Indeed, Perpetua initially proposed public access through the SGP would be prohibited. (R., at p. PET 527.) In response to public comments, Perpetua then proposed to allow "restricted seasonal [non-winter] access through the SGP site," which would "allow limited access to the Thunder Mountain recreational area from the town of Yellow Pine similar to the existing seasonal route." (R., at p. PRI00000418; *see also* R., at pp. PET 527, 530.) Alternative 2 under consideration by USFS under the National Environmental Policy Act ("NEPA") would allow continued access

through the SGP. (R., at p. PET 527.)

For the purposes of the air modeling, Perpetua proposed to treat the access road within the operational boundary of the SGP as part of the SGP. The access road within the SGP was not treated as "ambient air," the result being that Perpetua was not required to demonstrate NAAQS compliance within that portion of the road. According to the Petition, that access road should have been treated as ambient air, not excluded from it, such that compliance with NAAQS would be required within the road. (*See generally* Pet. ¶¶ 60, 62.)

3. Whether Perpetua Has Adequate Legal Authority to Exclude the General Public (Claim No. 11)

The Petitioners argue there is not sufficient evidence in the record demonstrating Perpetua's legal authority to preclude access by the general public, in part because USFS's evaluation of the SGP under NEPA is not complete. (*See* Pet. ¶ 62; Br. in Supp. of MSJ of 4/14/23, pp. 14-18.) DEQ and Perpetua's primary response is that DEQ reasonably relied upon Perpetua's representation in its permit application that it will have the legal authority to control access.

In advance of the summary judgment hearing, the hearing officer requested the parties identify "any legal authorities addressing the extent to which DEQ may so rely [on representations by a permit applicant] and/or the extent to which DEQ is responsible for verifying that information." (Not. Re SJ Hearing of 9/15/23, Att. A, No. 4.) At the hearing, the only specific legal authority cited by any party was Petitioners' reference to *Ctr. for Biological Diversity v. U.S. Fish & Wildlife Serv.*, 33 F.4th 1202 (9th Cir. 2022), referred to as the "*Rosemont*" case because it involved a project proposed by the Rosemont Copper Company. *Rosemont* involved a determination of the scope of rights provided to claimants of mining claims on federal land under the federal Mining Law of 1872. *Id*. at 1208. At its core, that case involves the ***legal interpretation*** of that particular set of federal statutes; it does not squarely address the issue of the extent to which an agency may rely upon

factual representations by an applicant.

In the absence of a specific legal requirement on this issue, the hearing officer must affirm DEQ's decision unless there is not substantial evidence in the record of Perpetua's legal ability to exclude the public or it was otherwise arbitrary or capricious to so rely. In its permit application materials, Perpetua makes the following representations:

> Midas Gold[5] ***will legally control the SGP***, an active industrial site where mining activities will occur, such as heavy equipment operation. Most areas of the mine will require strict safety protocols and controlled access. Midas Gold has established an operations boundary to identify the area ***where public access will be excluded***. Public access inside the operations boundary ***will be restricted for the life of the mine*** by physical barriers at points of potential access, including the current Stibnite Road point of entry and proposed site access via the Burntlog Route, as well as natural features of the landscape that prevent access.

(R., at p. PRI00000467 (emphasis added).)

The next section of this opinion discusses Section 2.7 of the Permit in detail. For now, it is adequate to note that Section 2.7 requires Perpetua to take actions to both "discourage" and "preclude" public access to the SGP. The Air Rules state:

> All documents, including but not limited to, ***application forms for permits to construct***, application forms for operating permits, progress reports, records, monitoring data, supporting information, requests for confidential treatment, testing reports or compliance certifications submitted to the Department must contain a certification by a responsible official. ***The certification must state that, based on information and belief formed after reasonable inquiry, the statements and information in the document are true, accurate, and complete***.
>
> ***
>
> Persons are prohibited from knowingly making any ***false statement, representation, or certification*** in any form, notice, or report required under any permit, or any applicable rule or order in force pursuant thereto.

AIR RULES 123, 125 (emphasis added).

Perpetua acknowledged the certification requirement in its application materials. (R., p.

PRI00000167-168, 381.) It is also worth noting that DEQ has broad enforcement authorities. *See* IDAHO CODE §§ 39-105, 39-108, 39-109. If the representations that Perpetua "will legally control the SGP" in a manner in which "public access will be excluded" and "restricted for the life of the mine" were not true at the time they were made, then Perpetua would be subject to enforcement by DEQ. If Perpetua ultimately lacks the ability to preclude public access as a result of the NEPA process, operating the SGP anyway would be in plain violation of Section 2.7 of the Permit, which requires Perpetua to "preclude" and "discourage" public access.

In the experience of the hearing officer, it is not unusual for an agency to rely on representations made in a permit application, even as to an issue as fundamental as the nature of the applicant's interests in the relevant property. *See* APPLICATION FOR PERMIT TO APPROPRIATE THE PUBLIC WATERS OF THE STATE OF IDAHO, Item No. 11, *available at* https://tinyurl.com/yc5p48ss (last visited Oct. 15, 2023). Under these circumstances, the hearing officer finds DEQ's reliance on Perpetua's representation that it will eventually have the ability to control access reasonable and supported by substantial evidence in the record.

As to Claim No. 11, the Petitioners' motion for summary judgment is hereby DENIED, and the motions for summary judgment filed by DEQ and Perpetua are hereby GRANTED.

4. Whether the Permit Adequately Precludes Access by the General Public (Claim No. 12)

The Petitioners argue the Permit does not adequately preclude access by the general public through the SGP. Sections 2.6 and 2.7 of the Permit require Perpetua to develop an "Access Management Plan (AMP)" that, among other things, "clearly specifies measures used to discourage public access to the facility," and that "shall be submitted to DEQ for approval 30 days prior to startup…." (R., at p. PET 010.) The Petition alleges that, "[w]ithout full disclosure and knowledge

[5] Midas Gold Corp. formally changed its name to Perpetua Resources Corp. in Februrary 2021.

of the exact measures and requirements in the AMP and enforceable permit limits, DEQ cannot make a determination of whether exclusion of the access road from ambient air protections complies with EPA's ambient air policy and the Idaho Air Rules, nor can DEQ determine whether the SGP will comply with the NAAQS and TAPs." (Pet., ¶¶ 58, 59, 62, 65).

In contrast to many of the other errors alleged by Petitioners, the hearing officer finds establishment of ambient air boundaries as a matter that is within the common knowledge or a layperson. Therefore, expert testimony is not necessary. The hearing officer agrees that Perpetua and DEQ cannot demonstrate compliance by reference to a document that is not yet final. Therefore, consideration of this issue is limited to the "four corners" of the Permit, which states:

- Perpetua must "[o]bserve all primary access points to preclude unauthorized public access" and ensure "[o]nsite personnel [are] available for this purpose during active mining and mineral processing operations."
- Perpetua may control access at the North Entry and South Entry either "by the use of locked gates, barriers, or equivalent measures," by "manned guardhouses," or "by the use of security escort vehicles."
- Perpetua is required to "[p]ost warning signs and periodically patrol secondary access points to the facility [*i.e.*, secondary roadways and trails traversing the SGP] to preclude public access" and to make onsite personal available for this purpose.
- Perpetua may only provide "registered guests of the facility" with access to or through the SGP "for the sole purpose of passing through the facility to another destination," and is required to provide literature that "explains Perpetua's requirements for accessing the site" and that "identifies potential hazards of the site."

(R., at p. PET 010.)

Aside from the relatively brief definition of "ambient air," the Air Rules do not articulate legal standards for when the general public has adequate "access" to the atmosphere and when it does not. As a result, the parties refer to guidance documents promulgated by EPA and DEQ.

According to EPA's 2019 ambient air policy: (1) it is appropriate to exclude areas from ambient air where measures are employed that are "effective in precluding access to the land by the general public;" (2) such measures can include physical barriers, but physical barriers are not required; (3) determinations by the agency are discretionary on a case-by-case basis; (4) the permit applicant must have the legal ability to preclude access by the general public and must employ measures that actually preclude the general public as a practical matter; (5) in evaluating the adequacy of the preclusion measures, the agency applies a "rule of reason" as to whether the general public will have access "under reasonably anticipated circumstances." (R., at p. PET772-785.)

DEQ's 2021 guidance document asks a series of questions to determine if access by the general public is sufficiently precluded. If there is a fence or other physical barrier, it is appropriate to establish the ambient air boundary at that location. If access by the general public is discouraged by the nature or remote location of the facility and the facility either posts "no trespassing" signs or has security personnel who will ask trespassers to leave, then it is appropriate to establish the ambient air boundary at the property boundary. If none of the above are true, then the ambient air boundary is determined by a variety of factors. (*See* R., at pp. PET743-744.)

Again, the specific error alleged by Petitioners is that exclusion of the access road from ambient air was error. This is not an evaluation of the entire ambient air boundary adopted by DEQ. In this regard, the requirements in the Permit enumerated above are consistent with both agency guidance documents and the conclusion that the access road is appropriately excluded from ambient air. At a minimum, the Permit makes it clear that Perpetua is required to preclude unauthorized

access by the general public and that members of the public can become guests of the facility only if they are seeking to pass through to access another destination. Even Petitioners acknowledge their understanding that members of the general public who become guests of the SGP for the purpose of passing through will not be able to stop within the SGP. (*See* Tr. of 9/21/23 at 34:7-15.) And, if Perpetua does not take measures to discourage and preclude access by the general public, DEQ states that would be a violation of the Permit—likely a "major" violation. (Tr. of 9/21/23 at 40:8-18.)

While it is always possible to suggest ways in which a particular permit provision could be drafted differently, the hearing officer does not believe his role is to nitpick the language DEQ drafted in the Permit. Even without considering the yet-to-be-developed AMP, the hearing officer finds Section 2.7 of the Permit to adequately require Perpetua to preclude access by the general public for the purpose of excluding the access road from the definition of "ambient air."

Therefore, the Petitioners' motion for summary judgment as to Claim Nos. 11 and 12 is hereby DENIED, and the summary judgment motions filed by DEQ and Perpetua as to Claim Nos. 11 and 12 are hereby GRANTED.

D. Lack of Requirements for Ongoing Ambient Air Monitoring (Claim No. 13)

The Permit contains a variety of provisions requiring Perpetua to take actions to minimize air pollution. Section 1.2 and Table 1.1 identify and categorize the various discrete activities that will take place throughout the SGP and identify the pollution "control equipment" required for each individual activity. (R., at pp. PET 003-007.) The Permit also contains facility-wide requirements to control fugitive dust, visible emissions, and odors. (R., at pp. PET 008-011.). The Permit also contains several monitoring and recordkeeping requirements. Generally applicable requirements to the SGP appear in Section 7.10, which states:

> The permittee shall maintain sufficient records to ensure compliance with all of the terms and conditions of this permit. Monitoring records shall include, but not be

> limited to, the following: (a) the date, place, and times of sampling or measurements; (b) the date analyses were performed; (c) the company or entity that performed the analyses; (d) the analytical techniques or methods used; (e) the results of such analyses; and (f) the operating conditions existing at the time of sampling or measurement. All monitoring records and support information shall be retained for a period of at least five years from the date of the monitoring sample, measurement, report, or application. Supporting information includes, but is not limited to, all calibration and maintenance records, all original strip-chart recordings for continuous monitoring instrumentation, and copies of all reports required by this permit. All records required to be maintained by this permit shall be made available in either hard copy or electronic format to DEQ representatives upon request.

(R., at p. PET 040).

The same "General Provisions" portion of the Permit contains multiple reporting requirements. (*See* R., at pp. PET 041-042.) In addition, the portion of the Permit applicable to fugitive dust contains several monitoring and recordkeeping requirements. (*See* R., at pp. 008 (§ 2.2), 011 (§ 2.10), and 012-014 (§ 2.20).) Moreover, the Permit incorporates several portions of the Code of Federal Regulations, including 40 C.F.R. Part 60, Subpart A (General Provisions), which includes requirements related to recordkeeping (40 C.F.R. § 60.7), monitoring (40 C.F.R. § 60.13), and reporting (40 C.F.R. § 60.19.) (*See* R., at p. PET 014 (§ 2.22).)

The Permit does not require ongoing monitoring of the quality of the ambient air while the SGP is operating. The Petition alleges that "without ambient air monitoring, it will be impossible for DEQ to assess whether the SGP's operation is in compliance with NAAQS and TAPs increments at any given time." (Pet., ¶ 68). Air Rule 211.01(d) expressly authorizes—but does not require—DEQ to include reasonable ambient air monitoring requirements in a permit-to-construct. Therefore, the question is whether it was arbitrary, capricious, or an abuse of discretion for DEQ not to require ongoing ambient air quality monitoring.

Recognizing that ambient air quality monitoring is not legally required in all cases, Mr. Schilling describes the circumstances in which ambient air quality monitoring is typically

appropriate. These include situations in which (1) "postconstruction air quality is projected to be so close to the NAAQS that monitoring is needed to certify attainment;" (2) "uncertainties in source or emissions characteristics result in significant uncertainties about the projected impact of the source or modification; and (3) when there are nearby sensitive receptors such as hospitals and schools. (*See* Schilling Decl., pp. 14-19.) According to Mr. Schilling, DEQ normally utilizes very conservative assumptions that overstate emissions in order to ensure NAAQS compliance is achieved. Upon discovery that a non-conservative figure for median silt content was used during the evaluation of Perpetua's Permit application, Mr. Schilling testifies:

> The options at this point were: 1) recalculate PM_{10} emissions from haul roads using a more conservative statistic for road silt than the median value, then revise the air impact modeling analyses; 2) require post construction ambient air monitoring to increase the assurance of NAAQS compliance; 3) use the 4.0 percent silt value as a maximum allowable value in the permit, requiring periodic monitoring of the road silt content during mining operations; and/or 4) develop other means by which lower levels of fugitive emissions from vehicle traffic could be attained and assured through monitoring (monitoring other than ambient air monitoring).
>
> Requiring ambient air monitoring for the SGP was discussed within the Air Division, including stationary source staff, ambient monitoring staff, and State Implementation Plan (SIP) staff. From the perspective of air permit modeling verification, I believe the requirement of PM_{10} ambient air monitoring to assure NAAQS compliance is of limited value for the SGP because of the following:
>
> - Monitored values showing compliance with the NAAQS only demonstrates compliance for that point in space and time. While a monitored exceedance likely indicates a failure to adequately control emissions (unless the exceedance may be caused by elevated background concentrations), compliance doesn't assure compliance at other ambient air locations.
>
> - Selecting a single monitoring location to represent worst-case impacts is nearly impossible. In general, atmospheric dispersion models perform reasonably well at predicting the magnitude of maximum impacts (provided the inputs of emissions and emission release parameters is reasonably accurate); however, they perform poorly at predicting the location of maximum impacts in most cases. The accuracy of predicted locations of maximum impacts is even worse for analyses involving complex terrain, complex meteorological conditions, and emission sources involving atypical release characteristics (fugitive emissions from vehicle traffic, blasting

operations, ore handling, *etc*.). Monitoring results that show compliance with NAAQS may portray a false confidence of NAAQS compliance on a facility-wide scale.

- No sensitive receptors have been identified near the facility. Sensitive receptors are locations where there is likely to be a concentration of the general public present. These include private residences, schools, hospitals, care centers, retail stores, parks, and resorts. DEQ believes the confidence of NAAQS compliance must be higher at these locations than at locations where there is a lower probability of public exposure. Ambient air monitoring at these locations can provide the additional assurance that air pollutant impacts from a neighboring industry will not violate standards and impact the health of the general public at sensitive receptor locations.

After internal discussions, Option 3 was selected, changing the 4.0 percent silt content limit from the median value to a maximum value. If the required sampling and testing of road material indicates a maximum silt content above 4.0 percent, it will be a permit violation. The permittee must then work with DEQ to develop a way to further reduce emissions, adjust operations, and/or revise impact analyses to enable NAAQS compliance to be demonstrated. This would likely require a permit modification.

(Schilling Decl., pp. 18-20.)

In addition, Mr. Simon testifies as follows:

DEQ did consider the option of requiring a PM_{10} ambient air monitor in the PRI PTC. In considering this option, staff reviewed DEQ's history of decisions requiring ambient air monitors in permits. Where DEQ did require an ambient monitor in a permit, the facility had already been in operation for many years and there was a recent modeled NAAQS (National Ambient Air Quality) violation. In these cases, DEQ negotiated with the facility to site and operate an ambient air monitor and develop a corrective action plan for the facility. This allowed the facility to monitor air quality while it made process changes and modified its permit to demonstrate a return to NAAQS compliance. Once the changes were implemented or approved, the facility would then demonstrate NAAQS compliance through modeling analysis. The monitor was eventually removed from their respective permits. In these few situations, DEQ never had an ambient air monitored violation.

In all cases where DEQ processed a PTC application for a new or modified facility, DEQ required the applicant to demonstrate NAAQS pre-construction compliance using DEQ's approved modeling procedures as outlined in the 'State of Idaho Guideline for Performing Air Quality Impact Analysis.' DEQ will not issue a final PTC if the applicant has not demonstrated pre-construction NAAQS compliance to the satisfaction of the Department.

> DEQ also considered the location of the proposed PRI facility, the proximity of nearby residences and the implementation costs of requiring an ambient monitor. Given all of these factors, DEQ ultimately decided not to require an ambient air monitor in the permit. DEQ did reach out to PRI prior to final PTC issuance to see if they would voluntarily install an ambient monitor but declined at that time.

(Simon Decl., pp. 10-11.)

DEQ recognized that whether to require ambient air quality monitoring is within its discretion, and Schilling and Simon describe a reasoned, logical explanation for why DEQ did not require such monitoring in this case. This is unrebutted expert testimony on an issue that is not within the common knowledge of a layperson. The Petitioners identify various ways NAAQS violations could occur hypothetically, but these are arguments in a brief. Without expert testimony explaining why monitoring should have been required in this case, the hearing officer lacks discretion to find that DEQ committed error by not requiring ambient air quality monitoring.

Based on the foregoing, the Petitioners' motion for summary judgment as to Claim No. 13 is hereby DENIED. The motions for summary judgment filed by DEQ and Perpetua as to Claim No. 13 are hereby GRANTED.

E. Reliance on Plans Instead of Enforceable Limitations on Three Variables Affecting Control of PM_{10} Emissions (Claim No. 1)

The Petition asserts error occurred because "important variables affecting the quantity of PM_{10} generated by the ore haul trucks are not directly limited and enforceable as PTC permit conditions." (Pet., ¶ 36). More specifically, even though Perpetua used multiple "[c]ritical variables…as inputs to PM emission calculations," the Petition argues DEQ erred by "rel[ying] on a surrogate limit in the PTC…and on plans[6] that have not yet been developed," "[i]nstead of developing PTC conditions for these other critical variables." (Pet., ¶¶ 36-37). According to the

[6] These are the Fugitive Dust Control Plan and the Haul Road Capping Plan.

Petition, the three "critical variables" lacking relevant Permit conditions are the average empty weight of ore haul trucks, the average loaded weight of ore haul trucks, and the total number of vehicle miles traveled by ore haul trucks.[7] (*See* Pet. ¶ 36). Without enforceable limitations on those three variables, Petitioners argue "DEQ could not reasonably claim when it issued the Permit that the facility will not cause or contribute" to violations of applicable air quality standards. (Mem. in Supp. of MSJ of 4/14/23, p. 24.)

Petitioners do not point to an Air Rule specifically requiring every modeling input and variable to be the subject of a specific permit condition or limitation. Therefore, this issue is governed by Air Rule 210.01, which provides DEQ with discretion to impose reasonable conditions on a permit to construct. The inquiry here is whether it was arbitrary, capricious, or an abuse of discretion for DEQ not to include Permit conditions specifically regulating the average empty weight of ore haul trucks, the average loaded weight of ore haul trucks, and the total number of vehicle miles traveled by ore haul trucks. On this issue, Mr. Simon testifies:

> In reviewing the mean vehicle weight variable used in calculating haul road emissions, PRI proposed the use of 20 large Cat 789D mining trucks and 12 smaller CAT 740B dump trucks. PRI stated that the ratio of large to small trucks would be 20:12. Mean vehicle weight used in the calculation for haul road emissions include the total mean vehicle weight from fully loaded trucks. ***Rather than developing a methodology in the permit to measure and determine average vehicle weight each day, DEQ developed a haul road usage limit of 180,000 tons of ore and development rock per day (PTC condition 3.5). This limit accounts for the average loaded vehicle weight of all trucks as well as the average round-trip distance traveled as presented in the application***. The monitoring methodology required to measure daily ore and development rock hauling is addressed in the required Operations and Maintenance Manual (PTC condition 2.20).

(Simon Decl., p. 9 (emphasis added).)

This is unrebutted testimony from an expert witness on an issue that is not within the

[7] The Petition acknowledges that an enforceable Permit condition was included for silt content of haul roads.

common knowledge of the layperson. On its face, this is a reasonable explanation that is consistent with DEQ's response to comments:

> Enforceable monitoring, recordkeeping, and reporting [MMR] requirements were established in the permit. $PM/PM_{10}/PM_{2.5}$ emissions limits for point sources were established with supporting activity rate limits and MRR requirements. ***While emissions limits and emission factors are not commonly included in the permit for fugitive sources, activity rate limits and MRR requirements were established for those sources that were identified as process rate-limiting (as summarized in Table 1.1 of the permit). These activity rate limits serve as surrogate emissions limits for PM, PM_{10}, $PM_{2.5}$, HAP and TAP from fugitive sources***. And while documented in the Statement of Basis and application materials, underlying parameters associated with calculating emissions such as vehicle speed limit, type, and miles traveled are not typically included in the permit ***but can be found in the application materials*** (Appendix A).

(R., at p. PET 557 (emphasis added).)

In other words, due to the nature of fugitive emissions, DEQ chose to control those emissions by limiting the amount of ore and development rock that can be hauled per day, with both a daily haulage limit and a limit on the five-year rolling average of daily haulage. (*See* R., at p. Pet 019 (Permit § 3.5).) If the representations of vehicle weights and miles traveled in Perpetua's application materials end up being materially different from reality, those discrepancies will be well documented via the various plans, monitoring, and reporting required by the Permit, and DEQ will have enforcement capabilities pursuant to Air Rules 123, 125, and 202 and Idaho Code Sections 39-105, 39-108, and 39-109.

Based on the foregoing, the hearing officer hereby DENIES Petitioners' motion for summary judgment as to Claim No. 1. The motions for summary judgment filed by DEQ and Perpetua as to Claim No. 1 are hereby GRANTED.

F. Assumption of Control of 93.3% of PM10 Emissions Without Related Enforceable Conditions (Claim No. 2)

Section 3.1 and Table 3.2 of the Permit provide in pertinent part:

Table 3.1 contains a description of control equipment used to control emissions from mining and ore processing activities.

Table 3.1 Mining and Ore Processing Control Device Descriptions

Emission Sources	Control Devices
Mining	
Excavating and hauling activities	Reasonable control & FDCP Chemical suppression and water sprays ***Control efficiency: 93.3% for PM/PM10 (haul roads)*** Haul road capping with low-arsenic quartzite

(*See* R., PET018 (emphasis added).)

The Petition asserts error occurred because "DEQ assumed 93.3% of all haul road PM_{10} emissions from the SGP can be controlled by using an unspecified combination, volume, and frequency of water sprays and chemical dust suppressants" without also including "specific and enforceable permit conditions within the PT to ensure a 93.3% control efficiency." (Pet. ¶¶ 38-39). According to the Petition, "[a] lesser control efficiency, even just slightly lesser, could result in large enough PM_{10} emissions to violate the NAAQS." (*Id*. at ¶ 39).

On summary judgment, the Petitioners further elaborate on these three distinct but related points: First, DEQ's assumption that Perpetua can achieve 93.3% control efficiency is without an adequate basis. Second, DEQ's assumption that Perpetua can achieve 93.3% control efficiency is aggressive because "[i]t is challenging to consistently and continuously achieve 93.3 percent control." (Tr. of 9/21/23 at 67:10-14.) According to Petitioners, this provides only a "razor thin" margin of error, such that if the 93.3% figure is not achieved, violations of the NAAQS will necessarily result. (Tr. of 9/21/23, 66:13.) Third, given the first two points, it was error for DEQ not to include more specific requirements to ensure 93.3% control efficiency is achieved.

1. Without Adequate Basis

As to the first point, it is helpful to note that the 93.3% control efficiency figure is based on two separate assumptions regarding the control efficiency for chemical suppressants and the control efficiency for water. Regarding the control efficiency for chemical suppressants, Simon explains:

> PRI's consultant, Air Sciences, Inc., provided information in their application from their research of AP-42: Compilation of Air Emission Factors, Section 13.2.2, emission factors for unpaved roads (EPA 2006). According to AP-42, test studies on various unpaved industrial roads where chemical dust suppressants were applied documented a range from 90 to 99 percent dust control efficiency for PM_{10}. Based on this data, PRI proposed to use a 90% dust control efficiency for PM_{10} when utilizing chemical dust suppressants on unpaved roads.

(Simon Decl., pp. 5-6.)

Regarding the control efficiency for water, Simon explains:

> In addition to using the chemical dust suppressant, controlled PM_{10} emission calculations for unpaved haul roads also incorporate the control efficiency for water. For annual dust control from water, AP-42 accounts for this in an equation that uses annual precipitation data. When using the 120 days of precipitation obtained from AP-42 section 13.2.2, the precipitation term accounts for natural mitigation in calculating the annual unpaved road emissions. Staff reviewed and approved this methodology. The daily unpaved road emission calculations use an applied water control efficiency of 33%. This value was supported by permit staff based on an evaluation of figure 13.2.2-2 of AP-42 for water control effectiveness on unpaved roads.

(Simon Decl., p. 8.)

Stated in layman's terms, the 93.3% control efficiency is essentially calculated as follows: Chemical dust suppressants will control 90% of the dust emissions from unpaved roads, and water will control 33% of the remaining uncontrolled 10%. (*See generally* R., at pp. PET 551, 557-558.)

DEQ has adduced expert testimony explaining the basis for the 93.3% control efficiency figure, an issue not within the common knowledge of the layperson. The Petitioners have not offered expert testimony to rebut it. At oral argument, the Petitioners cited to the EPA Letter. However, the hearing officer has ruled the EPA Letter cannot be relied on as a proxy for expert

testimony, in part because EPA is not a party and therefore not subject to cross-examination. Without admissible expert testimony, under *Greenfield*, the hearing officer must affirm DEQ's action unless there is some obvious flaw in DEQ's reasoning. Seeing none, the hearing officer finds DEQ's adoption of the 93.3% control efficiency figure adequately supported.

2. Razor Thin Margin

As to Petitioners' second point, again, Mr. Simon has testified that the 90% control efficiency assumption for chemical suppressants is on the low end of the 90-99% range identified in AP-42. Mr. Schilling testifies:

> Late in the review process, PRI determined that the West End Development Rock Storage Facility will not be constructed, thereby eliminating the modeling operational scenario W5. Scenario W5 was the scenario where modeled exceedances of the 24-hour PM_{10} NAAQS were shown when using the BULKRN-processed meteorological data. When Scenario W5 is removed, the highest impacting operational scenario is W3, which represents the transport of development rock from the West End Pit to the Hanger Flats Development Rock Storage Facility. Maximum impacts still slightly exceed the NAAQS when using a single value background concentration value, ***but are well below NAAQS when seasonal backgrounds are used*** (82% of the NAAQS at 123.5 μg/m3).

(Schilling Decl., pp. 17-18 (emphasis added).)

Mr. Schilling further testifies that DEQ's modeling group did not learn until later in the review process that a non-conservative assumption of 4.0% silt content of the road surface was used in the modeling. Because he believed "NAAQS compliance could not be assured at a sufficiently high confidence level…even though there are other areas of the analyses that are very conservative," Mr. Schilling adopted 4.0% as the maximum allowable silt content value. (Schilling Decl., pp. 17, 19.) That limitation is in Section 3.13 of the Permit, (R., p. PET020), and "[i]f the required sampling and testing of road material indicates a maximum silt content above 4.0 percent, it will be a permit violation." (Schilling Decl., p. 19.)

To support their argument that 93.3% control efficiency provides only a "razor thin" margin

of error, the Petitioners rely on assertions by counsel and isolated references in the permitting record and the EPA Letter. By contrast, DEQ has adduced expert testimony describing multiple ways in which conservativism was utilized in the modeling and permit-writing process. In the absence of expert testimony to the contrary, the hearing officer finds DEQ's explanations reasonable.

3. Failure to Include More Specific Requirements to Ensure Compliance

Petitioners argue, "[t]he error is that there is…no 93.3 percent enforceable limitation or there is no other limitations that reasonably assure" 93.3% control is achieved. (Tr. of 9/21/23 at 67:24-68:2.) However, as to the first argument, as previously referenced, the Permit includes a specific requirement that 93.3% control efficiency be achieved. As to the second argument, the Petitioners do not cite to any legal standard requiring additional requirements or otherwise explaining how the existing Permit provision is legally inadequate. Moreover, the Petitioners have not offered expert testimony describing the terms they believe are necessary to ensure compliance. Without these, and given the presumption in favor of agency action on technical issues, the hearing officer finds no basis to conclude DEQ committed error.

4. Summary and Conclusion as to Claim No. 2

For the foregoing reasons, as to Claim No. 2, the hearing officer hereby DENIES the Petitioners' motion for summary judgment and GRANTS the motions filed by DEQ and Perpetua.

G. Reliance on Plans Instead of Enforceable Monitoring and Recordkeeping Requirements (Claim No. 3)

Developing enforceable emissions limitations for a mining operation can be challenging. DEQ's air quality regulations have been developed "to primarily regulate well-defined, consistent pollutant-emitting processes," such as manufacturing operations. (*See* Schilling Decl., p. 8.) Mining operations, by contrast, involve "numerous operational phases, each with different emission generating activities and a different magnitude of emission quantities, occurring at different locations

at the site and at differing times." (*Id*.) Therefore, as previously discussed with respect to Claim No. 1, for mining operations, emissions limitations often take the form of limitations on ***activities*** that generate air emissions, rather than on the concentration of pollutants in those emissions.

One such activity limitation appears in Section 3.5 of the Permit, which states that Perpetua shall not haul more than 180,000 tons per day of ore and development rock. (R., at p. PET 019.) Section 3.16, in turn, states:

> Each day, the permittee shall monitor and record the amount of ore and DR [development rock] transported on haul trucks (T/day). The devices and methodologies used to measure weights shall be identified in the O&M Manual.
>
> Each calendar month, the permittee shall monitor and record the amount of ore and DR transported on haul trucks in tons per month (T/mo) and in tons per year (T/yr). Annual amounts of ore and DR transported shall be determined by summing the monthly amount over the previous consecutive 12-month period. The annual amounts of ore and DR transported shall be used to calculate the 5-year rolling average in T/day.

(R., at PET 020.)

The "O&M Manual" is governed by Sections 2.20 and 2.21 of the Permit. (*See* R., at pp. PET 012-013.) Perpetua is required to submit the O&M Manual to DEQ for review and approval at least 30 days prior to the startup of emissions-generating activities. (*Id*.)

The Petitioners assert that DEQ's reliance on an O&M Plan to be developed in the future constitutes error. According to Petitioners, "[t]he O&M Manual is critical to ensuring the 180,000 tons per day hauling condition is satisfied, and the 180,000 tons per day is critical to DEQ's determination…that the SGP will not exceed the NAAQS." (Am. Pet. of 1/11/23, ¶ 40; *see also* Pets.' Opening SJ Br. of 4/14/23, pp. 28-31.)

1. Claim No. 3 Has Already Been Dismissed

The hearing officer issued an order formally dismissing Claim No. 3 on November 15, 2022. (*See* Order on Mot. to Dismiss of 11/15/22, pp. 11-12.) The Petitioners then filed their Motion to

File First Amended Petition on December 6, 2022, which the hearing officer granted on January 6, 2023. The Petitioners described the intent of that motion as "merely…to correct deficiencies the Hearing Officer found with respect to some claims and to provide additional detail and clarity regarding each claim being pursued in this contested case…." (Mot. to File Am. Pet. of 12/6/22, p. 3.) That motion did not contain any express references to Claim No. 3.

The Petitioners formally filed their Amended Petition on January 11, 2023. The Amended Petition added some additional content to Paragraph 40, the portion of the original Petition most closely associated with Claim No. 13. But, it did not otherwise reference Claim No. 3 or request the hearing officer to take any action regarding Claim No. 3.

Generally speaking, when a judge or hearing officer renders a formal, written decision on an issue, that ruling is then the established "law of the case" for the remainder of the proceeding. The only way to reverse a prior ruling is to formally ask the judge or hearing officer to reconsider that prior ruling. Indeed, DEQ actively decided not to advance further argument regarding Claim No. 3 on summary judgment because it understood the claim had been dismissed. (*See* DEQ Resp. and Br. in Supp. of MSJ of 5/12/23, p. 16.)

The Petitioners did not accompany either their December 6, 2022 motion to amend or their Amended Petition with any formal request to re-visit the dismissal of Claim No. 3. Neither of those filings specifically reference Claim No. 3. In this regard, it is helpful to recall that the Amended Petition contains 30 pages of lengthy, detailed allegations. It is unrealistic to expect adding a few additional sentences to an allegation within a 30-page pleading to adequately inform the hearing officer and BEQ of a belief that a claim has been automatically revived, in spite of a prior formal ruling dismissing it. In this regard, it is helpful to recall that, even though the standards for amending pleadings are easily met, amending a pleading still requires approval; it is not done "as of

right." *See* BEQ R.PROC. 003.05; AG R.PROC. 305.

For the foregoing reasons, the hearing officer finds that Claim No. 3 was not revived simply by the filing of the Amended Petition.

2. Summary Judgment in Favor of DEQ and Perpetua on Claim No. 3 Is Appropriate

If BEQ finds the Petitioners adequately revived Claim No. 3, it will be more efficient for this order to have also addressed the substance of the claim, particularly given that the Petitioners and Perpetua briefed it on summary judgment.

Air Rule 202 identifies the information a permit applicant is required to provide to DEQ. Once DEQ has determined the application is sufficiently complete to be evaluated, Air Rule 209 describes the procedures for evaluating the application and developing the permit. These include a requirement to solicit public comment. When DEQ is preparing the permit, Air Rule 211.01 states that DEQ "may impose any reasonable conditions upon an approval [of a permit to construct]," including conditions related to sampling, monitoring, and recording emissions data.

The Petitioners assert that DEQ's deferring aspects of emissions monitoring and recordkeeping requirements to an O&M Plan that has not yet been developed was error and did not satisfy DEQ's responsibilities under Air Rules 202, 209, and 211.01 and related federal air quality statutes and regulations. The hearing officer is not aware of any outright prohibition of this practice, and the language of Air Rule 211.01 provides DEQ with wide discretion regarding appropriate permit terms. Therefore, stated in terms of applicable standards, the question is whether DEQ's reliance upon plans to be developed in the future was arbitrary, capricious, or an abuse of discretion.

