standards for Particulate Matter (U.S. EPA, 2016). To address these questions and update the scientific judgments in the 2009 PM ISA (U.S. EPA, 2009a), this ISA aims to:

- Assess whether new information (since the last PM NAAQS review) further informs the relationship between exposure to PM and specific health and nonecological welfare effects.
- Inform whether the current indicators (i.e., $PM_{2.5}$ for fine particles and PM_{10} for thoracic coarse particles), averaging times (e.g., 24-hour avg, annual average), and levels of the PM NAAQS are appropriate.

In addressing policy-relevant questions, this ISA aims to characterize the independent health and welfare effects of PM, specifically $PM_{2.5}$ (fine PM; particulate matter with a nominal mean aerodynamic diameter less than or equal to 2.5 μm) and $PM_{10–2.5}$ (thoracic coarse or coarse PM; particulate matter with a nominal mean aerodynamic diameter greater than 2.5 μm and less than or equal to 10 μm) and whether there is evidence of an independent health effect for other size fractions [e.g., ultrafine particles (UFP), generally considered as particulates with a diameter less than or equal to 0.1 μm (typically based on physical size, thermal diffusivity or electrical mobility); U.S. EPA (2009a)] or specific PM components (e.g., metals). In characterizing whether there is evidence of an independent health and welfare effect due to PM, the ISA considers possible influences of other atmospheric pollutants, including both gaseous (i.e., O_3, NO_2, SO_2, and CO) and other PM size fractions. The information summarized in this ISA will serve as the scientific foundation for reviewing the current primary and secondary PM NAAQS.

P.3. Process for Developing Integrated Science Assessments

The U.S. EPA uses a structured and transparent process for evaluating scientific information and determining the causal nature of relationships between air pollution exposures and health effects [details provided in the Preamble to the Integrated Science Assessments (U.S. EPA, 2015)] and the Appendix. The ISA development process describes approaches for literature searches, criteria for selecting and evaluating relevant studies, and a framework for evaluating the weight of evidence and forming causality determinations. Table P-2 provides a description of each of the five causality determinations and the types of scientific evidence that is considered for each category for both health and welfare effects.

Table P-2 Weight-of-evidence for causality determinations.

	Health Effects	Ecological and Other Welfare Effects
Causal relationship	Evidence is sufficient to conclude that there is a causal relationship with relevant pollutant exposures (e.g., doses or exposures generally within one to two orders of magnitude of recent concentrations). That is, the pollutant has been shown to result in health effects in studies in which chance, confounding, and other biases could be ruled out with reasonable confidence. For example: (1) controlled human exposure studies that demonstrate consistent effects, or (2) observational studies that cannot be explained by plausible alternatives or that are supported by other lines of evidence (e.g., animal studies or mode-of-action information). Generally, the determination is based on multiple high-quality studies conducted by multiple research groups.	Evidence is sufficient to conclude that there is a causal relationship with relevant pollutant exposures. That is, the pollutant has been shown to result in effects in studies in which chance, confounding, and other biases could be ruled out with reasonable confidence. Controlled exposure studies (laboratory or small- to medium-scale field studies) provide the strongest evidence for causality, but the scope of inference may be limited. Generally, the determination is based on multiple studies conducted by multiple research groups, and evidence that is considered sufficient to infer a causal relationship is usually obtained from the joint consideration of many lines of evidence that reinforce each other.
Likely to be causal relationship	Evidence is sufficient to conclude that a causal relationship is likely to exist with relevant pollutant exposures. That is, the pollutant has been shown to result in health effects in studies where results are not explained by chance, confounding, and other biases, but uncertainties remain in the evidence overall. For example: (1) observational studies show an association, but copollutant exposures are difficult to address and/or other lines of evidence (controlled human exposure, animal, or mode of action information) are limited or inconsistent or (2) animal toxicological evidence from multiple studies from different laboratories demonstrate effects but limited or no human data are available. Generally, the determination is based on multiple high-quality studies.	Evidence is sufficient to conclude that there is a likely causal association with relevant pollutant exposures. That is, an association has been observed between the pollutant and the outcome in studies in which chance, confounding, and other biases are minimized but uncertainties remain. For example, field studies show a relationship, but suspected interacting factors cannot be controlled, and other lines of evidence are limited or inconsistent. Generally, the determination is based on multiple studies by multiple research groups.
Suggestive of, but not sufficient to infer, a causal relationship	Evidence is suggestive of a causal relationship with relevant pollutant exposures but is limited, and chance, confounding, and other biases cannot be ruled out. For example: (1) when the body of evidence is relatively small, at least one high-quality epidemiologic study shows an association with a given health outcome and/or at least one high-quality toxicological study shows effects relevant to humans in animal species or (2) when the body of evidence is relatively large, evidence from studies of varying quality is generally supportive but not entirely consistent, and there may be coherence across lines of evidence (e.g., animal studies or mode of action information) to support the determination.	Evidence is suggestive of a causal relationship with relevant pollutant exposures, but chance, confounding, and other biases cannot be ruled out. For example, at least one high-quality study shows an effect, but the results of other studies are inconsistent.

Table P-2 (Continued): Weight of evidence for causality determinations.

	Health Effects	Ecological and Other Welfare Effects
Inadequate to infer the presence or absence of a causal relationship	Evidence is inadequate to determine that a causal relationship exists with relevant pollutant exposures. The available studies are of insufficient quantity, quality, consistency, or statistical power to permit a conclusion regarding the presence or absence of an effect.	Evidence is inadequate to determine that a causal relationship exists with relevant pollutant exposures. The available studies are of insufficient quality, consistency, or statistical power to permit a conclusion regarding the presence or absence of an effect.
Not likely to be a causal relationship	Evidence indicates there is no causal relationship with relevant pollutant exposures. Several adequate studies, covering the full range of levels of exposure that human beings are known to encounter and considering at-risk populations and lifestages, are mutually consistent in not showing an effect at any level of exposure.	Evidence indicates there is no causal relationship with relevant pollutant exposures. Several adequate studies examining relationships with relevant exposures are consistent in failing to show an effect at any level of exposure.

Source: U.S. EPA (2015).

As part of this process, a draft of the ISA is reviewed by the Clean Air Scientific Advisory Committee (CASAC), which is a formal independent panel of scientific experts, and by the public. As this ISA informs the review of the primary and secondary PM NAAQS, it integrates and synthesizes information characterizing exposure to PM and potential relationships with health and welfare effects. Relevant studies include those examining atmospheric chemistry, spatial and temporal trends, and exposure assessment, as well as U.S. EPA analyses of air quality and emissions data. Relevant health research includes epidemiologic, controlled human exposure, and toxicological studies on health effects, as well as studies on dosimetry and biological plausibility. Additionally, relevant welfare research includes studies examining visibility impairment, effects on materials, and climate impacts.

The U.S. EPA initiated the current review of the primary and secondary PM NAAQS in December 2014 with a call for information from the public (U.S. EPA, 2014). Subject-area experts and the public were also able to recommend studies and reports to consider for the ISA during a science/policy issue "kick-off" workshop held at the U.S. EPA in February 2015. Thereafter, the U.S. EPA routinely conducted literature searches to identify relevant peer-reviewed studies published since the previous ISA (i.e., since May 2009). Multiple search methods were used [Preamble to the ISAs (U.S. EPA, 2015), and further detailed in the Appendix], including searches in the PubMed and Web of Science databases. These searches were meant to broadly capture all potentially relevant PM literature. To ensure the most policy-relevant evaluation of the current state of the science, the scope of this PM ISA reflects not only the evolving PM literature base but also the ability of the studies evaluated to directly inform the policy-relevant questions that form the basis of this review. Using both the scope of this ISA, detailed below, as well as the policy-relevant questions outlined in the PM IRP, studies that were uninformative based on title screening were excluded. Studies that were judged to be potentially relevant based on review of the abstract or full text and "considered" for inclusion in the ISA are documented in the Health and Environmental Research Online (HERO) website. The HERO project page for this ISA

(https://hero.epa.gov/hero/particulate-matter) contains the references that are cited in the ISA, the references that were considered for inclusion but not cited, and electronic links to bibliographic information and abstracts.

P.3.1. Scope of the ISA

As initially detailed in the PM IRP (U.S. EPA, 2016) and further expanded upon here, when evaluating the broad body of literature across scientific disciplines, the U.S. EPA considers whether the studies fall within the scope of the PM ISA (i.e., provide information which can address key policy-relevant questions). Thus, the focus of the PM ISA with respect to the health effects evidence is on studies of short-term (i.e., hours up to 1 month) and long-term (i.e., 1 month to years) exposures conducted at concentrations of PM that are relevant to the range of human exposures across ambient microenvironments (up to 2 mg/m^3, which is one to two orders of magnitude above ambient concentrations), and (1) include a composite measure of PM[27] or (2) characterize PM and apply some approach to assess the direct effect of PM when the exposure of interest is a source-based mixture (e.g., diesel exhaust, gasoline exhaust, wood smoke). For epidemiologic studies, the scope is further refined when evaluating the evidence for those health outcomes that the 2009 PM ISA concluded a *causal relationship* (i.e., short- and long-term $PM_{2.5}$ exposure and mortality and cardiovascular effects) to ensure the evaluation of the evidence focuses on the studies that are the most policy-relevant. Therefore, the focus is on those studies conducted in areas where mean $PM_{2.5}$ concentrations are <20 $\mu g/m^3$ or, in the case of a multicity study, where more than half of the cities have concentrations <20 $\mu g/m^3$. However, studies with mean $PM_{2.5}$ concentrations exceeding 20 $\mu g/m^3$ are included if they address specific areas of uncertainty or where limitations remain in the evidence base, as identified in the 2009 PM ISA, such as copollutant confounding. The scope is broader for experimental studies when examining biological plausibility for PM health effects, and in some cases, includes in vitro studies, studies that use intratracheal (IT) installation, studies examining relative toxicity, and studies conducted at concentrations >2 mg/m^3.

In the first case, studies that focus on a single component, group of components, or source, must also examine a composite measure of PM (e.g., mass of $PM_{2.5}$ and/or $PM_{10–2.5}$, or in the case of ultrafine particles [UFP] mass, particle number, etc.). This requirement helps in comparing effects or associations observed for individual components or alternative metrics to the current mass-based PM indicators. To assess the relationship between $PM_{2.5}$ components and specific health effects in experimental studies, this ISA relies on the approach initially outlined in the 2009 PM ISA and further refined in Stanek et al. (2011). This approach is consistent with the Health Effects Institute (HEI) review panel of the National Particle Component Toxicity (NPACT) initiative that states both source categories and component concentrations should be used directly in the health analyses with a focus on examining consistencies and

[27] Composite measures of PM may include mass, volume, surface area, or number concentration.

differences between the two approaches (Lippmann et al., 2013). Thus, experimental studies included within this ISA fulfill the following four criteria: (1) the studies examined exposures consisting of $PM_{2.5}$ from U.S. airsheds or those representative of the U.S. (e.g., Europe, Canada); (2) the studies examined at least five PM components; (3) the studies grouped PM components using statistical methods, for which the groups were not predefined based on common physical or chemical properties (e.g., water soluble vs. nonsoluble); and (4) the studies applied a formal statistical analysis to investigate the relationship between groups of PM components or PM sources and health effects. The criteria applied to both experimental and epidemiologic studies in evaluating PM components ensures that a systematic approach is used in both identifying and evaluating those studies that examine PM components.

The second case primarily applies to experimental studies that attempt to disentangle the effect of PM on health from a complex air pollution mixture of particles, gases, and components distributed between the gas and particle phases. Studies that assess the PM effect from a source-based mixture (e.g., wood smoke, diesel exhaust, gasoline exhaust, etc.) are only included if they use filtration (e.g., a particle trap) or another approach to differentiate between effects due to the mixture and effects due to the particles alone.

Whereas the preceding paragraphs focused broadly on the scope of the entire PM ISA, there are additional nuances that further frame the scope of the ISA, specifically with respect to UFPs. UFPs have often been defined as particles <0.1 μm (U.S. EPA, 2009a), but depending on the scientific discipline, the methods used and the particle sizes examined to assess the UFP-health effects relationship varies. UFP exposures in animal toxicological and controlled human exposure studies typically use a particle concentrator, which can result in exposures to particles <0.30 μm (Section 2.4.3.1). Whereas toxicological studies typically rely on examining UFP mass, epidemiologic studies examine multiple UFP metrics, including particle number concentration (NC), mass concentration (MC), and surface area concentration (SC). However, depending on the monitor used and the metric, the UFP size distribution included within each of these ranges can vary. Some studies that examine NC use no additional size classification and instead measure NC over the entire size range of the particle counter. If the entire size range is measured, limited available measurement data in the U.S. and Europe indicates that approximately 67 to 90% of NC consists of particles <0.1 μm (Section 2.4.3.1). Studies that examine MC or SC often include a range of particle sizes up to 0.3 μm. Currently, there is no consensus within the scientific community on the metric that best represents exposure to UFPs (Baldauf et al., 2016). Consequently, this ISA focuses on evaluating the UFP-health effects relationship of particles <0.3 μm for MC and SC metrics included in experimental studies, and any size range that includes particles <0.1 μm for NC. Focusing on these criteria will provide the most comprehensive assessment of UFPs and ensure that the metric examined represents primarily the UFP size range.