As previously referenced, the Permit already contains requirements to monitor and record the tonnage of ore and development rock transported. What the Permit defers until later in the O&M Manual are "[t]he devices and methodologies used to measure weights…." (R., at PET 020.) On

this issue, Mr. Simon testifies as follows:

> It is common for the permit program to require certain plans, such as an O&M manual or FDCP to be prepared by the permittee post permit issuance. This allows the permittee to prepare a specific plan or manual based on ***the actual equipment purchased and installed, the manufacturer's instructions and recommendations, as well as the operational characteristics of the facility after construction is completed***. DEQ uses its authority to require a permittee to develop and submit for DEQ approval Plans and Manuals in accordance with IDAPA 58.01.01.211.01 as reasonable permit conditions.

(Simon Decl., ¶ 10 (emphasis added).)

This is a logical explanation for deferring identification of the "devices and methodologies" until later. Given that (a) there is a requirement in the Permit to monitor and record the amount of ore and development rock transported, and (b) the Petitioners have not offered expert testimony explaining how deferring identification of the specific "devices and methodologies" until later could be arbitrary, capricious, or an abuse of discretion, the hearing officer lacks discretion to conclude that DEQ committed reversible error.

Based on the foregoing, as to Claim No. 3, the hearing officer hereby DENIES the Petitioners' motion for summary judgment and GRANTS the motions filed by DEQ and Perpetua.

H. Assumption of 120 Days of Recordable Precipitation Data Instead of Use of Local Weather Data (Claim No. 5)

The Petition alleges that (1) "[d]ays of recordable precipitation is an important variable affecting the SGP's emissions of PM_{10} from ore haul roads;" (2) "DEQ assumed there would be 120 days of recordable precipitation at the SGP" based on "general geographic guidance" instead of "local meteorological data;" and (3) "DEQ's failure to use the most representative site data…increases the risk of miscalculation of ore haul road emissions." (Pet., ¶ 41). The Petitioners moved for summary judgment on this issue, arguing:

> Rather than use available site-specific meteorological data to calculate fugitive dust emissions from haul roads, DEQ used a generic value in EPA guidance to assume

> that there are 120 days of recordable precipitation at the Project site. See PET 146; see also PET 805 (map). This was arbitrary and counter to DEQ guidance.
>
> For modeling ambient air impacts, Section 6.8 of DEQ's Guideline for Performing Air Quality Impact Analyses states: "The meteorological data used in the modeling analysis should be representative of the meteorological conditions at the particular site of the proposed construction or modification."

(Pets.' Br. ISO MSJ of 4/12/23, p. 25.)

That same DEQ guidance document goes on to state that, "[t]here are several sources of meteorological data besides on-site collected data." (R., at p. PET 746.) Ultimately, the relevance of this issue is that "precipitation can reduce fugitive dust emissions." (Pets.' Br. ISO MSJ of 4/12/23, p. 25.) In other words, a higher number of precipitation days per year is generally associated with lower expected fugitive dust emissions from the ore haul roads. In response, Mr. Schilling makes several important clarifications:

First, the 120 annual precipitation days is derived from EPA's AP42 guidance document, which includes a map for the entire United States that is contoured based on climatological data. According to Schilling, "[t]he resolution provided by the AP42 map is adequate to provide reasonably accurate emission estimation, well within the general uncertainty of the factor and other inputs…that can be taken to reduce emissions." (Schilling Decl., p. 13).

Second, the Taylor Ranch station raised by Petitioners "is over 40 kilometers from the SGP site, making it questionably more representative than the AP42 map." (*Id*.)

Third, "the Taylor Ranch data indicated there was an average of 113 [precipitation] days each year…effectively matching the 120-day value obtained from the AP42 map." (*Id*.)

Fourth, the onsite data from 2014 "indicates there were 155 [precipitation] days…." (*Id*.) In other words, use of the onsite data (which has 35 more precipitation days than the AP42 figure) presumably would have lowered expected emissions substantially more than the heightened expected

emissions had the Taylor Ranch data (which has 7 fewer precipitation days) been used. Ultimately, DEQ did not use the 155-day figure because the "onsite data were only collected for one year," making it "questionable whether it can be considered more representative than the AP42 map for typical conditions because of the year-to-year variability…." (Schilling Decl., p. 13.)

With these explanations, DEQ has satisfied its burden as a summary judgment movant and has shifted the burden to Petitioners to explain why the decision to utilize the 120 precipitation days figure from AP42 was arbitrary, capricious, or an abuse of discretion. Because the selection of proper precipitation data is not within the common knowledge of a layperson, expert testimony was required to rebut DEQ's expert testimony. "If an expert is qualified to render an opinion, based on his expertise in the subject, then he must be accorded substantial deference in the selection of data upon which he chooses to base his opinion." *Earl v. Cryovac, A Div. of W.R. Grace Co*., 772 P.2d 725, 728, 115 Idaho 1087, 1090 (App. 1989). In order to create a disputed, triable issue of material fact for a hearing on the merits, the Petitioners were required to adduce expert testimony explaining more specifically how DEQ's use of the AP42 figure could be error. Without such testimony, summary judgment in favor of DEQ and Perpetua is appropriate.

Therefore, as to Claim No. 5, the Petitioners' motion for summary judgment is DENIED, and the motions for summary judgment filed by DEQ and Perpetua are GRANTED.

I. Whether Errors in Estimating PM_{10} Emissions Result in Errors as to As Emissions (Claim No. 8)

Paragraph 54 of the Petition alleges:

> Second, because the underlying particulate and PM_{10} emissions estimates and particulate control assumptions are unreliable in numerous respects, as already discussed above, so too are the estimated arsenic emissions. The SGP's estimated arsenic emissions were based on its PM_{10} emissions. PM_{10} emissions from the SGP may be higher, and their control effectiveness may be lower, than DEQ assumed, in which case arsenic emissions would also be higher and might exceed the AACC [Acceptable Concentrations of Carcinogens].

(Pet. ¶ 54).

Because the hearing officer has granted summary judgment in favor of DEQ and Perpetua as to all of the alleged errors related to PM_{10} emissions as described above, the disposition of this particular claim is automatic. As to Claim No. 8, the motions for summary judgment filed by DEQ and Perpetua are hereby GRANTED, and the motion for summary judgment filed by the Petitioners is hereby DENIED.

J. Exclusion of Economic and Environmental Evaluations in T-RACT Analysis (Claim Nos. 6 and 7)

The Petition alleges DEQ's evaluation of "reasonably available control technologies" ("RACT") for the toxic air pollutant arsenic ("T-RACT") "contained no persuasive economic information and no discussion at all regarding associated environmental impacts" resulting from "Perpetua's decision to use water and chemical dust suppressants as compared to paving the haul roads, even though paving was shown to achieve the highest reasonable dust control efficiency." (Pet. ¶¶ 48, 53). According to the Petition, this violated Air Rule 210.14. T-RACT is defined in the Air Rules as:

> An emission standard based on the lowest emission of toxic air pollutants that a particular source is capable of meeting by the application of control technology that is reasonably available, as determined by the Department, considering ***technological and economic feasibility***. ***If control technology is not feasible, the emission standard may be based on the application of a design, equipment, work practice or operational requirement, or combination thereof.***

AIR RULE 210 (emphasis added).

The first step in the T-RACT process is for the applicant to "submit information to [DEQ] identifying and documenting which control technologies or other requirements the applicant believes to be T-RACT." AIR RULE 210.14(a). DEQ must then review the information submitted by the applicant and determine if it has proposed T-RACT "on a case-by-case basis" considering separate

factors for both technological feasibility and economic feasibility. AIR RULE 210.14(b), (c).

Based upon the T-RACT definition above, these feasibility determinations are relevant to whether the control technology is "reasonably available" for use by the applicant. For economic feasibility, DEQ must consider a non-exclusive list of factors, including costs of necessary mitigation measures, capital costs, cost effectiveness, and the difference in costs between the particular source and other sources, if any, that have implemented emissions reductions. AIR RULE 210.14(d). For technological feasibility, the Air Rules specifically require DEQ's evaluation to include consideration of "[t]he environmental impacts caused by the control technology that cannot be mitigated, including, but not limited to, water pollution and the production of solid wastes." AIR RULE 210.14(c)(ii). "If [DEQ] determines that the applicant has proposed T-RACT, [it] shall determine which of the options, or combination of options, will result in the lowest emission of toxic air pollutants, develop the emission standards constituting T-RACT and incorporate the emission standards into the permit to construct." AIR RULE 210.14(e).

The Simon Declaration describes DEQ's five-step process for determining T-RACT:

1. Identify all available control options.

2. Eliminate technically infeasible options.

3. Rank remaining control technologies.

4. Consider the energy, environmental, and economic impacts.

5. Select the most effective control technology not eliminated in Step 4.

(Simon Decl., pp. 11-12.)

While these five steps do not necessarily repeat the language of Air Rule 210.14 verbatim, they are not inconsistent with it either. Given the deference given to an agency in interpreting its rules, the hearing officer has no basis to question this five-step process. According to Simon:

> In reviewing T-RACT analysis for haul roads, PRI identified the following possible control options:
>
> 1. Paving roads
>
> 2. Application of chemical dust suppressants and water
>
> Paving haul roads was determined to be technically infeasible by PRI and permit staff because paving is not feasible for mining roads utilizing very heavy trucks which would exceed the design limitations of paving.

(Simon Decl. of 5/12/23, p. 13.)

More specifically, Perpetua submitted information indicating that paved haul roads would only be capable of supporting vehicles with weights up to 10 tons. (R., at p. PET 547.) However, Perpetua's loaded haul trucks will weigh between 60 tons and 260 tons. (*Id*.) The Petitioners do not rebut Mr. Simon's explanation for elimination of paving as technically infeasible with their own expert testimony that it is feasible. On its face, Mr. Simon's explanation is otherwise reasonable and supported by the record. Therefore, elimination of paving as T-RACT was not error.

The next question is whether it was error for DEQ not to evaluate the environmental impacts of the control technology that was chosen, a combination of chemical dust suppressants and water. This is where a careful reading of the language of Air Rule 210.14 in connection with the definition of T-RACT is important.

According to the language of the rules, evaluation of environmental impacts occurs specifically within the context of evaluating technological feasibility. The purpose of evaluating both economic feasibility and technological feasibility is to determine whether a particular control technology is "reasonably available." According to Mr. Simon, the combination of chemical dust suppressants and water is already known by DEQ to be "reasonably available" because:

> Application of chemical dust suppressants and water is an effective dust control method which is a common control technology for unpaved haul roads. Magnesium chloride and water combinations are widely used and effective dust suppressant by

> state, county, and industrial unpaved roadways. DEQ is not aware of any negative environmental impacts as long as the operators apply the dust suppressant according to manufacturer's recommendations.[8]

(Simon Decl., p. 13.)

This issue is not within the common knowledge of the layperson. Mr. Simon's declaration is unrebutted expert testimony that is otherwise reasonable, so there is no basis for the hearing officer to find that DEQ's decision lacked adequate basis. Without the ability to establish factual error, the Petitioners can establish error only by demonstrating that DEQ's T-RACT process violated the plain language of the Air Rules.

In this regard, Petitioners argue DEQ's reliance on its pre-existing knowledge regarding the availability of chemical suppressants and water as dust control technology violated the requirement to determine T-RACT on a "case-by-case basis" under Air Rule 210.14. In effect, Petitioners argue DEQ must ignore what it already knows about the availability of chemical suppressants and water as a control technology and determine anew that it is "reasonably available." It is also notable that, elsewhere in the Air Rules, "suitable chemicals" are specifically recognized as a "reasonable precaution" for controlling dust from dirt roads. *See* AIR RULE 651.02.

In addition to the requirement to defer to DEQ's interpretation of its rules, there is a canon of construction that disfavors absurd results. *See, e.g., Friends of Farm to Market v. Valley County*, 137 Idaho 192, 46 P.3d 9, 14 (Idaho 2002). To the hearing officer, interpreting the "case-by-case" language in Rule 210.14 to require DEQ to ignore Air Rule 651.02, ignore the technical knowledge it possesses as the entity with statutory responsibility to administer Idaho's air permitting programs, and to engage in a brand-new feasibility evaluation every time an applicant proposes a well-

[8] The Permit, in turn, requires that "[c]hemical dust suppressants shall be applied consistent with manufacturer's instructions and recommendations." (R., at p. PET 010.)

established control technology would be an absurd result. It is also notable that Air Rule 210.14 further defines what constitutes a "case-by-case" evaluation by stating "as follows" and then enumerating the T-RACT steps previously described. The Simon Declaration describes DEQ's process for evaluating the T-RACT information submitted by Perpetua pursuant to Air Rule 210.14. The hearing officer finds that explanation adequate to satisfy Rule 210.14.

Finally, it is helpful to recall that the Air Rules are concerned with the control of "air pollution," which is defined by statute as follows:

> The presence in the outdoor atmosphere of any air pollutant or combination thereof in such quantity of such nature and duration and under such conditions as would be injurious to human health or welfare, to animal or plant life, or to property, or to interfere unreasonably with the enjoyment of life or property.

IDAHO CODE § 39-103(2).

While this definition allows for regulation of pollution "injurious…to animal or plant life," it does so specifically within the context of pollutants that are "presen[t] in the outdoor atmosphere." The term "atmosphere" is not defined in the Air Rules, the Clean Air Act, or Black's Law Dictionary. The Clean Air Act does, however, define "air pollutant" as pollutants emitted into the "ambient air," a phrase this opinion has already discussed in detail. *See* 42 U.S.C. § 7602(g). The Petitioners allege:

> There will be water quality and biological impacts associated with Perpetua's use of substantial amounts of chemical dust suppressants and water that have not been considered in the PTC. For example, the use of chemical dust suppressants like magnesium chloride can cause toxicity in trees and can lead to tree death. Magnesium chloride is also known to adversely affect aquatic ecosystems. Moreover, the proposed water source for dust control is primarily water collected in runoff ponds (captured rain or snowfall that has become contaminated through the contact of mine facilities), groundwater, and surface water from the East Fork of the South Fork of the Salmon River. USGS sampling indicates elevated arsenic in these waters. The environmental impact of using magnesium chloride or arsenic-polluted water as dust suppression methods was never considered as part of the T-RACT demonstration.

(Pet. ¶ 53.)

The Petitioners may indeed have legitimate concerns regarding the impacts of chemical dust suppressants on trees and aquatic ecosystems, but this air permit proceeding is not the appropriate forum for them. The "air pollutant" at issue in the T-RACT determination is arsenic (not magnesium chloride) that is present in the "outdoor atmosphere" and "ambient air" (not bodies of water). The Petitioners' concerns on these issues are more appropriately raised through authorities such as IDAPA 58.01.02 (Water Quality Standards) and 58.01.05 (Rules & Standards for Hazardous Waste).

In short, the Petitioners have not established that DEQ's reliance upon existing knowledge of chemical suppressants and water as "reasonably available" control technologies was error. Based on the Simon declaration, DEQ has offered expert testimony and a reasonable explanation for its T-RACT analysis. Therefore, the Petitioners' motion for summary judgment as to Claims 6 and 7 is hereby DENIED, and DEQ's and Perpetua's motions for summary judgment as to Claims 6 and 7 are hereby GRANTED.

K. Averaging of Projected As Emissions (Claim No. 9)

The Petition alleges DEQ utilized "three improper averaging tactics: (1) averaging emissions over a 5-year period for the T-RACT input to ambient toxics modeling; (2) averaging the estimated annual ambient modeling impacts across two multi-year scenarios; and (3) averaging the resultant 16-year total emissions over the 70-year human lifetime to assert compliance." (Pet. ¶ 55.) According to the Petitioners, the Air Rules do not allow "multi-year emissions averaging" and instead require DEQ to "estimate the SGP's maximum 1-year annual arsenic emissions and compare it to the annual arsenic AACC" in Air Rule 586. (*Id.*) In effect, the Petitioners allege DEQ employed a "tactic" that is contrary to the plain language of the Air Rules.

All three sets of parties moved for summary judgment on this issue. Before discussing the

motions, it will be helpful to summarize the relevant Air Rules. The starting place is Air Rule 203:

> No permit to construct shall be granted for a new…stationary source unless the applicant shows to the satisfaction of the Department all of the following:
>
> ***
>
> **Toxic Air Pollutants.** ***Using the methods provided in Section 210***, the emissions of toxic air pollutants from the stationary source…would not injure or unreasonably affect human health or animal life or vegetation ***as required by Section 161***. Compliance with all applicable toxic air pollutant carcinogenic increments and toxic air pollutant non-carcinogenic increments ***will also demonstrate preconstruction compliance with Section 161*** with regards to the pollutants listed in Sections 585 and 586.

AIR RULE 203.03 (emphasis added).

Section 161, in turn, provides:

> Any contaminant which is by its nature toxic to human or animal life or vegetation shall not be emitted in such quantities or concentrations as to alone, or in combination with other contaminants, ***injure or unreasonably affect human or animal life or vegetation***.

AIR RULE 161 (emphasis added).

The use of the phrase "will also demonstrate preconstruction compliance" in Section 203.03 effectively creates two regulatory paths. First, the applicant and DEQ can use "the methods in Section 210" to show that emissions will not "injure or unreasonably affect human or animal life or vegetation." Section 210, in turn, consists of six-and-a-half pages of detailed, technical, complex regulations, and any attempt by the hearing officer to summarize Section 210 in a manner that is both useful and accurate would be an exercise in futility. Regardless, the relevant legal standard—"injure or unreasonably affect"—is not further defined within the Air Rules.

Effectively, the second path—compliance with Sections 585 and 586—provides applicants with a safe harbor. If an applicant demonstrates "[c]ompliance with all applicable toxic air pollutant carcinogenic increments and toxic air pollutant non-carcinogenic increments…with regards to the

pollutants listed in Sections 585 and 586," then satisfaction of Section 161 is automatic and application of the "injure or unreasonably affect" standard unnecessary. Section 586, in turn, identifies "acceptable ambient concentrations" (AACCs) for a variety of pollutants, including "arsenic compounds." According to the plain language of that Rule, these AACCs are expressed as "annual averages." For arsenic compounds, the applicable AACC is $2.3E^{-04}$ $\mu g/m^3$. So, if an applicant can demonstrate arsenic emissions will not exceed that AACC, then the Section 203.03 analysis for arsenic is over. As a matter of law, the legal standard of Section 161 is satisfied.

While out of sequence with the order of the motions filed, it is helpful to begin with a discussion of the summary judgment motions filed by DEQ and Perpetua. Broadly speaking, DEQ provides the factual background regarding its decision-making process on this issue through the Schilling Declaration, and Perpetua's briefing includes a "deep dive" into the language of the relevant and complex Air Rules.

According to Mr. Schilling, DEQ analyzed Perpetua's application under Air Rule 210.12. (Schilling Decl., p. 10.) That section contains somewhat of a trade-off: If an applicant demonstrates it is utilizing T-RACT as pollution control technology for a particular toxic air pollutant, then it satisfies Section 161 if its modeled emissions for that toxic pollutant is less than 10 times the applicable AACC. *See* AIR RULE 210.12. This effectively creates another "safe harbor" that allows an applicant to demonstrate compliance with Section 161 through the quantitative standards in Section 586 instead of the qualitative toxicity standard. According to that Rule:

> If the source's…approved T-RACT ambient concentration at the point of compliance is less than or equal to the amount of the air pollutant that would contribute an ***ambient air cancer risk probability of less than one to one hundred thousand (1:100,000)***, no further procedures for demonstrating preconstruction compliance will be required for that toxic air pollutant as part of the application process.

AIR RULE 210.12(c) (emphasis added).

The preceding subsection explains that the "ambient air cancer risk probability of less than one to one hundred thousand (1:100,000)" is "equivalent to ten (10) times the applicable [AACC] in Section 586." AIR RULE 210.12(b). So again, if Perpetua's approved T-RACT ambient concentration for arsenic at the point of compliance is less than 10 times the AACC in Section 586, compliance with Section 161 is achieved as a matter of law.

Paraphrasing Mr. Schilling, DEQ determined that Perpetua proposed T-RACT for arsenic emissions and, therefore, evaluated modeled emissions under Air Rule 210.12 as described above. DEQ started with very conservative assumptions that overestimate emissions. Using those conservative assumptions, the modeling showed exceedances of the 10x AACC standard. As a result, he and DEQ then conducted a "refinement of exposure calculations to provide a more representative comparison to the AACC." (Schilling Decl., pp. 9-11.)

The issue here is that the AACCs are based on an assumed lifetime exposure to the relevant carcinogen over a 70-year period because for permitting and conservatism principles, DEQ normally assumes the project life will exceed that 70-year period. Clearly, if a project will only operate for 16 years and AACC compliance is still achieved, that is the end of the inquiry, because exposure to a carcinogen at a certain level for only 16 years cannot result in a higher cancer risk than exposure to the same carcinogen at the same level for 70 years. But, if a project will only operate for 16 years and AACC compliance is not achieved, that does not automatically mean that the cancer risk exceeds the 1 in 1,000,000,000 or 1 in 100,000 standards. This is because comparison of emissions that will only take place for 16 years to a standard that is based on an assumed 70-year exposure period is an "apples to oranges" comparison. Based upon his knowledge that the AACCs are based on a lifetime cancer risk over a 70-year period, Mr. Schilling and DEQ made a more refined exposure calculation that proceeds as follows:

First, they reviewed the 14 modeling scenarios provided by PRI for the 16-year period of operations. From this set of 224 data points, they chose the highest modeled concentration of arsenic emissions.

Next, they multiplied that highest annual concentration by the 16-year operational period to calculate a conservative figure for total arsenic emission exposure over the life of the mine.

Next, they divided that figure by the 70-year exposure period on which the AACCs are based.

Finally, they compared that figure to the AACC for arsenic. Because it was less than the AACC, DEQ concluded there was not an unreasonable risk or injury posed to human life. (*See* R., at pp. PET 332, 344; Schilling Decl., pp. 8-12).

The Petitioners may indeed be correct that DEQ's approach is not strictly consistent with Section 586. However, that is not the end of the inquiry. As previously described, and as DEQ and Perpetua correctly note, if strict compliance with the quantitative standards in Sections 585 and 586 is not achieved, then the applicable standard to be met is the qualitative one, that the toxic air pollutant "shall not be emitted in such quantities or concentrations as to alone, or in combination with other contaminants, ***injure or unreasonably affect human or animal life or vegetation***." AIR RULE 161 (emphasis added). Among other things, Mr. Schilling testifies as follows:

> The typical permitting approach is to use worst-case assumptions and data in a limited number of analyses that will confidently show that allowable operations, as described and limited in the permit and permit-required plans and procedures, cannot result in impacts that exceed applicable standards. When this approach is applied to mining operations, results of the impact modeling tend to greatly overstate actual impacts that will occur or even could occur.

> The number of TAP-applicable arsenic emission sources for the SGP was expanded late in the permit application review process, after it was determined that some sources had been incorrectly excluded from analysis as per Idaho Air Rules Section

210. The incorrect exclusion was confirmed by the DEQ Permit Writer, the DEQ Permitting Supervisor, and the DEQ Stationary Source Bureau Chief after considering comments received during a public comment period. Without completely reworking the complex and still very conservative approach used to assess carcinogenic TAP impacts, compliance could not be demonstrated using the typical approach outlined above. I then undertook the task of evaluating whether a more refined approach could be used to demonstrate compliance with TAP rules of Section 210.

A first step in refinement of impacts or adjustment of allowable impacts was to assure that reasonably available control technologies were used for all sources of arsenic. This level of control is referred to as T-RACT and its use in the evaluation of carcinogenic TAPs is described in Idaho Air Rules Section 210.12. If T-RACT is used to control emissions from sources, then the allowable impact is ten times that of the AACCs, corresponding to a lifetime cancer risk of 1 in 100,000. The AACC conservatively represents a long-term exposure (70 years) that would result in a 1 in 1,000,000 cancer risk.

***

A worst-case conservative but simplistic approach used for the SGP did not show compliance with the arsenic AACC, or even the AACC multiplied by a factor of ten to reflect the allowable impact when using T-RACT. ***DEQ then reviewed the basis for the AACCs to further evaluate refinement of exposure calculations to provide a more representative comparison to the AACC***. AACCs were established in Idaho Air Rules to protect against a project-caused lifetime excess cancer risk of more than 1-in-1,000,000, or 1-in-100,000 where T-RACT is used to control emissions from sources.

***

Although a lifetime risk is the benchmark, DEQ listed annual averages for the AACCs in Idaho Air Rules because that timeframe 1) is long enough to establish a good representation of long-term impacts for most sources requiring a permit, 2) is short enough to provide compliance assurance early in the life of the industrial operation, and 3) is convenient for compliance monitoring and reporting, providing a practically enforceable limit on operations. ***Use of an annual limit is not key to attaining a limit on the lifetime cancer risk; and, since a lifetime risk is the benchmark, use of annual averaged emissions to show compliance with the AACC on an annual basis could be unnecessarily restrictive where processes vary considerably year-to-year and have a project lifetime substantially shorter than 70 years, such as mining processes.***

PRI indicated that the SGP will have a 16-year maximum project lifetime. To calculate a project-based arsenic concentration representative of the project, appropriate for comparison to the AACC (based on a 70-year exposure), the modeled

impact was adjusted by the factor 16/70.

(Schilling Decl., pp. 9-11.)

Even if the 16/70 adjustment is not specifically authorized by Sections 210.12 and 586, the hearing officer finds Mr. Schilling's testimony adequate to support DEQ's decision under the qualitative standard of Section 161. Mr. Schilling recognizes that the over-arching legal standard is the toxicity standard in Section 161 and explains why strict compliance with standards expressed as annual limitations is not always necessary to satisfy that standard, particularly when the exposure period is considerably shorter than the assumed 70-year exposure period on which the AACCs are based. Overall, he provides a thoughtful and conservative approach to ensuring arsenic emissions will not exceed the 1-in-100,000 lifetime cancer risk standard when T-RACT is used.

The Schilling Declaration is unrebutted expert testimony on an issue clearly not within the common knowledge of the layperson. To be clear, the hearing officer understands and appreciates the Petitioners' argument that in applying the 16/70 exposure refinement, DEQ "assumed the cancer risk probability from high dose/short-term exposure was equivalent to low dose/long term exposure." (Pet.'rs' Resp. of 6/9/23, p. 44.) It is unclear to the hearing officer if "normalizing" arsenic exposure for a 16-year project in order to compare it to a health standard based on a 70-year lifetime exposure period is truly as simple as applying the 16/70 adjustment factor.

On the other hand, Petitioners do not question the accuracy of the 16-year operational period,[9] and it is illogical for this issue to turn solely on satisfaction of a standard that is based on a 70-year exposure period, when the permitted project is expected to operate for less than one-fourth

[9] It is worth noting that Air Rule 210.12(d) requires DEQ to "include emission limits and other permit terms for the toxic air pollutant in the permit to construct that assure that the facility will be operated in the manner described in the preconstruction compliance demonstration." To the extent Petitioners are concerned the 16-year mine life was not adopted as a limitation within the Permit, DEQ explains that the hauling limits in Permit Condition 3.6 acts as "a life of mine

of that time. Given the deference accorded to DEQ in the interpretation of its rules, the presumption DEQ acted reasonably, and the layers of conservatism built into the TAP evaluation process described by Mr. Schilling, without expert testimony from the Petitioners explaining why the 16/70 adjustment could cause injury to human life or is otherwise arbitrary, capricious, or an abuse of discretion, Petitioners have not sufficiently rebutted Mr. Schilling.

Based on the foregoing, the hearing officer hereby DENIES the motion for summary judgment filed by Petitioners as to Claim No. 9. The hearing officer hereby GRANTS the motions for summary judgment filed by DEQ and Perpetua as to Claim No. 9.

IV. SUMMARY, CONCLUSION, AND PRELIMINARY ORDER

The Petition alleges thirteen discrete errors. On November 15, 2022, the hearing officer dismissed Claim Nos. 3, 4, and 10, and partially dismissed Claim No. 8. As to the remaining claims, based on the foregoing, it is hereby ordered that:

The motion for summary judgment filed by Petitioners as to Claim Nos. 1, 2, 5, 6, 7, 9, 11, 12, 13, and the remainder of Claim No. 8 is hereby DENIED.

The motions for summary judgment filed by DEQ and Perpetua as to Claim Nos. 1, 2, 5, 6, 7, 9, 11, 12, 13, and the remainder of Claim No. 8 are hereby GRANTED.

To the extent the Amended Petition adequately revived Claim No. 3, the motion for summary judgment filed by Petitioners is hereby DENIED, and the motions for summary judgment filed by DEQ and Perpetua are hereby GRANTED.

All of the claims for relief asserted in the Petitioners' Amended Petition have now been resolved in favor of DEQ and Perpetua and against the Petitioners.

---

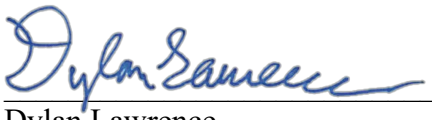
hauling and excavating limit." (R., at p. PET 597.)

V. RULE 730 NOTICE

Pursuant to Idaho Code Sections 67-5243 and 67-5245, BEQ Rule of Procedure 730, and AG Rule of Procedure 730:

This is a preliminary order of the Hearing Officer and will become final without further action of the Idaho Board of Environmental Quality unless any party appeals to the Board by filing a petition for review of the preliminary order.

Within fourteen (14) days of the service date of this preliminary order, any party may take exceptions to any part of this preliminary order by filing a petition for review of the preliminary order. Otherwise, this preliminary order will become a final order of the Board. The basis for review must be stated in the petition. The Board may review the preliminary order on its own motion.



If any party files a petition for review of the preliminary order, the Board will allow all parties an opportunity to file briefs in support of or taking exceptions to the preliminary order and may schedule oral argument in the matter before issuing a final order. The hearing coordinator will issue a notice setting out the briefing schedule and date and time for oral argument. The Board will issue a final order within fifty-six (56) days of receipt of the written briefs or oral argument, whichever is later, unless waived or extended by the parties or for good cause shown. The Board may hold additional hearings or may remand the matter for further evidentiary hearings if further factual development of the record is necessary before issuing a final order.

Pursuant to Idaho Code Sections 67-5270 and 67-5272, if this preliminary order becomes final, any party aggrieved by the final order or orders previously issued in this case may appeal the final order and all previously issued orders in this case to district court by filing a petition in the district court of the county in which: (1) a hearing was held; (2) the final agency action was taken;

(3) the party seeking review of the order resides or operates its principal place of business in Idaho; or (4) the real property or personal property that was the subject of the agency action is located.

This appeal must be filed within twenty-eight (28) days of this preliminary order becoming final. *See* IDAHO CODE § 67-5273. The filing of an appeal to district court does not itself stay the effectiveness or enforcement of the order under appeal.

Dated this 5th day of December 2023.

Dylan Lawrence
Hearing Officer

CERTIFICATE OF SERVICE

I hereby certify that on this 5th day of December 2023, I caused to be served a true and correct copy of the foregoing by the following method to:

Attorney for Save the South Fork Salmon

BEFORE THE BOARD OF ENVIRONMENTAL QUALITY
STATE OF IDAHO

IN THE MATTER OF AIR QUALITY PERMIT TO CONSTRUCT P-2019.0047	)	
	)	CASE DOCKET NO. 0101-22-01
NEZ PERCE TRIBE, IDAHO CONSERVATION LEAGUE, and SAVE THE SOUTH FORK SALMON	)	**AMENDED PETITION FOR REVIEW OF PRELIMINARY ORDERS**
Petitioners,	)	
v.	)	
IDAHO DEPARTMENT OF ENVIRONMENTAL QUALITY,	)	
Respondent,	)	
and	)	
PERPETUA RESOURCES IDAHO, INC.	)	
Intervenor.	)	

Petitioners Nez Perce Tribe, Idaho Conservation League ("ICL"), and Save the South Fork Salmon ("SSFS") hereby petition the Idaho Board of Environmental Quality (the "Board") for review of the October 31, 2023 Preliminary Order and the December 5, 2023 Amended Preliminary Order issued by the Hearing Officer in this matter. This Amended Petition for Review of Preliminary Orders is brought under Idaho Code §§ 67-5243(3), 67-5245(2) and IDAPA 58.01.23.730. The Preliminary Orders should be modified, amended, or revoked, and the Permit should be vacated and remanded to DEQ, based on the following errors:

1. The Hearing Office erred, factually and legally, in upholding DEQ's determination that Perpetua has legal control of the Stibnite Road Access Route such that the Route need not comply with ambient air quality standards;

2. In finding that Perpetua will preclude the general public from accessing locations within the ambient air boundary, the Hearing Officer lacked a reasonable factual basis and misapplied applicable regulations, policy, and guidance;

3. In the Preliminary Order, the Hearing Officer failed to decide Petitioners' claim that DEQ violated the Clean Air Act and applicable state and federal rules and regulations by allowing Perpetua to submit plans with important project details in the future—after Permit issuance and without public comment; and in the Amended Preliminary Order, the Hearing Officer erroneously found that this issue was not raised in the First Amended Petition to Initiate Contested Case and erroneously determined that, if this issue was raised, DEQ is allowed to let Perpetua develop the plans later;

4. The Hearing Officer erroneously determined that the Permit includes enforceable conditions that will achieve 93.3% dust control.

5. The Hearing Officer misinterpreted and misapplied applicable rules to uphold DEQ's decision to artificially dilute the ambient arsenic concentrations attributable to the SGP by 16/70;

Petitioners request that the Board set out a briefing schedule on this petition as required under IDAPA 58.01.23.730.03.

BACKGROUND

In this contested case, Petitioners challenge the Idaho Department of Environmental Quality's ("DEQ" or "Department") approval of a permit to construct (the "Permit") issued to Perpetua Resources Idaho, Inc. ("Perpetua") for the proposed Stibnite Gold Project ("SPG" or "Project"): a massive open-pit mine in Valley County, Idaho. As proposed, Perpetua would excavate 340 million tons of waste rock to mine and process approximately 100 million tons of ore, using 55 miles of haul truck routes over 16 years. Blasting, excavating, ore hauling, and other Project activities will emit air pollutants, including coarse particulate matter ("PM_{10}") and arsenic. PM_{10} and arsenic are regulated under the federal Clean Air Act and Idaho's air pollution regulations, because they can cause significant and severe health and environmental hazards.

On June 17, 2022, DEQ issued permit to construct ("PTC") P-2019.0047, which is the Permit at issue in this contested case. On July 22, 2022, Petitioners timely filed the original Petition to Initiate Contested Case. On July 28, 2022, the Hearing Officer Dylan Lawrence was assigned to preside over this matter. On August 12, 2022, Perpetua filed a Petition to Intervene. On August 22, 2022, Perpetua's Petition to Intervene was granted. On September 6, 2022, Perpetua filed a Motion to Dismiss. On November 15, 2022, the Hearing Officer issued the Order on Motion to Dismiss, denying the motion with respect to the majority of Petitioners' claims, dismissing or partially dismissing four claims, and declining to allow the pleadings to be

amended unless Petitioners file for consideration a formal motion to amend the Petition. On January 11, 2022, Petitioners filed their First Amended Petition to Initiate Contested Case.

After DEQ produced a Project Record and the Parties engaged in limited discovery, Petitioners filed a Motion for Summary Judgment on all claims remaining in the contested case on April 14, 2023. DEQ and Perpetua filed Cross Motions for Summary Judgment.

On August 28, 2023, Perpetua and DEQ filed a joint Motion in Limine to exclude an August 10, 2023 letter from EPA Region 10 Administrator Casey Sixkiller to IDEQ Director Jess Byrne requesting an in-person meeting to discuss EPA's concerns with the Permit. In the letter, EPA raised three primary concerns with the Permit, including concerns that: DEQ used the wrong emission factors, and had it used proper emission factors, the SGP's potential to emit would exceed the major source permitting threshold; DEQ's emission limits were inadequate to demonstrate compliance with NAAQS for particulate matter; and DEQ's delineation of the SGP's ambient air boundary was not supported. Further explanation of the EPA's concerns were detailed in a 19-page enclosure. Three days later, Petitioners filed a Motion to Supplement with EPA's letter and enclosure, and on September 8, 2023, filed a Motion to Amend Contested Case Petition to add a claim regarding the issue EPA raised in its letter about whether DEQ used improper emission factors and was thus wrong when it concluded the SGP's potential to emit will be below major source thresholds. On September 15, 2023, the Hearing Officer denied Perpetua and DEQ's motion in limine, granted Petitioners' motion to supplement with the EPA letter, and denied Petitioners' motion to amend.

On September 21, 2023, the Hearing Officer held a hearing on the cross motions for summary judgment. On October 31, 2023, the Hearing Officer issued a Memorandum Decision on Motions for Summary Judgment and Preliminary Order (the "Preliminary Order").

In the Preliminary Order, the Hearing Officer rejected DEQ's and Perpetua's arguments that Petitioners lacked standing to pursue this contested case, finding each Petitioner had standing to challenge the Permit. But the Hearing Officer ruled against Petitioners on all claims addressed in the Preliminary Order and granted Summary Judgment to DEQ and Perpetua. The Preliminary Order, however, never addressed one of Petitioners' bases for review: DEQ's allowing Perpetua to defer the submittal of project plans until later, after the Permit is already issued, outside of the normal permitting process, and without public comment.

On November 14, 2023, Petitioners filed a timely Petition for Review of Preliminary Order, seeking review of the October 31, 2023 Preliminary Order, including review of the issue ("Claim No. 3") never addressed by the Hearing Officer, as well as review of additional issues.

On November 10, 2023, DEQ and Perpetua filed a Joint Motion for Reconsideration and/or Clarification regarding whether Claim No. 3 was addressed. Petitioners responded, and on December 5, 2023, the Hearing Officer issued an Order on Joint Motion for Reconsideration and/or Clarification and also issued an Amended Memorandum Decision on Motions for Summary Judgment and Preliminary Order (the "Amended Preliminary Order"). The Amended Preliminary Order found Claim No. 3 had already been dismissed and, alternatively, granted summary judgment to DEQ and Perpetua on Claim No. 3.

Petitioners hereby file this Amended Petition for Review, seeking review of the issues set forth below on which the Hearing Officer erred. This Amended Petition for Review seeks review of the same five issues as in the original Petition for Review, with minimal changes to reflect that review is now sought of the Preliminary Order and/or the Amended Preliminary Order.

//

//

BASES FOR PETITION

1. The Hearing Office erred, factually and legally, in upholding DEQ's determination that Perpetua has legal control of the Stibnite Road Access Route such that the Route need not comply with ambient air quality standards.

The Clean Air Act ("CAA") and the Rules for the Control of Air Pollution in Idaho ("Air Rules"), IDAPA 58.01.01 *et seq.*, require Perpetua to meet various air quality standards, including the National Ambient Air Quality Standards ("NAAQS") and acceptable ambient concentrations of carcinogens ("AACCs") for toxic air pollutants ("TAPs"), in ambient air. *See*, *e.g.*, Air Rules Sections 006.11 (NAAQS), 006.125 (TAPs). The U.S. Environmental Protection Agency ("EPA") CAA regulations define "ambient air" as "that portion of the atmosphere, external to buildings, to which the general public has access." 40 C.F.R. § 50.1(e).

The Stibnite Road Access Route ("Route") is a road that passes through what Perpetua and DEQ have defined as the mine's operations boundary and the ambient air boundary, and the inside of that boundary is the active industrial site where Project mining activities and heavy equipment operation will occur. Perpetua has indicated that it will not cut off public access along the Stibnite Road Access Route during mine operations, and as explained by DEQ, Perpetua "will manage an access route to provide the general public with limited access through the [Project] site between Stibnite Road at Sugar Creek and Thunder Mountain Road at Meadow Creek."

Petitioners presented evidence that Perpetua lacks authority to control access along the Stibnite Access Route. This included evidence that there is an ongoing process where the United States Forest Service is reviewing Perpetua's proposed mine, and that Perpetua's authority to control access along the Stibnite Access Route depends on the outcome of that ongoing process. In the Preliminary Order and Amended Preliminary Order, the Hearing Officer concluded that

DEQ could rely on Perpetua's assertions in its submissions to DEQ that it has authority to control access. The Hearing Officer ignored the evidence to the contrary and misapplied the law.

Petitioners seek review of this issue, and ask the Board to vacate and remand the Permit and hold that Perpetua lacks the required authority to control access on the Stibnite Access Route for purposes of determining the Project's ambient air boundary.

2. In finding that Perpetua will preclude the general public from accessing locations within the ambient air boundary, the Hearing Officer lacked a reasonable factual basis and misapplied applicable regulations, policy, and guidance.

Even if Perpetua has authority to control access, Perpetua does not plan to (and the Permit does not require Perpetua to) preclude access. Instead, as the evidence in the record shows, Perpetua plans to allow public access. Petitioners presented evidence showing that Perpetua will allow anyone to use the Stibnite Access Route, so long as they check in and agree to be "guests of the mine." Petitioners showed that under applicable laws, regulations, guidance, and policy, these people are general public, requiring ambient air quality standards to be met along the Stibnite Access Route.

In ruling against Petitioners, the Hearing Officer stated: "the Permit makes it clear that Perpetua is required to preclude unauthorized access by the general public and that members of the public can become guests of the facility only if they are seeking to pass through to access another destination." Prelim. Order at 21; Amended Prelim. Order at 21–22. The Hearing Officer failed to address Petitioners' specific argument that under the CAA, the Air Rules, and EPA's and DEQ's guidance, "guests of the facility" who are passing through to access another destination still count as the general public. Perpetua cannot simply convert the general public to something else by labeling them "guests," and it does not matter whether they are passing through to another destination versus lingering on site. By authorizing people to use the Stibnite Access Road to pass through the site and access other destinations is letting the general public in,

and ambient air standards must, therefore, be met along the Stibnite Access Route. The Hearing Officer erred in simply assuming that by labeling them "guests of the facility," people Perpetua will allow on site are not the general public.

Petitioners seek review of this issue, and ask the Board to vacate and remand the Permit and hold that "guests of the facility" traveling the Stibnite Access Route are entitled to ambient air quality protections.

3. The Hearing Officer failed to decide Petitioners' claim that DEQ violated the Clean Air Act and applicable state and federal rules and regulations by allowing Perpetua to submit plans with important project details in the future–after Permit issuance and without public comment; or to the extent that this claim was decided, the Hearing Officer erred.

EPA has delegated to DEQ authority to issue air quality permits in Idaho. Under the Clean Air Act, State air rules like DEQ's "shall" include "enforceable emission limitations" and other control measures, means, or techniques as necessary or appropriate to meet Clean Air Act requirements. 42 U.S.C. § 7410(a)(2)(A). State plans "shall" include a "program to provide for the enforcement" of the limitations and measures described in subparagraph (A), and for the "regulation of the modification and construction of any stationary source . . . to assure that [NAAQS] are achieved." *Id.* § 7410(a)(2)(C).

EPA's Clean Air Act regulations require each State plan to "set forth legally enforceable procedures" that enable the State to determine whether the construction of a facility will result in a violation of its air pollution control strategies or interfere with attaining or maintaining the NAAQS. 40 C.F.R. § 51.160(a). These legally enforceable procedures: must include means by which the State will prevent construction if the facility will violate air pollution control strategies or will interfere with attaining or maintaining the NAAQS; and must provide for the applicant to submit information on the "location, design, construction, and operation of such facility . . . as may be necessary" to permit the state to "to make the determination" that the facility will comply

with its air pollution control strategies and the NAAQS. *Id.* § 51.160(b)–(c). "The legally enforceable procedures in § 51.160(b) must also require" the State to provide opportunity for public comment on information submitted by the applicant and on the State's analysis of the effects on ambient air quality. *Id.* § 51.161(a).

Under the Rules for the Control of Air Pollution in Idaho, DEQ is required to ensure that no PTC shall be granted for a new or modified stationary source unless the applicant shows to the satisfaction of DEQ that the source would not cause or significantly contribute to a violation of any NAAQS. IDAPA 58.01.01.203.02. To satisfy these requirements, DEQ must assess air impacts using maximum potential emissions as limited by either the capacity of the unit/operation or as limited by enforceable permit provisions. *See* IDAPA 58.01.01.006.88. Prior to issuing a permit to construct, DEQ must provide an opportunity for public comment by making available DEQ's proposed action together with information provided by the applicant and with DEQ's analysis of air quality impacts. IDAPA 58.01.01.209.c.

Under the Permit, Perpetua is required to submit the following plans in the future: the Fugitive Dust Control Plan; the Haul Road Capping Plan; the Operation and Maintenance Manual; and the Stibnite Road Access Management Plan. These plans are not subject to public comment, and while DEQ will review them, it will do so outside of the permitting process set forth in the Air Rules. Despite devoting extensive briefing to this issue, the Hearing Officer erred when he did not decide this specific issue in the Preliminary Order.

The Hearing Officer also erred in the Amended Preliminary Order where he determined that this issue was not raised in the Amended Petition for Contested Case and determined, alternatively, that DEQ can issue a permit first and allow these plans to be submitted later under the CAA and the Idaho Air Rules. Amended Prelim. Order at 32–36. Both the original Petition

and the Amended Petition included a Relief Requested section titled "FDCP, AMP, O&M Manual, & HRCP" which states as follows:

> DEQ must require Perpetua to submit the FDCP, AMP, O&M Manual, and HRCP (collectively, "Plans"), must provide for public comment on the Plans, must review and revise Plans to ensure the SGP's emissions comply with IDAPA 58.01.01.203, and must incorporate the Plans as enforceable PTC conditions.

Petition to Initiate Contested Case at ¶ D; First Amended Petition to Initiate Contested Case at ¶ D. After the Hearing Officer's decision on the Motion to Dismiss, Petitioners revised Paragraphs 32 and 70 in the Amended Petition to Initiate Contested Case by adding CAA regulation and Idaho Air Rule provisions related to the permit review process requirements, including public comment requirements. The FDCP and HRCP were already discussed in the original Petition to Initiate Contested Case in Paragraphs 37 and 39, including stating that these plans had not yet been developed but were being relied upon by DEQ. After the decision on the Motion to Dismiss, Paragraph 37 was revised to add references raising the issue that DEQ failed to take public comment on the FDCP and HRCP in the First Amended Peition to Initiate Contested Case. The O&M Manual was already discussed in the original Petition to Initiate Contested Case in Paragraph 40, and after the decision on the Motion to Dismiss, Paragraph 40 was revised to add additional information about the O&M Manual and about Air Rule permit process requirements, including requirement for submitting project plans and for taking public comment. The AMP was already discussed in the original Petition in Paragraphs 63 through 65, including raising the issue that DEQ was relying on the AMP even though it had not yet been written and would not go through public comment.

Petitioners seek review of this issue, and ask the Board to vacate and remand the Permit and hold that DEQ must require Perpetua to submit the plans as part of the public permitting process.

4. The Hearing Officer erroneously determined that the Permit includes enforceable conditions to achieve 93.3% dust control.

Under the Air Rules, DEQ cannot issue a PTC unless it determines that the facility: (1) "would comply with all applicable federal emissions standards;" (2) "would not cause or significantly contribute to a violation of any ambient air quality standards" (i.e., the NAAQS); and (3) "emissions of toxic air pollutants . . . would not injure or unreasonably affect human or animal life or vegetation as required by Section 161." Air Rules Section 203.

A critical factor affecting the SGP's fugitive dust emissions, and therefore whether DEQ can make the required determinations under Air Rules Section 203 that the Project will comply with the PM_{10} NAAQS and arsenic AACC limits, is the degree to which Perpetua will effectively control dust from haul roads. When it approved the Permit, DEQ assumed that Perpetua will achieve a 93.3% control efficiency of all haul road dust by using a combination of water sprays and chemical dust suppressants. However, as EPA and other commenters pointed out, it is highly questionable whether 93.3% fugitive dust control is realistically attainable for this Project, and even if it were technically possible, the Permit lacks conditions necessary to ensure that Perpetua will achieve such a high level of control.

In the Preliminary Orders, the Hearing Officer concluded that DEQ properly concluded that the Project will achieve 93.3% control because "the Permit includes a specific requirement that 93.3% control efficiency be achieved." Prelim. Order at 31; Amended Prelim. Order at 32. This is incorrect. The Permit does not include a specific requirement to achieve 93.3% or any other level of dust control. The Permit does include requirements for Perpetua to develop a Fugitive Dust Control Plan and a Haul Road Capping Plan. And while the Permit requires specific things to be included in those plans, none of them ensure any specific control efficiency be achieved—let alone an aggressive 93.3% control efficiency.

The Hearing Officer also faulted Petitioners for not offering "expert testimony describing the terms they believe are necessary to ensure compliance." Preliminary Order at 31. The Hearing Officer ignored the expert testimony in the form of public comments and other submissions to DEQ made by the EPA, Petitioners, and others with technical expertise on this very issue, including testimony that conditions specifying the combinations, volumes, and frequencies for applying water sprays and chemical dust suppressants are necessary.

Petitioners seek review of this issue, and ask the Board to vacate and remand the Permit and hold that DEQ must include enforceable permit limits on the combinations, volumes, and frequencies for applying water sprays and chemical suppressants sufficient to achieve 93.3% dust control.

5. The Hearing Officer misinterpreted and misapplied applicable rules to uphold DEQ's decision to artificially dilute the ambient arsenic concentrations attributable to the SGP by 16/70.

No PTC can be granted unless DEQ determines the applicant showed: "Using the methods provided in Section 210, the emissions of toxic air pollutants from the . . . source . . . would not injure or unreasonably affect human health or animal life or vegetation as required by Section 161." Air Rules Section 203.03. Section 161 states, "[a]ny contaminant which is by its nature toxic to human or animal life or vegetation shall not be emitted in such quantities or concentrations as to alone, or in combination with other contaminants, injure or unreasonably affect human or animal life or vegetation." Air Rules Section 161.

For each carcinogenic TAP, including arsenic, the Air Rules set Acceptable Ambient Concentrations of Carcinogens ("AACC"), where each AACC is an annual average in ug/m3. Air Rules Section 586. The applicable TAPs "carcinogenic increments" that must be met to satisfy Section 203.03 are the AACCs, which are *annual average* ambient concentrations. *See* Air Rules Section 586.

The "methods provided in Section 210" that must be followed to satisfy Section 203.03 spell out in detail how to estimate TAPs emissions and ambient concentrations. *See* Air Rules Section 210. The Air Rules include explicit exceptions to meeting the normal AACCs, allowing less stringent AACCs either where: (a) a project is five years or less; or (b) a T-RACT demonstration is done. Air Rules Sections 210.12, 210.15. There are no other exceptions in the Air Rules.

Because the Stibnite Gold Project is for 16 years (which is longer than five years or less), it is not eligible for the short-term source exception. DEQ did grant the T-RACT exception to Perpetua. Even with the T-RACT adjusted arsenic AACC—which allows Perpetua 10 times the normal limit—DEQ recognized that the Project would still exceed the arsenic AACC. To avoid this problem, DEQ contrived a new tactic to artificially reduce the apparent arsenic exposure by spreading out the actual arsenic exposure resulting from the 16-year Project over a longer 70-year human lifetime. This new trick artificially reduces the apparent concentration of arsenic to a mere 23% (16/70 x 100) of what the arsenic concentration will actually be each year during the Project.

In accepting DEQ's approach, the Hearing Officer stated that "unless an issue is squarely addressed by the Air Rules, the hearing officer will defer to 'practical' interpretations of the Air Rules by DEQ." Prelim. Order at 7; Amended Prelim. Order at 7. Here, the Hearing Officer improperly deferred to DEQ's interpretation of the Air Rules and ignored the fact that the Air Rules squarely address this issue: the Air Rules provide two specific exceptions to meeting the arsenic AACC, and do not allow for other exceptions. The Hearing Officer effectively allowed DEQ to rewrite the Rules without following the rulemaking process and allowed DEQ to create a

new exception—found nowhere in the Air Rules—to the requirement to comply with the arsenic AACCs following the methods in Section 210.

Petitioners seek review of this issue, and ask the Board to vacate and remand the Permit and order that DEQ must comply with the methods in Air Rules Section 210 and cannot authorize the Permit unless it will comply with the arsenic AACCs, as adjusted by the T-RACT, without any 16/70 adjustment.

CONCLUSION

Petitioners request that the Board issue an order remanding to DEQ and vacating the Permit, and/or remand to the Hearing Officer for additional proceedings.

Dated: December 15, 2023

Respectfully submitted,

BEFORE THE BOARD OF ENVIRONMENTAL QUALITY
STATE OF IDAHO

IN THE MATTER OF AIR QUALITY PERMIT TO CONSTRUCT P-2019.0047 NEZ PERCE TRIBE, IDAHO CONSERVATION LEAGUE, and SAVE THE SOUTH FORK SALMON, Petitioners, v. IDAHO DEPARTMENT OF ENVIRONMENTAL QUALITY, Respondent, and PERPETUA RESOURCES IDAHO, INC., Intervenor-Respondent.	Agency Case No. 0101-22-01 OAH Case No. 23-245-01 **CERTIFICATION AND TRANSMITTAL OF AGENCY RECORD AND TRANSCRIPT**

I, Paula J. Wilson, certify and state as follows:

1. My name is Paula J. Wilson. I am a paralegal with the Energy and Natural Resources Division of the Idaho Attorney General's Office.

2. My duties as paralegal include assisting the Department of Environmental Quality with contested cases by organizing and managing the documents filed into the agency record.

3. In this capacity and for the purpose of contested cases, I am referred to as hearing coordinator.

4. As hearing coordinator, I am custodian of the record compiled under Idaho Code § 67-5249.

5. A true and correct copy of the *Agency Record and Transcript* is transmitted to the Idaho Board of Environmental Quality via posting at https://www2.deq.idaho.gov/admin/LEIA/api/document/download/21659 and available on the

Department of Environmental Quality's Petitions for Review website. The posted *Agency Record and Transcript* is current as of December 15, 2023, and will be updated as documents are filed with the Board.

6. I will issue a notice of briefing schedule on December 27, 2023. Date for oral argument is pending.

I certify under penalty of perjury pursuant to the law of the State of Idaho that the foregoing is true and correct.

Dated this 15th day of December, 2023.

THE CLEAN AIR ACT AND IDAHO AIR RULES 1

STATEMENT OF FACTS 4

I. THE STIBNITE GOLD PROJECT. 4

II. OVERVIEW OF PERPETUA'S APPLICATION AND DEQ'S APPROVAL. 5

III. PM10 EMISSIONS FROM THE PROJECT. 7

IV. ARSENIC EMISSIONS FROM THE PROJECT. 9

V. AMBIENT AIR BOUNDARY AND THE STIBITE ROAD ACCESS ROUTE. 11

CONTESTED CASE BACKGROUND 12

APPLICABLE LEGAL STANDARDS 15

ARGUMENT 16

I. AMBIENT AIR PROTECTIONS MUST BE MET ALONG THE STIBNITE ROAD ACCESS ROUTE. 16

A. DEQ Impermissibly Relied on Perpetua's Assertions That It Has Legal Control of the Route. 17

B. Because Perpetua Will Allow "Guests of the Mine" to Use the Route, the Route Is Ambient Air. 22

II.DEQ VIOLATED THE PROCEDURAL REQUIREMENTS OF THE AIR RULES BY ISSUING A PERMIT FIRST AND ALLOWING PERPETUA TO SUBMIT PROJECT PLANS LATER. 25

A. Petitioners Properly Raised This Issue in Their Petition to Initiate Contested Case and Opening Summary Judgment Brief. 25

B. By Deferring Permit Details to Be Determined Later Outside the PTC Process and Without Public Comment, DEQ Violated the Air Rules. 29

III. DEQ LACKED A REASONABLE BASIS FOR FINDING THE PROJECT WILL ACHIEVE 93.3% DUST CONTROL, AS NEEDED TO COMPLY WITH THE NAAQS AND TAPS. 35

IV. DEQ'S CREATION OF A "PROJECT SPECIFIC ADJUSTMENT FACTOR" TO ARTIFICIALLY DILUTE THE AMBIENT ARSENIC CONCENTRATIONS ATTRIBUTABLE TO THE SGP VIOLATES THE AIR RULES. 40

VI. THE PERMIT MUST BE SET ASIDE AND REMANDED TO DEQ TO CORRECT ALL ERRORS. 47

Antonin Scalia & Bryan A. Garner,
Reading Law: The Interpretation of Legal Texts 183 (2012) 45

Petitioners Nez Perce Tribe ("NPT"), Idaho Conservation League ("ICL"), and Save the South Fork Salmon ("SSFS") submit this opening in support of their Amended Petition for Review of the Preliminary Orders.

In this contested case, Petitioners challenge the Idaho Department of Environmental Quality's ("DEQ" or "Department") approval of a permit to construct (the "Permit") issued to Perpetua Resources Idaho, Inc. ("Perpetua") for the proposed Stibnite Gold Project ("SPG" or "Project"): a large open-pit mine in Valley County, Idaho. As proposed, Perpetua would excavate 340 million tons of waste rock to mine and process approximately 100 million tons of ore, using 55 miles of haul truck routes over 16 years. Blasting, excavating, ore hauling, and other Project activities will emit air pollutants, including coarse particulate matter ("PM_{10}") and arsenic. PM_{10} and arsenic are regulated under the federal Clean Air Act and Idaho's air pollution regulations, because they can cause significant and severe health and environmental hazards.

The Hearing Officer committed multiple errors in granting summary judgment for DEQ and Perpetua in the October 31, 2023 Preliminary Order and the December 5, 2023 Amended Preliminary Order. The Preliminary Orders should be modified, amended, or revoked, and the Permit should be vacated and remanded to DEQ, based on the errors below.

THE CLEAN AIR ACT AND IDAHO AIR RULES

The federal Clean Air Act ("CAA"), 42 U.S.C. § 7401 *et seq.*, was passed to "protect and enhance the quality of the Nation's air resources" by prescribing national ambient air quality standards ("NAAQS") which state and regional authorities are required to either maintain or make progress toward. To achieve the CAA's goals, Congress directed the Environmental Protection Agency ("EPA") to establish primary and secondary NAAQS for any pollutant "reasonably . . . anticipated to endanger public health or welfare" and to periodically review and

revise those standards. *Id.* §§ 7408(a)(1)(A), 7409(a)(1), (d). The CAA also requires the EPA to divide up the country into areas designated as "nonattainment," "attainment," or "unclassified" based on whether these areas meet the NAAQS. *Id.* § 7407(d).

States have the primary responsibility for assuring that air quality within their borders meets the NAAQS. Each state must establish a state implementation plan (SIP), which is submitted to EPA for review. *Id.* § 7410. To be approved by EPA, each SIP must "include enforceable emission limitations and other control measures, means, or techniques . . . as may be necessary or appropriate to meet the applicable requirements of [the CAA]." *Id.* § 7410(a)(2)(A); 40 C.F.R. § 52.02(a). States can adopt and enforce their own standards regarding emissions "provided such state standard is no less stringent than any applicable federally mandated SIP provision." *Nat. Res. Def. Council v. Thomas*, 845 F.2d 1088, 1090 (D.C. Cir. 1988).

The CAA requires that State air rules "shall" include "enforceable emission limitations" and other control measures, means, or techniques as necessary or appropriate to meet CAA requirements. 42 U.S.C. § 7410(a)(2)(A). SIPs "shall" also include a "program to provide for the enforcement" of the limitations and measures described in subparagraph (A), and for the "regulation of the modification and construction of any stationary source . . . to assure that [NAAQS] are achieved." *Id.* § 7410(a)(2)(C).

EPA's CAA regulations require each SIP to "set forth legally enforceable procedures" that enable the State to determine whether the construction of a facility will result in a violation of its air pollution control strategies or interfere with attaining or maintaining the NAAQS. 40 C.F.R. § 51.160(a). These legally enforceable procedures must include means by which the State will prevent construction if the facility will violate air pollution control strategies or interfere with attaining or maintaining the NAAQS, and they must provide for the applicant to submit

information on the "location, design, construction, and operation of such facility . . . as may be necessary" to permit the State to "to make the determination" that the facility will comply with its air pollution control strategies and the NAAQS. *Id.* § 51.160(b)–(c). "The legally enforceable procedures in § 51.160(b) must also require" the State to provide opportunity for public comment on information submitted by the applicant and on the State's analysis of the effects on ambient air quality. *Id.* § 51.161(a).

EPA has delegated to DEQ authority to issue air quality permits in Idaho pursuant to the Rules for the Control of Air Pollution in Idaho ("Air Rules"), IDAPA 58.01.01. Prior to construction of a facility, the owner or operator must first obtain a permit to construct ("PTC") from DEQ which satisfies the applicable requirements of the Air Rules. Air Rules Section 201.

A PTC application "shall be accompanied by all information necessary to perform any analysis or make any determination required under Sections 200 through 228." Air Rules Section 202. The applicant must provide the following required information: "Site information, plans, descriptions, specifications, and drawings showing the design of the stationary source, facility, or modification, the nature and amount of emissions (including secondary emissions), and the manner in which it will be operated and controlled." Air Rules Section 202.01.a.i. The applicant must also provide: "Any additional information, plans, specifications, evidence or documents that the Department may require to make the determinations required under Sections 200 through 225 shall be furnished upon request." Air Rules Section 202.03.

Among other determinations, DEQ cannot issue a PTC unless it determines that the facility: (1) "would comply with all applicable federal emissions standards;" (2) "would not cause or significantly contribute to a violation of any ambient air quality standards" (i.e., the

NAAQS); and (3) "emissions of toxic air pollutants . . . would not injure or unreasonably affect human or animal life or vegetation as required by Section 161." Air Rules Section 203. When making these determinations, DEQ must consider the source's "potential to emit" ("PTE"), which is defined as:

> The maximum capacity of a facility or stationary source to emit an air pollutant under its physical and operational design. Any physical or operational limitation on the capacity of the facility or source to emit an air pollutant, including air pollution control equipment and restrictions on hours of operation or on the type or amount of material combusted, stored or processed, shall be treated as part of its design if the limitation or the effect it would have on emissions is state or federally enforceable. Secondary emissions do not count in determining the potential to emit from a facility or stationary source.

Air Rules Section 006.88.

For all PTC applications, DEQ must provide an opportunity for public comment. Air Rules Section 209.01.c. The Air Rules also require DEQ to issue either an "approval," a "conditional approval," or a "denial." Air Rules Sections 209.01.b.i & ii, c.iv. DEQ "may impose any reasonable conditions" upon the facility in the PTC. Air Rules Section 211. DEQ can also authorize revisions to permits, but such revisions must go through the Air Rule Section 209 public comment process if the revision results in an increase in emissions or if deemed appropriate by the DEQ director. Air Rules Section 209.04.b.iii.

STATEMENT OF FACTS

I. THE STIBNITE GOLD PROJECT.

Perpetua proposes to construct and operate a conventional open-pit mine with ore preparation and gold extraction facilities approximately 10 miles east of the town of Yellow Pine, in Valley County, Idaho. *See* REC 0415–17 (DEQ Statement of Basis ("SOB"), Facility Information). The Project is located on a combination of public National Forest and private

lands. *Id.* The Project is also geographically located within the Nez Perce Tribe's aboriginal homeland and within the area over which the Nez Perce Tribe has Treaty-reserved rights and resources. *See* REC 2390 (Oatman Decl.), 2548 (Taylor Decl.).

The Project includes 3 years of development and construction activities, followed by approximately 12 years of mining. REC 0415–17. The Project would require "construction of significant infrastructure," including a power transmission line, a primary mine site access road, onsite haul roads, an ore processing facility, onsite workspaces, employee housing and recreation, water storage and distribution facilities, and sewage disposal facilities. *Id.* Conventional open-pit mining methods including drilling, blasting, excavating, and hauling will be used to extract ore and waste rock (termed development rock) from three open pits. *Id*. Over the life of the mine, approximately 340 million tons of waste rock would be handled and 100 million tons of ore will be mined from the three pits. *Id.* A fleet of large trucks will haul ore and waste rock using a network of over 55 miles of unpaved haul roads at the mine site. REC 0431.

The Permit issued by DEQ on June 17, 2022 (REC 0367–409) is the first of over 50 permits required from various local, state, and federal agencies for the proposed mine. Perpetua is currently in the process of seeking these other permits for the proposed Project, including from the U.S. Forest Service, U.S. Army Corps of Engineers, and U.S. Fish and Wildlife Service.

II. OVERVIEW OF PERPETUA'S APPLICATION AND DEQ'S APPROVAL.

Perpetua (previously Midas Gold) submitted a PTC application to DEQ on August 20, 2019. *See* REC 0418–420 (SOB, Application Chronology). Between that date and March 6, 2020, DEQ determined that the application was incomplete, requested additional information, and received supplementary materials from Perpetua no fewer than four times. *Id.* On May 15, 2020, DEQ deemed Perpetua's application complete. *Id.*

Between May 15, 2020, and March 16, 2022, DEQ developed three versions of the draft Permit and released them for public comment. *Id.* As noted in comments submitted by the Nez Perce Tribe, ICL, SSFS, and other members of the public and agencies, the first two draft versions of the Permit (the "September 2020" and "February 2021" Draft Permits) contained significant shortcomings. *See* REC 0983–1000 (DEQ Response to Comments ("RTC")). After taking public comment, DEQ deemed the September 2020 draft Permit deficient and required updated information from Perpetua, including updated hazardous air pollutants ("HAP") and toxic air pollutants ("TAP") emissions estimates. *See* REC 0418–420.

DEQ subsequently updated the draft Permit in February 2021, and took public comment. *Id.* Following additional comments, DEQ determined that the February 2021 draft Permit was deficient and required additional information from Perpetua, including Prevention of Significant Deterioration ("PSD") emissions estimates and regulatory applicability for the lime manufacturing plant. *Id.*

DEQ revised the February 2021 draft PTC and released it for public comment on January 13, 2022. *Id.* Comments were submitted by the Nez Perce Tribe, ICL, SSFS, EPA, and Ian von Lindern of Terragraphics International Foundation. *See* REC 0915–0982. Commenters raised numerous concerns and urged DEQ to gather additional information, to perform additional modeling and analysis, and to develop additional enforceable permit conditions and limits prior to issuing a final Permit. *See id.*

DEQ rejected most of the issues raised by the commenters. *See id.* And on June 17, 2022, DEQ issued the final Permit (REC 0367–409) along with the Statement of Basis ("SOB") (REC 0410–0914) and Response to Comments ("RTC") (REC 0915–1000).

III. PM_{10} EMISSIONS FROM THE PROJECT.

Particulate matter ("PM") is a "criteria air pollutant." Under CAA Sections 108 and 109, EPA is required to establish NAAQS for each criteria pollutant to protect the nation's public health and welfare. The NAAQS specify a maximum amount of PM to be present in the outdoor air. *See* 40 C.F.R. §§ 50.6, 50.7. EPA established primary and secondary NAAQS for coarse particulate matter, or "PM_{10}," and for fine particulate matter, or "$PM_{2.5}$". 40 C.F.R. § 50.6–50.7. PM_{10} consists of inhalable particles with diameters that are generally ten micrometers and smaller; whereas, $PM_{2.5}$ consists of inhalable particles that are 2.5 micrometers and smaller. *Id.*

DEQ found that the Project has the potential to emit 986 tons per year of PM_{10} from a variety of controlled fugitive sources, plus 55.7 additional tons per year of PM_{10} from a variety of controlled point sources. REC 0430 (Table 3). The generation of dust from ore haul trucks traveling along haul roads is the most significant source, representing approximately 72% of all fugitive PM_{10} emissions, and 68% of all modeled PM_{10} emissions. *See id.* The next most significant sources of PM_{10} are from drilling and blasting activities, which together account for an estimated 21% of all fugitive PM_{10} emissions (20% of all emissions). *See id.*

To evaluate whether the Project would comply with the PM_{10} NAAQS, DEQ modeled receptors at various locations along the Project's ambient air boundary and found the Project would exceed the 24-hour PM_{10} NAAQS at one receptor, when using a single-value for PM_{10} background at the site. REC 0717–19 (SOB, App'x B at "TAPs Addendum Modeling Review"). DEQ then used seasonal and monthly background PM_{10} values to find that the maximum 24-hour PM_{10} pollution from the Project would be 123.5 micrograms per meter cubed ("ug/m^3), which is 82.3% of the NAAQS. REC 0717 (Table 7).

Among other factors, these modeled PM_{10} emissions are based on Permit Condition 3.5 limiting Perpetua's production to no more than 180,000 tons per day, and no more than an average of 135,000 tons per day on a rolling five-year basis. *See* REC 0421 (Table 1). They also depend on Perpetua achieving a 93.3% rate of control of fugitive dust. *Id.* Achieving these and other Permit conditions, and assumptions used in the modeling, also depend on future plans called for in the Permit, including a Fugitive Dust Control Plan ("FDCP"), Operations and Maintenance Plan ("O&M Plan"), and Haul Road Capping Plan ("HRCP"). *See* REC 0375, 0378, 0386 (Permit Conditions 2.6, 2.20, 3.13), 0456–57.

During public comment, Petitioners, EPA, and other commenters warned that DEQ unreasonably assumed PM_{10} emissions would be this low. REC 0921–25. Specifically, Petitioners and EPA commented that DEQ unreasonably assumed Perpetua would be able to control 93.3% of dust it would otherwise emit on haul roads, and pointed out that DEQ's assumptions relied on the yet-to-be determined details of numerous future plans that have not yet been developed by Perpetua, submitted to DEQ, or included as conditions of the Permit. *Id.*

In its comments, EPA underscored that achieving 93.3% control for excavation and haul roads, and 90% control for drilling, "are critical to ensuring no violation of the NAAQS and Title V HAP limits." REC 0921. EPA warned that the Permit lacks conditions necessary to assure Perpetua achieves these efficiencies and that record fails to show those efficiencies are achievable based on site-specific conditions. REC 0921–22. EPA also noted that DEQ failed to provide evidence to support its claim that a 90% control using magnesium chloride could be improved by also using water sprays to achieve a 93.3% control. REC 0923.

Similarly, the NPT, ICL, and SSFS commented that DEQ had not demonstrated that 93.3% control was attainable or enforceable under the Permit. REC 0921, 0923–24.

IV. ARSENIC EMISSIONS FROM THE PROJECT.

Arsenic is a Toxic Air Pollutant ("TAP") regulated by DEQ. Air Rules Section 586. DEQ determined arsenic is the largest projected TAP emission from the Project. REC 0435. DEQ found that the Project could emit 0.544 lbs/hr at the maximum mine production rate of 180,000 tons per day. REC 0433. Arsenic is a component of rocks, soils, and dust at the Project site, so arsenic emissions are essentially a percentage of the Project's PM_{10} emissions, and like with PM_{10}, the largest source of Project arsenic emissions are haul roads, estimated at 0.464 lbs/hr. REC 0428.