Across disciplines, studies defined as examining UFPs, but focusing on the sources, transport, and fate of fibers and unique nano-objects (namely, dots, hollow spheres, plates, rods, fibers, tubes) are not reviewed because substantial exposures to fibers and unique nano-objects generally occur in the

occupational settings rather than the ambient environment. Furthermore, the in vivo disposition of unique nano-objects is not likely relevant to the behavior of ultrafine (UF) aerosols found in ambient air, which are created by combustion sources and photochemical formation of secondary organic aerosols. However, some studies focusing on engineered nano- or ultrafine particles (e.g., carbon black, titanium dioxide) are included if they contribute to an understanding of the dosimetry or biological plausibility of PM.

In addition to the specific parameters that broadly form the overall scope of the review of PM and health effects, additional criteria were applied in evaluating the evidence for cancer. As detailed in the PM IRP, the PM ISA focuses on whether PM can directly cause cancer through only inhalation exposures at ambient and near-ambient concentrations (i.e., up to 2 mg/m^3). When evaluating the epidemiologic evidence for cancer, consistent with the overall scope of the ISA, the focus is on those studies with composite measures of PM. Whereas the ISA tends not to focus on the health effects evidence from in vitro studies, such studies are discussed regarding the mutagenicity of PM because they provide information on the biological pathways underlying cancer. While some components of PM are known carcinogens (e.g., hexavalent chromium), the focus of this ISA is on composite measures of PM (e.g., $PM_{2.5}$). When applicable, comparisons are made with the effects or associations observed for individual PM components to help inform the adequacy of current mass-based PM indicators. As such, the relationship between PM exposure and cancer is evaluated similarly to that of other health effects, resulting in the exclusion of studies that examine individual PM components without a composite PM measure. The evaluation of cancer includes studies that use PM filter extracts with the understanding that bioavailability of PM components in vivo is a complex issue not easily mimicked by extraction of PM collected on filters. Overall, the evaluation of cancer in the ISA will primarily focus on studies of inhaled PM because these studies are more relevant to ambient exposure conditions, with the recognition of the extensive historical evaluations on the mutagenicity, genotoxicity, and carcinogenicity of whole PM exposures (i.e., not defined by size fraction).

For nonecological welfare effects (i.e., visibility, climate, and materials effects), this ISA will build on information from the last review by discussing PM's role in impairing visibility, in radiative forcing, which can cause global and regional climate change, and in damaging and soiling materials. For visibility effects, studies are included that advance our understanding of visual impairment of airborne PM, such as studies of atmospheric chemistry, visibility preference, or other measures of adversity to public welfare, in urban and rural settings. This ISA focuses on climate as the welfare effect as listed in the Clean Air Act Amendments of 1970 with a focus on radiative forcing, surface meteorological trends, and climate feedbacks, and not on downstream ecosystem effects, human health effects, or future air quality projections resulting from changes in climate (CAA, 1970). The primary literature base for the evaluation of the effects of airborne and deposited PM on climate comes from recent national and international climate assessments such as the National Climate Assessment (Melillo et al., 2014) and the Intergovernmental Panel on Climate Change (IPCC, 2014), as well as other recent and more focused reports relevant to PM climate forcing [e.g., U.S. EPA (2012)]. The focus is on studies that inform the independent role of PM in climate forcing as well as effects on U.S. national and regional climate. For

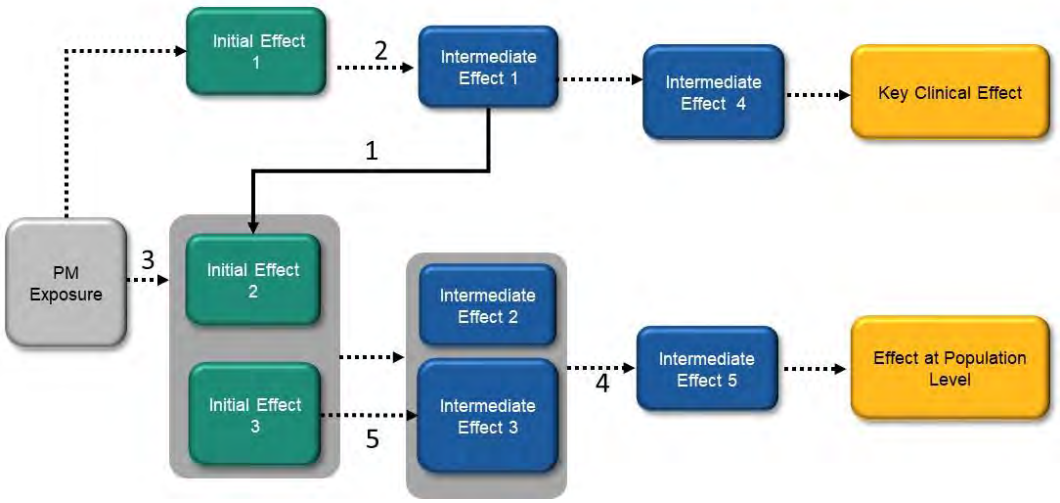
effects on materials, studies included in the PM ISA examine the role of PM and relevant precursor gases on materials damage and soiling. Specifically, studies that examine both particulate and gaseous contributions from oxides of nitrogen and oxides of sulfur along with other PM components are included here due to the difficulty associated with isolating the effects of gaseous and particulate N and S wet deposition.

P.3.2. Evaluation of the Evidence

The Preamble to the ISAs (U.S. EPA, 2015) describes the general framework for evaluating scientific information, including criteria for assessing study quality and developing scientific conclusions. Aspects specific to evaluating studies of PM are described in the Appendix, which were applied to studies that fit the overall scope of the PM ISA. Categories of health and welfare effects were considered for evaluation in this ISA if they were examined in previous U.S. EPA assessments for PM or in multiple recent studies. Therefore, in this ISA, the broad health effects categories evaluated include those considered in the 2009 PM ISA (i.e., respiratory effects, cardiovascular effects, central nervous system effects, cancer, and mortality) along with the addition of metabolic effects. New research indicates it is more appropriate to further refine the category of reproductive and developmental effects to instead focus overall conclusions specifically on fertility and pregnancy effects, and birth outcomes separately. The welfare effects categories evaluated include visibility impairment, effects on materials, and climate.

P.3.2.1. Biological Plausibility

In forming the key science judgments for each of the health effects categories evaluated, the PM ISA draws conclusions about relationships between PM exposure and health effects by integrating information across scientific disciplines and related health outcomes and synthesizing evidence from previous and recent studies. A new advancement in this ISA is the inclusion of biological plausibility sections that are specific for each PM size fraction, exposure duration, and broad health outcome category for which causality determinations are formed within each of the health effects chapters (Chapter 5, Chapter 6, Chapter 7, Chapter 8, Chapter 9, Chapter 10, and Chapter 11). These sections outline potential pathways along the exposure to outcome continuum and provide plausible links between inhalation of PM (i.e., $PM_{2.5}$, $PM_{10–2.5}$, or UFPs) and health outcomes at the population level. Biological plausibility can strengthen the basis for causal inference (U.S. EPA, 2015). In this ISA, biological plausibility is part of the weight-of-evidence analysis that considers the totality of the health effects evidence, including consistency and coherence of effects described in experimental and observational studies. Although there is some overlap in the potential pathways between the health effects chapters, each biological plausibility section is tailored to the specific broad health outcome category, PM size fraction, and exposure duration being evaluated within the respective section of each health effects chapter.



Each of the biological plausibility sections includes a figure depicting potential biological pathways that is accompanied by text. The figures illustrate possible pathways related to PM exposure that are based upon evidence evaluated in previous assessments, both AQCDs and ISAs, as well as evidence from more recent studies. The text characterizes the evidence upon which the figures are based, including results of studies demonstrating specific effects related to PM exposure and considerations of physiology and pathophysiology. Together, the figure and text portray the available evidence that supports the biological plausibility of PM exposures leading to specific health outcomes. Gaps and limitations in the evidence base correspond to gaps in the figure and accompanying text. In addition to portraying the plausible pathways leading to health outcomes, these figures provide insights on future research that may address knowledge gaps.

A model figure is presented below to illustrate its features (Figure P-1). Each box represents evidence that has been demonstrated in a study or group of studies for a particular effect related to exposure to a specific size fraction of PM. While most of the studies used to develop the figures are experimental studies (i.e., animal toxicological and controlled human exposure studies), some observational epidemiologic studies also contribute to the pathways. These epidemiologic studies are generally: (1) panel studies that measure the same or similar effects as the experimental studies (and thus provide supportive evidence) or (2) emergency department and hospital admission studies or studies of mortality, which are effects observed at the population level. The boxes are arranged horizontally, with boxes on the left side representing initial effects that reflect early biological responses and boxes to the right representing intermediate (i.e., subclinical or clinical) effects and effects at the population level. The boxes are color coded according to their position in the exposure to outcome continuum.

The arrows that connect the boxes indicate a progression of effects resulting from PM exposure. In most cases, arrows are dotted (Arrow 1), denoting a possible relationship between the effects. While most arrows point from left to right, some arrows point from right to left, reflecting progression of effects in the opposite direction or a feedback loop (Arrow 2). In a few cases, the arrows are solid (Arrow 2), indicating that progression from the upstream to downstream effect occurs as a direct result of PM exposure. This relationship between the boxes, where the upstream effect is necessary for progression to the downstream effect, is termed "essentiality" (OECD, 2016). Evidence supporting essentiality is generally provided by experimental studies using pharmacologic agents (i.e., inhibitors) or animal models that are genetic knockouts. The use of solid lines, as opposed to dotted lines, reflects the availability of specific experimental evidence that PM exposure results in an upstream effect which is necessary for progression to a downstream effect.

In the figures, upstream effects are sometimes linked to multiple downstream effects. To illustrate this proposed relationship using a minimum number of arrows, downstream boxes are grouped together within a larger shaded box and a single arrow (Arrow 3) connects the upstream single box to the outside of the downstream shaded box containing the multiple boxes. Multiple upstream effects may similarly be linked to a single downstream effect using an arrow (Arrow 4) that connects the outside of a shaded box,

which contains multiple boxes, to an individual box. In addition, arrows sometimes connect one individual box to another individual box that is contained within a larger shaded box (Arrow 2) or two individual boxes both contained within larger shaded boxes (Arrow 5). Thus, arrows may connect individual boxes, groupings of boxes, and individual boxes within groupings of boxes depending on the proposed relationships between effects represented by the boxes.

PM = particulate matter.

Note: The boxes above represent the effects for which there is experimental or epidemiologic evidence related to PM exposure, and the arrows indicate a proposed relationship between those effects. Solid arrows denote evidence of essentiality as provided, for example, by an inhibitor of the pathway or a genetic knockout model used in an experimental study involving PM exposure. Shading around multiple boxes is used to denote a grouping of these effects. Arrows may connect individual boxes, groupings of boxes, and individual boxes within groupings of boxes. Progression of effects is generally depicted from left to right and color coded (gray = exposure; green = initial effect; blue = intermediate effect; orange = effect at the population level or a key clinical effect). Here, population-level effects generally reflect results of epidemiologic studies. When there are gaps or limitations in the evidence, there are complementary gaps in the figure and the accompanying text below.

Figure P-1 Illustrative figure for potential biological pathways for health effects following PM exposure.

P.3.2.2. Comparing Epidemiologic Study Results

For consistency in evaluating health effects evidence for epidemiologic studies, additional parameters to those outlined in the scope (Section P.3.1) were developed. To help compare results across epidemiologic studies, risk estimates were standardized to a defined increment for both short- and long-term exposure to $PM_{2.5}$ and $PM_{10–2.5}$, unless otherwise noted in the text. To determine the appropriate increment, the distribution of $PM_{2.5}$ and $PM_{10–2.5}$ concentrations were examined across the three most recent years of air quality data (2012−2014) within the U.S. For both $PM_{2.5}$ and $PM_{10–2.5}$, an increment of

10 µg/m^3 was defined for short-term exposure studies; this value approximates the 50th−95th percentile of concentrations and accounts for the variability observed in daily $PM_{2.5}$ concentrations. An increment of 5 µg/m^3 was defined for long-term exposure studies; this value approximates the 25th−75th percentile of concentrations and represents the variation observed in long-term mean concentrations. Because there is no extensive monitoring network for UFPs within the U.S., results from UFP studies are not standardized and reflect the increment of exposure defined in each study evaluated. Additionally, in assessing correlations, either with other copollutants or variables, in epidemiologic studies high, moderate, or low correlations are explicitly defined as: low correlation, $r < 0.40$; moderate correlation, $r \geq 0.40$ and $r < 0.70$; and high correlation, $r \geq 0.70$. Consistency interpreting the epidemiologic evidence through approaches such as the standardization of risk estimates and the evaluation of correlations, in combination with the integration of evidence across scientific disciplines, supports a thorough evaluation of the current state of the science for PM.

P.3.2.3. Assessing Causality

In the evaluation of the evidence, determinations are made about causation, not just association, and are based on judgments about the consistency of evidence within a discipline, the coherence of effects across disciplines, and the biological plausibility of observed effects, as well as related uncertainties. The ISA uses a formal causal framework [Table II of the Preamble to the ISAs (U.S. EPA, 2015)] to classify the weight of evidence for both health and welfare effects according to the five-level hierarchy summarized below.

- *Causal relationship*: the pollutant has been shown to result in health or welfare effects at relevant exposures based on studies encompassing multiple lines of evidence and chance, confounding; and other biases can be ruled out with reasonable confidence.
- *Likely to be causal relationship*: there are studies in which results are not explained by chance, confounding, or other biases, but uncertainties remain in the health or welfare effects evidence overall. For example, the influence of co-occurring pollutants is difficult to address, or evidence across scientific disciplines may be limited or inconsistent.
- *Suggestive of, but not sufficient to infer, a causal relationship*: health or welfare effects evidence is generally supportive but not entirely consistent or is limited overall. Chance, confounding, and other biases cannot be ruled out.
- *Inadequate to infer the presence or absence of a causal relationship*: there is insufficient quantity, quality, consistency, or statistical power of results from studies of health or welfare effects.
- *Not likely to be a causal relationship*: several adequate health or welfare effects studies, examining the full range of anticipated exposure concentrations and for health effects, potential at-risk populations, and lifestages, consistently show no effect.

EXECUTIVE SUMMARY

Purpose and Scope of the Integrated Science Assessment

This Integrated Science Assessment (ISA) is a comprehensive evaluation and synthesis of policy-relevant science aimed at characterizing exposures to ambient particulate matter (PM), and health and welfare effects associated with these exposures.[28] PM is a mixture of solid particles and liquid droplets found in the ambient air,[29] which encompasses multiple size fractions (e.g., fine PM [$PM_{2.5}$, particulate matter with a nominal mean aerodynamic diameter less than or equal to 2.5 μm]; thoracic coarse or coarse PM [$PM_{10–2.5}$, particulate matter with a nominal mean aerodynamic diameter greater than 2.5 μm and less than or equal to 10 μm]; and ultrafine particles [UFPs, generally considered as particulates with a diameter less than or equal to 0.1 μm, typically based on physical size, thermal diffusivity, or electrical mobility]) and is comprised of various components (e.g., metals, black carbon, etc.; Figure ES-1). The evaluation of the science and the overarching conclusions of the ISA serves as the scientific foundation for the review of the primary (health-based) and secondary (welfare-based) National Ambient Air Quality Standard (NAAQS) for PM. This ISA focuses on nonecological welfare effects[30] because ecological effects resulting from deposition of PM and PM components are being considered in a separate assessment as part of the review of the secondary (welfare-based) NAAQS for oxides of nitrogen and sulfur, and PM (U.S. EPA, 2018).

[28] The general process for developing an ISA, including the framework for evaluating weight of evidence and drawing scientific conclusions and causal judgments, is described in a companion document, *Preamble to the Integrated Science Assessments* (U.S. EPA, 2015), https://www.epa.gov/isa.
[29] As defined by U.S. EPA, https://www.epa.gov/pm-pollution/particulate-matter-pm-basics.
[30] From this point forward referred to as welfare effects.

µm = micrometer; PM = particulate matter; $PM_{2.5}$ = particulate matter with a nominal mean aerodynamic diameter less than or equal to 2.5 µm; PM_{10} = particulate matter with a nominal aerodynamic diameter less than or equal to 10 µm.

Source: U.S. EPA (https://www.epa.gov/pm-pollution/particulate-matter-pm-basics).

Figure ES-1 Comparison of PM size fractions.

In 2012, the U.S. Environmental Protection Agency (U.S. EPA) established a new annual $PM_{2.5}$ primary standard of 12 µg/m^3 (the annual mean averaged over 3 years) and retained the 24-hour $PM_{2.5}$ standard of 35 µg/m^3 (the 98th percentile averaged over 3 years; 75 FR 3086).[31] For the primary PM_{10} standard, the U.S. EPA retained the 24-hour standard of 150 µg/m^3 (not to be exceeded more than once per year on average over 3 years) to continue to provide protection against effects associated with short-term exposure to thoracic coarse particles (i.e., $PM_{10-2.5}$). Regarding the secondary PM standards, the U.S. EPA retained the 24-hour (i.e., 35 µg/m^3) and annual (i.e., 15 µg/m^3) $PM_{2.5}$ standards[32] and the 24-hour PM_{10} standard (i.e., 150 µg/m^3) to address visibility and nonvisibility welfare effects. On judicial review, the revised and retained standards were upheld in all respects. NAM v EPA, 750 F.3d 921 (D.C. Cir. 2014).

This ISA updates the 2009 ISA for Particulate Matter [U.S. EPA (2009); hereafter referred to as the 2009 PM ISA] with studies and reports published from January 2009 through approximately January 2018. The U.S. EPA conducted in-depth literature searches using well-defined methods to identify peer-reviewed studies on relevant topics such as health and welfare effects, atmospheric chemistry, ambient concentrations, and exposure. In addition, input on recent studies that the U.S. EPA should

[31] The legislative requirements and history of the PM NAAQS are described in detail in the Preface to this ISA.
[32] Consistent with the primary standard, the U.S. EPA eliminated the option for spatial averaging with the annual standard.

consider in the process of developing the ISA was also solicited from subject-matter experts and the public during a kick-off workshop held at the U.S. EPA in February 2015 (U.S. EPA, 2014). After the broad literature search was conducted and additional studies were identified during the kick-off workshop, the U.S. EPA used various systematic review techniques to identify the most policy-relevant studies and evaluate overall study quality (see the Appendix). To fully describe the state of available science, the U.S. EPA also included in this ISA the most relevant studies from previous assessments.

Section 109(d)(2) of the Clean Air Act, describes the appointment of an independent scientific review committee and their role in reviewing the documents developed by U.S. EPA that provide the air quality criteria defined in Section 108(a)(2), herein the draft PM ISA. This independent review function has been performed by the Clean Air Scientific Advisory Committee (CASAC) of the U.S. EPA's Science Advisory Board. The U.S. EPA released the External Review Draft of the PM ISA on October 23, 2018 (83 FR 53471), which was reviewed in a public meeting of the CASAC to discuss the ISA and provide an independent scientific peer review of the document (83 FR 55529). The CASAC review of the External Review Draft of the PM ISA resulted in a final letter to the Administrator detailing their review, which was released on April 11, 2019.[33]

The Administrator responded to the CASAC's letter on the External Review Draft of the PM ISA on July 25, 2019,[34] and indicated the Agency will "incorporate the CASAC's comments and recommendations, to the extent possible, and create a final PM ISA so that it may be available to inform a proposed decision on any necessary revisions of the NAAQS in early 2020." The U.S. EPA focused on addressing comments presented in the main body of the CASAC letter (i.e., the cover letter and consensus responses to charge questions), and to the extent possible, addressed individual CASAC member comments as well as public comments on the draft PM ISA. The consensus CASAC comments on the draft PM Policy Assessment (December 16, 2019) stated "…the Draft PM ISA, does not provide a … comprehensive, systematic review of relevant scientific literature; inadequate evidence and rationale for altered causal determinations; and a need for clearer discussion of causality and causal biological mechanisms and pathways." To address these comments in the Final PM ISA, the EPA: (1) added text to the Preface and developed a new Appendix to more clearly articulate the process of ISA development; (2) revised the causality determination for long-term UFP exposure and nervous system effects to *suggestive of, but not sufficient to infer, a causal relationship*; and (3) added additional text to the Preface (Section P.3.2.1) as well as text in the health effects chapters to clarify the discussion of biological plausibility and its role in forming causality determinations. Additionally, the U.S. EPA focused on addressing those comments that contributed to improving clarity, could be addressed in the near-term, and identified errors in the draft PM ISA. Lastly, Administrator Wheeler noted, "for those comments and

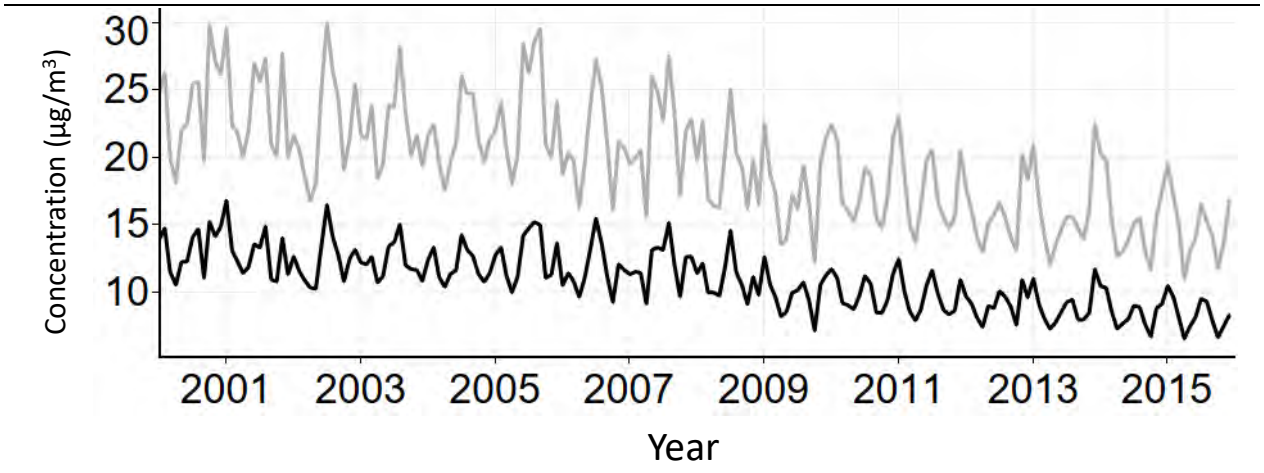
[34] Available at: https://yosemite.epa.gov/sab/sabproduct.nsf/264cb1227d55e02c85257402007446a4/6CBCBBC3025E13B4852583D90047B352/$File/EPA-CASAC-19-002_Response.pdf.

recommendations that are more significant or cross-cutting and which were not fully addressed, the Agency will develop a plan to incorporate these changes into future PM ISAs as well as ISAs for other criteria pollutant reviews."

As in the 2009 PM ISA, this ISA determines the causal nature of relationships between health effects and exposure to $PM_{2.5}$, $PM_{10–2.5}$, and UFPs (Chapter 5, Chapter 6, Chapter 7, Chapter 8, Chapter 9, Chapter 10, and Chapter 11). To accomplish this task, a defined scope was developed to narrow the focus to studies that address the question of whether PM exposure directly causes health effects (see Preface). Health effects are considered in relation to exposures at concentrations of PM that are relevant to the range of human exposures across ambient microenvironments, generally within one to two orders of magnitude of current conditions (i.e., up to 2 mg/m^3; Preface, Section P.3.1). The ISA also evaluates: the relationship between PM components and sources to assess whether there is evidence that a component, group of components, or source is more closely related to health effects than PM mass (see Preface); whether specific populations or lifestages are at increased risk of PM-related health effects; and the causal nature of relationships between PM and welfare effects. In the evaluation of the welfare-based evidence (Chapter 13), the PM ISA focuses specifically on the nonecological welfare effects of PM (i.e., visibility, materials effects, and climate). The ecological effects of PM are assessed in the ISA for Oxides of Nitrogen, Oxides of Sulfur, and Particulate Matter—Ecological Criteria because these criteria pollutants are interrelated through complex chemical and physical atmospheric processes and all contribute to nitrogen (N) and sulfur (S) deposition (U.S. EPA, 2018). However, in its assessment of effects on materials, the PM ISA summarizes soiling and deterioration of materials attributable to PM and related N and S components because of the difficulty associated with isolating the effects of gaseous and particulate N and S dry and wet deposition, and because the ISA for Oxides of Nitrogen, Oxides of Sulfur, and Particulate Matter—Ecological Criteria focuses only on ecological effects (U.S. EPA, 2018).