No PTC can be granted unless DEQ determines the applicant showed "the emissions of toxic air pollutants from the . . . source . . . would not injure or unreasonably affect human health or animal life or vegetation as required by Section 161." Air Rules Section 203.03. Section 161 states, "[a]ny contaminant which is by its nature toxic to human or animal life or vegetation shall not be emitted in such quantities or concentrations as to alone, or in combination with other contaminants, injure or unreasonably affect human or animal life or vegetation." Air Rules Section 161. For each carcinogenic TAP, including arsenic, the Air Rules set Acceptable Ambient Concentrations of Carcinogens ("AACC"), where each AACC is an annual average in ug/m^3. Air Rules Section 586. To demonstrate compliance with these TAPs requirements, ambient impacts must be less than the AACC. Air Rule Section 203; *see also* REC 0836.

Because of the Project's high arsenic emissions, Perpetua used what DEQ described in the SOB as "a highly refined TAPs analysis approach to demonstrate compliance with applicable TAP increments." REC 0698.

As one part of this approach, DEQ approved Perpetua's "T-RACT demonstration" to allow a 10-times increase in the arsenic AACC. *Id.* As the Air Rules provide, a permittee can

analyze reasonable available control technologies ("RACT") that could be applied to a source of TAPs. *See* Air Rules Section 210.14. If using RACT does not sufficiently reduce toxic emissions to below the AACC, then the permittee is allowed a 10-fold increase in the AACC and can employ production limitations to ensure compliance with the now increased AACC. *See* Air Rules Section 210.12.b. Perpetua submitted to DEQ a T-RACT demonstration for arsenic emissions from open-pit drilling and ore haul roads. *See* REC 0909–914 (SOB, App'x G, T-RACT Analysis). For open-pit drilling, Perpetua determined dry drilling with dust collectors was the most effective RACT. REC 0911. For ore haul roads, Perpetua determined that the application of chemical dust suppressant, supplemented with frequent watering, as the RACT. REC 0914.

As another part of this "highly refined" approach, DEQ allowed what it called an "AACC adjustment for the Operational Life of the Mine." REC 0698. Under this approach, instead of comparing the highest annual average ambient arsenic concentration during the Project lifetimes to the T-RACT adjusted AACC (which is also an annual average), DEQ stretched out and diluted the arsenic concentrations from the 16-year Project lifetime over a longer 70-year human life. *See* REC 0710. Multiplying the modeled highest annual arsenic concentration by 16 and dividing by 70, as DEQ did here, dilutes the arsenic concentration to only 23% of its actual value. During permitting, DEQ staff noted that this approach had not been used before, and raised concerns about whether it was permissible under the Air Rule. *See* REC 1183–190; REC 1191–96.

During public comment, Petitioners questioned DEQ's novel tactic for diluting the apparent arsenic exposure by spreading it over 70 years, and warned that without this the Project would exceed the arsenic AACC, even with the T-RACT adjustment. REC 0962, 0971, 0975. Petitioners also warned that DEQ failed to assess the environmental impacts caused by the

control technology, including by applying large amounts of magnesium chloride to roads to control dust, which can accumulate over time to toxic concentrations in trees and soils and can impact water. REC 0962, 0978.

In the end, DEQ approved Perpetua's T-RACT demonstration and, thus, granted a 10-fold increase in allowable arsenic pollution combined with using the creative new "adjustment" to dilute the apparent arsenic exposure to just 16/70 (or 23%) of its modeled value so that DEQ and Perpetua could determined the Project would comply with the AACC. *See* REC 0698.

V. AMBIENT AIR BOUNDARY AND THE STIBITE ROAD ACCESS ROUTE.

The CAA and Idaho Air Rules require Perpetua to meet various air standards, including the NAAQS and TAPs AACCs, in ambient air. *See*, *e.g.*, Air Rules Sections 006.11 (NAAQS), 006.125 (TAPs). EPA's CAA regulations define "ambient air" as "that portion of the atmosphere, external to buildings, to which the general public has access." 40 C.F.R. § 50.1(e).

The Stibnite Road Access Route ("Route") is a road that passes through what Perpetua and DEQ have defined as the mine's operations boundary and the ambient air boundary, and the inside of that boundary is the active industrial site where Project mining activities and heavy equipment operation will occur. REC 0415 (map). Perpetua has indicated that it will not cut off public access along the Stibnite Road Access Route during mine operations, and as explained by DEQ, Perpetua "will manage an access route to provide the general public with limited access through the [Project] site between Stibnite Road at Sugar Creek and Thunder Mountain Road at Meadow Creek." REC 0676.

In public comments, Petitioners urged DEQ to count the Stibnite Road Access Route as ambient air where air quality standards would have to be met, since Perpetua plans to allow public access on the Route. REC 0956–58. But DEQ excluded everything within the mine

operations boundary from ambient air—including the Stibnite Road Access Route. *See id.*; *see also* REC 0415 (map).

In its comments, EPA urged: "Given the unique situation with a public access road traversing the mine site, the key assumptions, parameters, and methodologies used to preclude public access from the mine site must be fully disclosed in the permit record and the necessary requirements be included in the permit and available for public review and comment." REC 0935. But instead of following EPA's advice, DEQ is instead allowing Perpetua to develop an Access Management Plan ("AMP") to address these issues later without public review. REC 0376, 0436.

CONTESTED CASE BACKGROUND

On June 17, 2022, DEQ issued a permit to construct ("PTC") P-2019.0047, which is the Permit at issue in this contested case. *See* REC 0367–0409 (Permit). On July 22, 2022, Petitioners timely filed the original Petition to Initiate Contested Case. REC 0001. On July 28, 2022, the Hearing Officer Dylan Lawrence was assigned to preside over this matter. REC 0031. On August 12, 2022, Perpetua filed a Petition to Intervene. REC 0040. On August 22, 2022, Perpetua's Petition to Intervene was granted. REC 0044. On September 6, 2022, Perpetua filed a Motion to Dismiss. REC 0052. On November 15, 2022, the Hearing Officer issued the Order on Motion to Dismiss, denying the motion with respect to the majority of Petitioners' claims, dismissing or partially dismissing four claims, and declining to allow the pleadings to be amended unless Petitioners file for consideration a formal motion to amend the Petition. REC 0160. On December 6, 2022, Petitioners filed their First Amended Petition to Initiate Contested Case. REC 0292.

After DEQ produced a Project Record and the Parties engaged in limited discovery, Petitioners filed a Motion for Summary Judgment on all claims remaining in the contested case on April 14, 2023. REC 0319 (Petitioners' Motion for Summary Judgment), 0323 (Petitioners' Opening Summary Judgment Brief), REC 0364 (Hurlbutt Declaration, submitting documents cited in brief). DEQ and Perpetua filed Cross Motions for Summary Judgment, along with opening briefs and declarations. *See* REC 1204-2316. On June 9, 2023, Petitioners filed a Response/Reply Summary Judgment Brief (REC 2317), additional documents (REC 2555), and standing declarations (REC 2372-2554). DEQ filed a "non-reply" (REC 2986), and Perpetua filed a reply brief (REC 2989).

On August 28, 2023, Perpetua and DEQ filed a joint Motion in Limine to exclude an August 10, 2023 letter from EPA Region 10 Administrator Casey Sixkiller to IDEQ Director Jess Byrne requesting an in-person meeting to discuss EPA's concerns with the Permit. REC 3097. In the letter, EPA raised three primary concerns with the Permit, including concerns that: DEQ used the wrong emission factors, and had it used proper emission factors, the SGP's potential to emit would exceed the major source permitting threshold; DEQ's emission limits were inadequate to demonstrate compliance with NAAQS for particulate matter; and DEQ's delineation of the SGP's ambient air boundary was not supported. Further explanation of the EPA's concerns were detailed in a 19-page enclosure. REC 3146. Three days later, Petitioners filed a Motion to Supplement with EPA's letter and enclosure, and on September 8, 2023, filed a Motion to Amend Contested Case Petition to add a claim regarding the issue EPA raised in its letter about whether DEQ used improper emission factors and was thus wrong when it concluded the SGP's potential to emit will be below major source thresholds. REC 3137. On September 15, 2023, the Hearing

Officer denied Perpetua and DEQ's motion in limine, granted Petitioners' motion to supplement with the EPA letter, and denied Petitioners' motion to amend. REC 3265.

On September 21, 2023, the Hearing Officer held a hearing on the cross motions for summary judgment. REC 3275 (Notice of Hearing), TR 0001 (Transcript).

On October 31, 2023, the Hearing Officer issued a Memorandum Decision on Motions for Summary Judgment and Preliminary Order (the "Preliminary Order"). REC 3280.

In the Preliminary Order, the Hearing Officer rejected DEQ's and Perpetua's arguments that Petitioners lacked standing to pursue this contested case, finding each Petitioner had standing to challenge the Permit. But the Hearing Officer ruled against Petitioners on all claims addressed in the Preliminary Order and granted Summary Judgment to DEQ and Perpetua. The Preliminary Order, however, never addressed one of Petitioners' bases for review: DEQ's allowing Perpetua to defer the submission of project plans until later, after the Permit is already issued, outside of the normal permitting process, and without public comment.

On November 14, 2023, Petitioners filed a timely Petition for Review of Preliminary Order, seeking review of the October 31, 2023 Preliminary Order, including review of the issue ("Claim No. 3") never addressed by the Hearing Officer, as well as review of additional issues. REC 3342.

On November 10, 2023, DEQ and Perpetua filed a Joint Motion for Reconsideration and/or Clarification regarding whether Claim No. 3 was addressed. REC 3332. Petitioners responded (REC 3361), and on December 5, 2023, the Hearing Officer issued an Order on Joint Motion for Reconsideration and/or Clarification (REC 3367) and also issued an Amended Memorandum Decision on Motions for Summary Judgment and Preliminary Order (the "Amended Preliminary Order") (REC 3372). The Amended Preliminary Order found Claim

No. 3 had already been dismissed and, alternatively, granted summary judgment to DEQ and Perpetua on Claim No. 3.

On December 15, 2023, Petitioners filed the Amended Petition for Review, seeking review of the same five issues as in the original Petition for Review, with minimal changes to reflect that review is now sought of the Preliminary Order and/or the Amended Preliminary Order. REC 3426.

APPLICABLE LEGAL STANDARDS

Petitioners bring this contested case to challenge DEQ's action in issuing the Permit. Under the Idaho APA, an agency action like DEQ issuing the Permit will be overturned where its findings, inferences, conclusions, or decisions are: "(a) in violation of constitutional or statutory provisions; (b) in excess of the statutory authority of the agency; (c) made upon unlawful procedure; (d) not supported by substantial evidence on the record as a whole; or (e) arbitrary, capricious, or an abuse of discretion." Idaho Code ("I.C."). § 67-5279(3). *See 917 Lusk v. City of Boise*, 158 Idaho 12, 14 (2015).

"An action is capricious if it was done without a rational basis. It is arbitrary if it was done in disregard to the facts and circumstances presented or without adequate determining principles." *Am. Lung Ass'n of Idaho/Nev. v. Idaho State Dep't of Agric.*, 142 Idaho 544, 547 (2006) (citations omitted).

Motions for summary judgment before the Board are allowed by IDAPA 58.01.23.162.02 and are governed by the Idaho Rules of Civil Procedure ("I.R.C.P."). Summary judgment is proper here under I.R.C.P. 56(c), because there is no genuine issue as to any material fact and Petitioners are entitled to judgment as a matter of law. I.R.C.P. 56(c).

ARGUMENT

I. AMBIENT AIR PROTECTIONS MUST BE MET ALONG THE STIBNITE ROAD ACCESS ROUTE.

The Clean Air Act and Idaho's Air Rules, IDAPA 58.01.01 *et seq.*, require Perpetua to meet various air quality standards, including the National Ambient Air Quality Standards ("NAAQS") and acceptable ambient concentrations of carcinogens ("AACCs") for toxic air pollutants ("TAPs"), in ambient air. *See*, *e.g.*, Air Rules Sections 006.11 (NAAQS), 006.125 (TAPs). The U.S. Environmental Protection Agency ("EPA") CAA regulations define "ambient air" as "that portion of the atmosphere, external to buildings, to which the general public has access." 40 C.F.R. § 50.1(e). This definition of ambient air is incorporated by reference in Idaho Air Rule 006.05.

The Permit, however, fails to provide any ambient air protections to the general public traveling on the Stibnite Road Access Route thought the SGP to access public lands, exposing the public to concentrations of particulate matter and toxic, carcinogenic air emissions that exceed the NAAQS and health-based standards for carcinogenic pollutants. This includes NPT, ICL, and SSFS members, whose declarations demonstrate that they regularly use the Route and will be injured by the Project. *See* REC 2372–2554 (Petitioners' standing declarations).

The Hearing Officer's determination that DEQ had substantial evidence of Perpetua's legal authority to preclude the public from entering, and reasonably determined that the Perpetua did not need to provide ambient air protections to the public traveling over the Stibnite Road Access Route to access recreational sites on public land was in err. The Board of Environmental Quality should grant this Petition for Review, set aside the Permit, and order DEQ on remand to ensure that the Stibnite Road Access Route maintains air quality consistent with the NAAQS and health-based standards for arsenic.

A. DEQ Impermissibly Relid on Perpetua's Assertions That It Has Legal Control of the Route.

The Stibnite Road Access Route ("Route") is a road that passes through what Perpetua and DEQ have defined as the mine's 14,000+-acre operations boundary and the ambient air boundary. The Amended Memorandum and Decision on Motions for Summary Judgment and Preliminary Order ("Amended Order") make several misstatements and implications regarding the Route, which are corrected here. First, the Amended Order states that "one could drive northeast from Cascade to reach the South Entry of the SGP." REC 3385. Currently, to access the South Entry by driving northeast from Cascade, one would have to pass through Yellow Pine to reach the North Entry and travel through the proposed mine site to reach the South Entry and public sites on National Forest land as the Burntlog Route does not exist.[1] . Second, the Amended Order states that the "Burntlog Route would provide year-round access to the south side of the SGP." REC 3386. This statement is true *only if* the Burntlog Road alternative is approved by the Forest Service after the NEPA process. However, even with the Burntlog Route, if access through the SGP is precluded, residents of Yellow Pine would have to travel west on Lick Creek Road, through McCall, south to Cascade, and northeast on Johnson Creek Road to reach the proposed Burntlog Route and the south side of the SGP to access public sites on National Forest land. REC 340. Finally, the Amended Order states that "if access through the SGP is precluded, those traveling from Yellow Pine to access those recreational areas would have to travel much farther and around the SGP to do so." REC 3387. This is true, however, *only if* the Forest Service approves the alternative that allows for the construction and extension of the

[1] Currently, access from Yellow Pine to public recreational sites is possible by continuing east, past the Stibnite Road turn off, and traveling along Sugar Creek on NF-374. However, this route will presumably be closed at the North Entry point because it is within the ambient air boundary. REC 340.

Burntlog Route, which currently does not exist, and thus far has not been approved.[2] If the Burntlog Route is not approved and travel is precluded through the SGP, the public will *not* have access to important public recreational areas on National Forest land. *Id.*

Second, the Hearing Officer erred in determining that it was reasonable for DEQ to rely on Pereptua's single, factual statement in its application that Perpetua had legal control of the Stibnite Road Access Route without any other documentation to that effect and without consideration of other, conflicting evidence in the record. *See* REC 3389–390. Specifically, the Hearing Officer's erred in three ways.

First, the Hearing Officer erred in determining that it was reasonable for DEQ to rely solely on one single statement made in the application by a permit applicant to determine that Perpetua had legal control over the Stibnite Road Access Route. *See* REC 3388–90. However, an agency's determination can only be upheld where "evidence supporting the agency decision is substantial when viewed in the light of *the entire record, including the body of evidence opposed to the agency's view.*" *State Ins. Fund v. Hunnicutt*, 110 Idaho 257, 261 (1985) (emphasis added); *see also Local 1494 of Intern. Ass'n of Firefighters v. City of Coeur d'Alene*, 99 Idaho 630, 638, (1978) (stating that a court's "task" is to "determine whether, on the whole record, the [agency's] decision was substantially supported by the evidence and by applicable law"). Instead of considering the whole record, the Hearing Officer stated, "in the experience of the Hearing Officer, it is not unusual for an agency to rely on representations made in a permit application." REC 3390. The Hearing Officer's finding that "DEQ's reliance on Perpetua's representation," without further consideration of the record as a whole, was "reasonable and supported by

[2] The other alternative mining route that the Forest Service is considering would follow Johnson Creek Road up to Yellow Pine and travel east along Stibnite Road to the North Entry of the SGP.

substantial evidence in the record" is inconsistent with Idaho Supreme Court precedent, and should be rejected.

Second, the evidence in the record does not support DEQ's finding that Perpetua had legal control over the Stibnite Road Access Route to preclude public access. As discussed above, the ambient air is "that portion of the atmosphere, external to buildings, to which the general public has access." Idaho Air Rules 006.05. The EPA's Revised Policy on Exclusions from "Ambient Air" states that the agency's

> longstanding policy is based on the view that the general public does not have access to land occupied by a stationary source . . . when the land meets both of the following conditions: (1) the land is owned or controlled by the owner or operator of the stationary source: and (2) the land is surrounded by a fence or other physical barriers that preclude general public access.

REC 1141. EPA's policy further explains:

> it uses "controlled" . . . to mean that the owner or operator of the source has the legal right to use the land, and that its land-use rights include "the power to control public access" *and* "the power to exclude the general public."

REC 1143 (emphasis added).

Here, DEQ's determination—based solely on the representation made by Perpetua in the application itself—that Perpetua has legal control to exclude the general public from the Stibnite Road Access Route was erroneous, unreasonable, and not supported by substantial evidence in the record. Perpetua's single statement on the issue provides that:

> [Perpetua] will legally control the SGP, an active industrial site where mining activities will occur, such as heavy equipment operation. Most areas of the mine will require strict safety protocols and controlled access. [Perpetua] has established an operations boundary to identify the area where public access will be excluded. Public access inside the operations boundary will be restricted for the life of the mine by physical barriers at points of potential access, including the current Stibnite Road point of entry and proposed site access via the Burntlog Route, as well as natural features of the landscape that prevent access.

REC 1807. Notably, Perpetua does not state that it *has* legal control over the Stibnite Road Access Route. That is because Perpetua does not have legal control over the Route, which is a public road managed by the Forest Service. To get legal control over the Route, and the power to *exclude* the public from it, requires Forest Service approval—something Perpetua has not received.

Perpetua is in the process of seeking Forest Service approval for the Stibnite Gold Project. However, not only has Perpetua yet to achieve such approval, even if the Forest Service approves the SGP, the SGP will not authorize Perpetua to exclude the public.

Perpetua initially proposed to the Forest Service during the NEPA process to exclude public access through the SGP site, which would limit or preclude all access to Thunder Mountain and other important public recreational sites. REC 0893, 0896. However, due to extensive public comments in opposition, access preclusion was dropped, and the *only* alternative now under consideration for approval by the Forest Service provides the public with continued access through the SGP on the Stibnite Road Access Route. REC 0983; *see also* REC 2677 (stating that "public access would be provided by" the Stibnite Road Access Route); REC 2625 (indicating that during operations "public access" will be provided "through the Operations Area Boundary [ ] by constructing new road through Yellow Pine pit and below mine haul road to link Stibnite Road (FR 50412) to Thunder Mountain Road (FR 50375)"); REC 2684 ("The 2021 [Modified Mine Plan] would include a 12-foot-wide gravel road to provide public access from Stibnite Road (FR 50412) to Thunder Mountain Road (FR 50375) through the SGP."); REC 2557 ("During operations, the public access road would be used to travel through the mine site and would provide seasonal use, open to all vehicles."). Thus, even if the Forest Service

approves the current mine plan, it would only give Pereptua the legal ability to "control public access;" it will not give Perpetua the legal "power to exclude the general public."

As is evident in the record before DEQ, the Forest Service has not approved the SGP yet, has therefore not given Perpetua legal control over the Stibnite Road Access Route, and based on the current alternative under consideration, will *not* give Perpetua the legal authority to preclude public access such that Perpetua can exclude the Stibnite Road Access Route from meeting ambient air quality standards. *See* REC 1142 (EPA policy stating that to exclude an area from ambient air, an "owner or operator of the source [must] ha[ve] the legal right to use the land, and that its land-use rights include 'the power to control public access' *and* 'the power to exclude the general public'"). DEQ's reliance on a single, unsupported statement from the permit applicant to determine that Perpetua has legal control to exclude the public from Stibnite Road Access Route, and thus exclude it from ambient air protections, is not supported by substantial evidence. In fact, the evidence in the record shows Perpetua does not have and will not have the power to exclude the public. DEQ's determination is thus arbitrary and capricious.

Third, the Hearing Officer's post-hoc rationale that DEQ's "broad enforcement authority" is relevant to the legality of DEQ'S determination on the application at hand cannot be used to justify improper and unreasonable decision-making. *See* REC 3390.

The Board must set aside and remand the Permit to DEQ, hold that Perpetua lacks the required authority to preclude public access on the Stibnite Access Route, and direct DEQ to treat the Route as ambient air entitled to air quality protections.

B. Because Perpetua Will Allow "Guests of the Mine" to Use the Route, the Route Is Ambient Air.

Because Perpetua does not–and will not[3]–have the legal right to preclude the public from using the Stibnite Road Access Route to access important public recreational sites (and thus would have to exclude the Stibnite Road Access Route from the ambient air boundary), it created a new definition for "guests of the mine" which neither has a basis in law nor in EPA policy or DEQ guidance. The Hearing Officer erred in finding that the Permit is consistent with the Idaho Air Rule's definition of ambient air, agency policy, and guidance documents, and that exclusion of the Stibnite Road Access Route from ambient air was appropriate. *See* REC 3392.

First, the Hearing Officer erroneously determined that the Permit conditions sufficiently demonstrate that the Permit complies with EPA's ambient air policy and DEQ guidance. *Id.* Air Rule 006.005 defines "ambient air" as "that portion of the atmosphere, external to buildings, to which the general public has access (incorporating EPA's regulatory definition of ambient air found in 40 C.F.R 50.1(e)). Conversely, if the general public does not have access, the area can be excluded from complying with ambient air quality standards. "EPA has long recognized that certain areas external to buildings may be excluded from the regulatory definition of ambient air because *the general public does not have access to them*." REC 1140 (emphasis added). As discussed above, "the general public does not have access to land occupied by a stationary source . . . when the land meets" two conditions: (1) it "is owned or controlled by the owner or operator . . .; and (2) the land is surrounded by a fence or other physical barriers that preclude general public access." REC 1141; *see also* REC 1109 (DEQ guidance stating the same). "Controlled"

[3] Again, the only alternative under consideration by the Forest Service would leave the Stibnite Road Access Route open for public use to travel through the SGP to public recreational sites, like Thunder Mountain and Monumental Summit.

means the owner or operator has "'the power to control public access' and 'the power to exclude the general public.'" REC 1141.

DEQ's guidance is similar to EPA's policy in that it "assume[s] that the air within the facility boundaries is ambient air unless the facility can demonstrate that public access is *precluded*." REC 1109. "The facility-proposed ambient air boundary must include justification that demonstrates the facility has reasonable control of the area *and effectively precludes public access on a routine basis.*" *Id.*

Point blank, in order to exclude an area from ambient air, both EPA's policy and DEQ's guidance together require that the owner or operator be able to *exclude* the general public from accessing the area on a routine basis. The Permit conditions referenced by the Hearing Officer do not demonstrate that.

The first condition in Permit Section 2.7 requires Perpetua to "[o]bserve all primary access points to preclude *unauthorized* public access." REC 0376 (emphasis added). It is unclear what "unauthorized" public access is. But the condition does not preclude authorized public access—travel over the Stibnite Road Access Route for access to public recreational sites—that would be allowed under the mine plan being considered for approval by the Forest Service. *See* REC 2677; REC 2625; REC 2684; REC 2557. The second condition in Permit Section 2.7 states that Perpetua may control access at the North and South Entry does not speak to precluding authorized public access, but only exerting some control over access. *See* REC 0376. The third condition in Permit Section 2.7 discusses "secondary access points" and is not relevant to access to the Stibnite Road Access Route, which is a primary access point. *See id.*

Finally, the fourth condition in Permit Section 2.7 restricts access to "guests of the facility." *Id.* Allowing the general public to use the Route such as to access public lands (as

Perpetua has committed to doing, and as the Forest Service expects under the Project it is reviewing), but labeling them "guests of the mine," does not count as precluding public access..

The Hearing Officer erred in finding that DEQ and Perpetua's labeling of the public as "guests of the mine" is consistent with EPA policy and DEQ guidance. *See* REC 3392–93. For example, "EPA also recognized that some persons that have both legal and practical access to the source's property" but "are not necessarily considered members of the general public." REC 1142. However, those persons EPA recognized as not necessarily members of the general public are limited to persons with a direct, business connection for accessing the facility, such as "employees of the owner or operator who work at the site, or business invitees; such as contractors or delivery persons." *Id.* These persons recognized by EPA are nothing like any and all people driving the Stibnite Access Route to access public lands.

Similarly, DEQ's guidance states that if the "general public [is] invited as part of the normal business conducted on the facility site" then the area where the "public is invited is determined to be ambient air." REC 1110. Furthermore, if the "general public [is] allowed on site as a part of a right-of-way easement or a common service road," then that road is "determined to be ambient air." *Id.* Here, the Stibnite Access Route is such a road that the general public will be invited and allowed to use. As such, the DEQ guidance (like EPA policy) affords people using the Route ambient air quality protections, whether or not Perpetua labels them "guests of the mine."

The Board should vacate and remand the Permit and hold that "guests of the facility" traveling the Stibnite Access Route are entitled to ambient air quality protections.

II. DEQ VIOLATED THE PROCEDURAL REQUIREMENTS OF THE AIR RULES BY ISSUING A PERMIT FIRST AND ALLOWING PERPETUA TO SUBMIT PROJECT PLANS LATER.

Under the Permit, Perpetua is allowed to submit the following plans in the future: the Fugitive Dust Control Plan ("FDCP"); the Haul Road Capping Plan ("HRCP"); the Operation and Maintenance Manual ("O&M"); and the Stibnite Road Access Management Plan ("AMP"). *See* REC 0375–76, 0378–80, 0385–86 (Permit conditions). These plans will include numerous Project details which significantly affect air emissions and public access. *See id.* Yet, because DEQ already issued the Permit, DEQ will review the plans outside of the PTC permitting process set forth in the Air Rules, including reviewing them without public comment.

Despite devoting extensive briefing to this issue in Petitioners' Opening Summary Judgment Brief (REC 0353–56) and Response/Reply Summary Judgment Brief (REC 2350–57), the Hearing Officer failed to even consider this issue in the Preliminary Order (*see* REC 3280–3328). In the Amended Preliminary Order, the Hearing Officer erred where he first found that Petitioners' failed to raise this issue, and he erred again when he found that DEQ satisfied the Air Rules anyway. REC 3403–7.

A. Petitioners Properly Raised This Issue in The Petition to Initiate Contested Case and Summary Judgment Briefs.

DEQ's Contested Case Rules and Rules for the Protection and Disclosure of Records ("Contested Case Rules"), IDAPA 58.01.23, govern contested cases, such as this one. The Contested Case Rules incorporate Rules 52 and 305 (among others) of the Idaho Rules of Administrative Procedure of the Attorney General ("Idaho Rules of Administrative Procedure"). IDAPA 58.01.23.003.01, .05. Rule 52 states:

> The rules in this chapter will be liberally construed to secure just, speedy and economical determination of all issues presented to the agency. Unless prohibited by statute, the agency may permit deviation from these rules when it finds that compliance with them is impracticable, unnecessary or not in the public interest.

IDAPA 04.11.01.052. Similarly, Rule 305 favors liberal construction of the pleadings and amendment if necessary:

> The presiding officer may allow any pleading to be amended or corrected or any omission to be supplied. Pleadings will be liberally construed, and defects that do not affect substantial rights of the parties will be disregarded. . . .

IDAPA 04.11.01.305 Rule 52 further provides: "Unless required by statute, the Idaho Rules of Civil Procedure and the Idaho Rules of Evidence do not apply to contested case proceedings." *Id*.

Nowhere do the rules require that a petition to initiate a contested case include specific claims for relief. Rather, Rule 160.01 provides that a contested case petition must include the following contents:

> a. Fully state the facts upon which it is based, including the specific alleged action or inaction of the Department;
>
> b. Refer to the particular provisions of statute, rule, order or other controlling law upon which it is based. Legal assertions will be accompanied by citations of cases and statutory provisions;
>
> c. State the relief sought; and
>
> d. State the basis for the petitioner's legal standing to initiate the contested case.

IDAPA 58.01.23.160.01.

The Amended Petition to Initiate Contested Case complied with these rules by including detailed factual and legal background describing DEQ's action in issuing the Permit and citing applicable laws and regulations. REC 0270–80. The Amended Petition also described the errors and omissions DEQ allegedly made when it issued the Permit. REC 0280–87. The Amended Petition also included a section on the requested relief, stating in detail the relief sought by Petitioners. REC 0287–291. The Amended Petition did not, and was not required to by the applicable rules, set forth separate claims for relief.

Later, in the Argument section of its Opening Summary Judgment Brief, Petitioners organized the brief to argue the separate bases upon which DEQ was alleged to have erred. *See* REC 0339–62. Each of these sections in the Opening Summary Judgment Brief addressed alleged errors, omissions, and other flaws which had been identified and discussed in the Amended Petition to Initiate Contested Case.

The Hearing Officer erroneously held that the issue of whether DEQ violated procedural requirements of the Air Rules when it issued the Permit first and allowed Perpetua to submit various plans later, outside the PTC process and without public comment, was not raised in the Amended Petition.

Both the original Petition and the Amended Petition included a Relief Requested section titled "FDCP, AMP, O&M Manual, & HRCP" which states as follows:

> DEQ must require Perpetua to submit the FDCP, AMP, O&M Manual, and HRCP (collectively, "Plans"), must provide for public comment on the Plans, must review and revise Plans to ensure the SGP's emissions comply with IDAPA 58.01.01.203, and must incorporate the Plans as enforceable PTC conditions.

REC 0025 (Petition, ¶ D); REC 0289–90 (Amended Petition, ¶ D). After the Hearing Officer's decision on the Motion to Dismiss, Petitioners revised Paragraphs 32 and 70 in the Amended Petition to Initiate Contested Case by adding CAA regulation and Idaho Air Rule provisions related to the permit review process requirements, including public comment requirements. *See* REC 0274–75, 0288. The FDCP and HRCP were already discussed in the original Petition to Initiate Contested Case in Paragraphs 37 and 39, including stating that these plans had not yet been developed but were being relied upon by DEQ; and after the decision on the Motion to Dismiss, Paragraph 37 was revised to add references raising the issue that DEQ failed to take public comment on the FDCP and HRCP in the First Amended Petition to Initiate Contested Case. *See* REC 0276–78. The O&M Manual was already discussed in the original Petition to

Initiate Contested Case in Paragraph 40; and after the decision on the Motion to Dismiss, Paragraph 40 was revised to add additional information about the O&M Manual and about Air Rule permit process requirements, including requirement for submitting project plans and for taking public comment. *See* REC 0278. The AMP was already discussed in the original Petition in Paragraphs 63 through 65, including raising the issue that DEQ was relying on the AMP even though it had not yet been written and would not go through public comment; and these statements remained in the Amended Petition. *See* REC 0286.

Petitioners also devoted extensive briefing to this issue in their summary judgment briefing. Petitioners' Opening Summary Judgment Brief included an entire section on this specific issue: Section III, titled "DEQ's Reliance on Future Plans to be Prepared by Perpetua Outside of the PTC Process Violates the Air Rules and CAA." REC 0353–56. In that section of the opening brief, Petitioners argued that DEQ violated the Air Rules and the CAA by relying on the FDCP, HRCP, O&M Manual, and AMP without preparing these plans during the permitting process set forth in the Air Rules and CAA, including without taking public comment on the plans. DEQ and Perpetua responded, opposing this specific claim on the merits, and without arguing the claim had been dismissed or was not raised in the Amended Petition. REC 1229–30 (DEQ); REC 1319–23 (Perpetua). Petitioners' Response/Reply Summary Judgment Brief again devoted an entire section to this issue: Section IV, titled "DEQ's Reliance on Future Plans to be Prepared by Perpetua Outside of the Permit Process Violates the Air Rules and the Clean Air Act." REC 2350–57. In fact, this was the lengthiest argument section of Petitioners' reply brief.

The Board should find that Petitioners properly raised this issue.

B. By Deferring Permit Details to Be Determined Later, Outside the PTC Process and Without Public Comment, DEQ Violated the Air Rules and the CAA.

DEQ deferred addressing many issues during the PTC permitting process and will let Perpetua address those issues in the future through various plans. Again, these "plans" include the the Fugitive Dust Control Plan ("FDCP"); the Haul Road Capping Plan ("HRCP"); the Operation and Maintenance Manual ("O&M"); and the Stibnite Road Access Management Plan ("AMP"). *See* REC 0375–76, 0378–80, 0385–86 (Permit conditions). All of the Plans are to be developed by Perpetua later and submitted to DEQ for 30 days prior to starting operation for review and approval without public comment. *See id.* (Permit Conditions 2.8, 2.21, 3.13).

DEQ's reliance on these future Plans violates the Air Rules and CAA, and is otherwise arbitrary and capricious. No provisions in the Air Rules authorize DEQ to save portions of a PTC to be developed later, outside the normal PTC permitting process. Rather, the Air Rules require DEQ to process PTC applications only when they are complete, require DEQ to ensure the applicant has submitted sufficient information so DEQ can make all required determinations for PTCs, and requires DEQ to take public comment. *See* Air Rules Section 209.

EPA's CAA regulations require each SIP to "set forth legally enforceable procedures" that enable the State to determine whether the construction of a facility will result in a violation of its air pollution control strategies or interfere with attaining or maintaining the NAAQS. 40 C.F.R. § 51.160(a). These legally enforceable procedures must include means by which the State will prevent construction if the facility will violate air pollution control strategies or interfere with attaining or maintaining the NAAQS, and they must provide for the applicant to submit information on the "location, design, construction, and operation of such facility . . . as may be necessary" to permit the State to "to make the determination" that the facility will comply with

its air pollution control strategies and the NAAQS. *Id.* § 51.160(b)–(c). "The legally enforceable procedures in § 51.160(b) must also require" the State to provide opportunity for public comment on information submitted by the applicant and on the State's analysis of the effects on ambient air quality. *Id.* § 51.161(a).

Under the Air Rules (which are Idaho's EPA-approved SIP), DEQ must provide an opportunity for public comment. Air Rules Section 209.01.c. During public comment, the "Department's proposed action, together with the information submitted by the applicant and the Department's analysis of the information, *will* be made available to the public . . . ." Air Rules Section 209.01.c.i. (emphasis added). A PTC application "must . . . be accompanied by all information necessary to perform any analysis or make any determination required under Sections 200 through 227," which includes the requirement to determine whether the facility will cause or contribute to a violation of the NAAQS. Air Rules Section 202. "Required Information" that the applicant must provide includes: "Site information, *plans*, descriptions, specifications, and drawings showing the design of the . . . facility, . . . the nature and amount of emissions . . . , and the manner in which it will be operated and controlled." Air Rules Section 202.01.a.i (emphasis added).