Key to interpreting the health and welfare effects evidence is understanding the sources, chemistry, and distribution of PM in the ambient air (Chapter 2). It is these atmospheric relationships and processes that influence human exposure (Chapter 3) and the uptake of inhaled PM in the respiratory tract (Chapter 4). The uptake of PM and its deposition in the body directly influences the biological mechanisms by which PM could result in a health effect (Chapter 5, Chapter 6, Chapter 7, Chapter 8, Chapter 9, Chapter 10, and Chapter 11). Further, the ISA aims to characterize the effect of PM (i.e., $PM_{2.5}$, $PM_{10–2.5}$, and UFP) on health by evaluating whether there is evidence of an independent effect in epidemiologic studies, often assessed through copollutant models, or a direct effect (i.e., exposure to only PM elicits a health effect) in experimental studies. The ISA also informs policy-relevant issues (Section 1.5), such as (1) potential copollutant confounding (Section 1.5.1); (2) timing of effects (i.e., averaging time of exposure metric and lag at which associations are observed in epidemiologic studies; Section 1.5.2); (3) PM concentration-response relationship(s), and evaluation of potential thresholds below which effects do not occur (Section 1.5.3); (4) PM components and sources and relationships with health effects (Section 1.5.4); and (5) populations or lifestages at increased risk for health effects related to PM exposure (Section 1.5.5 and Chapter 12).



Sources and Exposure to PM

The main objective of the ISA is to characterize health and welfare effects related to ambient PM exposure. This requires understanding PM sources, atmospheric formation, measurement methods, and concentrations. Additionally, characterizing the health effects of PM requires an understanding of the factors that affect both exposure to ambient PM and the uncertainty in estimating exposure. These factors include unmeasured variability in $PM_{2.5}$, $PM_{10–2.5}$, and UFP concentrations and size distributions, exposure to copollutants, and uncharacterized PM composition.

Particulate matter is comprised of components that are directly emitted (primary PM) as well as formed through atmospheric chemical reactions involving gaseous precursors (secondary PM; Section 2.3). Both primary and secondary PM contribute substantially to overall PM mass in ambient air. Within an urban environment, most primary $PM_{2.5}$ emissions are from anthropogenic sources and include some combination of industrial activities, motor vehicles, cooking, and fuel combustion, including biomass burning. However, in many locations, secondary PM formed from the precursors sulfur dioxide (SO_2), oxides of nitrogen (NO_X), ammonia (NH_3), and volatile organic compounds (VOCs), accounts for the majority of $PM_{2.5}$ mass. Direct emissions of primary $PM_{2.5}$ have decreased slightly (~9% since 2002), along with a substantial decrease in emissions since 2006 of the major $PM_{2.5}$ precursors SO_2 and NO_X, 65 and 30%, respectively. $PM_{10–2.5}$ is almost entirely primary in origin, composed largely of crustal material, sea salt, and biological material. Ambient UFPs originate from two distinct processes, primary particles directly emitted from specific sources like motor vehicles and new particle formation by photochemical processes under favorable atmospheric conditions.

There are well-established Federal Reference Methods (FRM) and national monitoring networks for $PM_{2.5}$, PM_{10}, and $PM_{10–2.5}$, but not for UFPs (Section 2.4). Recent monitoring initiatives include the implementation of the National Core multipollutant monitoring network, which includes measurements of $PM_{2.5}$ and $PM_{10–2.5}$, along with a suite of other pollutants, a new near-road monitoring network that includes $PM_{2.5}$ monitors at 36 sites, and the first routine monitoring of UFPs by measuring particle number count (NC) at 24 sites. Satellite-based measurements in conjunction with chemical transport models have also become increasingly used for estimating $PM_{2.5}$ concentrations. In general, the fraction of PM_{10} accounted for by $PM_{2.5}$ is higher in the eastern U.S. than in the western U.S. $PM_{10–2.5}$ concentrations are more spatially variable than $PM_{2.5}$ concentrations. The limited amount of available UFP measurements data indicates that the highest UFP concentrations occur in the winter and near roads with heavy traffic, often over short time periods. Overall, UFP concentrations are more spatially variable than $PM_{2.5}$. As Figure ES-2 shows, the long-term trend in monthly average $PM_{2.5}$ concentrations decreased by about 5 $\mu g/m^3$ from 2000 to 2015. Much of this decrease can be attributed to a corresponding decrease in sulfate concentrations, especially in the eastern U.S., attributed to reduced SO_2 emissions. Sulfate concentrations are mainly associated with $PM_{2.5}$ and have historically been highest in summer. The reduction in $PM_{2.5}$ and sulfate concentrations has coincided with a shift in the season with the highest national average concentration, from summer to a more even distribution of $PM_{2.5}$

concentrations between summer and winter. Additionally, the reduction in $PM_{2.5}$ concentrations has resulted in an increase in the contribution of $PM_{10-2.5}$ to PM_{10} concentrations.

µg/m³ = micrograms per cubic meter; $PM_{2.5}$ = particulate matter with a nominal mean aerodynamic diameter less than or equal to 2.5 µm.

Note: Black = mean, gray = 90th percentile.

Source: Chan et al. (2018).

Figure ES-2 Long-term trend in national monthly average $PM_{2.5}$ concentrations (µg/m³) from 2000−2015.

Fixed-site monitoring is frequently used for obtaining $PM_{2.5}$ exposure surrogates in epidemiologic studies of both short-term and long-term exposure (Section 3.3), given that spatial variability in $PM_{2.5}$ concentrations tends to be lower than that observed for other size fractions. Fixed-site monitoring for $PM_{10-2.5}$ has been performed using several different methods. Thus, because $PM_{10-2.5}$ is typically more spatially variable than $PM_{2.5}$ it is important to consider the method used to measure $PM_{10-2.5}$ to characterize errors and uncertainties in the data that are related both to the monitoring method and the proximity of the individual receptor to the monitor. UFPs also tend to be more spatially variable than $PM_{2.5}$, contributing to uncertainties in exposure assignments. The condensation particle counter (CPC) is most commonly used to measure UFPs. However, some portion of the UFP size distribution may be omitted using CPC because these counters do not typically measure particles smaller than 10 nm.

Modeling approaches, such as spatial interpolation methods, land use regression, dispersion models, and chemical transport models (CTMs), have for years provided estimates of exposure where no measurements are available. More recently, hybrid models have become available that draw on input from CTMs, satellite observations of aerosol optical density, surface measurements of PM concentration, and land use variables. Most studies using hybrid methods are applied to model $PM_{2.5}$ and have out-of-sample

cross-validations with $R^2 > 0.8$. Models are employed less frequently to estimate $PM_{10–2.5}$ and UFP exposures, despite $PM_{10–2.5}$ and UFP typically being more spatially variable than $PM_{2.5}$. This is related in part to less availability of input data.

When particles enter a building envelope, they may be lost during the process of infiltration indoors, producing an infiltration factor (F_{inf}) < 1 (Section 3.4). F_{inf} varies with season, window opening, building age, wind speed, and particle size distribution (with F_{inf} lower for $PM_{10–2.5}$ and UFP compared with $PM_{2.5}$). When examining the influence of estimated exposures on health effect estimates in a time-series study of short-term $PM_{2.5}$ exposure, use of a fixed-site monitor in lieu of a microenvironmental model that accounted for infiltration produced considerably attenuated health effect estimates, which resulted in an underestimation of the health effect association. Infiltration of $PM_{2.5}$ through a building envelope may change the temporal variability of the indoor $PM_{2.5}$ concentration time series, resulting in reduced correlation between the health effect of interest and the estimated exposure. In an epidemiologic study of long-term $PM_{2.5}$ exposure, simulating indoor concentrations produced unbiased health effect estimates.

In summary, exposure error tends to underestimate health effects associations in epidemiologic studies of PM exposure, although bias in either direction can occur. Recent improvements in estimating spatial resolution of the $PM_{2.5}$ concentration surface have reduced bias and uncertainty in health effect estimates. $PM_{10–2.5}$ and UFP concentrations tend to be more spatially variable than $PM_{2.5}$ concentrations, but data are either unavailable or less often available to fit or validate hybrid models for those size fractions. Consequently, there is typically less uncertainty in health effect estimates derived from both monitored and modeled exposure estimates for $PM_{2.5}$ compared with either $PM_{10–2.5}$ or UFP.

Dosimetry of Inhaled PM

Particle dosimetry characterizes the intake, deposition, and retention of PM in the respiratory tract (Chapter 4). The basic understanding of particle dosimetry has not changed since the last review. Quantification of the fraction of inhaled particles reaching the lung and the small fraction of deposited particles that enter the blood, distribute around the body, and accumulate in organs and tissues has improved. Understanding the dosimetry of particles is crucial to providing evidence for biologically plausible pathways that support the link between PM exposure and a range of health effects spanning multiple organ systems.

A variety of factors influence the amount of inhaled particles deposited and retained in the respiratory tract. These factors include exposure concentration and duration, activity level, and breathing conditions (e.g., nasal vs. oronasal route and minute ventilation), and particle properties (e.g., particle size, hygroscopicity, and solubility in airway fluids and cellular components). The inhalability of a particle is particularly important when extrapolating between species because it decreases more rapidly as particle size increases in rodents (commonly used in laboratory studies) than in humans. In people, the fraction of oral versus nasal breathing is influenced by age, activity level, sex, disease status

(e.g., allergies, upper respiratory infections), and perhaps body mass index, which ultimately contributes to the fraction of particles inhaled and reaching the lower respiratory tract.

Recent evidence demonstrates the translocation of poorly soluble particles (generally less than 200 nm) from the respiratory tract into circulation with transport to other organs. For example, in both humans and rodents, a small fraction of gold nanoparticles depositing in the peripheral lung may move into circulation. The fraction of deposited particles that move into circulation is dependent on particle size and is in the range of 0.2% or less for particles between 5 and 200 nm but may reach a few percent for smaller particles. The translocated particles are distributed around the body and may be retained in other organs or eliminated via urine. Some more limited data show that particles may also reach the fetus in a size-dependent manner. Although translocation in humans has only been demonstrated for gold nanoparticles and, to some degree, for titanium dioxide, the translocation of several types of nanoparticles has been demonstrated in rodents. The importance of elemental composition on particle translocation has not yet been ascertained. These studies suggest that, following deposition in the lung, a small fraction of ambient particles under 200 nm may translocate into circulation.

Health and Welfare Effects of PM Exposure

This ISA integrates information on PM exposure and health effects from epidemiologic, controlled human exposure, and toxicological studies to determine the causal nature of relationships between exposure to PM of various size fractions (i.e., $PM_{2.5}$, $PM_{10–2.5}$, and UFPs) and broad health effect categories. For most health effect categories, effects are evaluated separately for short-term exposures (i.e., hours up to approximately 1 month) and long-term exposures (i.e., 1 month to years), except for reproductive and developmental effects where exposures are considered to be long term. For welfare effects, the ISA evaluates evidence as it pertains to visibility impairment, climate effects, and effects on materials. A consistent and transparent framework [Preamble to the ISA (U.S. EPA, 2015), Table II] is applied to classify the health and welfare effects evidence according to a five-level hierarchy:

1. *Causal relationship*
2. *Likely to be causal relationship*
3. *Suggestive of, but not sufficient to infer, a causal relationship*
4. *Inadequate to infer the presence or absence of a causal relationship*
5. *Not likely to be a causal relationship*

The causality determinations presented in Table ES-1, reflect the PM size fraction, exposure duration, and health effect category combinations evaluated in this ISA. The conclusions presented are informed by recent findings in combination with the evidence detailed in the 2009 PM ISA. Important considerations include: (1) determining whether laboratory studies of humans and animals, in combination with epidemiologic studies, inform the biological mechanisms by which PM can impart health effects and provide evidence demonstrating that PM exposure can independently cause a health effect; (2) determining whether there is consistency in epidemiologic evidence across various geographic

locations, populations, and methods used to estimate PM exposure; (3) evaluating epidemiologic studies that examine the potential influence of factors (i.e., confounders) that could bias associations observed with PM exposure; (4) determining the coherence of findings integrated across controlled human exposure, epidemiologic, and toxicological studies; and (5) making judgments regarding the influence of error and uncertainty on the relationship between PM exposure and health effects in the collective body of available studies. Table ES-2 details the causality determinations for the welfare effects.

Table ES-1 Summary of causality determinations for PM exposure and health effects from the 2009 and current Integrated Science Assessment for Particulate Matter.

$PM_{2.5}$ = particulate matter with a nominal mean aerodynamic diameter less than or equal to 2.5 μm; $PM_{10-2.5}$ = particulate matter with a nominal mean aerodynamic diameter greater than 2.5 μm and less than or equal to 10 μm; UFP = ultrafine particles.

[a]An array of outcomes are evaluated as part of a broad health effect category: physiological measures (e.g., airway responsiveness), clinical outcomes (e.g., hospital admissions), and cause-specific mortality. Total mortality includes all nonaccidental causes of mortality and is informed by findings for the spectrum of morbidity effects (e.g., respiratory, cardiovascular) that can lead to mortality.

Note: The 2009 PM ISA made causality determinations for the broad category of "Reproductive and Developmental Effects." Causality determinations for 2009 represent this broad category and not specifically for "Male and Female Reproduction and Fertility" and "Pregnancy and Birth Outcomes." Table P-2 provides a description of each of the five causality determinations and the types of scientific evidence that is considered for each category. Previous causality determinations taken from the 2009 PM ISA (U.S. EPA, 2009).