Here, instead of following these procedural requirements in Sections 202 and 209, DEQ rushed forward and issued Perpetua what is essentially a *partial, incomplete PTC*, based on incomplete information and analysis, and lacking numerous permit conditions. DEQ will effectively issue a complete PTC later, after Perpetua develops and submits to DEQ additional plans, information, and conditions through the AMP, HRCP, FDCP, and O&M Manual, shielded from public review and outside the normal PTC process required by the Air Rules and the CAA.

Through the future "plans," DEQ is allowing Perpetua to submit Section 202.01.a.i information later, and allowing itself to review that information later. But Air Rules Section 209.01.c.i requires the "information submitted by the applicant" and DEQ's "analysis of the information, will be made available to the public" for comment. DEQ's use of these future work plans, thus, violates the Air Rules and the CAA regulations upon which they are based. No provisions in the Air Rules authorize DEQ to save pieces of a PTC to be developed later, outside the normal PTC permitting process and without public comment as DEQ has done here.

The Board must, therefore, set aside and remand the Permit.

Not only does DEQ's reliance on these Plans fail to comport with the Air Rules and the CAA provisions discussed above, but it also undermines DEQ's determinations that the Project will comply with air quality standards. Because DEQ has deprived the public of meaningful involvement, and has failed to conduct a full and adequate review of the application before it issued the Permit, DEQ cannot reasonably claim that the Project will comply with the PM_{10} NAAQS and arsenic AACC.

Federal courts have rejected similar tactics when it comes to Clean Water Act ("CWA") permitting. In one case, the Second Circuit recognized that CWA permitting schemes that do not allow for public review of best management practices incorporated into permits violate the CWA. *Waterkeeper Alliance v. U.S. EPA*, 399 F.3d 486, 503-504 (2d Cir. 2005). The Second Circuit held that a permit that relies on best management practices but does not specifically list those best management practices in the permit itself "deprives the public of the opportunity for the sort of regulatory participation that the Act guarantees because [such a permit] effectively shields the . . . management plans from public scrutiny and comment." *Id*. at 503. The Ninth Circuit has similarly held that "programs that are designed by regulated parties must, in every instance, be

subject to meaningful review by an appropriate regulating entity to ensure that each such program reduces the discharge of pollutants to the maximum extent practicable [i.e., the relevant statutory standard]." *Envtl. Def. Ctr. v. U.S. EPA*, 344 F.3d 832, 856 (9th Cir. 2003).

By allowing Perpetua to provide plans, descriptions, specifications, and information about the manner in which the facility will be operated and controlled at a later date after the Permit has already been approved, DEQ has similarly circumvented the Air Rules and CAA permitting requirements, shielding the plans from public scrutiny and comment, depriving the public of meaningful review, and undermining DEQ's determinations that the Project will comply with applicable standards.

DEQ tries to rationalize its use of post-permit work plans as allowing "the permittee to prepare a specific plan or manual based on the actual equipment purchased and installed, the manufacturer's instructions and recommendations, as well as the operational characteristics of the facility after construction is completed." REC 1230. But the work plans for this Project go way beyond waiting for these limited types of relatively inconsequential final details.

For example, Permit Condition 3.13 requires that the HRCP include a sampling plan for analyzing arsenic concentrations of materials Perpetua uses, a silt content sampling plan, and information about the frequency with which Perpetua will inspect haul roads, among other similar requirements. REC 0385–86. It is entirely feasible for Perpetua to provide, and DEQ to review, these types of sampling plans and road inspection details during the public PTC permitting process. These plans do not depend on final details of actual equipment Perpetua purchases or the operational characteristics of the facility after it is complete. Many, if not all, of these details can and should have been developed during the PTC process and submitted to the public for comment.

Likewise, Permit Condition 2.6 requires the FDCP to include "specific criteria to determine what frequency and type (water and/or chemical) of dust suppressant must be applied, and appropriate suppressant application rates." REC 0376. Why couldn't Perpetua provide details on the "specific criteria" it will use "to determine" the frequency, type, and application rates of suppressants to DEQ for review during the public PTC process? Petitioners and the EPA raised serious concerns about Perpetua's ability to achieve 93.3% dust control; DEQ itself admitted this was an "aggressive" level of control that would require vigilant monitoring and aggressive requirements in the permit, and admitted that achieving 93.3% control is critical to ensuring the NAAQS are met. *See infra* Part III. Yet, the Permit does not require 93.3% dust control, and details about how Perpetua will control dust are to be developed later in the FDCP, without public comment.

Similarly, Permit Condition 2.7 requires the AMP to specify the "measures to be used to discourage public access to the facility." REC 0376. Again, what does this have to do with the equipment Perpetua actually purchases, and why could these measures not be submitted by Perpetua and reviewed by DEQ during the public PTC process? Access management is a critical issue that generated controversy during public comment. EPA warned in its comments: "Given the unique situation with a public access road traversing the mine site, the key assumptions, parameters, and methodologies used to preclude public access from the mine site must be fully disclosed in the permit record and the necessary requirements be included in the permit and available for public review and comment." REC 0935. But through the AMP DEQ is letting Perpetua decide important details about access management later, outside of public review.

Likewise, the Permit provides that the Operation and Maintenance Manual will "ensure compliance with emission limits (Permit Conditions 2.9, 2.13, 4.3, and 5.3)." REC 0378. But

again, the Permit does not include monitoring and recordkeeping requirements; Perpetua will develop those later, shielded from public scrutiny.

Like the nutrient management plans (NMPs) at issue in *Waterkeeper*, the work plans here are critical, indispensable features of the Permit. And like the EPA in *Waterkeeper*, DEQ here has acknowledged that details in these work plans are critical to ensuring the Project meets air quality standards. Thus, these plans and their details must be submitted by the applicant under Air Rules Section 202.01.a.i, and that information, along with DEQ's review of the information, are required to be made available to the public under Air Rules Section 209.01.c.i.[4]

Again, the Board should set aside and remand the Permit, and should require Perpetua to submit the AMP, FDCP, O&M Manual, and HRCP; to provide for public comment on the Plans; to review and revise Plans to ensure the Project's emissions, as limited by enforceable conditions, comply with Air Rules Section 203; and to complete these steps before issuing a new Permit—not afterward and behind closed doors.

---

[4] Purporting to address the merits of this issue, the Hearing Officer inexplicably considered only whether "deferring aspects of emissions monitoring and recordkeeping requirements to an O&M Plan that has not yet been developed." REC 3406. He never mentions the other three plans at issue (the FDCP, HRCP, and AMP), never mentions the public comment requirement and other permit application requirements of Air Rules Sections 202 and 209, and never mentions the *Waterkeeper* and *Environmental Defense Center* cases. *See* REC 3406–7. Again, these issues were briefed extensively by Petitioners and Perpetua (and to a lesser degree by DEQ).

And when he considered this one limited issue, the Hearing Officer faulted Petitioners for not offering "expert testimony explaining how deferring identification of the specific 'devices and methodologies' until later could be arbitrary, capricious, or an abuse of discretion." REC 3407. The Hearing Officer improperly ignored the fact that Petitioners extensively cited to DEQ's own statements (already discussed above), as well as the expert federal agency EPA and other commenters with expertise. *See also* REC 1036 (EPA stating that "[t]o make the [potential to emit] limitations enforceable as a practical matter, the permit should include the parameters and assumptions used to develop the fugitive dust emission factors estimates for the haul roads and access roads.").

III. DEQ LACKED A REASONABLE BASIS FOR FINDING THE PROJECT WILL ACHIEVE 93.3% DUST CONTROL, AS NEEDED TO COMPLY WITH THE NAAQS AND TAPS.

Under the Air Rules, DEQ cannot issue a PTC unless it determines that the facility: (1) "would comply with all applicable federal emissions standards;" (2) "would not cause or significantly contribute to a violation of any ambient air quality standards" (i.e., the NAAQS); and (3) "emissions of toxic air pollutants . . . would not injure or unreasonably affect human or animal life or vegetation as required by Section 161." Air Rules Section 203.

A critical factor affecting the SGP's fugitive dust emissions, and therefore whether DEQ can make the required determinations under Air Rules Section 203 that the Project will comply with the PM_{10} NAAQS and arsenic AACC limits, is the degree to which Perpetua will effectively control dust from haul roads. When it approved the Permit, DEQ assumed that Perpetua will achieve a 93.3% control efficiency of all haul road dust by using a combination of water sprays and chemical dust suppressants. However, as EPA and other commenters pointed out, it is highly questionable whether 93.3% fugitive dust control is realistically attainable for this Project, and even if it were technically possible, the Permit lacks sufficient conditions for DEQ to reasonably assume Perpetua will achieve such a high level of control.

The Hearing Officer concluded that DEQ reasonably determined that the Project will achieve 93.3% control because "the Permit includes a specific requirement that 93.3% control efficiency be achieved." REC 3402. This is incorrect. The Permit does not include a specific requirement to achieve 93.3% or any other level of dust control. *See* REC 0367–409 (Permit).

The Permit does include requirements for Perpetua to develop a Fugitive Dust Control Plan (Permit Condition 2.6, (REC 0375–76)) and a Haul Road Capping Plan (Permit Condition 3.13 (REC 0385–86)). And while Permit conditions 2.6 and 3.13 require specific things to be

included in those plans, none of the required contents of the plan ensure any specific control efficiency will be achieved—let alone an aggressive 93.3% control efficiency.

As approved, Perpetua can comply with the Permit conditions by submitting its plans to DEQ, even if those plans will not actually achieve 93.3% dust control. All Perpetua must do is describe what it will do to control dust, and then follow through on those plans. For example, if Perpetua's plans would only achieve only, say, 90% dust control in actuality, so long as Perpetua submits those plans to DEQ, DEQ signs off on them, and Perpetua follows through and complies with the deficient plans, then Perpetua will be in compliance with the terms of the Permit--even though it will not achieve 93.3% dust control. And this is significant, because Perpetua's and DEQ's modeling showed that if Perpetua cut its operations by a third (hauling 120,000 tons per day instead of the authorized 180,000 tons per day) and achieved only 90% dust control, this slightly lower dust control—even when combined with a major cut in mining activity—would cause exceedances of the PM_{10} NAAQS. REC 0691–92.

Thus, contrary to the Hearing Officer's finding, the Permit does not explicitly require 93.3% dust control. Moreover, the Permit lacks other conditions necessary to ensure such a high level of control is achieved. It was, therefore, arbitrary and capricious for DEQ to conclude the Project will achieve 93.3% control and thereby comply with the NAAQS.

The Hearing Officer also faulted Petitioners for not offering "expert testimony describing the terms they believe are necessary to ensure compliance." REC 3402. The Hearing Officer ignored the briefing and the expert testimony in the form of public comments and other submissions to DEQ made by the EPA, Petitioners, and others with technical expertise on this very issue, including briefing relying on expert statements.

As Petitioners noted in their summary judgment briefing, information in the record shows that 93.3% is a very high and aggressive level of control; EPA and other commenters questioned whether this was even achievable by applying chemicals and water as Perpetua plans to do; and DEQ itself repeatedly stated it would be critical to meeting the NAAQS, yet challenging to actually achieve, 93.3% control. *See* REC 0344–48. DEQ experts admitted that 93.3% is a high, aggressive, and a "challenging" level to achieve. REC 0431 (DEQ stating it will be "challenging to consistently and continuously achieve the targeted level of fugitive dust control"), 0629, 0691. Elsewhere in the Statement of Basis ("SOB"), DEQ admitted that meeting 93.3% was based on an "assumption" that Perpetua would appropriately apply water and magnesium chloride, "vigilant inspection and monitoring" would be required, and additional measures—not in the Permit—would be necessary in the Fugitive Dust Control Plan ("FDCP") Perpetua will develop later. REC 0456. DEQ modeling staff thus "recommend[ed] that the permit require an aggressive implementation of measures to achieve above 93% control efficiency for fugitive particulate emissions from roadways." REC 0694. Because DEQ did not include such limits, conditions, and aggressive implementation measures in the Permit, it was arbitrary and capricious for DEQ to assume this high 93.3% would be achieved, and that the Project would comply with the PM_{10} NAAQS and arsenic AACC.

In their briefing, Petitioners also pointed to guidance from the expert agency EPA to argue that even if one assumes that the high 93.3 % dust control efficiency could technically be achieved, the Permit fails to include enforceable limits on the spray frequency and rates, and other important factors, affecting whether Perpetua will in fact achieve anywhere near 93.3% dust control. EPA guidance identifies the following factors bearing on the effectiveness of chemical dust suppressants: (a) the dilution rate used in the mixture; (b) the application rate

(volume of solution per unit road surface area); (c) the time between applications; (d) the size, speed, and amount of traffic during the period between applications; and (e) meteorological conditions (rainfall, freeze/thaw cycles, etc.) during the period. REC 1163–82.

To be sure, the Permit includes conditions related to dust control. Permit Conditions 2.1 through 2.5 require Perpetua to take "reasonable precautions" to monitor and maintain records related to dust emissions; but they do not specify the quantity or frequency of spray or other important variables. *See* REC 0374–75. Permit Condition 2.6 requires Perpetua to develop the Fugitive Dust Control Plan ("FDCP"), which will become an enforceable part of the Permit, with a "list of all potential sources of fugitive dust emissions and the following reasonable precautions to minimize fugitive dust emissions." REC 0375. But Permit Condition 2.6 does not set out those "reasonable precautions" such as requirements for the frequency or quantity of sprays and other important variables that EPA (an expert) said is important. Instead, Condition 2.6 directs Perpetua to "[d]evelop specific criteria to determine what frequency and type (water and/or chemical) of dust suppressant must be applied, and appropriate suppressant application rates." REC 0376.

This vague direction for Perpetua to develop "criteria to determine" spray frequency, rates, and types in no way assures that the criteria Perpetua decides on will actually achieve its ambitious 93.3% control efficiency—or anywhere close to it. This is especially so since the FDCP will be developed by Perpetua and submitted to DEQ for approval 30 days prior to startup, without public comment. *See supra* II.B.

Again, DEQ (an expert agency) itself recognized that it will be "challenging to consistently and continuously achieve the targeted level of fugitive dust control for emissions from traffic on unpaved roadways, with over 55 miles of haul truck routes within the operations

boundary a fleet of 32 haul trucks weighting between 37 and 357 tons, and a targeted dust control efficiency of 93.3% accomplished by application of both dust suppressant and water controls." REC 0430. Later in the SOB, DEQ admitted that meeting 93.3% was based on an "assumption" that Perpetua would appropriately apply water and magnesium chloride, that "vigilant inspection and monitoring" would be required, and that additional measures beyond those actually required by the Permit would be necessary in the FDCP:

> Reduction of PM emissions from haul roads by a combined 93.3% was supported by assuming appropriate application of water and magnesium chloride dust suppression; DEQ is cognizant that to consistently achieve this level of control requires conscientious efforts, vigilant inspection and monitoring, and a comprehensive FDCP. Because continuous operation was proposed, suppression measures will need to account for and accommodate all weather conditions including diurnal and seasonal variability, and all traffic loads including mining and public traffic along publicly accessible roads. Conditions outside of what may normally be anticipated may require additional measures such as a reduction in vehicle speeds or selection of a more effective chemical dust suppressant. Although the FDCP specifies a minimum of efforts required, additional operational limits and monitoring are to be considered moving forward and evaluated for incorporation into the FDCP.

REC 0456.

DEQ's modeling staff similarly recognized that "it is critical for NAAQS compliance that this high level of control [(93.3%)] be achieved." REC 0641. The modeling staff called this "an aggressive level of control," adding that this "high level of emission control was needed to demonstrate compliance with NAAQS." REC 0691. Again, DEQ modeled what would happen if Perpetua cut its operations by a third (hauling 120,000 tons per day instead of the authorized 180,000 tons per day) and achieved only 90% dust control; DEQ found that this slightly lower dust control, even when combined with a major cut in mining activity, would cause exceedances of the PM10 24-hour NAAQS. REC 0691–92. Ultimately, DEQ's modeling team

"recommend[ed] that the permit require an aggressive implementation of measures to achieve above 93% control efficiency for fugitive particulate emissions from roadways." REC 0694.

But DEQ failed to require such "aggressive implementation" and "vigilant inspection and monitoring" in the Permit, instead relying on the vague direction for Perpetua to consider some of these issues later in its FDCP. Without determining first what dust suppressant types, frequencies, and rates Perpetua will employ, DEQ had no reasonable basis for assuming the Project will achieve 93.3% dust control as required so as not to cause or contribute to a violation of the NAAQS.

The Board should vacate and remand the Permit and hold that DEQ must include enforceable permit limits on the combinations, volumes, and frequencies for applying water sprays and chemical suppressants, as well as necessary monitoring and inspection, sufficient to achieve 93.3% dust control and meet the NAAQS before it can issue a PTC. Air Rules, Section 203.

IV. DEQ'S CREATION OF A "PROJECT SPECIFIC ADJUSTMENT FACTOR" TO ARTIFICIALLY DILUTE THE AMBIENT ARSENIC CONCENTRATIONS ATTRIBUTABLE TO THE SGP VIOLATES THE AIR RULES.

The Hearing Officer ignored the plain language of the Air Rules when he endorsed DEQ's use of "other methods" and DEQ's creation of a "project specific adjustment factor" to show (fictitiously) that the Project would comply with the arsenic toxic pollutant standards, as required to issue a PTC.

Under the Air Rules, "no permit to construct shall be granted" unless DEQ determines that the applicant has shown: "Using the methods provided in Section 210, the emissions of toxic air pollutants from the . . . source . . . would not injure or unreasonably affect human health or animal life or vegetation as required by Section 161." Air Rules Section 203.03.

Section 161 requires, "[a]ny contaminant which is by its nature toxic to human or animal life or vegetation shall not be emitted in such quantities or concentrations as to alone, or in combination with other contaminants, injure or unreasonably affect human or animal life or vegetation." Air Rules Section 161. For each carcinogenic TAP, including arsenic, the Air Rules set Acceptable Ambient Concentrations of Carcinogens ("AACC"), where each AACC is an annual average in ug/m3. Air Rules Section 586. If an applicant can demonstrate that its annual average emissions meet the specified AACC, then compliance with Section 161 is demonstrated. Air Rules Section 203.03 The AACC for arsenic is 0.00023 μg/m^3. *See id.*

The "methods provided in Section 210" (which must be followed to satisfy Section 203.03) spell out in detail how to estimate TAPs emissions and ambient concentrations. *See* Air Rules Section 210. Section 210 includes two explicit exceptions to meeting the normal AACCs in Sectio 586: (a) a project is short term (five years or less); and/or (b) a T-RACT demonstration is made. Air Rules Sections 210.12, 210.15. A T-RACT demonstration is a specific "emission standard based on the lowest emissions of toxic air pollutants that a particular source is capable of meeting by the application of control technology that is reasonably available." Air Rules Section 210. When either of these exceptions apply, the AACC is adjusted by increasing it tenfold (making it more lenient); but the applicant must still satisfy the adjusted AACC.

There are no other exceptions in the Air Rules.

The Stibnite Gold Project is for 16 years, and thus it is not eligible for the short-term (five-year-or-less) source exception at Section 210.15. DEQ did, however, grant the Section 210.12 T-RACT exception to Perpetua, which allows Perpetua 10 times the normal annual average arsenic limit, or 0.0023 ug/m^3 of arsenic (instead of 0.00023 μg/m^3). Even with this large leniency afforded by the T-RACT adjustment, DEQ found, however, that the Project would still

exceed the adjusted arsenic AACC of 0.0023 µg/m^3. In summary judgment briefing, Petitioners demonstrated based on Perpetua's and DEQ's modeling that annually the Project will result in around 0.0042 µg/m^3 arsenic.[5] This value, which represents the undisputed annual arsenic exposure modeled to occur during the 16 years of the Project, is *181%* of the T-RACT adjusted arsenic AACC and thus would not meet Section 210.12.a requirement that a "source's . . . approved T-RACT ambient concentration at the point of compliance" be "less than or equal to the amount" "which is equivalent to ten (10) times the [AACC] listed in Section 586." Air Rules Sections 210.12.b, c.

DEQ recognized that the Project would exceed the AACC, even with the T-RACT adjustment. To avoid this problem, DEQ created a new tactic not authorized under the Air Rules to artificially reduce the apparent arsenic exposure by spreading out the actual arsenic exposure resulting from the 16-year Project over a longer 70-year human lifetime. *See* REC 0698, 0710 (SOB, App'x B). This never-before-used tactic artificially reduces the apparent concentration of arsenic to a mere 23% (16/70 x 100) of what the arsenic concentration will actually be (based on Perpetua and DEQ's modeling) each year during the Project. This violates the Air Rules.[6]

---

[5] Applying the novel "lifetime exposure adjustment" to dilute the Project's annual arsenic concentration by 16/70, DEQ calculated a Maximum Modeled Lifetime Exposure Concentration of 0.00095 ug/m^3 of arsenic. REC 0714 (Table 6). *See also* REC 0710. This value is less than (about 41% of) the T-RACT adjusted arsenic AACC of 0.0023 ug/m^3 (*see* Air Rules Section 586). DEQ's dilution can be removed by multiplying 0.00095 ug/m^3 by 70 and then dividing by 16, which results in an *annual* arsenic exposure during the Project of 0.0042 ug/m^3.

[6] DEQ permitting staff recognized this problem, and documented their concerns in two memos. *See* REC 1183–90; REC 1191–96. DEQ staff acknowledged that this approach had not been used before, stating that requiring the methods in Section 210 is "certainly how DEQ has used this in the past." REC 1185. DEQ staff questioned whether this novel approach was allowed under the Air Rules. *See*, *e.g.*, REC 1188 ("Can a 70 year average concentration be used for comparison to AACCs rather than a single year average for Section 210 analyses?"). In the end, DEQ broke from its established practice of comparing annual average arsenic exposures from a facility to the annual average AACC and instead spread the arsenic exposures from the 16-year Project over 70 years, reducing the supposed arsenic exposure to a mere 23% of what it is really modeled be during Perpetua's operations. *See* REC 0710.

Again, Section 210 allows applicants to seek a 10-times larger AACC through T-RACT (a large leniency, which DEQ allowed Perpetua) and/or through the five-year-or-less short-term project exception (which everyone agrees does not apply to this 16-year Project). *Id.* But nothing in Section 210 allows DEQ to grant *even greater leniency* or use of a "qualitative" standard when it comes to meeting the AACCs, such as by diluting a project's 16-year TAPs concentrations over 70 years, as it did here.

During these proceedings, DEQ conceded that this 16/70 adjustment is not found in the Air Rules. At the summary judgment hearing, DEQ's counsel explained that the agency "applied the five-year rule [in Section 210.15] by analog and extend[ed] it to a 16-year projected mine site." TR 0021 (Transcript p. 80). Similarly, in its briefing and declarations, DEQ explained:

> [This] approach to modeling TAP compliance employed the Short-Term Source Factor rule (Section 210.15) by analogue. This section allows an impact of 10 times the AACC for projects having an operational lifetime of no greater than five years. DEQ simply used this general approach to develop *a project-specific adjustment factor* for the [Stibnite Gold Project], using the 16-year maximum life of the project.

REC 1227 (quoting Schilling Decl. 11–12) (internal citations omitted) (emphasis added). DEQ, thus, admits that it instead of applying the "methods provided in section 210" (as required by the Air Rules), such as the applying the short-term exception at 210.15 as written, it used the short-term exception as a starting point to then make up an entirely new exception for Perpetua—"a project specific adjustment factor."

Accepting DEQ's approach, the Hearing Officer stated that "unless an issue is squarely addressed by the Air Rules, the hearing officer will defer to 'practical' interpretations of the Air Rules by DEQ." REC 3378. But as already stated above, the Air Rules squarely address this issue: they provide two specific exceptions to meeting the numeric arsenic AACC (the short-term exception at 210.15 and the T-RACT exception at 210.10); and they do not provide

other exceptions. The Hearing Officer erred by deferring to DEQ's "practical" interpretation, an interpretation fabricated a third exception found nowhere in the Rules.

DEQ is not free to disregard the plain language of the Air Rules, even if it has some rationale for doing so. Agency rules (like the Air Rules) have the full force and effect of law. *See Mead v. Arnell*, 117 Idaho 660, 664–65 (1990). As the Idaho Supreme Court has explained: "We must follow the law as written. If it is socially or economically unsound, the power to correct it is legislative, not judicial." *Herndon v. West*, 87 Idaho 335, 339 (1964). Thus, the Air Rules—as written—apply to the Project, whether or not DEQ has some rationale for deviating from the plain language of the rules.

Nor can DEQ simply amend the Air Rules through the process of issuing an individual permit, as it did here when it invented "a project specific adjustment factor" for Perpetua. A rule is void if it was not adopted following the required processes. *See Asarco Inc. v. State*, 138 Idaho 719, 722–25 (2003) (voiding TMDL issued by DEQ because it qualified as a rule and was not promulgated according to the rulemaking requirements of the Idaho Administrative Procedure Act). DEQ can seek to change the Air Rules following the required process under the Idaho APA and other applicable laws. Until then, DEQ must follow the Air Rules "as written," and DEQ is not free to make up project-specific rules for Perpetua, as it did here.

The Hearing Officer also erred by drawing on the general provisions of the Rules at Sections 161 to override the specific provisions in Section 210 and 586. "Regulations, like statutes, are interpreted according to canons of construction." Black & Decker Corp. v. C.I.R., 986 F.2d 60, 65 (4th Cir. 1993). Under the canon of *generalia specialibus non derogant*, when there is a conflict between a general provision and a specific provision, the specific provision prevails. "The canon provides that a 'narrow, precise, and specific' statutory provision is not

overridden by another provision 'covering a more generalized spectrum' of issues." *Perez-Guzman v. Lynch*, 835 F.3d 1066, 1075 (9th Cir. 2016) (quoting *Radzanower v. Tourche Ross & Co.*, 426 U.S. 148, 153–54 (1976)). "[T]he assumption being that the more specific of two conflicting provisions 'comes closer to addressing the very problem posed by the case at hand and is thus more deserving of credence.'" *Perez-Guzman*, 835 F.3d at 1075 (quoting Antonin Scalia & Bryan A. Garner, Reading Law: The Interpretation of Legal Texts 183 (2012)). The Idaho Supreme Court applies this cannon. *See Tomich v. City of Pocatello*, 127 Idaho 394, 400 (1995); *Mickelsen v. City of Rexburg*, 101 Idaho 305, 307 (1980).

Again here, Air Rules Section 203.03 requires "no permit to construct shall be granted" unless DEQ determines that the applicant has shown: "Using the methods provided in Section 210, the emissions of toxic air pollutants from the . . . source . . . would not injure or unreasonably affect human health or animal life or vegetation as required by Section 161." To protect human health, Section 586 specifically sets a numeric arsenic AACC at an annual average of 0.00023 ug/m^3. Section 210 creates two specific exceptions to meeting the AACC (which is an annual emissions factor), allowing a 10x higher AACC where the applicant makes a T-RACT demonstration (Section 210.10) and/or where a project is short-term (5 years or less) (Section 210.15).

Disregarding these specific, numerical provisions in Sections 586 and 210, and disregarding Section 203.03's unequivocal command to "Us[e] the methods provided in section 210," the Hearing Officer accepted DEQ's argument that it could rely on other general and qualitative language in the Air Rules as an excuse for DEQ to invent and grant Perpetua "a project specific adjustment factor." *See* REC 3419–21. Specifically, the Hearing Officer relied on the "qualitative" standard in Air Rule 161, which provides that a toxic air pollutant "shall not be

emitted in such quantities or concentrations as to alone, or in combination with other contaminants, injure or unreasonably affect human or animal life or vegetation." REC 3419. The Hearing Officer's interpretation runs afoul of basic rules of regulatory interpretation, because it lets a general and qualitative provision trump the specific numeric provisions that apply.

Another cannon of construction requires interpreting regulations to avoid rendering provisions superfluous. "A statute should be construed so that effect is given to all its provisions, so that no part will be rendered superfluous or insignificant." *Brown v. Caldwell Sch. Dist. No. 132*, 127 Idaho 112, 117 (1995). In order to determine whether a project will meet the Air Rules' general, qualitative directive that it "would not injure or unreasonably affect human health or animal life or vegetation", the Air Rules explicitly require the applicant and DEQ to "Us[e] the methods provided in Section 210" to make such a determination. Air Rules 203.03. To do so, DEQ must find that the applicant has shown it will meet the numerical AACC for arsenic (0.00023 ug/m^3), which is specifically set in the Air Rules at Section 586. And again, Section 210 includes two specific exceptions for when a project need not meet that AACC (projects that have demonstrated T-RACT and short-term five-year-or-less projects), which must meet a more lenient AACC. Under DEQ's interpretation of the rules, where it can simply offer a qualitative explanation for why any project will not injure or unreasonably affect human health, then what is the point of Section 203.03's directive to follow the methods in Section 210? What is the point of the numeric AACC for arsenic and other carcinogens in Section 586? What is the point of the two explicit exceptions to meeting the AACCs in Section 210 (T-RACT, and five-year-or-less short term projects)? DEQ's interpretation renders these provisions superfluous and, thus, cannot stand.

In summary, even with the T-RACT adjustment allowing a 10 times higher limit, Perpetua's and DEQ's modeling shows that the Stibnite Gold Project would exceed the arsenic AACC. DEQ agrees that the Project was not eligible for the short-term five-year-or-less project adjustment set forth in the Rules at Section 210.15. DEQ also agrees that annual arsenic emissions as calculated over the 16-year lifetime of the Project exceeds the T-RACT adjusted AACC. But instead of denying the Permit or requiring Perpetua to reduce arsenic emissions as required by Air Rules Section 203.03, DEQ created "a project specific adjustment factor" of 16/70 to dilute the apparent arsenic to a mere 23 percent of its true, modeled concentration. Accepting this approach, the Hearing Officer allowed DEQ to impermissibly ignore and rewrite the Air Rules.

The Hearing Officer incorrectly interpreted the Air Rules to find a "qualitative standard" for compliance with Section 161 that neither exists in Section 210 nor anywhere else in the Air Rules to justify DEQ's "16/70 adjustment." *See* REC 3421 DEQ does not have discretion to deviate from the plain language of the Air Rules and make up new exceptions to meeting the AACCs. The Board must, therefore, set aside and remand the Permit and order that DEQ not authorize the Permit unless it will comply with the arsenic AACCs using the methods in Air Rules Section 210, without any "project specific adjustment factor" of 16/70.

V. THE PERMIT MUST BE SET ASIDE AND REMANDED TO DEQ TO CORRECT ALL ERRORS.

Under the Idaho APA, when an agency action is not affirmed by a court, it "shall" be set aside, in whole or in part, and remanded for further proceedings as necessary. I.C. § 67-5279. *See also In re Variance ZV2011-2*, 156 Idaho 491, 496 (Idaho 2014) (vacating and remanding arbitrary agency action for further proceedings consistent with the Court's opinion). Upon reversing the Hearing Officer and granting summary judgment for Petitioners on any of their

claims above, the Board of Environmental Quality should set aside the Permit and remand to DEQ to correct the errors it made when it issued the Permit.

CONCLUSION

Petitioners request that the Board of Environmental Quality issue an order remanding to DEQ and vacating the Permit, and/or remand to the Hearing Officer for additional proceedings.

BEFORE THE BOARD OF ENVIRONMENTAL QUALITY
STATE OF IDAHO

IN THE MATTER OF AIR QUALITY PERMIT TO CONSTRUCT P-2019.0047 NEZ PERCE TRIBE, IDAHO CONSERVATION LEAGUE, and SAVE THE SOUTH FORK SALMON, Petitioners, v. IDAHO DEPARTMENT OF ENVIRONMENTAL QUALITY, Respondent, and PERPETUA RESOURCES IDAHO, INC., Intervenor-Respondent.	Agency Case No. 0101-22-01 OAH Case No. 23-245-01 **AMENDED NOTICE OF ORAL ARGUMENT**

On October 31, 2023, the Hearing Officer issued the *Memorandum Decision on Motions for Summary Judgment and Preliminary Order*, and on November 14, 2023, Petitioners filed the *Petition for Review of Preliminary Order*.

On December 5, 2023, the Hearing Officer issued the *Amended Memorandum Decision on Motions for Summary Judgment and Preliminary Order*, and on December 15, 2023, Petitioners filed the *Amended Petition for Review of Preliminary Orders*.

Pursuant to Idaho Code § 67-5245 and IDAPA 58.01.23.730, NOTICE IS HEREBY GIVEN that oral argument will take place on March 14, 2024, at 9:00 a.m. Mountain Time, or as soon thereafter as the matter may be heard, in conference rooms C and D at the Department of Environmental Quality State Office, 1410 N. Hilton, Boise, Idaho. The parties will each be allowed thirty (30) minutes for argument, including rebuttal.

The oral argument in this matter will be heard by the Idaho Board of Environmental Quality at the Special Board Meeting scheduled to commence at 9:00 a.m. Mountain Time on March 14, 2024. The public may attend the meeting in person or via Microsoft Teams. The meeting location and Teams link will be available in the Meeting Notice posted at https://www.deq.idaho.gov/board-of-environmental-quality/ five (5) or more days prior to the meeting date.

Dated this 30th day of January, 2024.

INTRODUCTION 3
PROCEDURAL HISTORY 3
STATEMENT OF FACTS 5
LEGAL STANDARDS 6
I. Standard of Review. 6
II. Agency Deference. 7
ARGUMENT 8
I. DEQ acted reasonably and in accordance with all applicable law in excluding the Stibnite Access Road from the Ambient Air Boundary. 8
A. DEQ reasonably relied on Perpetua's assertions regarding control of the Route, and the record supports DEQ's determination. 8
B. The PTC requires Perpetua to have the ability to restrict the general public from the Route. 10
C. DEQ and EPA guidance support DEQ's determination that the Route is not "ambient air." 11
II. DEQ acted reasonable and did not violate any rule or statute by allowing Perpetua to submit certain plans later. 13
A. Allowing Perpetua to submit the Plans later does not violate the CAA or the Air Rules. 13
B. DEQ's Approach was reasonable and is customary practice. 19
III. DEQ clearly demonstrated a reasonable basis for determining that Perpetua can achieve 93.3% dust control under the terms of the PTC. 20
A. DEQ had a reasonable basis to determine Perpetua could achieve 93.3% dust control. 21
B. The PTC includes enforceable and sufficient conditions to ensure compliance with Idaho's Air Rules. 22
IV. DEQ's "project specific adjustment factor" clearly complied with the Air Rules, and DEQ used proper discretion and expertise to average arsenic emissions over the projected duration of the Mine. 26
A. DEQ's use of the "project specific adjustment factor" is not contrary to the Air Rules. 27
B. DEQ did not rely on a qualitative standard and Petitioners misunderstand DEQ's approach. 31
CONCLUSION 32

Respondent, the Idaho Department of Environmental Quality ("DEQ"), by and through the Office of the Attorney General, hereby submits this Brief and Response to Petitioners' Opening Brief.

INTRODUCTION

On June 17, 2022, DEQ issued a Permit to Construct ("PTC") to Perpetua Resources Idaho, Inc. ("Perpetua") for the Stibnite Gold Project ("SGP"). REC 1274. The PTC, which is the subject of this petition for review, was issued after a nearly three-year permitting effort by DEQ. *Id.* This effort included three extended public comment periods, two public informational meetings, frequent meetings with Perpetua, numerous requests for additional information from Perpetua, and four permit iterations. *Id*. Nez Perce Tribe, Idaho Conservation League ("ICL"), and Save the South Fork Salmon ("SSFS") (collectively, "Petitioners") challenge the permitted dust emissions covered by the PTC in this petition to the Board of Environmental Quality ("the Board").

Although Petitioners make many claims in their Opening Brief, they present no evidence or facts demonstrating that DEQ acted unreasonably or violated any rule or statute in issuing the PTC. Petitioners' arguments can primarily be summarized as a collection of gross oversimplifications and misstatements. The Hearing Officer, who carefully and thoroughly considered this matter for over a year after Petitioners first challenged the PTC issuance, also found Petitioners' claims unpersuasive, granting Summary Judgment in DEQ and Perpetua's favor. DEQ now urges the Board to do the same and find that the PTC meets all applicable legal requirements and to uphold the Hearing Officer's December 5, 2023 decision.

PROCEDURAL HISTORY

On July 22, 2022, Petitioners initiated a contested case, challenging DEQ's issuance of the PTC to Perpetua for the SGP. REC 0001-0028. Soon thereafter, the Board appointed a Hearing

Officer to oversee and decide the contested case. REC 0031-0032. On August 12, 2022, DEQ responded to the Petition, denying it committed any error in issuing the PTC. REC 0033-0039. That same day, Perpetua filed a petition to intervene in the contested case, as the permittee, which the Hearing Officer granted. REC 0040-0045.

On September 6, 2022, Perpetua filed a Motion to Dismiss the Petition, which DEQ joined. REC 0052-0124. The Hearing Officer ruled on the Motion to Dismiss on November 15, 2022, dismissing three of Petitioners' claims and partially dismissing an additional claim. REC 0160-0186. Thereafter, Petitioners were given leave to amend their Petition and an Amended Petition was filed on January 11, 2023. REC 0263-0292.

Petitioners filed a Motion for Summary Judgment on April 14, 2023, and DEQ and Perpetua filed their own Motions for Summary Judgment on May 12, 2023. REC 0319-0363; REC 1204-1232; REC 1276-1336. The Hearing Officer held a hearing on the motions on September 21, 2023. REC 3275-3279. On October 31, 2023, the Hearing Officer issued a *Memorandum Decision on Motions for Summary Judgment and Preliminary Order*, appearing to dismiss all of Petitioners' claims. REC 3280-3328. Because DEQ and Perpetua sought clarity on whether the Hearing Officer did intend to dismiss all of Petitioners' claims, they filed a Joint Motion for Reconsideration and/or Clarification on November 10, 2023. REC 3332-3341. On December 5, 2023, the Hearing Officer issued his *Amended Memorandum Decision on Motions for Summary Judgment and Preliminary Order* ("Preliminary Order"). REC 3372-3425. The Hearing Officer made it clear he dismissed <u>all</u> of Petitioners' claims. *Id*.

On December 15, 2023, Petitioners filed the Amended Petition for Review of Preliminary Orders ("the Petition"), initiating this appeal to the Board. REC 3426-3441.

STATEMENT OF FACTS

The Clean Air Act ("CAA") is the federal law that regulates air emissions from stationery and mobile sources. 42 U.S.C. § 7401, *et seq*. The Environmental Protection Agency ("EPA") has delegated the authority to implement the CAA in Idaho to DEQ. REC 1272. To implement the CAA in Idaho, DEQ promulgated the Rules for the Control of Air Pollution in Idaho, IDAPA 58.01.01 (the "Air Rules"). DEQ has received delegated authority from EPA for decades, and EPA has approved DEQ's CAA program year after year. *Id.* This delegation includes the authority to issue permits to qualifying facilities in Idaho. *Id.* DEQ's air quality permit program issues more than 100 permits a year. REC 1258. In writing these permits, DEQ staff use federal and state regulations as well as the internal guiding practices outlined in standard operating procedures. REC 1273. When DEQ receives a permit application for a "permit to construct," DEQ strives to issue the permit within 150 days, which includes the necessary time for a public comment period. *Id.*

Perpetua submitted an application for a permit to construct for the SGP on August 20, 2019. REC 0418. The SGP will consist of conventional open-pit mining, ore preparation, and gold extraction. REC 0415. DEQ expended extraordinary efforts to evaluate the application, consider public comments, and engage in highly technical decision-making to arrive at a legally and environmentally sound permit. *See* REC 1273-1274. DEQ engaged in three extended public comment periods, two public informational meetings, frequent meetings with Perpetua, and made many requests for additional information from Perpetua. REC 0418. DEQ determined Perpetua's application incomplete on three occasions. *Id.* Petitioners attempt to suggest that DEQ's three incompleteness determinations and multiple requests for supplemental information somehow indicate a failure or dereliction by Perpetua or DEQ. *See* REC 3464. They are wrong. In fact,

DEQ's relentless pursuit for necessary information, and Perpetua's willingness to provide it, demonstrate the parties' desire to prepare only a defensible, environmentally protective permit.

On June 17, 2022, DEQ issued the 43-page PTC and accompanying 505-page Statement of Basis for the SGP. *See* REC 0367-0914. Petitioners then initiated the contested case on July 22, 2022, challenging DEQ's issuance of the PTC. REC 0001-0028.

LEGAL STANDARDS

I. Standard of Review.

In a contested case proceeding, "the Board must determine whether DEQ has acted reasonably and in accordance with law." *In the Matter of Sunnyside Park Utilities' Application for Sewage Disposal Permit*, Final Order on Petition for Review of Preliminary Order, at 10 (BEQ Dkt. 0103-07-02, Apr. 7, 2009).[1] A court will affirm the Board's decision, should it be appealed, unless the court finds that DEQ and the Board's decision is in violation of constitutional or statutory provisions, is in excess of statutory authority, is made on unlawful procedure, or is arbitrary, capricious, or an abuse of discretion. *See* I.C. § 67-5279(3).[2] But, it is the Petitioners who have "the burden of proving by a preponderance of the evidence, the allegations in the petition." IDAPA 58.01.23.062. Thus, the Board must uphold DEQ's decision to issue the PTC unless it determines that Petitioners have in fact proven, by a preponderance of the evidence, that DEQ's decision was (1) unreasonable, (2) not in accordance with law, (3) issued upon unlawful procedure, and (4) was arbitrary, capricious, or an abuse of discretion.

[1] Publicly available at https://www2.deq.idaho.gov/admin/LEIA/api/document/download/5566.

[2] The Hearing Officer recognized the helpfulness of using the judicial standard of review in I.C. § 67-5279, "[b]ecause those are the standards that ultimately govern the disposition of this matter…" REC 3377. Further, and importantly, Petitioners use the judicial standard of review set out in I.C. § 67-5279 in asking for relief. REC 3474.

When reviewing the Hearing Officer's Preliminary Order, the Board has the authority to "exercise all of the decision-making power that [the Board] would have if [the Board] had presided over the hearing." I.C. § 67-5245(7). "This means that, in reviewing the Preliminary Order, the Board may review all of the evidence *de novo*…" *In the Matter of Sunnyside Park Utilities' Application for Sewage Disposal Permit*, at 2. "A de novo standard of review permits an appellate court to review all legal issues raised in the lower court, even if one of the issues was not addressed in the first instance, so long as there is a sufficient factual basis." *State v. Jay*, 167 Idaho 592, 598, 473 P.3d 861, 867 (Ct. App. 2020).

II. Agency Deference.

In a contested case, "[t]he agency's experience, technical competence, and specialized knowledge may be utilized in the evaluation of the evidence." I.C. § 67-5251(5). Because agencies have technical, specialized expertise and knowledge, the Idaho Supreme Court has recognized that "[t]he actions of an agency… are afforded a strong presumption of validity." *Duncan v. State Bd. of Accountancy*, 149 Idaho 1, 3, 232 P.3d 322, 324 (2010). Agencies are "clothed with power to construe [the law] as a necessary precedent to administrative action." *J.R. Simplot Co. v. Idaho State Tax Comm'n*, 120 Idaho 849, 854, 820 P.2d 1206, 1211 (1991). The Idaho Supreme Court has "long followed the rule that the construction given to a statute by the executive and administrative officers of the State is entitled to great weight and will be followed by the courts unless there are cogent reasons for holding otherwise." *Id*. (citations omitted). And an "agency's factual determinations are binding on the reviewing court, even where there is conflicting evidence before the agency, so long as the determinations are supported by substantial and competent evidence in the record." *Peck v. State, Dep't of Transp.*, 153 Idaho 37, 42, 278 P.3d 439, 444 (Ct. App. 2012) (citations omitted).

When an agency is interpreting its own rules, the court "applies a four-pronged test to determine the appropriate level of deference to the agency interpretation." *Duncan*, 149 Idaho at 3, 232 P.3d at 324. Under this test, the court must determine whether:

> (1) the agency is responsible for administration of the rule in issue; (2) the agency's construction is reasonable; (3) the language of the rule does not expressly treat the matter at issue; and (4) any of the rationales underlying the rule of agency deference are present.

Id. Here, DEQ is responsible for administering the CAA and the Air Rules in Idaho. Therefore, when the agency is interpreting the language of the Air Rules, the Board should defer to DEQ's reasonable and practical interpretations.

ARGUMENT

I. DEQ acted reasonably and in accordance with all applicable law in excluding the Stibnite Access Road from the Ambient Air Boundary.

In the PTC, DEQ determined that the Stibnite Access Route ("the Route") was not accessible by the general public and was, therefore, not "ambient air," as that term is defined at 40 CFR § 50.19(c) and IDAPA 58.01.01.006.10. REC 3475. Petitioners claim the Route is in fact ambient air and that the Hearing Officer erred when he determined that DEQ had permissibly excluded the Route from the ambient air boundary. *Id.* The Hearing Officer established that DEQ had substantial evidence to find that Perpetua had the legal authority to preclude the general public from traveling over the Route, and that DEQ and EPA guidance supported DEQ's determination. *Id*. For the reasons discussed below, Petitioners fail to prove these allegations or demonstrate that DEQ acted unreasonably or in violation of any law.

A. DEQ reasonably relied on Perpetua's assertions regarding control of the Route, and the record supports DEQ's determination.

In support of this claim, Petitioners first argue that DEQ impermissibly relied on the assertions provided by Perpetua—primarily, Perpetua's statement in its permit application

regarding its control over the Route.[3] DEQ did exclude the Route from ambient air because, in part, Perpetua represented that it would have legal authority to prohibit access by the "general public" and the practical ability to do so. REC 1260; REC 1236-1240. DEQ's reliance on these assertions is completely reasonable. As the Hearing Officer stated:

> In the experience of the hearing officer, it is not unusual for an agency to rely on representations made in a permit application, even as to an issue as fundamental as the nature of the applicant's interests in the relevant property.

REC 3390. In advance of the hearing on the motions for summary judgment, the Hearing Officer asked the parties to provide any legal authorities addressing DEQ's ability to rely on representations made by a permit applicant and the extent to which DEQ is responsible for verifying that information. REC 3388. None of the parties provided any legal authority demonstrating DEQ was responsible for verifying factual information provided by the permittee. Id. This is both logical and practical, as DEQ cannot be expected to fact check every individual averment made by a permittee. This is also why permit applicants are required to certify that the information and statements provided in a permit application are "true, accurate, and complete." IDAPA 58.01.01.123. Perpetua certified that the information in its application was accurate. REC 3389. And, as the Hearing Officer pointed out, should it later be determined that Perpetua does not have legal control over the Route as it claimed it will, then Perpetua would be in violation of its permit. REC 3390.

[3] Petitioners cite *State Ins. Fund v. Hunnicutt*, 110 Idaho 257, 715 P.2d 927 (1985), in support of the contention that "an agency determination can **only** be upheld where 'evidence supporting the agency decision is substantial when viewed in the light of the entire record, including the body of evidence opposed to the agency's view." REC 3477 (emphasis added). In *Hunnicutt*, the Court actually stated: "Nevertheless, reviewing courts should evaluate whether 'the evidence supporting that decision [under review] is substantial, when viewed in the light that the record in its entirety furnishes, including the body of evidence opposed to the [agency's] view.'" *Hunnicutt*, 110 Idaho at 261, 715 P.2d at 931 (citations omitted).

Petitioners discuss at length Perpetua's current process of seeking Forest Service approval for the SGP. REC 3479-3475. Petitioners contend that because the Forest Service has not yet approved the SGP, Perpetua does not have legal control over the Route. *Id.* Besides being an oversimplification, this discussion is irrelevant to DEQ's review of Perpetua's application and ultimate issuance of the PTC. Many things could change from the time a permittee submits an application. While DEQ may wish it had a crystal ball to see into the future, including what the Forest Service may or may not do regarding the SGP, DEQ can only permit a project based on the facts as they exist at the time the application is submitted. If circumstances do change, the permit may need to be modified, or the permittee could be in violation of the issued permit. The bottom line is that the agency record as it currently exists—namely Perpetua's assertions and the conditions of the PTC, discussed below—support DEQ's determination that Perpetua will have legal authority to exclude the general public from the Route.[4]

B. The PTC requires Perpetua to have the ability to restrict the general public from the Route.

The PTC itself requires that the "general public" be precluded from accessing the Route and requires that access for all guests be carefully managed. REC 0376. The Route will not be, as Petitioners contend, a "public access road." Permit Condition 2.7 requires a combination of security escort vehicles, manned guardhouses, locked gates, barriers, warning signs, and registration of all guests to the mine site. *Id*. Condition 2.7 also requires Perpetua to submit an Access Management Plan, which must include the specific measures Perpetua will use to discourage public access, including those included in Condition 2.7. *Id.* These conditions will be more than sufficient to notify a reasonable person that his or her presence is not permitted and

[4] Petitioners claim that the Hearing Officer ignored other facts in the record. REC 3478. It is unclear what the Petitioners are referring to. The only other information discussed is what the Forest Service may or may not end up approving regarding the project. This is not information that needed to be considered, as discussed above.

therefore punishable under I.C. § 18-7008 for criminal trespass and actionable under I.C. § 6-202 for civil trespass. Looking just at the "four corners" of the PTC, the Hearing Officer also found "Section 2.7 of the Permit to adequately require Perpetua to preclude access by the general public for the purpose of excluding the access road [the Route] from the definition of 'ambient air.'" REC 3393. It is disingenuous of Petitioners to call the Route a "public access road" when the PTC itself requires Perpetua to take all necessary actions to discourage public access.

C. DEQ and EPA guidance support DEQ's determination that the Route is not "ambient air."

Next, Petitioners claim that DEQ acted contrary to EPA and DEQ guidance in finding the Route does not qualify as "ambient air." In this way, the Petitioners are challenging DEQ's interpretation of its own rule, which should be afforded substantial deference. Petitioners also miscite EPA's 2019 "Revised Policy on Exclusions from 'Ambient Air,'" which does not require state agencies to apply the policy because they "retain the discretion to determine whether the steps taken by a source will be adequate to preclude public access." REC 1139.

However, DEQ's determination that the Route is not "ambient air" is supported by both DEQ and EPA guidance. The Hearing Officer summarized EPA's guidance well when he stated:

> According to EPA's 2019 ambient air policy: (1) it is appropriate to exclude areas from ambient air where measures are employed that are "effective in precluding access to the land by the general public;" (2) such measures can include physical barriers, but physical barriers are not required; (3) determinations by the agency are discretionary on a case-by-case basis; (4) the permit applicant must have the legal ability to preclude access by the general public and must employ measures that actually preclude the general public as a practical matter; (5) in evaluating the adequacy of the preclusion measures, the agency applies a "rule of reason" as to whether the general public will have access "under reasonably anticipated circumstances.

REC 3392. DEQ's modeling staff "evaluated EPA guidance on Ambient Air and outlined requirements the permit needed to address to manage access to the facility…" which was

"documented in Section 3.3.10 of the January 6, 2022, Modeling Memorandum from [DEQ staff person] Dr. Pao Baylon." REC 1260. When DEQ staff consulted with EPA on this issue, EPA Region 10 Meteorologist and Regional Modeling Contact, Dr. Jay McAlpine, stated:

> My understanding is the road is likely exempt from ambient air protections because it is fully under the control and surveillance of the source and unsupervised public access is precluded. It seems like a slam dunk, based on my understanding of EPA's revised ambient air policy.

REC 1240. DEQ's decision is in line with EPA's guidance, as the PTC requires Perpetua to take several measures to preclude access, as discussed, and Perpetua must have the legal ability to do so.

Similarly, DEQ's guidance focuses on the ways in which the permittee will discourage public access. REC 3392. The nature or remote location of the facility may discourage public access, or the permittee may take steps to prevent access. *Id.* If the general public is sufficiently precluded, it is reasonable to consider that the facility or specific area would not qualify as ambient air. *Id.* Petitioners rely on DEQ guidance language that states "if the general public [is] invited as part of the normal business conducted on the facility site" the area where the "public is invited is determined to be ambient air," and if the "general public [is] allowed on site as a part of a right-of-way easement or a common service road," then that road is "determined to be ambient air." Again, the general public is not invited, but meant to be precluded. This is not a "right-of-way easement" or "common service road." As one example, PTC condition 2.7 requires registration of all guests of a mine—surely no easement or common service road requires such registration.

DEQ's decision to differentiate between the "general public" and Perpetua's guests was not unreasonable or otherwise not in accordance with any law. DEQ's interpretation of the definition of "ambient air" is due considerable deference because: (1) DEQ is responsible for administration of this rule in issue; (2) its construction is reasonable; and, (3) the language of the rule does not

expressly treat the matter at issue. *See Preston v. Idaho State Tax Comm'n,* 131 Idaho 502, 960 P.2d 185 (1998). Thus, the Hearing Officer's Order should be affirmed, and the PTC should be upheld.

II. DEQ acted reasonable and did not violate any rule or statute by allowing Perpetua to submit certain plans later.

Pursuant to DEQ's discretion, the PTC requires Perpetua to develop plans and manuals and submit them to DEQ for approval at least 30 days prior to startup. REC 1264; REC 0367-0409. These plans and manuals include the Fugitive Dust Control Plan, the Haul Road Capping Plan, the Operation and Maintenance Manual, and the Stibnite Road Access Management Plan (collectively, "the Plans"). Petitioners claim that allowing Perpetua to submit the Plans later violates the Air Rules and CAA, and that "DEQ deferred addressing many issues during the PTC permitting process" by allowing Perpetua to "address those issues in the future through various plans." REC 3488. Petitioners contend that the PTC is partial and incomplete without the Plans themselves. This is a misstatement. DEQ did not defer addressing any issues, and the PTC contains all necessary conditions. As discussed below, DEQ is allowing Perpetua to provide additional detail in the required Plans. Petitioners fail to demonstrate that DEQ violated any rule or statute in using this customary practice of requiring plans be submitted later pursuant to the PTC.

A. Allowing Perpetua to submit the Plans later does not violate the CAA or the Air Rules.

Petitioners assert that "[n]o provision in the Air Rules authorizes DEQ to save portions of a PTC to be developed later, outside the normal PTC permitting process," and that the Air Rules require the Plans to be included in Perpetua's application and subject to public comment. REC 3488. Petitioners' Opening Brief regurgitates CAA regulations requiring legally enforceable procedures to protect air quality and requiring public comment on information submitted by an

applicant, as well as the Air Rules requiring that DEQ provide opportunity for public comment. REC 3488-89. Petitioners, however, do not provide any rule or regulation requiring that every detail and plan be included in the application or available for public comment. Instead, as the Hearing Officer recognized, there is no "outright prohibition of this practice [requiring detailed implementation plans after issuance of the PTC], and the language of Air Rule 211.01 provides DEQ with wide discretion regarding appropriate permit terms." REC 3406.

The PTC itself contains specific requirements that will ensure Perpetua complies with the Air Rules and CAA—that is, the PTC details "what" is required for compliance. The PTC conditions requiring that detailed plans be developed later merely mandates that Perpetua develop the specific details on "how" the PTC requirements will be achieved. Section 202 of the Air Rules specifies the requirements for a permit to construct application and identifies information required to be included in the application. IDAPA 58.01.01.202.01. Requisite information for new sources includes information related to the design of the source, nature and amount of emissions, the manner in which the source will be operated and controlled, and a schedule for construction. *Id.* The PTC does include all necessary information under Section 202. And DEQ may request any additional information necessary to make determinations under the Air Rules, IDAPA 58.01.01.202.03, while Section 211.01 also provides DEQ with flexibility and discretion to "impose any reasonable conditions."

During the public comment period, Petitioners submitted similar comments, raising concerns with the submission and review process of the Plans. PET 0922-0923. DEQ responded and explained that the PTC specifies minimum and substantive requirements for the Plans. *Id.* In addition, DEQ will exercise oversight, review, and approve the Plans, and publish the final plans

on its website. *Id*. Furthermore, all elements of the Plans will be incorporated and enforceable through the Final Permit. REC 0376; REC 0380; REC 0386.

Petitioners also claim that because the Plans have not yet been submitted, then "DEQ cannot reasonably claim that the Project will comply with the PM10 NAAQS and arsenic AACC." REC 3490. Petitioners utterly downplay what the PTC contains and what the Plans will actually entail. Using the Operation and Maintenance Manual ("O&M") as an example, the PTC contains at least ten substantive requirements, most of which contain additional related requirements, that must be in Perpetua's O&M. These requirements include, among other things, the following:

- Identify the manufacturer, model, date of manufacture, and maximum capacity (as-built) for each regulated emission source assigned a source ID, and for each control device in the service of ore concentration and refining, lime production, and concrete production (in Table 1.1).

- Establish operating ranges for control equipment, based on manufacturer specifications and conditions measured during performance testing [with six additional requirements following therein].

- Describe the procedures for proper operation, startup, and shutdown of control equipment, based on manufacturer specifications.

- Describe the schedule and procedures for routine inspection (Permit Condition 2.10), maintenance, repair, and replacement of control equipment.

- Describe the schedule and procedures for corrective action that will be taken if visible emissions are present from wet scrubber…, carbon filter…, baghouse…, or bin vent filter… control equipment at any time. Procedures should include how to determine whether filter cartridges are ruptured or are not appropriately secured in place, and how to determine whether the wet scrubber, condenser, and carbon filters are operating properly.

- Describe each monitoring device and methodology used to measure weight rates of materials to demonstrate compliance with each material throughput limit (Permit Conditions 3.5–3.9, 4.8–4.11, and 5.4–5.8). Procedures for proper installation, calibration, and maintenance shall be included.

- Describe each monitoring device and methodology used to measure the volumetric rates of materials to demonstrate compliance with the electrowinning cells and pregnant solution tank throughput limit (Permit Condition 4.12). Procedures for proper installation, calibration, and maintenance shall be included.

- Describe each monitoring device and methodology used to monitor pH, temperature, and free cyanide in each cyanide leach tank, each cyanide detox tank, and each tailings reclaim stream to comply with Cyanide Emissions Limit Compliance Monitoring (Permit Condition 4.18). Procedures for proper installation, calibration, and maintenance shall be included.

REC. 0378-0379. The PTC also contains the necessary operational conditions—conditions for drilling limits, blasting limits, daily hauling and excavating limits, life of mine hauling and excavating limits, and so on. REC 0386. In short, DEQ is relying on the PTC itself to ensure compliance with the Air Rules and CAA.

Petitioners also claim that allowing Perpetua to submit the Plans later deprives the public of meaningful involvement. REC 3490. Petitioners fail to cite any case law to support their position that public review is required for the Plans under the CAA or Air Rules. The relevant CAA jurisprudence affords broad discretion to states to develop permit conditions. *See Train v. Nat. Res. Def. Council, Inc.*, 421 U.S. 60, 79 (1975). The Air Rules state that DEQ must provide an opportunity for public comment on its "proposed action, together with the information submitted by the applicant and the Department's analysis of the information." IDAPA 58.01.01.209.01.c.i. But, as previously discussed, DEQ underwent three extended public comment periods. REC 1274. DEQ responded to the many public comments received, at times making changes to the PTC based upon comments. *See* REC 1242. And, although not required, DEQ held two informational public meetings. REC 1274. DEQ is not denying the public an opportunity that they would otherwise be provided. The public has had many opportunities to engage with DEQ in the development of this PTC. Allowing Perpetua to submit the Plans later does not change that fact; the public was able to engage with DEQ on the development of the substantive requirements of the PTC, as required by IDAPA 58.01.01.209.01.c.i.

Petitioners cite inapposite cases, none of which support Petitioners' position that use of post-permit plans is prohibited. In *Waterkeeper Alliance v. U.S. EPA*, 399 F.3d 486 (2d Cir. 2005), environmental groups challenged an administrative rule promulgated by the EPA under the Clean Water Act ("CWA") to regulate water pollutants from concentrated animal feeding operations (the "CAFO Rule"). The CAFO Rule established non-numerical effluent limitations in the form of best management practices, rather than numerical effluent limitations. However, the Court determined that the CWA requires that (NPDES) permits include the effluent limitations the CAFO Rule deferred for inclusion in a post-permit nutrient management plan. *Id.* at 502. Additionally, "the CAFO Rule prevents the public from calling for a hearing about—and then meaningfully commenting on—NPDES permits before they issue." *Id.* at 503. For these reasons, "the CAFO Rule violates the plain dictates of 33 U.S.C. § 1251(e)." *Id.*

Waterkeeper is easily distinguished from the present case. For one, *Waterkeeper* challenges EPA's promulgation of an administrative rule and is not concerned with whether any specific permit adequately provides public participation, or whether any specific permit complies with federal emission requirements. Instead, *Waterkeeper* considers whether EPA's administrative rule allowing the inclusion of effluent limits in a post-permit plan violates the CWA. Here again, *Waterkeeper* is inapposite. The Plans Petitioners criticize are not meant to include emissions limitations required under the statute—those are provided in the PTC itself. Unlike the CAFO Rule's nutrient management plan, which deferred specific effluent limitations for formulation after issuance of a permit, the PTC mandates a litany of specific requirements, all meant to safeguard air quality and achieve compliance with the Air Rules. The post-permit plans required by DEQ will not include the conditions and limitations required by the CAA and Air Rules—they are

included in the PTC and were part of the public comment process. *Waterkeeper* simply does not support Petitioners' claim that the Plans deprive the public of meaningful involvement.

In *Env't Def. Ctr., Inc. v. U.S. E.P.A.,* 344 F.3d 832 (9th Cir. 2003), petitioners challenged an EPA rule to control pollutants from storm sewers (the "Phase II Rule"). Under the Phase II Rule, "dischargers may apply for an individualized permit with the relevant permitting authority, or may file a 'Notice of Intent' ('NOI') to seek coverage under a 'general permit.'" *Id.* at 853. "The Phase II Rule requires that each NOI contain information on an individualized pollution control program that addresses each of the six general criteria specified in the Minimum Measures." *Id.* The Court found that this scheme "constitutes compliance with the standard of reducing pollutants to the 'maximum extent practicable.'" *Id.* The Court concluded that EPA is "required to ensure that the individual programs adopted are consistent with the law." *Id.* at 856. Consequently, the aspect of the rule allowing coverage under an NOI was remanded. The Court noted however: "Our holding does not preclude regulated parties from designing aspects of their own stormwater management programs." *Id.*

Env't Def. Ctr. is also distinguishable from the present case, for many of the same reasons as the *Waterkeeper* case. *Env't Def. Ctr.* challenges an administrative rule, not a specific permit. Further, while the Phase II Rule provided an end-run around creating stormwater management programs or issuing permits without public comment, the PTC here did not. Instead, the PTC and its conditions for compliance with the Air Rules went through public comment. Only the details of implementation, not compliance and consistency with law, remain to be developed in the Plans. DEQ has satisfied the Ninth Circuit's admonishment that "programs that are designed by regulated parties must, in every instance, be subject to meaningful review by an appropriate regulating entity." *Id.* at 503.

Both *Waterkeeper* and *Environmental Defense Center* rested their holdings on express requirements under the Clean Water Act for public review of specific materials. The decisions are clearly distinguishable from Perpetua's Plans, which are not required by any express provision of the Air Rules (nor the CAA) to be included in the application, the Final Permit, or any part of the public comment process. The Board should accordingly not give any weight to these cited cases because they are factually and legally distinguishable. Instead, the Air Rules support DEQ's issuance of the permit and conditions for post-permit plans.

B. DEQ's Approach was reasonable and is customary practice.

Allowing Perpetua to submit the Plans later, but prior to startup, is both reasonable and consistent with DEQ's practice. REC 1265. As DEQ's Stationary Source Bureau Chief Mike Simon stated:

> It is common for the permit program to require certain plans, such as an O&M manual or FDCP to be prepared by the permittee post permit issuance. This allows the permittee to prepare a specific plan or manual based on the actual equipment purchased and installed, the manufacturer's instructions and recommendations, as well as the operational characteristics of the facility after construction is completed. DEQ uses its authority to require a permittee to develop and submit for DEQ approval Plans and Manuals in accordance with IDAPA 58.01.01.211.01 as reasonable permit conditions.

REC 1265. As to this explanation from Mr. Simon, the Hearing Officer found: "This is a logical explanation for deferring identification of the 'devices and methodologies' until later." REC 3407. Thus, the Hearing Officer held:

> Given that (a) there is a requirement in the Permit to monitor and record the amount of ore and development rock transported, and (b) the Petitioners have not offered expert testimony explaining how deferring identification of the specific "devices and methodologies" until later could be arbitrary, capricious, or an abuse of discretion, the hearing officer lacks discretion to conclude that DEQ committed reversible error.

Id.

Simply put, DEQ's rationale for deferring submittal of the Plans until later is justified because the PTC contains enforceable conditions and parameters which those Plans must include and achieve. DEQ made no special exceptions in this case, but simply followed its common, reasonable practice. Petitioners certainly disagree with this approach, but dislike is not the legal standard. DEQ exercised reasonable discretion in developing the PTC conditions and requiring the Plans with additional details be submitted later. DEQ did not violate the CAA or the Air Rules. Thus, the Board must affirm the Hearing Officer's Preliminary Order and find that DEQ acted reasonably and in accordance with all applicable law.

III. DEQ clearly demonstrated a reasonable basis for determining that Perpetua can achieve 93.3% dust control under the terms of the PTC.

Petitioners contend DEQ lacked a reasonable basis in determining that the SGP can achieve 93.3% dust control. REC 3494. Specifically, Petitioners argue "it is highly questionable whether 93.3% fugitive dust control is realistically attainable," and that "the Permit lacks sufficient conditions for DEQ to reasonably assume Perpetua will achieve such a high level of control." *Id.* Instead of attacking DEQ's underlying rationale, Petitioners summarily argue that "[b]ecause DEQ did not include such limits, conditions, and aggressive implementation measures in the Permit, it was arbitrary and capricious for DEQ to assume this high 93.3% would be achieved." REC 3496. Petitioners wrongly believe that without including specific limits "on the combinations, volumes, and frequencies for applying water sprays and chemical suppressants, as well as necessary monitoring and inspection" in the PTC itself, DEQ had no reasonable basis for assuming the SGP will achieve 93.3% dust control. REC 3499.

A. DEQ had a reasonable basis to determine Perpetua could achieve 93.3% dust control.

DEQ carefully and conscientiously studied this complex issue to ensure air standards were met. *See* REC 0924-0925; REC 1247-1248; REC 1260-1261. The 93.3%[5] control efficiency is based on a combination of dust suppressant chemical application (90% or higher) and watering (33% and higher) to increase road surface moisture. *See* REC 0509. As the Hearing Officer summarized, "DEQ has adduced expert testimony explaining the basis for the 93.3% control efficiency figure, an issue not within the common knowledge of the layperson." REC 3401. The Hearing Officer found that "Petitioners have not offered expert testimony to rebut" DEQ's efficiency figure. *Id.* Again, Petitioners have offered no evidence to contradict the Hearing Officer's reasoned decision, nor to suggest that DEQ's dust control figure is not adequately supported.[6]

Requiring Perpetua to achieve a 93.3% control efficiency was soundly within DEQ's discretion and supported by objective data that was reasonably relied upon. DEQ's evaluation to satisfy the requirements of Section 203 of the Air Rules included estimates of fugitive dust emissions from the Project's haul roads, including a dust control efficiency of 93.3%. *See* REC 0384. Conditions in the PTC will ensure that the control efficiency will be maintained through a combination of chemical dust suppressants (e.g., magnesium chloride or calcium chloride) and frequent watering, among other permit conditions. *Id.* Petitioners contend it is "highly questionable

[5] 93.3% control = (1-90%) * (1-33%).

[6] Petitioners seem to claim that "expert testimony" was offered "in the form of public comments and other submissions to DEQ made by the EPA." REC 3495. As the Petitioners know, the EPA is not considered an "expert" in the same manner DEQ is. As the Hearing Officer determined, because EPA is not a party to this case, they are not subject to discovery or cross examination, and are therefore not "experts." REC 3272. These vague references to "expert testimony" are disingenuous at best.

whether 93.3% fugitive dust control is realistically attainable." REC 3494. DEQ found otherwise, and Petitioners have not shown that DEQ's conclusion was unreasonable.

Petitioners have failed to show that DEQ's 93.3% control requirement is unachievable, nor have they actually demonstrated that 93.3% control would result in violations of Idaho's Air Rules. It is the burden of the party contesting an administrative agency's decision to show how the agency's decision was unsupportable. *See Grace at Fairview Lakes, LLC v. Idaho Department of Health and Welfare,* 172 Idaho 743, 748, 536 P.3d 382, 387 (2023). Petitioners have failed to meet that burden. DEQ determined that 93.3% dust control was both achievable and would protect air quality; the Board should uphold that determination and adopt the Hearing Officer's determination that "DEQ's adoption of the 93.3% control efficiency figure [was] adequately supported." REC 3402.

B. The PTC includes enforceable and sufficient conditions to ensure compliance with Idaho's Air Rules.

Petitioners' argument that the PTC "does not include a specific requirement to achieve 93.3% or any other level of dust control" fails. REC 3494. Petitioners mislead the Board, but the PTC speaks for itself. The PTC specifically requires that a dust control efficiency of 93.3% be maintained.

> Table 3.1 contains a description of control equipment used to control emissions from mining and ore processing activities.

Table 3.1 Mining and Ore Processing Control Device Descriptions

Emission Sources	Control Devices
Mining	
Excavating and hauling activities	Reasonable control & FDCP Chemical suppression and water sprays **Control efficiency: 93.3% for PM/PM10 (haul roads)** Haul road capping with low-arsenic quartzite

REC 0384 (PTC Table 3.1) (emphasis added). The Hearing Officer recognized this and determined that the PTC itself "includes a specific requirement that 93.3% control efficiency be achieved." REC 3403.

Next, Petitioners contend "the Permit lacks sufficient conditions for DEQ to reasonably assume Perpetua will achieve such a high level of control." REC 3494. But Petitioners recognize "the Permit includes conditions related to dust control" such as: monitoring and maintaining dust emission records (Permit Conditions 2.1-2.5) and development of a Fugitive Dust Control Plan ("FDCP") (Permit Condition 2.6). *See* REC 3497. Petitioners erroneously label these conditions "vague direction" and argue DEQ must include, in the PTC itself, details such as the exact dust suppressant types Perpetua will use and the frequency and rates of their use. REC 3499. Petitioners, however, "do not cite to any legal standard requiring additional requirements or otherwise explaining how the existing Permit provision is legally inadequate." REC 3403. Nonetheless, the PTC does include sufficient conditions for DEQ to believe Perpetua will achieve the required dust control level.