Health Effects of $PM_{2.5}$ Exposure

Across the PM size fractions evaluated within this ISA, the most substantial scientific evidence supporting relationships between short- and long-term PM exposure is for $PM_{2.5}$. The causality determinations for $PM_{2.5}$ reflect the total body of scientific evidence, building on the conclusions presented in the 2009 PM ISA. The following sections detail those exposure duration and broad health effect categories for which this ISA concluded a *causal* or *likely to be causal* determination, reflecting the highest degree to which the evidence reduces chance, confounding, and other biases in the exposure–health effect relationship. The causality determinations for health effect categories for which there is a larger degree of uncertainty or limited examination of the relationship between $PM_{2.5}$ exposure and health effects are *suggestive of, but not sufficient to infer, a causal relationship* and *inadequate to determine the presence or absence of a causal relationship.* These causality determinations are summarized in Table ES-1.

Respiratory Effects

As in the 2009 PM ISA, the current ISA concludes there is a *likely to be causal relationship* between short-term $PM_{2.5}$ exposure and respiratory effects (Section 5.1). Recent epidemiologic studies continue to provide strong evidence for a relationship between short-term $PM_{2.5}$ exposure and several respiratory-related endpoints, including asthma exacerbation, chronic obstructive pulmonary disease (COPD) exacerbation, and combined respiratory-related diseases, particularly from studies examining emergency department (ED) visits and hospital admissions. The consistent, positive associations observed for asthma and COPD ED visits and hospital admissions across studies that used different approaches to control for the potential confounding effects of weather (e.g., temperature) are further supported by evidence of increased symptoms and medication use in response to short-term $PM_{2.5}$ exposure, which are indicative of asthma and COPD exacerbations. Animal toxicological studies of short-term $PM_{2.5}$ exposure provide coherence and biological plausibility for asthma and COPD exacerbations by demonstrating asthma-related responses in an animal model of allergic airways disease and enhanced lung injury and inflammation in an animal model of COPD. Animal toxicological evidence in healthy animals demonstrates altered host defense, greater susceptibility to bacterial infection, airway irritant effects, as well as other effects. While there is animal toxicological evidence supporting asthma and COPD exacerbations, the broader body of experimental studies conducted in healthy animals generally provides biological plausibility for respiratory effects in association with short-term $PM_{2.5}$ exposure, not specifically for asthma or COPD exacerbation. Controlled human exposure studies provide minimal evidence of effects due to short-term $PM_{2.5}$ exposure, such as decrements in lung function and pulmonary inflammation, though these studies are limited in terms of endpoints evaluated and the size and health status of study subjects. Recent epidemiologic studies build upon the limited number of studies that previously examined potential copollutant confounding and indicate that $PM_{2.5}$ associations with asthma

exacerbation, combined respiratory-related diseases, and respiratory mortality remain relatively unchanged in copollutant models with gaseous pollutants (i.e., O_3, NO_2, SO_2, with more limited evidence for CO) and other particle sizes (i.e., $PM_{10–2.5}$). The copollutant results in combination with animal toxicological evidence further support an independent effect of $PM_{2.5}$ on respiratory health. Evidence of consistent, positive associations between $PM_{2.5}$ and respiratory mortality supports a continuum of respiratory-related effects.

Both the 2009 PM ISA, and the current ISA concluded there is a *likely to be causal relationship* between long-term $PM_{2.5}$ exposure and respiratory effects (Section 5.2). There is strong evidence from multiple cohorts that varied in study location, exposure assessment methods, and time periods examined that reported an association between long-term $PM_{2.5}$ exposure and lung development (i.e., lung function growth). Additional, although more limited, evidence from epidemiologic studies indicates associations between long-term $PM_{2.5}$ exposure and asthma development in children, asthma prevalence in children, childhood wheeze, and pulmonary inflammation. Animal toxicological studies demonstrating impaired lung development resulting from pre- and postnatal $PM_{2.5}$ exposure and the development of an allergic phenotype along with an increase in airway responsiveness following long-term $PM_{2.5}$ exposure provide biological plausibility for these findings. There is limited assessment of potential copollutant confounding of respiratory morbidity outcomes, but recent animal toxicological studies partially address the independence of $PM_{2.5}$ effects by demonstrating $PM_{2.5}$-induced oxidative stress, inflammation, and morphological changes in both upper and lower airways. This broad body of experimental evidence indicating $PM_{2.5}$-related respiratory effects in healthy populations generally provides biological plausibility for respiratory effects in association with long-term $PM_{2.5}$ exposure. Additional epidemiologic evidence indicates an acceleration of lung function decline in adults, as well as consistent evidence for respiratory mortality and cause-specific respiratory mortality, thereby providing evidence of a continuum of effects in response to long-term $PM_{2.5}$ exposure. The relationship between long-term $PM_{2.5}$ exposure and respiratory effects is further supported by epidemiologic studies demonstrating improvements in lung function growth and bronchitic symptoms in children and improvement in lung function in adults in association with declining $PM_{2.5}$ concentrations.

Cardiovascular Effects

Consistent with the 2009 PM ISA, this ISA concludes there is a *causal relationship* between short-term $PM_{2.5}$ exposure and cardiovascular effects (Section 6.1). The strongest evidence comes from epidemiologic studies that reported consistent, positive associations between short-term $PM_{2.5}$ exposure and cardiovascular-related ED visits and hospital admissions across studies that used different approaches to control for the potential confounding effects of weather (e.g., temperature), particularly for ischemic heart disease (IHD) and heart failure (HF), as well as cardiovascular-related mortality. Recent examinations of potential copollutant confounding generally indicate that the associations observed between $PM_{2.5}$ exposure and cardiovascular effects in single-pollutant models remain relatively

unchanged in copollutant models, providing evidence that the observed associations with $PM_{2.5}$ are not artifacts due to confounding by another air pollutant. The independence of a $PM_{2.5}$ cardiovascular effect is further supported by recent experimental studies. Controlled human exposure studies expand upon previous findings and demonstrate $PM_{2.5}$-induced changes in endothelial function, which is coherent with animal toxicological studies demonstrating the same effect. Moreover, experimental evidence demonstrating decreased cardiac contractility and altered left ventricular pressure is coherent with epidemiologic studies observing positive associations between ambient $PM_{2.5}$ and ED visits and hospital admissions for HF. Thus, the collective body of experimental evidence supports and provides biological plausibility for epidemiologic studies reporting associations, particularly between short-term $PM_{2.5}$ exposure and IHD and HF outcomes, as well as a range of other cardiovascular-related effects (e.g., arrhythmia, thrombosis) that can result in more severe outcomes, possibly including death.

The 2009 PM ISA, as well as the current PM ISA, concluded there is a *causal relationship* between long-term $PM_{2.5}$ exposure and cardiovascular effects (Section 6.2). Epidemiologic studies of multiple recent U.S.-based cohorts along with reanalyses of these cohorts provide strong evidence of consistent, positive associations between long-term $PM_{2.5}$ exposure and cardiovascular mortality. These studies used a variety of exposure assessment and statistical techniques and examined various spatial domains (e.g., 1 × 1-km grid cells, census tract, etc.) in many locations where mean annual average $PM_{2.5}$ concentrations are ≤12 μg/m^3. Recent epidemiologic studies of cardiovascular morbidity have greatly expanded upon the body of evidence available at the completion of the 2009 PM ISA by focusing on populations with distinct demographic characteristics (e.g., postmenopausal woman, male doctors, etc.) and extensively considering potential confounders (e.g., socioeconomic status [SES]). Although an extended analysis of the Women's Health Initiative (WHI) cohort strengthened the initial observation of a relationship between long-term $PM_{2.5}$ exposure and coronary events among postmenopausal women, additional cohorts of women similar to the WHI cohort did not report consistent, positive associations with coronary heart disease (CHD), myocardial infarction, or stroke. Longitudinal studies examining the progression of atherosclerosis in relation to long-term exposure to $PM_{2.5}$ reported inconsistent results that were dependent upon the vascular bed examined, but there was evidence of $PM_{2.5}$-associated coronary artery calcification, a strong predictor of CHD, within a study focusing on the progression of atherosclerosis in a healthy population (i.e., Multi-Ethnic Study of Atherosclerosis and Air Pollution [MESA–Air]). A limited number of epidemiologic studies examining other cardiovascular effects provide some evidence of associations with HF, blood pressure, and hypertension, as well as subclinical cardiovascular biomarkers. Recent studies also reduce the uncertainty associated with potential copollutant confounding by reporting that associations between long-term $PM_{2.5}$ exposure and cardiovascular mortality remained relatively unchanged or increased in copollutant models adjusted for O_3, NO_2, SO_2, and $PM_{10–2.5}$. Evidence from animal toxicological studies further supports a direct $PM_{2.5}$ effect on the cardiovascular system and provides coherence with effects observed in epidemiologic studies. For example, animal toxicological studies demonstrating atherosclerotic plaque progression in mice is coherent with epidemiologic studies of atherosclerosis, and animal toxicological studies reporting increased coronary artery wall thickness, decreased cardiac contractility and output, and changes in blood

pressure are coherent with epidemiologic studies of HF. Furthermore, when considering the collective body of evidence, there are biologically plausible pathways by which long-term exposure to $PM_{2.5}$ could lead to a continuum of effects potentially resulting in death.

Nervous System Effects

The 2009 PM ISA did not make a causality determination for long-term $PM_{2.5}$ exposure and nervous system effects because of the paucity of available data. Since the 2009 PM ISA, the literature base has greatly expanded, and the combination of animal toxicological and epidemiologic evidence supports a *likely to be causal relationship* between long-term $PM_{2.5}$ exposure and nervous system effects (Section 8.2). Animal toxicological studies provide evidence for a range of nervous system effects including neuroinflammation and oxidative stress, neurodegeneration, cognitive effects, and effects on neurodevelopment. Epidemiologic studies, although fewer in number, generally support associations between long-term $PM_{2.5}$ exposure and changes in brain morphology, cognitive decrements, and dementia. Both experimental and epidemiologic evidence are well substantiated and coherent, supporting a pathway involving neuroinflammation in specific regions of the brain (i.e., the hippocampus, cerebral cortex and hypothalamus) and morphologic changes in the brain indicative of neurodegeneration. Overall, the limited assessment of copollutant confounding introduces some uncertainty in interpreting the epidemiologic studies, but this uncertainty is addressed, in part, by the direct evidence of effects provided by experimental animal studies. In addition to the nervous system effects primarily observed in adults, there is preliminary but limited epidemiologic evidence of neurodevelopmental effects, specifically autism spectrum disorder (ASD). Evidence for this outcome is supported by an animal toxicological study demonstrating $PM_{2.5}$-induced inflammatory and morphologic changes in regions of the brain consistent with ASD.

Cancer

The 2009 PM ISA concluded that evidence was *suggestive of a causal relationship*[35] between long-term $PM_{2.5}$ exposure and cancer (Section 10.2). Building upon the decades of research on whole PM exposures and evidence presented in the 2009 PM ISA, recent experimental and epidemiologic evidence indicating genotoxicity, epigenetic effects (i.e., hypo- and hypermethylation of DNA), and carcinogenic potential due to $PM_{2.5}$ exposure, along with strong epidemiologic evidence for increases in the risk of lung cancer incidence and mortality, supports a *likely to be causal relationship* between long-term $PM_{2.5}$ exposure and cancer. $PM_{2.5}$ exhibits various characteristics of carcinogens, as shown in studies demonstrating genotoxic effects (e.g., DNA damage), epigenetic alterations, oxidative stress, and

[35] Since the 2009 PM ISA, the causality determination language has been updated and this category is now stated as *suggestive of, but not sufficient to infer, a causal relationship*.

electrophilicity. Studies of cancer development have often focused on whole PM exposures,[36] not individual PM size fractions, or individual components often found to comprise $PM_{2.5}$ (e.g., hexavalent chromium, arsenic). Ames *Salmonella*/mammalian-microsome mutagenicity assays of $PM_{2.5}$ and $PM_{2.5}$ extracts demonstrate that PM contains mutagenic agents. In vitro and in vivo toxicological studies demonstrate the potential for $PM_{2.5}$ exposure to result in DNA damage, which is supported by limited human evidence. Cytogenic effects (e.g., chromosomal aberrations), and differential expression of genes potentially relevant to genotoxicity or cancer pathogenesis have also been demonstrated. There is also limited evidence for cellular and molecular changes that could lead to genomic instability as well as for the carcinogenic potential of $PM_{2.5}$, which is demonstrated by enhanced tumor formation in animals treated with urethane. The experimental and epidemiologic evidence of genotoxicity, epigenetic effects, and carcinogenic potential provides biological plausibility for the results from multiple epidemiologic studies conducted in diverse cohorts in terms of geographic coverage and population demographics reporting primarily consistent, positive associations between long-term $PM_{2.5}$ exposure and lung cancer incidence and mortality, particularly in never smokers. In the limited assessment of potential copollutant confounding, $PM_{2.5}$-lung cancer incidence and mortality associations were found to be relatively unchanged in models with O_3.

Mortality

As in the 2009 PM ISA, the current ISA concludes there is a *causal relationship* between short-term $PM_{2.5}$ exposure and total (nonaccidental) mortality (Section 11.1). Recent multicity studies conducted in the U.S., Canada, Europe, and Asia in combination with the single- and multicity studies evaluated in the 2009 PM ISA continue to provide evidence of consistent, positive associations between short-term $PM_{2.5}$ exposure and total mortality. The positive associations reported across studies reflect both traditional analyses using ambient monitors as well as analyses conducted in both urban and rural locations that use new exposure assignment techniques and rely on multiple sources of $PM_{2.5}$ data (e.g., ambient monitors, statistical models, and satellite images). Recent studies also expand upon the assessment of potential confounding by copollutants as well as other factors (e.g., temporal trends, weather, long-term PM concentrations). These analyses indicate that $PM_{2.5}$-mortality associations are relatively unchanged in copollutant models with gaseous pollutants and $PM_{10–2.5}$, and when instituting different approaches to control for other confounders, both in terms of covariates included in statistical models and degrees of freedom employed. The positive associations reported for total mortality are supported by positive associations for cause-specific mortality (i.e., cardiovascular- and respiratory-related mortality). The consistent and coherent evidence across scientific disciplines for cardiovascular morbidity, particularly ischemic events and HF (Chapter 6), and to a lesser degree for respiratory morbidity, with the strongest evidence for exacerbations of COPD and asthma (Chapter 5), provide biological plausibility for cause-specific mortality and ultimately total mortality. Recent studies

[36] Whole PM exposures represent exposures that contain both PM and gaseous pollutants.

also further reduce chance, confounding, and other biases in the relationship between short-term $PM_{2.5}$ exposure and total mortality.

Both the 2009 PM ISA and the current ISA concludes there is a *causal relationship* between long-term $PM_{2.5}$ exposure and total (nonaccidental) mortality (Section 11.2). Additional reanalyses and extensions of the American Cancer Society and Harvard Six Cities cohorts, as well as new cohorts consisting of Medicare participants, people that live in Canada, or people employed in a specific job (e.g., teacher, nurse, etc.) further support a positive association between long-term $PM_{2.5}$ exposure and total mortality, particularly in areas with annual mean concentrations <20 $\mu g/m^3$, and in some cases below 12 $\mu g/m^3$. Positive associations persist regardless of the exposure assignment approach used (i.e., ambient monitors or the combination of monitoring, modeling, and satellite data); in copollutant models, particularly with O_3 and more limited evidence for NO_2 and $PM_{10-2.5}$; and across studies that control for a range of individual- and ecological covariates, such as smoking status and SES. The evidence for total mortality is supported by positive associations for cause-specific mortality, including cardiovascular, respiratory, and lung cancer mortality. The coherence of effects across scientific disciplines for cardiovascular morbidity, particularly for CHD, stroke and atherosclerosis, and respiratory morbidity for the development of COPD, contribute to the biological plausibility for mortality due to long-term $PM_{2.5}$ exposure. Additionally, recent studies demonstrating increases in life expectancy due to decreases in long-term $PM_{2.5}$ concentrations further support a relationship between long-term $PM_{2.5}$ exposure and total mortality.

Policy-Relevant Considerations for Health Effects Associated with Particulate Matter Exposure

This section describes issues relevant for considering the potential significance of impacts of ambient PM, particularly $PM_{2.5}$, exposure on public health (Section 1.5),[37] including potential copollutant confounding of $PM_{2.5}$-health effects associations, the relationship between $PM_{2.5}$ exposure and the timing of health effects, the shape of the concentration-response (C-R) relationship, whether $PM_{2.5}$ components and sources are more closely associated with health effects than $PM_{2.5}$ mass, and the identification of populations and lifestages potentially at increased risk of a $PM_{2.5}$-related health effect.

Recent epidemiologic studies greatly expand upon the evidence informing whether associations observed between short- and long-term $PM_{2.5}$ exposure and health are confounded by other pollutants observed in the air pollution mixture. The examination of potential copollutant confounding in studies of respiratory and cardiovascular effects are primarily limited to studies of ED visits and hospital admissions. Across studies of short-term $PM_{2.5}$ exposure and respiratory and cardiovascular effects and mortality, correlations between $PM_{2.5}$ and gaseous (i.e., SO_2, NO_2, CO, and O_3) and particulate pollutants (i.e., $PM_{10-2.5}$) varied across studies, with low to moderate correlations (i.e., <0.7). Collectively, studies of

[37] Section 1.5 in Chapter 1 integrates the evidence across all health chapters, but each health chapter has individual discussions on the topics discussed within this section.

short-term $PM_{2.5}$ exposure that examined potential copollutant confounding indicated that associations remained relatively unchanged in copollutant models, and in instances where associations were attenuated, they remained positive. Far fewer studies examined potential copollutant confounding and long-term $PM_{2.5}$ exposure, but there has been an expansion of studies focusing on mortality. Studies focusing on respiratory (i.e., lung function and asthma development) and cardiovascular effects (i.e., cardiovascular mortality), along with lung cancer incidence and mortality, provide initial evidence that associations with $PM_{2.5}$ are relatively unchanged in copollutant models with primarily traffic-related pollutants (i.e., NO_2, NO_X, and CO) and O_3. For mortality, the most extensive analyses were conducted for O_3, with more limited assessments of other pollutants, but overall associations remained unchanged in copollutant models for total (nonaccidental) mortality and cardiovascular and respiratory mortality.

An important question that informs different aspects of the PM NAAQS is the timing of observed effects due to short-term $PM_{2.5}$ exposure, specifically the averaging time of the exposure metric in epidemiologic studies and the lag days over which health effects are observed. Some recent epidemiologic studies focusing on respiratory- and cardiovascular-related ED visits and hospital admissions, cardiovascular effects (e.g., ST elevation, myocardial infarction, and out-of-hospital cardiac arrest), and mortality examined associations between subdaily exposure metrics and the widely used 24-hour avg exposure metric. Across the studies evaluated, the available evidence does not indicate that subdaily averaging periods for $PM_{2.5}$ are more closely associated with health effects than the 24-hour avg exposure metric. In addition to examining potential differences in associations by averaging time of the exposure metric, recent epidemiologic studies evaluated the timing of effects by systematically examining whether there is evidence of an immediate (e.g., lag 0−1 days), delayed (e.g., lag 2−5 days), or prolonged (e.g., lag 0−5 days) effect of PM on health. Epidemiologic studies examining potential differences in associations in relation to short-term $PM_{2.5}$ exposure focused on respiratory- and cardiovascular-related ED visits and hospital admissions as well as mortality. While recent studies provided evidence of associations in the range of 0−5 days for respiratory effects, there was evidence of an immediate effect for cardiovascular effects and mortality (i.e., 0−1 days) with some initial evidence of associations occurring over longer exposure durations (e.g., 0−4 days).

An examination of the C-R relationship between $PM_{2.5}$ exposure and health effects can help determine both the shape of the C-R curve and address the question of whether a threshold exists (i.e., concentration) below which there is no evidence of an effect of $PM_{2.5}$ on health. Studies of short-term $PM_{2.5}$ exposure and health are limited to studies of respiratory-related ED visits, hospital admissions, and mortality. Epidemiologic studies of respiratory disease and asthma ED visits and hospital admissions focusing on the shape of the C-R curve provide initial evidence of a linear relationship with less certainty at concentrations below 10 $\mu g/m^3$. However, studies focusing on whether the $PM_{2.5}$ association changes at different concentration ranges (i.e., cutpoint analyses) provide some evidence of potential nonlinearities in the C-R relationship. Epidemiologic studies of mortality greatly expand upon the evidence evaluated in the 2009 PM ISA where C-R analyses were limited to studies of PM_{10}. Evidence from U.S. studies examining short-term $PM_{2.5}$ exposure and mortality indicate a linear

relationship at concentrations as low as 5 μg/m^3 with cutpoint analyses providing no evidence of a threshold.

For long-term $PM_{2.5}$ exposure, most of the evidence on the shape of the C-R curve comes from studies of mortality with some initial recent evidence from studies of respiratory and cardiovascular effects, as well as lung cancer mortality and incidence. Epidemiologic studies of long-term $PM_{2.5}$ exposure and mortality used a variety of statistical approaches and cutpoint analyses, which support a linear, no-threshold relationship for total (nonaccidental) mortality, especially at lower ambient $PM_{2.5}$ concentrations, with confidence in some studies in the range of 5−8 μg/m^3. Additionally, there is initial evidence indicating that the slope of the C-R curve may be steeper (supralinear) at lower concentrations for cardiovascular mortality. Evaluation of the C-R relationship is more limited for respiratory and cardiovascular effects, but overall initial assessments support a linear relationship, specifically at long-term $PM_{2.5}$ concentrations ranging from 10−12 and 5−10 μg/m^3, respectively.

Recent epidemiologic and experimental studies extensively build on those studies evaluated in the 2009 PM ISA that examined relationships between exposure to $PM_{2.5}$ components and sources and health effects. As detailed in the Preface, this ISA focuses on specific study criteria to thoroughly evaluate whether there is evidence that an individual component(s) and/or source(s) is more closely related to health effects than PM mass. Across the health effects categories evaluated in this ISA, most studies that examine PM sources and components focused on $PM_{2.5}$. In studies examining both short- and long-term exposure, a variety of health effects were examined ranging from subclinical (e.g., changes in lung function, respiratory symptoms) to more overt (e.g., ED visits, hospital admissions, and mortality). Across exposure durations and health effects categories, it was concluded that many $PM_{2.5}$ components and sources are associated with many health effects, and the evidence does not indicate that any one source or component is consistently more strongly related to health effects than $PM_{2.5}$ mass.

Lastly, an important consideration in evaluating whether the NAAQS provides public health protection is assessing whether there are specific populations or lifestages at increased risk of a PM-related health effect. Whereas the ISA provides substantial evidence of health effects due to short- and long-term exposure to $PM_{2.5}$ across populations with diverse characteristics (e.g., children, older adults, people with pre-existing cardiovascular diseases, etc.), an evaluation of whether any of these populations are at increased risk of a PM-related health effect relies on evidence from specific types of studies that can directly inform this question as detailed in Section 1.5.5 and Chapter 12. Based on the framework for characterizing the evidence for populations potentially at increased risk of an air pollutant-related health effect detailed in the 2013 O_3 ISA (U.S. EPA, 2013), this ISA concludes there is adequate evidence that children are at increased risk of a $PM_{2.5}$-related health effect based on strong evidence of impaired lung function growth and additional evidence of decrements in lung function and asthma development. Additionally, there is adequate evidence that nonwhite people are at increased risk of $PM_{2.5}$-related health effects based on studies of long-term $PM_{2.5}$ exposure and mortality and studies demonstrating differential exposure by race. There was also suggestive evidence that populations with

pre-existing cardiovascular and respiratory disease, that are overweight or obese, with genetic variants in genes in the glutathione transferase pathway and genes related to oxidant metabolism, that are of low SES, or are current or former smokers are at increased risk for $PM_{2.5}$-related health effects. Inadequate evidence exists to determine whether having diabetes, being in an older lifestage (i.e., older adults), residential location (including proximity to source and urban residence), sex, or diet increase the risk of $PM_{2.5}$-related health effects.

PM Exposure and Welfare Effects

Compared with the evaluation of the health effects evidence, the evaluation of the welfare effects evidence focuses broadly on PM and not individual size fractions or exposure durations. Additionally, the evaluation, as noted previously, focuses on the welfare effects of visibility impairment, climate effects, and effects on materials due to the ecological effects of PM being evaluated in the ISA for Oxides of Nitrogen, Oxides of Sulfur and Particulate Matter—Ecological Criteria (U.S. EPA, 2018).

As noted in Table ES-2, this ISA concludes a *causal relationship* between PM visibility impairment, climate effects, and effects on materials which is consistent with the 2009 PM ISA. For visibility impairment (Section 13.2), the relationship between PM and light extinction has been well characterized. The rapid decline in $PM_{2.5}$ sulfate that has occurred from 2002−2012 (i.e., −4.6% per year in rural areas and −6.2% per year in urban areas) has contributed to improvements in visibility in many areas. However, an increasing amount of light extinction is now due to nitrate and organic matter. There have been no recent visibility preference studies; however, a recent meta-analysis demonstrates that scene-dependent haze metrics better account for preference than does using the deciview scale as a metric. For climate (Section 13.3), there is substantial evidence indicating that PM affects the radiative forcing of the climate system, both through direct scattering and absorption of radiation, and indirectly, by altering cloud properties. However, there are still substantial uncertainties with respect to key processes linking PM and climate, particularly those involving aerosol-cloud interactions, because of the scale difference between PM-relevant cloud processes and the resolution of state-of-the-art models, and the indirect impacts and feedbacks in the climate system resulting from an initial radiative perturbation due to PM. Lastly, for effects on materials (Section 13.4), most of the evidence has focused on examining PM effects on stone used for historic monuments and buildings. Recent evidence further expands the understanding of soiling and corrosion process for glass and metals and demonstrates that atmospheric soiling can affect energy efficiency of photovoltaic systems and of some buildings.