DEQ developed permit conditions to ensure the 93.3% control efficiency is maintained on a daily and annual basis, and Petitioners have not shown those conditions are unreasonable or unenforceable. According to EPA guidance, for source-specific permit provisions to be practically enforceable, they must specify: (1) a technically accurate limitation and the portions of the source subject to the limitation; (2) the time period for the limitation (hourly, daily, monthly, annually); and (3) the method to determine compliance including appropriate monitoring, recordkeeping and reporting. REC 1157. DEQ ensured those enforceability criteria were met with respect to the 93.3% control efficiency. Not only did DEQ include that level of control in the PTC and find it achievable, but the PTC requires proper application of chemical dust suppressant and watering,

verified through daily visible emission monitoring and recordkeeping. *See* REC 0917, 0921, 0923, 0934, 0937.

DEQ's conclusion is well supported and reasonable. Condition 2.2 requires Perpetua to monitor the frequency and methods used to control fugitive dust at least once every 12 hours and maintain those records. REC 0374. Condition 2.4 requires daily facility-wide inspections of hauling activities to ensure the expected control efficiency is achieved. *Id.* Condition 2.5 mandates that fugitive dust control measures be applied to haul roads "on a frequency such that visible emissions from vehicle traffic on a haul road do not exceed 10% opacity." REC 0375. And if emissions exceed that level, Perpetua must take immediate corrective action until fugitive dust control is achieved. *Id.* These daily inspection and haul road opacity requirements are more stringent than in other permits that DEQ has issued. REC 1261.

The FDCP will also ensure compliance with fugitive dust requirements. Condition 2.6 establishes minimum and substantive requirements for the FDCP, including:

- posting and limiting the maximum speed of haul trucks;
- applying water or suitable dust suppressant chemicals to haul roads during the dry season and at other times as necessary to control fugitive dust;
- prior to onset of winter conditions, maintenance of the roads and any preventative dust suppression activities before the roads are frozen;
- developing specific criteria to determine what frequency and type (water and/or chemical) of dust suppressant and appropriate suppressant application rates;
- applying chemical dust suppressants consistent with manufacturer's instructions and recommendations;
- providing training to all relevant employees and conducting visible emissions evaluations by certified employees who are visible emission observers; and,
- at least once each year, evaluating FDCP requirements to identify additional requirements and evaluating the effectiveness of practices.

REC 0375-0376. The PTC "requires a more comprehensive and detailed FDCP than in any other minor source permit DEQ has issued." REC 1263. Thus, DEQ did not give "vague direction" to consider type, quantity, and rates of dust suppressants later in its FDCP; DEQ provided specific dust control conditions and detailed guidance on the requirements that must be contained in the FDCP.[7]

DEQ's imposition of minimum and substantive requirements in the Permit and through the FCDP was reasonable. It understood how uncommon and impractical it would be to establish specific numeric limits to control efficiency variables. *See* REC 1261-1262. Instead, the Permit, among other conditions, requires that chemical suppressants be applied in accordance with the manufacturer's instructions and recommendations and that the control effectiveness of the combination of dust suppressant chemicals and watering be verified daily. *See* REC 0374-0375. Petitioners have not satisfied their burden to show that DEQ unreasonably relies on the many permit conditions to achieve the required control efficiency.

Finally, Petitioners contention that Perpetua need only "describe what it will do to control dust, and then follow through on those plans" in order to comply with the PTC, is wholly without merit. REC 3495. Petitioners' straw man argument claims that if Perpetua "submits [] plans to DEQ, DEQ signs off on them, and Perpetua follows through and complies with the deficient plans, then Perpetua will be in compliance with the terms of the PTC – even though it will not achieve 93.3% dust control."[8] *Id.* This is wrong. As discussed, the PTC explicitly requires a 93.3% dust control efficiency. DEQ could not, and would not, approve a FDCP that falls below the expressly

[7] As discussed above in Section II, DEQ's use of plans to provide additional detail is in line with the Air Rules, and a reasonable, customary practice.

[8] This begs the question: what evidence do Petitioners have that adding more specific provisions to the permit—rather than the FDCP—will ensure that Perpetua controls its dust emissions?

stated Permit limit. Petitioners' contention to the contrary is disingenuous and must be disregarded. If Perpetua fails to achieve a 93.3% dust control level—verified through the visible emission inspections—they will be in noncompliance with the PTC.

In sum, the PTC requires Perpetua to achieve a 93.3% control efficiency. The experts at DEQ determined that 93.3% is both achievable and will comply with Idaho's air quality standards—Petitioners have proffered no evidence showing DEQ's decision is unsupported. The PTC contains express dust control requirements to ensure Perpetua's compliance. Moreover, despite being under no legal obligation to include additional requirements or conditions in the PTC, the PTC provides a plethora of conditions that will also ensure Perpetua complies with the PTC and achieves the target dust control number. Thus, DEQ's determination that the PTC would comply with the NAAQS was rational and supported by substantial evidence and Petitioners have failed to offer competent expert testimony or sound legal argument to the contrary. As such, the Board should affirm DEQ's determinations and adopt the Hearing Officer's well-reasoned opinion.

IV. DEQ's "project specific adjustment factor" clearly complied with the Air Rules, and DEQ used proper discretion and expertise to average arsenic emissions over the projected duration of the Mine.

Finally, Petitioners allege that DEQ created a "project specific adjustment factor" to "artificially dilute the ambient arsenic concentrations attributable to the SGP." REC 3499. According to Petitioners, DEQ violated the Air Rules by "artificially reduc[ing] the apparent arsenic exposure by spreading out the actual arsenic exposure resulting from the 16-year Project over a longer 70-year human lifetime." REC 3501. Accordingly, Petitioners claim the Hearing Officer "incorrectly interpreted the Air Rules" in allowing DEQ to use this "adjustment." REC 3506. Fundamentally, Petitioners misunderstand DEQ's analysis, which was not based on a

"qualitative" standard, as alleged. For the reasons discussed below, Petitioners fail to demonstrate that DEQ acted unreasonably or violated any applicable rule.

A. DEQ's use of the "project specific adjustment factor" is not contrary to the Air Rules.

There are four rule sections applicable to this claim. First, Air Rule Section 203.03 states that DEQ cannot issue a permit to construct for a new stationary source "unless the applicant shows to the satisfaction of the Department" that the following is met:

> Toxic Air Pollutants. Using the methods provided in Section 210, the emissions of toxic air pollutants from the stationary source… would not injure or unreasonably affect human health or animal life or vegetation as required by Section 161. Compliance with all applicable toxic air pollutant carcinogenic increments and toxic air pollutant non-carcinogenic increments will also demonstrate preconstruction compliance with Section 161 with regards to the pollutants listed in Sections 585[9] and 586.

IDAPA 58.01.01.203.03. Section 210 begins as follows: "In accordance with Subsection 203.03, the applicant must demonstrate preconstruction compliance with Section 161 to the satisfaction of the Department." IDAPA 58.01.01.210. Section 210 goes on at length to provide the methods by which DEQ and the permit applicant analyze the toxic air pollution emissions.

Section 161 then states: "Any contaminant that is by its nature toxic to human or animal life or vegetation must not be emitted in such quantities or concentrations as to alone, or in combination with other contaminants, injure or unreasonably affect human or animal life or vegetation. IDAPA 58.01.01.161. Accordingly, the language of Section 161 mirrors Section 203, both of which state that toxic air pollutants must not "injure or unreasonably affect human health or animal life or vegetation." That determination is made using the methods in Section 210.

[9] Section 585, Toxic Air Pollutants Non-Carcinogenic Increments, is not relevant to this case. Section 586 is discussed below.

Finally, Section 586 provides the acceptable ambient concentrations (AACC) for carcinogens, which includes arsenic compounds. Petitioners appear to focus on the AACC in Section 586, while discounting the Departments discretion under the other applicable rules.

The Hearing Officer accurately described the interplay between these rule sections well, stating:

> The use of the phrase "will also demonstrate preconstruction compliance" in Section 203.03 effectively creates two regulatory paths. First, the applicant and DEQ can use "the methods in Section 210" to show that emissions will not "injure or unreasonably affect human or animal life or vegetation." Section 210, in turn, consists of six-and-a-half pages of detailed, technical, complex regulations… Regardless, the relevant legal standard— "injure or unreasonably affect"—is not further defined within the Air Rules.
>
> Effectively, the second path—compliance with Sections 585 and 586—provides applicants with a safe harbor. If an applicant demonstrates "[c]ompliance with all applicable toxic air pollutant carcinogenic increments and toxic air pollutant non-carcinogenic increments…with regards to the pollutants listed in Sections 585 and 586," then satisfaction of Section 161 is automatic and application of the "injure or unreasonably affect" standard unnecessary… For arsenic compounds, the applicable AACC is 2.3E-04 µg/m3. So, if an applicant can demonstrate arsenic emissions will not exceed that AACC, then the Section 203.03 analysis for arsenic is over. As a matter of law, the legal standard of Section 161 is satisfied.

REC 3416-3417.

Regarding Perpetua's PTC, DEQ took the "first path," analyzing Perpetua's application under Section 210.12. REC 1242. Section 210.12 essentially "allows an applicant to demonstrate compliance with Section 161 through the quantitative standards in Section 586 instead of the qualitative toxicity standard." (emphasis added). REC 3417. The rule states:

> If the source's… approved T-RACT [reasonably available control technologies] ambient concentration at the point of compliance is less than or equal to the amount of the toxic air pollutant that would contribute an ambient air cancer risk probability of less than one to one hundred thousand (1:100,000), no further procedures for demonstrating preconstruction compliance will be required for that toxic air pollutant as part of the application process.

IDAPA 58.01.01.210.12.c. And the "ambient air cancer risk probability of less than one to one hundred thousand (1:100,000) (which amount is equivalent to ten (10) times the applicable acceptable ambient concentration listed in Section 586)." IDAPA 58.01.01.210.12.b. As Kevin Schilling, DEQ's Stationary Source Air Modeling Supervisor, explained:

> If T-RACT is used to control emissions from sources, then the allowable impact is ten times that of the AACCs, corresponding to a lifetime cancer risk of 1 in 100,000. The AACC conservatively represents a long-term exposure (70 years) that would result in a 1 in 1,000,000 cancer risk.

REC 1242. Perpetua proposed the T-RACT of using chemical suppressants on the roads to address arsenic emissions. REC 1268.

When DEQ completed the analysis, using very conservative assumptions, the analyses "resulted in modeled arsenic impacts exceeding a value of 10 times the AACC." REC 1242. Mr. Schilling explained DEQ's next steps as follows:

> Before undertaking an extensive revision of the conservative emission calculation approach used in the emission inventory and the air impact model, DEQ evaluated whether certain refinements in exposure calculations would be consistent with requirements of *Idaho Air Rules* and specifically with *Idaho Air Rules* Section 210 for carcinogenic TAPs.

REC 1242. Here, DEQ considered refining the assumed lifetime exposure to the relevant carcinogen, arsenic, from the stated 70-year period. *Id.* Perpetua had indicated that the SGP will only have a 16-year maximum project lifetime.[10] *Id.* Thus, "[t]o calculate a project-based arsenic concentration representative of the project, appropriate for comparison to the AACC (based on a 70-year exposure), the modeled impact was adjusted by the factor 16/70." *Id.*

[10] Perpetua importantly noted the following during its summary judgment briefing: "DEQ set the life-of-mine hauling and excavating limit at 788.4 million tons of ore and development rock. Whether this amount is mined in 16-years, the life of the mine, or 70 years, the lifetime exposure period, the total arsenic emissions will be the same, they would just be spread out over more time. Thus, the total arsenic exposure to public receptors will be the same irrespective of how long the mine is in operation." REC 1334.

"DEQ simply used this general approach to develop a project-specific adjustment factor for the SGP, using the 16-year maximum life of the project." REC 1244. Still, DEQ's calculations were as conservative as reasonably possible: the equation for calculating lifetime exposure risk to arsenic utilized the highest annual concentration from 14 different operational scenarios and repeated it over sixteen years, the lifetime of the mine. REC 0789. The annual arsenic emissions were based on a five-year rolling average of 135,000 tons of per day, for sixteen years. REC 0710. This total ore production is over fifty percent greater than the actual potential mine production. *Id*. Using worst-case scenarios, or overestimating expected emissions, is a common modeling strategy that ensures actual emissions do not exceed applicable air standards. *See* REC 1246.

DEQ's use of this "project specific factor" is supported by the Air Rules. Petitioners make much of the fact that DEQ used a "novel" approach. *See* REC 3501. But DEQ's approach still fits squarely within the confines of the Air Rules. DEQ used the AACC in Section 586. DEQ also used the methods for a T-RACT analysis in 210.12.c. Ultimately, Section 203, as well as Section 161, require DEQ to demonstrate that the SGP's arsenic emissions "would not injure or unreasonably affect human health or animal life or vegetation…" IDAPA 58.01.01.203.03. DEQ was able to demonstrate this using the conservative modeling and data specific to the project itself, all based upon Sections 586 and 210.

The Hearing Officer was persuaded by DEQ's expert testimony, finding:

> Mr. Schilling recognizes that the over-arching legal standard is the toxicity standard in Section 161 and explains why strict compliance with standards expressed as annual limitations is not always necessary to satisfy that standard, particularly when the exposure period is considerably shorter than the assumed 70-year exposure period on which the AACCs are based. Overall, he provides a thoughtful and conservative approach to ensuring arsenic emissions will not exceed the 1-in-100,000 lifetime cancer risk standard when T-RACT is used.

REC 3421.

Further, Section 210.12.d states the following: "The Department will include emission limits and other permit terms for the toxic air pollutant in the permit to construct that assure that the facility will be operated in the manner described in the preconstruction compliance demonstration." The analysis discussed above demonstrates that the PTC does "assure that the facility will be operated in the manner described in the preconstruction compliance demonstration." DEQ developed the PTC to include operational permit limits that were used in the preconstruction compliance demonstration of the Air Rules – conditions such as throughput limits, hours of operation, materials combusted, processed, and stored, etc. REC 0385. DEQ took the parameters in the analysis, including the 16-year life of mine, and set them as operational limits per Section 210.12.d.

B. DEQ did not rely on a qualitative standard and Petitioners misunderstand DEQ's approach.

Petitioners claim that the Hearing Officer's decision was in error "because it lets a general and qualitative provision trump the specific numeric provisions that apply." REC 3505. As discussed above, DEQ did not rely solely on the "qualitative provision" of Section 161. As discussed at length in Mr. Schilling's declaration, REC 1233-1255, DEQ conducted the T-RACT analysis set forth in Section 210 and relied upon the AACC in Section 586 as representative of the cancer risk for a specified exposure period. DEQ is simply arguing that it had discretion to use the data points that made most sense, including the project specific information regarding the life of the mine. And Section 161 supports this decision, as it requires, ultimately, that DEQ find that "the emissions would not injure or unreasonably affect human health or animal life or vegetation." DEQ came to that conclusion – using the AACC and T-RACT analysis.

In a series of what appear to be rhetorical questions (e.g. "what is the point of Section 203.03's directive to follow the methods in Section 210?"), Petitioners allege that DEQ's

interpretation renders Sections 586 and 210 as "superfluous." REC 3505. Petitioner is reaching. Clearly, DEQ relied upon Section 586. As Mr. Schilling states: "To calculate a project-based arsenic concentration representative of the project, appropriate for comparison to the AACC (based on a 70-year exposure), the modeled impact was adjusted by the factor 16/70." REC 1243. A T-RACT analysis was performed, using conservative modeling and data, under Section 210. *Id.* Although Petitioners clearly imply DEQ would do so, it is hard to imagine DEQ finding a permittee in compliance with Section 161 without ample modeling and data to come to such a conclusion. These rhetorical questions miss the point.

DEQ provided unrebutted expert testimony supporting its interpretation and implementation of the Air Rules. While Petitioners take issue with DEQ's interpretation, DEQ should be afforded deference in its interpretation as (1) DEQ is responsible for administration of the rules at issue, (2) its construction is reasonable, and (3) the language of the rules does not expressly treat the matter at issue. *See* Preston, 131 Idaho 502, 960 P.2d 185 (1998). The Board should affirm the Hearing Officer's decision and find that DEQ acted reasonably and in accordance with law.

CONCLUSION

DEQ takes very seriously its mission to protect public health and the environment. After an enormous effort, which included much stakeholder involvement, DEQ issued a permit that is legally and technically defensible. REC 1273. Petitioners have failed to prove that DEQ committed any errors in its thorough and diligent PTC analysis. Petitioners fail to demonstrate that DEQ acted unreasonably, violated any constitutional or statutory provisions, was in excess of statutory authority, issued the PTC on unlawful procedure, or acted in a manner that was arbitrary, capricious, or an abuse of discretion. Thus, the Board must deny Petitioners' appeal, affirm the

Hearing Officer's Preliminary Order, and find that DEQ acted reasonably and in accordance with law in issuing the PTC.

TABLE OF AUTHORITIES iii

KEY TO TERMS AND ABBREVIATIONS vi

INTRODUCTION 1

EVIDENCE RELIED ON 3

STATEMENT OF UNDISPUTED FACTS 3

I. The Project and permit history. 3

A. The Project will develop gold and antimony resources and restore a previously mined and contaminated mine site. 3

B. DEQ issued the Final Permit after multiple requests for additional information, multiple public comment periods, and multiple draft permits. 5

II. PM_{10} fugitive emissions from the Project were conservatively estimated by DEQ. 6

III. The Stibnite Access Route. 8

IV. DEQ analyzed arsenic emissions and determined that they would not exceed the lifetime risk limit established by the Idaho Air Rules. 9

CONTESTED CASE BACKGROUND 11

I. Petitioners filed an amended contested case petition after the Hearing Officer partially dismissed the initial petition. 11

II. The Hearing Officer dismissed the amended contested case petition and found DEQ's decision making was reasonable and not in violation of the Idaho Air Rules. 12

III. Petitioners' Amended Petition seeks Board review of Claims 2, 3, 8, 9, 11, and 12. 13

IV. DEQ and Perpetua seek to supplement the record with DEQ's November 2023 response to the EPA letter. 14

STANDARD OF REVIEW 14

I. The Board must decide whether DEQ acted unreasonably or in violation of the law. 14

II. The Board may defer to DEQ's technical expertise and special skill. 16

ARGUMENT 18

I. The Hearing Officer correctly held that DEQ followed EPA guidance and properly exercised its discretion in excluding the Stibnite Access Route from ambient air (Claims 11 and 12). 18

A. EPA guidance on ambient air and agency discretion. 19

B. DEQ acted within its discretion to accept Perpetua's representation that it will have legal authority to preclude access by the general public. 20

C. DEQ acted within its discretion in determining that the Stibnite Access Route is exempt from ambient air. 23

II. The Hearing Officer correctly held that the Idaho Air Rules do not require Perpetua to develop work plans for DEQ approval before issuance of the Final Permit (Claim 3). 26

A. Petitioners cannot challenge DEQ's issuance of a permit to construct for failure to comply with the CAA. 27

B. The Idaho Air Rules do not require work plans to be submitted with applications or circulated for public comment. 28

C. DEQ's decision for Perpetua to develop and submit the work plans for approval before starting construction was not arbitrary or capricious. 30

D. Petitioners' legal authority from the Clean Water Act is distinguishable and inapplicable to DEQ's preconstruction permitting process. 31

III. The Hearing Officer correctly held that DEQ acted reasonably in determining that a 93.3% control efficiency for fugitive dust emissions from the Project's haul roads will meet the PM_{10} NAAQS and arsenic AACC (Claims 2 and 8). 33

A. DEQ acted reasonably and within its discretion in determining that 93.3% control efficiency for fugitive dust from haul roads is attainable. 33

B. DEQ acted within its discretion to impose daily monitoring and other substantive conditions to ensure a 93.3% control efficiency. 36

IV. The Hearing Officer correctly held that DEQ reasonably exercised its discretion in evaluating the health risks from arsenic (Claim 9). 42

Intervenor-Respondent Perpetua Resources Idaho, Inc. ("Perpetua") submits this opposition to the Amended Petition for Review of Preliminary Orders (the "Amended Petition") and Opening Brief submitted by Nez Perce Tribe, Idaho Conservation League, and Save the South Fork Salmon ("Petitioners").

INTRODUCTION

The Stibnite Gold Project (the "Project") is a pioneering approach to mining precious and critical minerals. Not only will it afford Valley County and resident Idahoans with economic benefits, the Project will restore a contaminated mine site that was abandoned by the federal government. Through an agreement with the United States Forest Service (the "Forest Service") and the United States Environmental Protection Agency ("EPA"), Perpetua is committing millions of dollars to pre-permitting cleanup of contaminated conditions it did not cause. Perpetua's restoration efforts at the site are ongoing, even while it procures the many permits needed to construct and operate the Project.

The Idaho Department of Environmental Quality's ("DEQ") issuance of Permit to Construct No. 2019.0047 (the "Final Permit") is the first of the many permits needed for the Project. The Final Permit authorizes construction of the Project, which is a minor source in a remote Idaho landscape designated in attainment with National Ambient Air Quality Standards ("NAAQS"). DEQ developed the Final Permit after a three-year process, which included four requests for supplemental information and air quality analyses from Perpetua, three draft permits, three extended public review and comment opportunities, and two public information meetings.

In July 2022, following the extensive scrutiny and review by DEQ and the public, Petitioners filed this contested case challenging the Final Permit. This Board appointed a Hearing Officer to decide Petitioners' challenges. Over the past 18 months, the parties participated in discovery, extensive motion practice, and a summary judgment hearing. In December 2023, the

Hearing Officer issued an Amended Memorandum Decision on Motions for Summary Judgment and Preliminary Order (the "Preliminary Order") granting DEQ and Perpetua's motions for summary judgment and dismissing the contested case. Now Petitioners seek review of the Preliminary Order, presenting the same opinions and critiques that were thoroughly addressed by DEQ during the permitting process and by the Hearing Officer during the contested case process.

Petitioners dislike DEQ's decision making in the Final Permit and ask the Board to substitute Petitioners' opinions and preferences for DEQ's substantive work and discretion. The Idaho Administrative Procedure Act leaves agencies with the ability to judge how to interpret data and deal with scientific uncertainty and to decide which scientific and technical analyses to accept or reject. DEQ is delegated responsibility to make such determinations in air quality preconstruction permitting. After repeated attempts to substitute their preferences for DEQ's, Petitioners now ask the Board to second-guess the experience, expertise, scientific analyses, expert judgments, and reasoned conclusions of DEQ.

To that end, in their Opening Brief, there is much that Petitioners conveniently ignore about the Final Permit and the exhaustive process to get to this point. Petitioners ignore that DEQ followed EPA guidance and acted reasonably to determine the Project's ambient air boundary. They ignore that DEQ thoroughly assessed future fugitive dust emissions and exercised its discretion in establishing protective fugitive dust controls. They ignore that an effective permit must conservatively regulate the expected mining activities while affording operational flexibility to the permittee. They ignore that an effective permit must protect the NAAQS through practically enforceable permit conditions that are consistent with DEQ programs, practices, and policies manifested in the Final Permit.

Overall, Petitioners ignore the expertise reflected in DEQ's careful, deliberative, thorough, and conservative analysis. Petitioners ignore that DEQ is better suited, and legally authorized, to make policy decisions based on scientific uncertainty and has the discretion to impose "any reasonable conditions upon an approval." IDAPA 58.01.01.211.01. And Petitioners ignore the dense record supporting the Hearing Officer's ruling and that they failed to carry their burden to show DEQ's decision making was arbitrary and capricious, was an abuse of discretion, or violated the law. Perpetua respectfully asks the Board to affirm the Hearing Officer's Preliminary Order and dismiss Petitioners' contested case petition.

EVIDENCE RELIED ON

In opposition to Petitioner's Amended Petition, Perpetua[1] relies on the Agency Record (cited as "REC") certified and transmitted to the Board on December 15, 2023. The Agency Record includes DEQ's permit file, the documents submitted during summary judgment proceedings, and the Hearing Officer's Preliminary Order and other orders. In addition, DEQ and Perpetua have submitted a motion to supplement the administrative record to include DEQ's response to an EPA letter referenced in Petitioner's Amended Petition and Opening Brief.

STATEMENT OF UNDISPUTED FACTS

I. The Project and permit history.

A. The Project will develop gold and antimony resources and restore a previously mined and contaminated mine site.

The Project is located in the Stibnite Mining District, a contaminated legacy mining area the federal government abandoned in 2012 after decades of mining.[2] The Project is designed to

[1] In the permit record, Perpetua is referred to as "PRI."

[2] In a series of consent decrees approved by the federal courts, settling federal agencies (including the United States Department of Agriculture, the United States Department of the Interior, the United States Department of Commerce, the United States Department of Defense,

produce precious metals from the previously mined landscape, as well as critical minerals necessary for the country's energy transformation and national security. REC 415, 417, 1758. The Project has a 16 year life span, as there are only 16 years of ore available to be mined and processed. REC 1949. As part of the Project, in 2021, Perpetua committed millions of dollars to pre-permitting cleanup and to remediate and restore the contaminated site under a voluntary administrative settlement agreement with the Forest Service and EPA. The initial phase to improve water quality is nearly complete.

The Project is approximately 10 miles east of the small community of Yellow Pine, Idaho. REC 415, 1758. The Project is remote, bounded by a mountainous landscape with elevations ranging from 6,000 to 8,500 feet above sea level. REC 1758. Between December and February, the area has an average snow depth of between 21 and 68 inches and receives 6 inches in average precipitation. REC 1759. Between March and May, the average snow depth is between 66 and 84 inches, and the area receives another 6.1 inches in average precipitation. *Id*. From June to November, the average precipitation is 7 inches. *Id*.

The Project includes both patented mining claims, which Perpetua owns and controls, and unpatented mining claims located on national forest land. REC 894, 1758. Because portions of the Project are on national forest land, Perpetua submitted a Plan of Restoration and Operations (which we refer to as the "mine plan") to the Forest Service for approval in 2016. *See* 36 C.F.R. pt. 228; REC 894-895. The mine plan has since been refined to reduce the environmental

---

EPA, and the United States General Services Administration) and other parties were released from past and future response costs in the Stibnite Mining District for pennies on the dollar. *See Mobil Oil Corp. v. United States of America*, Civil Action No. 99-1467-A (E.D. Virginia) (consent decree filed June 26, 2000); *United States of America v. Estate of J. J. Oberbillig*, Case No. CV 02-451-S-LMB (D. Idaho) (consent decree filed March 18, 2004); *United States of America v. Bradley Mining Co.*, Case Nos. 3:08-CV-03968 TEH and 3:08-CV-05501 TEH (N.D. Cal.) (consent decree filed April 19, 2012).

impacts and footprint of the Project. *See* REC 2163.

The Forest Service's approval of the mine plan will confirm the Project's operational boundary and authorize Perpetua to exclude the general public from the Project. *See* 30 U.S.C. § 612(b); 36 C.F.R. pt. 228, subpt. A. Perpetua's permit to construct application and the Final Permit are based on the mine plan, and Perpetua cannot begin to construct the Project until it obtains approval of the mine plan and secures other governmental authorizations.

B. DEQ issued the Final Permit after multiple requests for additional information, multiple public comment periods, and multiple draft permits.

In August 2019, Perpetua applied to DEQ for a permit to construct a minor source. REC 418. DEQ's review of Perpetua's application was thorough and comprehensive. A typical permit to construct with a public comment period is processed in 150 days. REC 1259 [Simon Decl. at 4]. DEQ's review of Perpetua's application took much longer.

Over three years, DEQ repeatedly asked Perpetua to supplement the application with additional information before determining the application complete, offered three extended comment opportunities to solicit public feedback, and held two public informational meetings. REC 418-420, 459, 1258 [Simon Decl. at 3]. Petitioners fully participated and repeatedly criticized DEQ's evaluations and proposed controls of particulate matter ("PM") and toxic air pollutant ("TAP") emissions. *See* REC 915-1000. Petitioners also engaged directly with DEQ staff throughout the permitting process requesting information, analysis, and explanations of DEQ's ongoing work. *See*, *e.g.*, REC 2147-51, 2152-56, 2157, 2310-14.

In response to Petitioners' formal comments, DEQ requested, and Perpetua provided, additional information such as updated hazardous air pollutant ("HAP") and TAP emission inventories and modeling analyses. *See* REC 418-420, 631-633, 1258 [Simon Decl. at 3]. With that information, DEQ conducted additional modeling evaluations of PM emissions and

additional analyses of TAP emissions and enhanced the enforceable permit requirements. *See* REC 627-628. All in all, DEQ asked Perpetua to supplement the application with additional information four times, prepared three draft permits (dated July 14, 2020, February 8, 2021, and December 9, 2021), and provided thorough responses to Petitioners' public comments. *See* REC 418-420, 631-633, 915-1000, 1258 [Simon Decl. at 3].

This multi-year, comprehensive process culminated in the issuance of the Final Permit on June 17, 2022. REC 367-409. Petitioners not only participated directly and indirectly in the permit development, their comments informed DEQ's requests and reviews, plus the permit content developed by DEQ over the three-year permitting process.

II. PM_{10} fugitive emissions from the Project were conservatively estimated by DEQ.

DEQ implements air quality permitting through the Idaho Air Rules, IDAPA 58.01.01 *et seq*. The Idaho Air Rules establish requirements for applicants and DEQ that govern the issuance of permits to construct for new and modified air emission sources. IDAPA 58.01.01.200-227. Under Section 203 of the rules, no permit to construct can be issued unless the applicant demonstrates "to the satisfaction of the Department" that the proposed project "would not cause or contribute to a violation of any ambient air quality standard" (or NAAQS) and that emissions of a TAP "would not injure or unreasonably affect human or animal life or vegetation." IDAPA 58.01.01.203.03.

PM_{10} emissions from the Project represent the largest emissions for this minor source. Emissions from stationary sources and fugitive sources of PM_{10} were estimated in the permit application materials. As DEQ recognized, air emission impact analyses for mining operations "typically involve considerable uncertainty and variability" in both emission-affecting parameters and dispersion-affecting parameters. REC 945. DEQ mitigated the uncertainties and variabilities with a conservative approach (i.e., overstating emissions and impacts) and analyzed

the proposed emissions and modeling to fulfill the requirements of Section 203. REC 917-919, 944-945, 927-928; *see generally* REC 1246-1252 [Schilling Decl. at 14-20].

There are four general steps for determinations based on modeling assessments.

Step 1: Calculate estimated air emissions from all appropriate sources of air pollution. This step typically utilizes the maximum capacity of each source of emissions, an emission factor that represents the best available information to estimate emissions, and an emission control efficiency if an emission control device or practice is used to reduce emissions. EPA's AP-42, *Compilation of Air Pollutant Emissions Factors*, is a commonly used reference for emission factor information for air pollution sources, such as unpaved roads.[3] Acceptable emissions estimation methods vary and often require site-specific parameters.

Step 2: Characterize each air pollution source. Each emission source must be characterized by its initial air dispersion type (e.g., point, volume, or area) and initial air dispersion parameters (e.g., initial exhaust temperature and velocity, length, width, and height of the emitting source), and source location.

Step 3: Use the EPA approved air dispersion model to predict the downwind impacts of the emissions from all sources. The model inputs include the emissions from each source estimated in Step 1, the source characterizations from Step 2, the local terrain and meteorological conditions, and other model inputs.

Step 4: Run the model. The final step is running the model for all pollutants and the appropriate averaging periods to inform DEQ's determinations. In the case of Perpetua's permit, DEQ ran the model for many emissions scenarios to reflect the dynamic operational plan

[3] U.S. EPA, Technical Air Pollution Rules, AP-42, https://www.epa.gov/air-emissions-factors-and-quantification/ap-42-compilation-air-emissions-factors-stationary-sources.

involved in mining activity.

DEQ issues a permit to construct when it is satisfied that the proposed emissions will not cause or contribute to a violation of a NAAQS and the TAP emissions would not injure or unreasonably harm human health, animal health, or vegetation. *See* IDAPA 58.01.01.203. The permitting record before DEQ, including the Final Permit, the Statement of Basis, and the Response to Comments, details the agency's analyses and decision making. As explained below, that record shows that DEQ repeatedly executed the steps outlined above to address different scenarios and to complete conservative assessments and satisfied the requirement to produce and issue the Final Permit in conformity with the Idaho Air Rules.

III. The Stibnite Access Route.

Because DEQ must be satisfied that a project's proposed emissions do not adversely impact compliance with the NAAQS, the boundary of the project's "ambient air" is important. Both EPA and the Idaho Air Rules define "ambient air" as "that portion of the atmosphere, external to buildings, to which the general public has access." 40 C.F.R. § 50(e); IDAPA 58.01.01.006.10. EPA's longstanding guidance provides that the ambient air boundary depends on the source's control of the area and the measures it takes to preclude the general public's access to the land. *See* REC 1138, 1341.

The Stibnite Access Route refers to a seasonal (non-winter) road that will pass through the Project. REC 415, 1758. Petitioners suggest—without any factual support—that the Stibnite Access Route is a Forest Service requirement of the Project and that Perpetua will be unable to preclude general public access to the route. *See* Opening Br. at 20-21. Petitioners are incorrect. The record reflects that public comments from local residents revealed a significant interest in access through the Project. *See* REC 676, 893-895, 1758. Individuals in the Johnson Creek and

Yellow Pine areas who use Stibnite Road to access Thunder Mountain Road and points beyond were particularly concerned about changes that would lengthen travel time. *See id*.

In response to those concerns and at the encouragement of the Forest Service, Perpetua's predecessor, Midas Gold Idaho Inc. ("Midas Gold"), evaluated numerous access options through and around the Project. REC 893-895. Perpetua's mine plan identifies the Stibnite Access Route as a route that would safely address local interests. *Id*.; *see also* REC 676. As noted above, once approved, the mine plan will affirm the Project's operational boundary and construction of the Stibnite Access Route, as well as Perpetua's authority to preclude general public access from the Project. Operations of the Project do not rely on the presence of the Stibnite Access Route and the road is not a Forest Service requirement.

Given the importance of establishing the Project's ambient air boundary, early in the permitting process, Midas Gold engaged with DEQ on the Stibnite Access Route to determine if the route could be excluded from ambient air. *See* REC 1237 [Schilling Decl. at 5]. DEQ contacted EPA, which indicated that the road would be exempt from the Project's ambient air because it will be fully under Perpetua's control and surveillance, and general public access would be precluded. REC 1240 [Schilling Dec. at 8], 1254, 1350-1351, 1496-1497. The Forest Service has recognized this conclusion too. *See* REC 2558, 2637.

IV. DEQ analyzed arsenic emissions and determined that they would not exceed the lifetime risk limit established by the Idaho Air Rules.