Table ES-2 Summary of causality determinations for relationships between PM exposure and welfare effects from the 2009 and current Integrated Science Assessment for Particulate Matter.

Welfare Effect Category	Causality Determination	
	2009 PM ISA	Current PM ISA
Visibility impairment Section 13.2.6	Causal relationship	Causal relationship
Climate effects Section 13.3.9	Causal relationship	Causal relationship
Effects on materials Section 13.4.5	Causal relationship	Causal relationship

PM = particulate matter.

Previous causality determinations taken from the 2009 PM ISA (U.S. EPA, 2009). Table P-2 provides a description of each of the five causality determinations and the types of scientific evidence that is considered for each category.

Scientific Considerations and Key Findings of the Health and Welfare Effects Evidence

As summarized in the Preface (Section P.3), the Preamble to the ISAs (U.S. EPA, 2015) describes the process by which the U.S. EPA evaluates the strengths and limitations in the scientific evidence using a weight-of-evidence framework to form causality determinations within the ISAs. There are five different causality determinations, which may be used to characterize evidence with each determination delineated by the degree to which chance, confounding, and other biases affect interpretation of the scientific evidence (Table P-2). As documented by the extensive evaluation of evidence throughout the subsequent chapters of this ISA, the U.S. EPA carefully considers uncertainties in the evidence, and the extent to which recent studies have addressed or reduced uncertainties from previous assessments, as well as the strengths of the evidence. Uncertainties considered in the epidemiologic evidence, for example, include the potential for confounding by copollutants or covarying factors (e.g., temporal trends and weather in short-term exposure studies, and individual-level and ecological factors in long-term exposure studies) and exposure error. The U.S. EPA evaluates many other important considerations (not uncertainties) such as coherence of evidence from animal and human studies, evaluation of different PM components, heterogeneity of risk estimates, and the shape of concentration-response relationships. All aspects are evaluated in drawing scientific conclusions and making causality determinations. Where there is clear evidence linking PM to effects and minimal remaining uncertainties, the U.S. EPA concludes a *causal* or *likely to be causal* relationship.

Key findings of the health effects evidence spanning each of the PM size fractions and welfare effects evaluated in this ISA are summarized below and in Chapter 1 (Section 1.6). These highlights

encapsulate the strengths and limitations in the evidence base that ultimately lead to the formation of causality determinations. For the health (i.e., respiratory and cardiovascular effects, and mortality due to short- and long-term $PM_{2.5}$ exposure) or welfare effects categories for which *causal* or *likely to be causal* determinations were made, recent findings were found to reduce or fully address previous uncertainties in the evidence and increase the strength of U.S. EPA's scientific conclusions. For other PM-effect relationships, the key findings highlighted below indicate where there is strength in the evidence, but uncertainties remain, resulting in causality determinations of *suggestive of, but not sufficient to infer, a causal relationship* or in some cases *inadequate to infer the presence or absence of a causal relationship*, both of which reflect that there is limited evidence to evaluate both strengths and weaknesses.

Health Effects Evidence: Key Findings

A large body of scientific evidence spanning many decades clearly demonstrates there are health effects attributed to both short- and long-term PM exposure, with the strongest evidence for a relationship between some health effects and $PM_{2.5}$. Generally, for most health effects and exposures to $PM_{10–2.5}$ and UFPs, there are more limitations and uncertainties across scientific disciplines (i.e., atmospheric chemistry, exposure science, and both epidemiology and experimental sciences), complicating the interpretation of the evidence. The collective body of evidence for each of the PM size fraction, exposure, and health effect category combinations evaluated in this ISA was carefully considered and assessed, including the inherent strengths, limitations, and uncertainties in the overall body of evidence such as the available methods, models and data used within and across studies. This full assessment of the current state of the science for $PM_{2.5}$, $PM_{10–2.5}$, and UFPs resulted in the causality determinations detailed in Table 1-4. Through identification of the strengths and limitations in the evidence, this ISA may help in prioritizing research efforts to support future PM NAAQS reviews. Examples of the key findings in the health effects evidence considered in this PM ISA include:

$PM_{2.5}$

- There are many recent epidemiologic studies conducted in diverse geographic locations, that include different population demographics, use a variety of exposure assignment techniques, and include different approaches and covariates to control for potential confounders that continue to report consistent positive associations between short- and long-term $PM_{2.5}$ exposure and respiratory and cardiovascular effects and mortality. This evidence is consistent with the large body of previously published epidemiologic studies reporting positive associations between $PM_{2.5}$ exposure and respiratory and cardiovascular effects and mortality and in some cases strengthens and extends the evidence base for other health effects.
- New $PM_{2.5}$ exposure assignment methods that use several sources of available data (i.e., satellite observations, model predictions, and ambient monitors) in epidemiologic studies better allow for the inclusion of less urban areas. These methods are well validated by $PM_{2.5}$ monitors in areas with moderate-to-high population density. Although fewer monitors are available for model validation in sparsely populated rural areas compared with urban areas, $PM_{2.5}$ concentrations are

typically lower and more spatially homogeneous in rural areas, resulting in the need for fewer validation sites.

- The large number of animal toxicological and controlled human exposure studies provide coherence and biological plausibility for effects observed in epidemiologic studies of short- and long-term $PM_{2.5}$ exposure, particularly respiratory and cardiovascular effects, and mortality.
- Both animal toxicological and controlled human exposure studies, using concentrated ambient particle (CAP) exposures, provide evidence of a direct effect of PM exposure on various health effects.
- Epidemiologic studies that conducted copollutant analyses show that associations remain relatively unchanged when adjusting for gaseous pollutants and other particle size fractions (e.g., $PM_{10–2.5}$), addressing a key uncertainty identified in the 2009 PM ISA.
- Recent epidemiologic studies indicate that the observed heterogeneity in risk estimates is not attributed solely to differences in the composition of $PM_{2.5}$, but also reflects city-specific exposure conditions (e.g., housing and commuting characteristics).
- Evidence continues to support a linear, no-threshold concentration—response relationship, but with less certainty in the shape of the curve at lower concentrations (i.e., below about 8 $\mu g/m^3$).
- For health effects where it was concluded that the evidence is *suggestive of, but not sufficient to infer, a causal relationship* (i.e., short- and long-term $PM_{2.5}$ exposure and metabolic effects, male and female reproduction and fertility, pregnancy and birth outcomes, and short-term exposures and nervous system effects), epidemiologic and experimental studies report inconsistent evidence of an association/effect or there are relatively few studies focusing on the health effect of interest.

$PM_{10–2.5}$

- Routine national monitoring of $PM_{10–2.5}$ was initiated in 2011. $PM_{10–2.5}$ concentrations are more spatially variable than $PM_{2.5}$. Although some $PM_{10–2.5}$ data are available across the nation, micro- to neighborhood-scale data are not widely available, adding uncertainty to the interpretation of results from epidemiologic studies, especially for long-term exposure studies that rely on spatial contrasts to examine associations with health effects.
- Epidemiologic studies that examined associations between short- and long-term $PM_{10–2.5}$ exposure and various health effects use multiple methods to estimate concentrations, complicating the comparison of results across studies.
- For some health effects, few or no experimental studies examined the relationship with short- and long-term exposure to $PM_{10–2.5}$. The few studies conducted provide inconsistent evidence of effects due to $PM_{10–2.5}$ exposures contributing to limited coherence and biological plausibility.
- The causality determinations for all health outcome categories for short- and long-term $PM_{10–2.5}$ exposure was concluded as either *suggestive of, but not sufficient to infer, a causal relationship* or *inadequate to infer the presence or absence of a causal relationship*, indicating limitations and uncertainties in the evidence base.

UFPs

- There is no national ambient monitoring network in place to measure UFP concentrations; thus, there is limited information on UFP exposures within the U.S.

- There are a limited number of epidemiologic studies that examined short- or long-term UFP exposure and various health effects.
- It is difficult to assess the results across epidemiologic studies because of the different size ranges of UFPs examined, the exposure metrics used, and spatial and temporal variability of UFP concentrations.
- While there is strong and consistent animal toxicological evidence linking long-term UFP exposure to nervous system effects, there is limited human data, represented by a single epidemiologic study, to support these effects.
- For all other health effect categories, animal toxicological studies and controlled human exposure studies provide limited, and in some instances inconsistent, evidence of effects due to short- or long-term UFP exposure contributing to limited coherence and biological plausibility.
- There is evidence of translocation of UFPs outside of the respiratory tract to the circulation and to the brain via the olfactory nerve. With respect to the brain, it is unclear whether this translocation occurs in humans as well as in animals. There is also uncertainty surrounding the mechanisms and degree to which particles translocate from the respiratory tract to the brain; however, translocation of particles to the brain may not be required for UFP-related nervous system effects.
- For health effects where it was concluded that the evidence is *suggestive of, but not sufficient to infer, a causal relationship* limitations and uncertainties in the evidence base remain, while for health effects where it was concluded *inadequate to infer the presence or absence of a causal relationship*, few or no epidemiologic and experimental studies examined the relationship between short- or long-term UFP exposures.

Welfare Effects Evidence: Key Findings

A large body of scientific evidence spanning many decades also demonstrates there are welfare effects attributed to PM. This collective body of evidence contributed to the causality determinations detailed in Chapter 13 of this ISA for each of the nonecological welfare effects evaluated (see Table 1-4). Examples of the key findings in the welfare effects evidence considered in this PM ISA include:

- Recent studies further confirm evidence from previous assessments supporting the strong relationship between PM and the nonecological welfare effects of visibility impairment, effects on climate, and materials damage.
- For visibility impairment and materials damage there is extensive evidence demonstrating the relationship between PM and light extinction and PM effects on stone, respectively.
- While there is substantial evidence indicating that PM affects the climate system, specifically through radiative forcing, there are still substantial uncertainties in key processes, such as interactions between clouds and aerosols and the indirect impacts and feedbacks in the climate system due to the radiative effect of PM.

CHAPTER 1 INTEGRATED SYNTHESIS

Overall Conclusions of the Particulate Matter (PM) Integrated Science Assessment (ISA)

- Recent evidence spanning scientific disciplines (i.e., atmospheric chemistry, exposure science, dosimetry, epidemiology, controlled human exposure, and animal toxicology) builds upon evidence detailed in the 2009 PM ISA and reaffirms a *causal relationship* between short- and long-term $PM_{2.5}$ exposure and cardiovascular effects and total (nonaccidental) mortality, and a *likely to be causal relationship* for respiratory effects.
- Recent experimental and epidemiologic evidence supports a *likely to be causal relationship* between long-term $PM_{2.5}$ exposure and nervous system effects.
- Recent evidence, primarily from studies of lung cancer incidence and mortality, in combination with the decades of research on the mutagenicity and carcinogenicity of PM supports a *likely to be causal relationship* between long-term $PM_{2.5}$ exposure and cancer.
- Remaining uncertainties and limitations in the scientific evidence contribute to a *suggestive of, but not sufficient to infer, a causal relationship* and *inadequate to infer the presence or absence of a causal relationship* for all other exposure, size fraction, and health effects category combinations.
- Recent evidence builds upon and reaffirms that there is a *causal relationship* between PM and the nonecological welfare effects: visibility impairment, climate effects, and materials effects.
- The assessment of PM sources and components confirms and continues to support the conclusion from the 2009 PM ISA: *Many $PM_{2.5}$ components and sources are associated with many health effects, and the evidence does not indicate that any one source or component is more strongly related with health effects than $PM_{2.5}$ mass*.
- Many populations (e.g., healthy, diseased, etc.) and lifestages (e.g., children, older adults, etc.) have been shown to be at risk of a health effect in response to short- or long-term PM exposure, particularly $PM_{2.5}$. However, of the populations and lifestages examined, current scientific evidence indicates that only some populations may be at *disproportionately increased risk* of a $PM_{2.5}$-related health effect, including nonwhite populations, children, people with specific genetic variants in genes in the glutathione transferase pathway, people who are overweight or obese, people with pre-existing cardiovascular and respiratory diseases, people of low socioeconomic status (SES), and people who smoke or were former smokers. Inadequate evidence exists to determine whether having diabetes, being in an older lifestage (i.e., older adults), residential location (including proximity to source and urban residence), sex, or diet increase the risk of $PM_{2.5}$-related health effects.

1.1 Introduction

1.1.1 Purpose

The subsequent chapters of this ISA evaluate and characterize in detail the current state of the science with respect to the health and nonecological welfare effects[38] from exposure to particulate matter (PM). The overall scope of the ISA, which governs the types of studies considered in evaluating the scientific evidence, is detailed in the Preface. Aspects specific to identifying, through literature searches,

[38] Hereafter welfare effects refers to nonecological welfare effects, unless otherwise noted. The ecological effects resulting from the deposition of PM and PM components are being considered in a separate assessment as part of the review of the secondary (welfare-based) NAAQS for oxides of nitrogen, oxides of sulfur, and PM (U.S. EPA, 2018).

Abstract: Arsenic in dust and aerosol generated by mining, mineral processing and metallurgical extraction industries, is a serious threat to human populations throughout the world. Major sources of contamination include smelting operations, coal combustion, hard rock mining, as well as their associated waste products, including fly ash, mine wastes and tailings. The number of uncontained arsenic-rich mine waste sites throughout the world is of growing concern, as is the number of people at risk of exposure. Inhalation exposures to arsenic-bearing dusts and aerosol, in both occupational and environmental settings, have been definitively linked to increased systemic uptake, as well as carcinogenic and non-carcinogenic health outcomes. It is therefore becoming increasingly important to identify human populations and sensitive sub-populations at risk of exposure, and to better understand the modes of action for pulmonary arsenic toxicity and carcinogenesis. In this paper we explore the contribution of smelting, coal combustion, hard rock mining and their associated waste products to atmospheric arsenic. We also report on the current understanding of the health effects of inhaled arsenic, citing results from various toxicological, biomedical and epidemiological studies. This review is particularly aimed at

those researchers engaged in the distinct, but complementary areas of arsenic research within the multidisciplinary field of medical geology.

Keywords: aerosol; arsenic; coal; dust; epidemiology; cancer; mining; smelting; tailings

1. Introduction

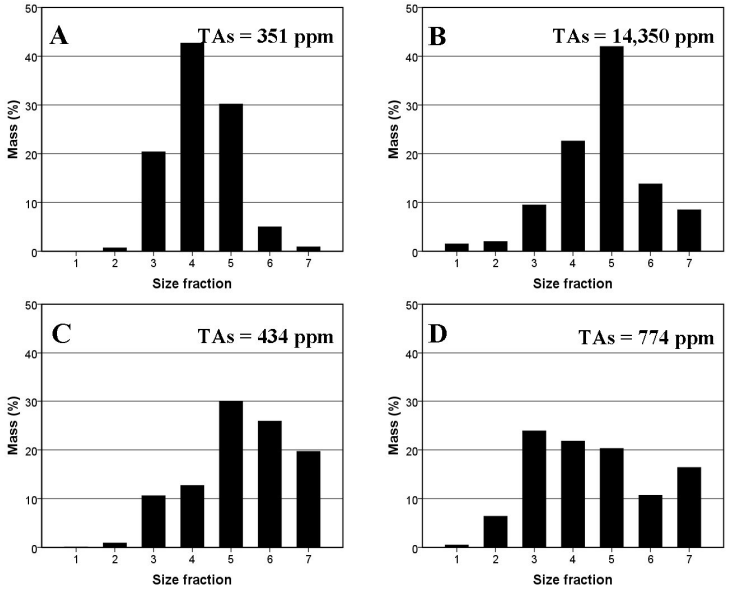
Arsenic is the 20th most abundant element in the earth's crust and may be released into the atmosphere as a result of natural processes and anthropogenic activities [1]. Environmental arsenic is released via chemical and physical weathering processes, biological activity and volcanic emissions, while anthropogenic sources include mining, metal smelting and burning of coal. Annual global arsenic emissions are estimated to be 24,000 t [2], with around 60% originating from copper smelting and coal combustion alone [3]. In some urban and highly industrialized areas, less than 2% of the atmospheric arsenic inputs originate from natural sources [3].

Emissions of arsenic-bearing particulate matter (PM) are of particular concern for human populations living in proximity to an emission source. Arsenic and inorganic arsenic compounds are classified as Group 1 carcinogens and are associated with cancers of the lung, bladder, kidney, skin, liver and prostate [2]. It should be noted that within the general population, inhalation is only considered a minor exposure pathway for inorganic arsenic compounds, and ingestion is considered the primary exposure pathway [2]. However, populations living in the vicinity of an arsenic emission source have an increased risk of additional exposure through inhalation of arsenic-contaminated particulates [4–9].

Despite their substantial contribution to global atmospheric arsenic species, mining operations play an understudied role in the generation of contaminated dust and aerosols [10]. To identify some of the emerging issues associated with arsenic in particulate matter this review presents key findings from a range of distinct but complimentary areas of research within the multidisciplinary field of medical geology, including geochemistry, toxicology, biomedicine and epidemiology. We will discuss two key themes: (i) the origin, occurrence and current monitoring of mining-related arsenic in the atmosphere; and (ii) the current understanding of the health effects of inhaled arsenic, citing results from various toxicological, biomedical and epidemiological studies.

2. Mining Operations as a Source of Airborne Arsenic

For brevity, the term "mining operations" is utilized throughout this paper to include all mining and mining-related activities including extraction, mechanical and high temperature processing, transportation, and storage of mine waste products. To compare or describe the impacts of different types of mining operations, specific mining terms are used.



2.1. Generation of Dust and Aerosol: An Overview

Mining operations release arsenic into the atmosphere via wind-borne dispersal of arsenic-laden particulates [11], with dust being the dominant transport medium for these emissions [3]. Active mining operations produce and/or mobilize dust to varying degrees in all stages of the mining process:

during the removal of overburden; in all aspects of the handling of ore, including its extraction, transportation and further processing; as part of waste disposal operations; and as a result of wind erosion of exposed areas [12–15]. Mining operations associated with an opencut coal mining operation in India, for example, generate 9.4 t of dust per day [16]. Active and abandoned mine tailings, mine sites and processing facilities also represent important sources of dust [17–22].

To demonstrate the potential for mine tailings to generate dust emissions, Figure 1 compares the total mass distribution (%) by particle size fraction of four different types of arsenic-bearing gold mine tailings in an historical mining region in regional Victoria, Australia. Comparable with the findings of a Californian-based study [21], our data suggest that mine tailings in this locality may contain up to 45% dust (particles ≤ 100 μm), as recorded in the fine-grained battery sand (Figure 1C). Future analysis may reveal the relationship between total arsenic concentration and particle size in these mine tailings samples.

Figure 1. Percentage mass distribution by particle size fraction for historical mine tailings including: (**A**) coarse battery sand; (**B**) red calcine sand; (**C**) fine battery sand; (**D**) composite coarse/fine battery sand. Size fractions Size fractions 1: >2000 μm; 2: 1000–2000 μm; 3: 500–1000 μm; 4: 250–500 μm; 5: 100–250 μm; 6: 53–100 μm; 7: ≤53 μm. Total arsenic (TAs) concentration (ppm) of each mine waste sample is also shown. (Our results obtained using a modified sieving method protocol described by Kim *et al.* [21]).

While most mining operations generate coarse dust, high temperature processes, such as smelting and coal combustion, are typically associated with fine particulates, accumulation-mode particulates, and vapors [10]. Coarse particles (≥2.5 μm diameter) are produced by mechanical processes such as the crushing and grinding of ore, and may be resuspended via wind erosion and mechanical disturbance [10,23]. Fine (≤2.5 μm) and accumulation mode particles (0.1–2.5 μm) are produced during smelting and combustion through the condensation of high temperature vapors, diffusion and coagulation [10,23].

Coarse and fine particulates have widely varying atmospheric residence times, and as a result, widely varying distributions. Arsenic associated with the fine fraction may remain in the atmosphere between seven [24] and up to 10 days (reviewed in Matschullat [3]), and can travel long distances [25].

Coarse particulates have a much shorter atmospheric residence time, typically minutes to hours due to a larger settling velocity [10]. Particle segregation of mine waste can occur during airborne transport, thereby reducing the size of the individual particles deposited [17]. In addition to mining operation type, atmospheric contaminant concentrations are also influenced by the distance and position of a sampling site in relation to the source, the height of the source (e.g., chimney or tailings pile), the type of dust suppression or flue gas cleaning, the exit velocity of the flue gas, and the prevailing wind speed [26] as well as changes in industrial technologies [27].

2.2. Origin, Production and Release of Particulate Arsenic

It is widely accepted that global atmospheric arsenic fluxes are dominated by mining-related industries involving high temperature processing [3]. An estimated 60% of global anthropogenically-generated atmospheric arsenic is attributed to copper smelting and coal combustion, with annual outputs of 12,080 and 6240 t respectively [3]. While it is well-documented that mine tailings represent major sources of arsenic-contaminated dust throughout the world [10,19,28,29], the contribution by these sources to total global atmospheric arsenic fluxes is yet to be assessed [3]. The occurrence of arsenic-bearing phases in unprocessed ore and the generation of particulate arsenic by different types of mining processes will be reviewed in the following sub-sections.

2.2.1. Smelting Operations

Gold, copper, lead and zinc ores typically contain arsenic-bearing minerals such as pyrite (FeS_2), galena (PbS), chalcopyrite ($CuFeS_2$) and the dominant arsenic-bearing mineral, arsenopyrite (FeAsS), which contains approximately 46% arsenic by weight [2]. The high temperature purification of arsenic-bearing ores during smelting and roasting volatilizes arsenic [30,31], and the resultant vapors may contain up to 95% arsenic [32]. Arsenic in close proximity to smelters and roasters is typically arsenic trioxide in particulate form [33,34], and depending on the feed material and extraction process, flue dusts can contain up to 30% arsenic trioxide [35,36]. Fugitive emissions of particulate arsenic may occur at various stages of high temperature processing, as well as during the transport and storage of ores, concentrates and waste heaps [37].

Although high efficiency control devices are often employed in smelters to reduce emissions, the quantity of total arsenic emitted from a single smelting operation can be substantially high. For example, around 300 t of arsenic are emitted annually from the Copper Smelter Complex Bor, in eastern Serbia [38]. Furthermore, uncontained smelter flue dusts represent an important potential source of airborne arsenic, compared with other secondary smelter by-products [39]. Over a period of 20 years, a copper smelter in Japan produced an estimated 9000 t of arsenic-rich flue dust (19.5 wt % of As) which is currently stockpiled at an undisclosed location in Japan [32]. Stockpiled by-products of the smelting process with high arsenic content present ongoing sources for redistribution.

2.2.2. Coal Combustion

Coal is a complex mixture of organic and inorganic compounds formed over millions of years from successive layers of fallen vegetation. Coal contains detectable levels of the vast majority of elements in the periodic table, including arsenic and other potentially toxic and environmentally sensitive

elements [40,41]. Although much of the arsenic in coal is associated with the inorganic or mineral fraction (such as pyrite and other sulphide minerals), a significant portion is associated with organic matter [42,43]. Arsenic concentrations in coal typically range between 1–10 and 1500 $mg \cdot kg^{-1}$, but concentrations as high as 32,000 $mg \cdot kg^{-1}$ have been reported in some super-enriched coal samples (reviewed in Kang *et al.* [42]). Arsenic in coal occurs in three non-exclusive distinct forms: arsenical pyrite, arsenopyrite and arsenate species [44,45].

During coal combustion, arsenic readily oxidizes to form arsenic oxide vapor [44] which combines with calcium oxide and condenses on the surface of fly ash particles in the form of calcium arsenate [46–48]. The inverse correlation between arsenic concentration and particle size which has been observed demonstrates that volatilized arsenic preferentially adsorbs or condenses on the finer particles [31]. Furthermore, higher combustion temperatures result in higher concentrations of particulate arsenic. For example, an increase in total arsenic concentration in PM_1 (particulate matter <1 μm) from 0.07 to 0.25 $mg \cdot m^{-3}$ at respective temperatures of 1100 and 1400 °C was reported in one study [48].

Solid by-products of the combustion process, including fly ash and bottom ash, are major sinks for arsenic. An estimated 90% to 100% of arsenic is captured in coal combustion by-products [49], with a preferential enrichment (up to 80%) for the fly ash component (reviewed in Yudovich and Ketris [50]). Removal efficiencies of arsenic by particulate control systems such as cyclones, electrostatic precipitators, wet scrubbers and fabric filters range between 43% and 99%, depending on the control device used [51]. An early study by Ondov *et al.* [52] reported that arsenic penetration through electrostatic precipitators (ESP) and wet scrubbers may be as high as 8.8% and 7.5%, respectively. Despite the widespread use of ESPs in Europe, a reported 575 t of arsenic were emitted from the combustion of coal during 1990 [35]. Similarly, in China around 550 t of arsenic were emitted from coal-fired power plants during 2007 [51]. Arsenic emissions arising from coal burning industries are an ongoing issue of global significance.

2.2.3. Mine Tailings