Under IDAPA 58.01.01.203, no permit to construct can be issued unless the applicant demonstrates "to the satisfaction of the Department" that the proposed emissions of a TAP "would not injure or unreasonably affect human or animal life or vegetation." Following the second public comment period, DEQ and Perpetua reevaluated TAP emissions in response to concerns expressed by Petitioners. REC 697. DEQ determined that a refined analysis of TAP

emissions, particularly arsenic, was needed to demonstrate preconstruction compliance with the Idaho Air Rules. *Id.*

On October 5, 2021, Perpetua submitted the *Stibnite Gold Project (SGP) Permit to Construct Application TAP Addendum* (the "TAP Addendum"). *Id*. The TAP Addendum reassessed conformity with TAP permitting requirements, refined TAPs evaluations to demonstrate compliance with applicable TAP increments, revised and refined operational parameters affecting TAP emissions, and refined TAP air impact analyses. *See id.* Specifically, the TAP Addendum evaluated arsenic emissions after considering reasonably available control technology ("T-RACT") and operational adjustments.[4] REC 699. The refined TAP analysis included many layers of conservative assumptions, including continual operation of the worst-case operational scenario; operation at maximum allowable rates for the entire averaging period; and no reduction in wintertime emissions from fugitive sources, thus discounting the emission suppression effects of increased moisture. *Id.*

Once the modeled carcinogenic TAP concentrations were obtained they were adjusted to account for the finite, 16-year life of the Project and the related finite exposure risks. REC 710, 1947. This was accomplished by multiplying the highest annual concentrations from the modeling scenarios by 16 years and then dividing by 70 years. *Id*. Multiplying the highest annual concentration of arsenic by 16 years allowed DEQ to determine the maximum concentration of arsenic an offsite receptor would be exposed to during the 16-year operational period. Dividing this maximum concentration by 70 years allowed DEQ to evaluate the lifetime health risk from

[4] As part of its reevaluation of TAP emissions, Perpetua proposed, and DEQ approved, T-RACT controls including installing and operating dust collection systems on drilling rigs, capping haul roads with clean development rock, and using chemical dust suppressant with frequent watering on roads. *See* REC 1291-1292.

that maximum exposure. *Id*. Through this process, DEQ determined that the maximum lifetime exposure concentration of carcinogenic TAPs were below regulatory thresholds and complied with the Idaho Air Rules. REC 710-11.

CONTESTED CASE BACKGROUND

I. Petitioners filed an amended contested case petition after the Hearing Officer partially dismissed the initial petition.

In July 2022, Petitioners filed a contested case petition asking the Board to set aside and remand the Final Permit. REC 1-27. In their petition, Petitioners repeat the same critiques made during the multiple public review periods, seeking to substitute their preferences for DEQ's expertise, pressing for more review and work by DEQ, and alleging that the Final Permit violates the federal Clean Air Act ("CAA"), 42 U.S.C. § 7401, *et seq*., and the Idaho Air Rules. *See id*. Petitioners remain dissatisfied with the Final Permit and urge the Board to substitute Petitioners' preferences for DEQ's reasoned decision making. *See id*.

The Board appointed a Hearing Officer to consider and decide Petitioners' contested case petition. REC 31. Perpetua was allowed to intervene, REC 44, and filed a motion to dismiss the petition, which DEQ joined. REC 52-76. The Hearing Officer partially granted the motion to dismiss. REC 160-185. In his order, the Hearing Officer categorized Petitioners' allegations into 13 claims and dismissed Claims 3, 4, and 10 in full and Claim 8 in part. REC 167-168, 184-185. That prompted Petitioners to file a motion to amend their contested case petition, which DEQ and Perpetua did not oppose. REC 190-192, 194-223.

After the Hearing Officer granted the motion to amend, REC 255-256, Petitioners filed an amended contested case petition in January 2023, REC 263-292. The amended contested case petition adds allegations reviving, of the dismissed claims, only Claim 3. *See generally* REC 209-210 (¶ 40), 219-220 (¶ 70).

II. The Hearing Officer dismissed the amended contested case petition and found DEQ's decision making was reasonable and not in violation of the Idaho Air Rules.

After the parties exchanged discovery, Petitioners moved for summary judgment. REC 319-363. DEQ and Perpetua filed cross-motions for summary judgment. REC 1204-1231, 1276-1335. After summary judgment briefing was completed, Petitioners moved to supplement the administrative record with a letter sent by EPA Region 10 to the Director of DEQ on August 10, 2023, regarding the Final Permit. REC 3137-3142. Petitioners also moved to stay the contested case on the grounds that DEQ should be given time to respond to the EPA letter, REC 3108-3112, and that Petitioners should be allowed to amend their contested case petition again, REC 3190-3197. DEQ and Perpetua opposed Petitioners' motions, REC 3236-3257, and sought to exclude the EPA letter, REC 3097-3102.

The Hearing Officer denied Petitioners' motions to stay and to amend their contested case petition. REC 3265-3270. As for the Petitioners' motion to supplement the record with the EPA letter, the Hearing Officer allowed admission of the EPA letter but limited how it could be considered. REC 3271-3273. The EPA letter could not be used to add new allegations of error on the part of DEQ or add factual information that was not already part of the record. REC 3272. Nor could the EPA letter "be used as a proxy for expert testimony from the Petitioners." *Id*. Petitioners have not sought Board review of those rulings, but still reference the EPA letter in their Amended Petition, REC 3429, and their Opening Brief, Opening Br. at 13-14, 36.

The Hearing Officer conducted a summary judgment hearing on the parties' motions in September 2023. *See* TR 1-57. On October 31, 2023, the Hearing Officer issued a Memorandum Decision on Motions for Summary Judgment and Preliminary Order. REC 3280-3327. The Hearing Officer's order denied Petitioners summary judgment and granted DEQ and Perpetua summary judgment on Claims 1, 2, 5, 6, 7, 9, 11, 12, 13 and the remainder of Claim 8. REC

3325. The Hearing Officer did not address Claim 3, believing the claim was dismissed. *See* REC 3281. That prompted DEQ and Perpetua to move for reconsideration and/or clarification requesting the Hearing Officer to reconsider whether Claim 3 was revived in Petitioners' amended contested case petition and should be addressed. *See id*. REC 3332-3333, 3335-3340.

On December 5, 2023, the Hearing Officer granted DEQ and Perpetua's motion for reconsideration and/or clarification and issued the Amended Memorandum Decision on Motions for Summary Judgment and Preliminary Order (which, as noted, is referred to as the "Preliminary Order"). REC 3367-3370, 3372-3424. In the Preliminary Order, the Hearing Officer granted summary judgment to DEQ and Perpetua on Claim 3, thereby dismissing the whole of Petitioners' amended contested case petition. REC 3422. Previously, on November 14, 2023, Petitioners filed a Petition for Review of Preliminary Order. REC 3342-54. December 15, 2023, Petitioners filed the Amended Petition for Review of Preliminary Orders (which is referred to as the "Amended Petition"). REC 3426-3439.

III. Petitioners' Amended Petition seeks Board review of Claims 2, 3, 8, 9, 11, and 12.

Petitioners' Amended Petition seeks Board review of some, not all, of the issues they raised in their amended contested case petition. Petitioners do not seek review of Claim 1 (dismissed on summary judgment, REC 3397-3399), Claim 4 (dismissed on motion to dismiss, REC 172-173), Claim 5 (dismissed on summary judgment, REC 3407-3409), Claims 6 and 7 (dismissed on summary judgment, REC 3410-3415), Claim 10 (dismissed on motion to dismiss, REC 178-179), and Claim 13 (dismissed on summary judgment, REC 3393-3397).

As for the remaining claims (Claims 2, 3, 8, 9, 11, and 12), Petitioners contend the Hearing Officer erred in holding that: (1) DEQ's determinations that Perpetua has legal control to exclude and will adequately preclude the general public from the Project were not arbitrary and capricious, or an abuse of discretion (Claims 11 and 12); (2) DEQ's determination that the

Final Permit's enforceable conditions will achieve 93.3% control of fugitive dust was not arbitrary and capricious or an abuse of discretion (Claims 2 and 8); (3) DEQ's determination that post-construction operational plans must be submitted for approval 30 days before the start of construction was not arbitrary and capricious, an abuse of discretion, or a violation of the Idaho Air Rules (Claim 3); and (4) DEQ's evaluation of the health risks from arsenic was not a violation of the Idaho Air Rules (Claim 9). As discussed below, Petitioners fail to meet the burden of proof required to support their claims of error before the Board.

IV. DEQ and Perpetua seek to supplement the record with DEQ's November 2023 response to the EPA letter.

On November 22, 2023, DEQ's Director responded to the EPA letter, thoroughly addressing each of EPA's issues and defending the Final Permit. DEQ's response, having come after the Hearing Officer's Preliminary Order, is not part of the administrative record. For that reason, DEQ and Perpetua have jointly sought to supplement the record with DEQ's response consistent with the limited purpose for which the Hearing Officer allowed consideration of the EPA letter. Because the EPA letter is part of the record on a limited basis, it is only appropriate that the record include DEQ's response with the same limitations.

STANDARD OF REVIEW

I. The Board must decide whether DEQ acted unreasonably or in violation of the law.

When reviewing a Preliminary Order, "[t]he head of the agency … for the review of preliminary orders shall exercise all of the decision-making power that he would have had if the agency head had presided over the hearing." Idaho Code § 67-5245(7). According to the Board, "[t]his means that, in reviewing the Preliminary Order, the Board may review all of the evidence *de novo*." *See In the Matter of Sunnyside Park Utilities' Application for Sewage Disposal Permit*, Final Order on Petition for Review of Preliminary Order, at 2 (BEQ Dkt. 0103-07-02, Apr. 7,

2009). The Board has also recognized that it "must determine whether DEQ has acted reasonably and in accordance with law." *Id*. at 10.

Under the Board's contested case rules, Petitioners have "the burden of proving by a preponderous of the evidence, the allegations in the petition." IDAPA 58.01.23.062. The rules also authorize the Board to consider motions for summary judgment, governed by the Idaho Rules of Civil Procedure ("I.R.C.P."). IDAPA 58.01.23.162.02, .410. Under I.R.C.P. 56(a), the Board "must grant summary judgment if the movant shows that there is no genuine dispute as to any material fact and the movant is entitled to judgment as a matter of law." A moving party must support its assertion by citing particular materials in the record or by showing the "materials cited do not establish the … presence of a genuine dispute, or that an adverse party cannot produce admissible evidence to support the fact[s]." I.R.C.P. 56(c)(1)(B).

As the Hearing Officer observed, it is also "important to understand the standards that will ultimately govern judicial review of the Board's decision." REC 3377. That is particularly true here because Petitioners challenge the Final Permit based on the standard for judicial review for adjudicative agency actions under the Idaho Administrative Procedure Act, Idaho Code § 67-5201 *et seq*. *See* Opening Br. at 15 (citing Idaho Code § 67-5279(3); REC 263-292 (¶¶ 4, 35, 52, 61, 69, 72), 338. Under that standard, an agency action may only be overturned if it is (a) in violation of constitutional or statutory provisions, (b) in excess of statutory authority, (c) made on unlawful procedure, (d) not supported by substantial evidence, or (e) arbitrary, capricious, or an abuse of discretion. Idaho Code § 67-5279(3).

There are additional principles regarding the Idaho Administrative Procedure Act's standard worth addressing. The party challenging the agency decision must demonstrate that the agency erred in a manner specified in Section 67-5279. *Wheeler v. Idaho Dep't of Health &*

Welfare, 147 Idaho 257, 260, 207 P.3d 988, 991 (2009). Thus, by relying on the judicial review standard, Petitioners have invited a review process. Under Idaho law, it is DEQ's role to resolve factual issues in determining whether and under what conditions to issue a permit to construct, supported by the permitting record before it. *See* Idaho Code § 39-115. It follows that the Board's function is to decide whether DEQ's issuance of the Final Permit violated the law, was arbitrary and capricious, or was an abuse of discretion.

That means Petitioners present no disputes of material fact—indeed their Opening Brief identifies none—and instead only question the legal conclusions made by DEQ based on the facts underlying the Final Permit. The Board's review is limited to determining whether DEQ acted unlawfully as Petitioners allege. A violation of law speaks for itself. An "arbitrary and capricious decision occurs where the decision was reached in an unreasonable manner or based on clearly erroneous findings." *Floyd v. Bd. of Ada Cnty. Comm'rs*, 164 Idaho 659, 668, 434 P.3d 1265, 1274 (2019). "Clearly erroneous applies where factual findings are not supported by substantial and competent evidence." *Id*. "An abuse of discretion standard examines whether the [agency] acted within the boundaries of its discretionary decision and applicable legal standards, and reached a decision by exercising reason." *Id*.

II. The Board may defer to DEQ's technical expertise and special skill.

In addition to the standards above, the Idaho Administrative Procedure Act speaks to the deference the Board may afford DEQ in reaching a decision in a contested case: "[t]he agency's experience, technical competence, and specialized knowledge may be utilized in the evaluation of the evidence." Idaho Code § 67-5251(5); *see also* IDAPA 04.11.01.600. Also the Board may take official notice of "generally recognized technical or scientific facts within the agency's specialized knowledge." Idaho Code § 67-5251(4)(b); *see also* IDAPA 04.11.01.602. Thus Idaho law explicitly recognizes that "the agency's repeated exposure to a specialized subject matter is a

source of specialized knowledge that is useful in evaluating evidence." Michael S. Gilmore & Dale D. Goble, *The Idaho Administrative Procedure Act: A Primer for the Practitioner*, 30 Idaho L. Rev. 273, 319 (1994).

Deference is particularly appropriate here. DEQ is granted primary authority to determine specific, source-by-source emission limitations in air quality permitting. *See* Idaho Code § 39-115 (granting DEQ the authority to issue pollution source permits); *see also* REC 1272 (¶ 7). As the United States Supreme Court recognized in *Train v. NRDC*, 421 U.S. 60, 79 (1975), "so long as the ultimate effect of a State's choice of emission limitations is compliance with the [NAAQS], the State is at liberty to adopt whatever mix of emission limitations it deems best suited to its particular situation." Thus the Board may give due consideration and deference to the technical expertise and special skill of DEQ, as the Hearing Officer did. *See* REC 3378.

The deference the Board may give DEQ is illustrated by the deference courts give agencies, when reviewing an agency action. First, Idaho courts defer to agency interpretations of law. *J.R. Simplot Co. v. Idaho State Tax Comm'n*, 120 Idaho 849, 862-63, 820 P.2d 1206, 1219-20 (1991). When an agency is entrusted with administering a statute, the courts may defer to the agency's interpretation of a statute or rule if the interpretation is reasonable and not contrary to its express language. *See id.* at 862, 820 P.2d at 1219. Generally, the Idaho Supreme Court finds agency interpretations of statutes and rules are "reasonable unless the agency relied on erroneous facts or law in its determination." *Duncan v. State Bd. of Accountancy*, 149 Idaho 1, 4, 232 P.3d 322, 325 (2010) (citing cases). Stated differently, an agency's interpretation of a rule or statute is unreasonable when it "is so obscure and doubtful that it is entitled to no weight or consideration." *Simplot*, 120 Idaho at 862, 820 P.2d at 1219 (citation omitted).

Second, consistent with the Idaho Code § 67-5251(5) and IDAPA 04.11.01.600 noted above, the reviewing courts defer to the agency when reviewing a scientific determination in its particular field of expertise. *See Simplot*, 120 Idaho at 859, 820 P.2d at 1216 ("[T]he expertise of an agency is often useful in technical areas of the law where the risk of failing to understand all of the implications of a decision are great."); *Grindstone Butte Mut. Canal Co. v. Idaho Pub. Utils. Comm'n*, 102 Idaho 175, 182, 627 P.2d 804, 811 (1981) (noting that the Court will temper its review with deference to the expertise of the Idaho Public Utilities Commission when considering testimony that is technical in nature); *see also* Idaho Code § 67-5251(5).

ARGUMENT

Applying those standards to this case, the Hearing Officer correctly granted summary judgment in favor of DEQ and Perpetua and dismissed Petitioners' contested case petition. Petitioners appeal the issuance of the Final Permit based on alleged errors in the preconstruction permitting process. That process requires DEQ to reach decisions through the exercise of discretion and through its scientific and technical expertise. Summary judgment on contested cases has been found appropriate where the action being challenged involved a discretionary decision reached by the exercise of DEQ's special skill and expertise. *See, e.g.*, *In re: Permit Applicant Garnet Energy LLC (Permit No. 0027-00081)*, Dkt. No. 0101-01-10, Order Granting Motion for Summary Judgment (Feb. 22, 2002).

I. The Hearing Officer correctly held that DEQ followed EPA guidance and properly exercised its discretion in excluding the Stibnite Access Route from ambient air (Claims 11 and 12).

Petitioners contend that DEQ's decision to exclude the Stibnite Access Route from ambient air protections was arbitrary and capricious and an abuse of discretion for two reasons. Opening Br. at 16-24. First, they argue that Perpetua does not have legal control to preclude the general public from the Project. *Id*. at 17-21. Second, they argue that the Final Permit does not

adequately preclude the general public. *Id*. at 22-24. The Hearing Officer disagreed and rightly so. REC 3384-3393. Petitioners simply dispute DEQ's exercise of discretion and take a view of ambient air that is far narrower than what EPA and DEQ guidance allows.

A. EPA guidance on ambient air and agency discretion.

The term "ambient air" is not defined in the CAA. EPA filled this gap by defining "ambient air" as "that portion of the atmosphere, external to buildings, *to which the general public has access*." 40 C.F.R. § 50.1(e) (emphasis added). Idaho similarly defines "ambient air" as "that portion of the atmosphere, external to buildings, to which the general public has access." IDAPA 58.01.01.006.05. EPA has long recognized that an applicant need not demonstrate the impact of a source's emissions on air within areas to which general public access is restricted. *See* REC 1138, 1341, 1805.

Thus, EPA has consistently exempted "the atmosphere over land [1] owned or controlled by the source and [2] to which the public access is precluded by a fence or other physical barriers" from "ambient air." REC 1138. In 2019, EPA broadened the "fence or other physical barriers" element and recognized that physical boundaries are not the only way in which to preclude public access. REC 1146. Specifically, EPA recognized that other measures (such as video surveillance, monitoring, clear signage, and routine security patrols) may be effective in deterring or precluding access to the land by the general public. *Id*. EPA gives the example that clearly visible "No Trespassing" signs in conjunction with some degree of fencing or other physical and/or non-physical barriers may be effective to preclude access by the general public in appropriate situations. REC 1147.

Also important, EPA recognizes a source's "ambient air" is reviewed based on an individual, case-by-case basis. REC 1147-1148. As EPA explains in the 2019 guidance:

> The EPA will apply a rule of reason in evaluating the effectiveness of any measure proposed by a source … this evaluation should address relevant factors, such as the nature of the measure used (e.g., physical or non-physical), source location, type and size of source and property to be excluded, surrounding area (including the proximity, nature, and size of the population in the area), and other factors affecting whether members of the general public would readily be able to trespass upon or otherwise have access to the source's properties.

REC 1147. Air agencies "should consider all relevant information provided by the source or other interested parties, or otherwise available regarding the effectiveness of the measures to prevent public access." *Id*. Thus air agencies exercise discretion in determining whether a permit condition is appropriate to ensure that the source administers selected measures in a manner that maintains continued public health protection. *Id*.

B. DEQ acted within its discretion to accept Perpetua's representation that it will have legal authority to preclude access by the general public.

Petitioners contend that the Hearing Officer erred in finding that DEQ could rely on Perpetua's representations that it will legally control the Project and the Project's operational boundary. Opening Br. at 17-21. Petitioners present a primary misunderstanding in their Opening Brief: that Perpetua will not have legal authority to preclude public access from the Stibnite Access Route. *Id*. The record does not support Petitioners, and the Hearing Officer was correct to reject their unsupported assertion for two reasons.

First, DEQ was satisfied with Perpetua's representation that it will have sole and complete control of general public access to the Stibnite Access Route, including complete closure when necessary. REC 676-677, 936. As the Hearing Officer observed, Midas Gold, Perpetua's predecessor, certified the truth of the following representation:

> Midas Gold will legally control the SGP, an active industrial site where mining activities will occur, such as heavy equipment operation. Most areas of the mine will require strict safety protocols and controlled access. Midas Gold has established an operations boundary to identify the area where public access will be excluded. Public access inside the operations boundary will be restricted for

> the life of the mine by physical barriers at points of potential access, including the current Stibnite Road point of entry and proposed site access via the Burntlog Route, as well as natural features of the landscape that prevent access.

REC 1807. Indeed, in the permit to construct application, Perpetua certified that, "based on information and belief formed after reasonable inquiry, the statement and information in this and any attached and/or referenced document(s) are true, accurate, and complete in accordance with IDAPA 58.01.01.123, 124." REC 1508; *see also* REC 1507, 1721. Perpetua also informed DEQ that the Stibnite Access Route was included in the mine plan and was subject to the Forest Service's approval. *See* REC 894-895, 2163.

Unlike DEQ and the Hearing Officer, Petitioners ignore that the Final Permit is a *preconstruction* permit, that construction of the Project has not begun, and that construction cannot begin until Perpetua obtains the Forest Service's approval of the mine plan. Petitioners' argument that Perpetua does not have control of the Project now is nothing more than misdirection. The Project is located on a combination of private land and public national forest land, and Perpetua is required to obtain authorization from the Forest Service. The mine plan establishes the Project's operational boundary and its approval will provide Perpetua with authority to preclude public access for safety and operational reasons.

Perpetua's application for a permit to construct and DEQ's approval of the Final Permit is based on the proposed operational boundary. If the Forest Service does not approve the mine plan, the Project will not proceed. If there is no Project, Perpetua has no need for the Final Permit. These sequential realities do not invalidate Perpetua's representation that it "will legally control" the Project and "has established an operations boundary to identify the area where public access will be excluded." DEQ can, and must, rely on the representations of permit

applicants, and the record supports that its reliance on Perpetua here was reasonable and supported.[5]

Second, Petitioners are wrong that Perpetua will not obtain legal authority to preclude the general public from the Stibnite Access Route once the Forest Service approves the Project's mine plan. On page 20 of their Opening Brief, Petitioners challenge Perpetua's control over the road by misrepresenting statements made in an Air Quality Specialist Report prepared for the Forest Service (the "USFS Report"), REC 2605-2985, and a May 2021 memorandum developed for the Forest Service by Stantec Consulting Services, REC 2557-2558. According to Petitioners, the mine plan *requires* Perpetua to provide public access through the Project and thus Perpetua will not have legal ability to preclude public access. Opening Br. at 20-21. This reading of the USFS Report and Stantec memorandum is fundamentally wrong and misleading.

As the record demonstrates, Perpetua volunteered to construct the Stibnite Access Route for limited connectivity to Thunder Mountain Road and points beyond. REC 985. Perpetua is not legally obligated to construct the Stibnite Access Route and has sole and complete control over construction, operation, and use of the road, including complete closure of the road when necessary for safety or operational reasons. REC 676-677, 936. The USFS Report and the Stantec memorandum merely *report* what Perpetua volunteered to do and will do once the mine plan is approved. *See* REC 2557-2558, 2625, 2637-2638, 2677, 2684.

[5] Petitioners also criticize the Hearing Officer's observations that DEQ has broad enforcement authority and that in his experience, agencies typically rely on representations made in permit applications. *See* Opening Br. at 18, 21 (citing REC 3390). The Hearing Officer simply recognized what is obvious. DEQ must rely on the representations of permit applicants to fulfill its permitting authority. And when there is a violation of the Idaho Air Rules, including IDAPA 58.01.01.123, .124, and .125. DEQ can enforce the violation and bring civil and criminal enforcement actions against violators. *See* Idaho Code §§ 39-108, 39-109.

The USFS Report simply states that public access through the Project will be provided by a new route through the Project. REC 2677. It also observes that in the operational boundary, "public access would be prohibited, or restricted through such measures that are accepted as means to control public access (EPA 2019a) as Perpetua security checkpoints, physical barriers at points of potential access road and trail entry, and security surveillance patrols." REC 2637. The USFS Report does not require the Stibnite Access Route, nor does it treat the road as the ambient air boundary. *See* REC 2637-2638. In fact, the USFS Report references the Stantec memorandum, REC 2737, which concludes that the road is not ambient air:

> After review of all pertinent information associated with other cooperating agencies, *it is Stantec's understanding that the public access road can be justifiably excluded from ambient air consideration*. The State agency responsible for issued air permits has excluded the road because of restriction measures put in place consistent with their rules and requirements in the permit.

REC 2558 (emphasis added). The Stantec memorandum also observed, "*EPA Region X has accepted DEQ's conclusions*." *Id*. (emphasis added).

Thus Petitioners' argument that Perpetua does not have the legal ability to preclude public access is disingenuous, as they ignore and misrepresent the record. *See* Opening Br. at 20-21. Moreover, as explained below, the Final Permit illuminates the many ways the general public will be legally and physically precluded from accessing the Stibnite Access Route.

C. DEQ acted within its discretion in determining that the Stibnite Access Route is exempt from ambient air.

As the Hearing Officer held, DEQ conformed to EPA guidance and exercised reasonable discretion in excluding the Stibnite Access Route from the Project's ambient air. REC 3390-3393. While Petitioners raise several questions in their Opening Brief and may have different opinions on how DEQ should have established the ambient air boundary, they fail to meet their burden to show that DEQ's decision is arbitrary and capricious, or an abuse of discretion. *See*

Opening Br. at 22-24. As evidenced by the record, DEQ conducted a thorough review of this issue. In deciding that the Stibnite Access Route is excluded from ambient air, DEQ reached a reasonable determination consistent with the definition of ambient air and agency guidance.

As noted earlier (at p. 9), DEQ and Perpetua recognized from the beginning the importance of establishing the ambient air boundary to permit the Project. *See* REC 1240 [Schilling Decl. at 8]. In 2018, DEQ contacted EPA Region 10, which gave this guidance regarding the Stibnite Access Route: "If the public access road is only accessible to public traveling in automobiles under the escort, supervision, and monitoring of Midas personnel (they mentioned a pilot car as a possibility), and there are no stopping points with public access along the road, then the road is not ambient air." REC 1350. In 2020, EPA Region 10 reiterated that the road would be exempt "because it is fully under the control and surveillance of the source and unsupervised public access is precluded. It seems like a slam dunk, based on my understanding of EPA's revised ambient air policy." REC 1496, 1240 [Schilling Decl. at 8].

DEQ analyzed the ambient air boundary issue using EPA's guidance. *See* REC 676-677, 935-936, 958. As to the second element (measures precluding public access), DEQ evaluated how Perpetua would restrict access and prohibit the public from freely accessing the Stibnite Access Route. REC 676-677, 936. DEQ considered that Perpetua would preclude general public access to the road by (1) establishing manned access gates at points prior to the ambient air boundary; (2) employing physical barriers at points of potential access; (3) posting signs warning the public against entry into the site; (4) implementing routine patrolling and surveillance for unauthorized individuals; and (5) only allowing registered guests access to or through the facility. *Id*.; *see also* REC 1807-1809.

Nevertheless, Petitioners liken the Stibnite Access Route to a right-of-way easement or common service road and argue that individuals traveling the Route are the general public. Opening Br. at 24. They also contend that the Final Permit does not preclude access to the general public. *Id*. at 23. But unlike a right-of-way or common service road, members of the general public will not be permitted to freely access the Stibnite Access Route. REC 376 (Condition 2.7); *see also* REC 676-677, 935-936. In Condition 2.7, DEQ conditioned the Final Permit on the establishment of an Access Management Plan ("AMP") prohibiting the general public from freely accessing the Stibnite Access Route. REC 376.

Under Condition 2.7, "Only registered guests of the facility will be allowed access to or through the facility. Those seeking to be a guest for the sole purpose of passing through the facility to another destination shall be provided a registration sheet that explains Perpetua's requirements for accessing the site and identified potential hazards of the site." *Id*. Those that seek access must be required to register at the access gate and will be informed that they are proceeding as guests rather than members of the general public. *Id*. Perpetua must also install locked gates and barriers for the two primary access points, plus post warning signs, require registration by users seeking access, and more. *Id*. Also the measures specified in the AMP will be incorporated by reference into the Final Permit and will be enforceable permit conditions. *Id.*

Despite those restrictions, Petitioners persist that those accessing the Stibnite Access Route cannot be considered "guests of the mine," yet they ignore DEQ's record and reasoned analyses and simply argue the semantics of a "guest." *See* Opening Br. at 23-24. But based on Condition 2.7 and Perpetua's barriers to entry, only registered vehicles and their passengers will be permitted entry onto the Stibnite Access Route. REC 376. Vehicles will be supervised, cannot stop, and must check out at the egress point. *See id*. The elaborate measures at both entry and

egress locations, plus supervision of vehicles requiring continuous movement without stopping along the route, reinforce Perpetua's control of the road, in contrast to a county road or other thoroughfare that is uninhibitedly open to the general public.

Thus, the measures required by the Final Permit preclude access by the general public and support DEQ's well-reasoned decision to exclude the Stibnite Access Route from the ambient air boundary. *See REDOIL v. U.S. EPA*, 716 F.3d 1155, 1165 (9th Cir. 2013) (holding that EPA's grant of an ambient air exemption conditioned on a safety zone was a permissible interpretation of the ambient air regulation and EPA's 2019 guidance).

***

In sum, as the Hearing Officer found, Perpetua demonstrated it has the legal and practical ability to preclude the general public from the Stibnite Access Route consistent with EPA's 2019 Guidance. REC 3384-3393. After thorough deliberation and consultations with EPA Region 10, DEQ concluded the Stibnite Access Route was properly excluded from the ambient air boundary based on the Project's individual circumstances. *See* REC 1236-1240 [Schilling Decl. at 4-8], 1254, 1350, 1496, 2558, 2737. Just as the Ninth Circuit upheld EPA's decision in *REDOIL*, the Board should uphold DEQ's determination on the Project's ambient air boundary.

II. The Hearing Officer correctly held that the Idaho Air Rules do not require Perpetua to develop work plans for DEQ approval before issuance of the Final Permit (Claim 3).

DEQ lawfully required future development of the AMP, Fugitive Dust Control Plan ("FDCP"), Haul Road Capping Plan ("HRCP"), and Operations and Maintenance Manual ("O&M Manual"). Petitioners' arguments that the Final Permit is incomplete and the work plans violate the CAA and the Idaho Air Rules ignore the permit record and DEQ's well established practice and are legally unfounded. *See* Opening Br. at 29-34. Pursuant to DEQ's discretion, the Final Permit requires Perpetua to develop the work plans, include specific provisions in the

plans, and submit them to DEQ for approval prior to startup. REC 375-376 (Condition 2.6 (FDCP) and Condition 2.7 (AMP)), 378-380 (Condition 2.20 (O&M Manual)), 385-386 (Condition 3.13 (HRCP)). As the Hearing Officer held, DEQ did not violate the CAA or the Idaho Air Rules or act arbitrarily and capriciously. REC 3406-3407.

A. Petitioners cannot challenge DEQ's issuance of a permit to construct for failure to comply with the CAA.

At the start, the Board must reject Petitioners' allegations that DEQ's issuance of the Final Permit violates the CAA. *See* Opening Br. at 29-32. The CAA and part 51 regulations delineate the required contents of SIPs. *See* 42 U.S.C. § 7410(a). In other words, the federal provisions describe "the general *types* of emissions standards and limitations that a SIP must contain"—they establish "requirements for *SIPs*, not *sources*." *NRDC v. S. Coast Air Quality Mgmt. Dist.*, 694 F. Supp. 2d 1092, 1105, 1111 (C.D. Cal. 2010) (emphases in original), *aff'd*, 651 F.3d 1066 (9th Cir. 2011). EPA must approve a SIP so long as it satisfies those requirements. *See* 42 U.S.C. § 7410(k)(3).

This distinction between SIPs and sources is important here. EPA "is plainly charged by the Act with the responsibility for setting the [NAAQS]. Just as plainly, however, it is relegated by the Act to a secondary role in the process of determining and enforcing the specific, source-by-source emission limitations." *Train*, 421 U.S. at 79. Thus, EPA has "no authority to question the wisdom of a State's choices of emission limitations." *Id*. "[S]o long as the ultimate effect of a State's choice of emission limitations is compliance with the [NAAQS], the State is at liberty to adopt whatever mix of emission limitations it deems best suited to its particular situation." *Id*.

The CAA and part 51 regulations require that SIPs provide for an opportunity for public comment on "information submitted by owners and operators [and] [t]he public information must include the agency's analysis of the effect of construction or modification on ambient air

quality, including the agency's proposed approval or disapproval." 40 C.F.R. § 51.161. EPA approved Idaho's SIP, including DEQ's specific preconstruction rules. IDAPA 58.01.01.200-223. Because the CAA and the part 51 regulations establish requirements for SIPs, not sources, the only relevant question now is whether DEQ complied with the Idaho Air Rules.

B. The Idaho Air Rules do not require work plans to be submitted with permit to construct applications or circulated for public comment.

The Idaho Air Rules do not require that work plans be developed at all, let alone that they be prepared before construction commences or be available for public comment before a preconstruction permit can be issued. *See* IDAPA 58.01.01.211.01. Section 202 of the Idaho Air Rules specifies the requirements for a permit to construct application and identifies information required to be included in the application. IDAPA 58.01.01.202.01. Requisite information for new sources includes "[s]ite information, plans, descriptions, specifications, and drawings showing the design of the stationary source, facility, or modification, the nature and amount of emissions (including secondary emissions), and the manner in which it will be operated and controlled." IDAPA 58.01.01.202.01.a.i. DEQ may request any additional information necessary to make determinations under the Idaho Air Rules. IDAPA 58.01.01.202.03.

Petitioners cite Section 202.01 and argue the work plans at issue were required "plans" to be submitted as part of Perpetua's permit application and to be circulated for public comment. Opening Br. at 30. There is no textual support that the AMP, FDCP, HRCP, and O&M Manual are "plans" as that term is used in Section 202.01. Petitioners fail to present any argument to support their interpretation of the term. Moreover, DEQ's interpretation of its rules, plus its authority to determine an application complete, are entitled to deference. *See* IDAPA 58.01.01.202.03; *see also* Idaho Code § 67-5251(5); IDAPA 04.11.01.600.

DEQ must provide an opportunity for public comment on its "proposed action, together with the information submitted by the applicant and the Department's analysis of the information." IDAPA 58.01.01.209.01.c.i. As such, Petitioners' argument that Perpetua's application is incomplete or that these plans must be made available for public comment is legally incorrect. *See* Opening Br. at 29. Following the Idaho Air Rules, DEQ's review of Perpetua's application was an exemplar of this process: it included four requests for additional information to supplement the application, three extended public comment opportunities, two informational meetings requested by the public, and three iterations of draft permits. REC 418-419, 459. Notably, none of DEQ's incompleteness letters to Perpetua requested that the work plans be included in the permit application.

DEQ confirmed that requiring work plans after issuance of the Final Permit and prior to startup for DEQ review and approval complies with the Idaho Air Rules, its discretion under the rules, and agency practice:

> DEQ contends the requirement to review and approve each Plan and Manual after the permit is issued and prior to facility startup is sufficient, reasonable, and appropriate to ensure compliance with applicable requirements…[;] DEQ uses its authority to require a permittee to develop and submit for DEQ approval Plans and Manuals in accordance with IDAPA 58.01.01.211.01.

REC 1264 [Simon Decl. at 9]. DEQ explains that this is standard protocol, because more information becomes available after the permit application is submitted and approved and prior to startup, such as actual equipment purchased and installed, and the operational activities that are actually implemented after construction is completed. REC 1265 [Simon Decl. at 10].

In the end, Petitioners fail to point to any legal obligation in the Idaho Air Rules that requires AMPs, FDCPs, HRCPs, or O&M Manuals be circulated for public comment and review. In the absence of such rules, Petitioners try to shift the burden to Perpetua and DEQ by

arguing that "[n]o provisions in the Air Rules authorize DEQ to save portions of a PTC to be developed later." Opening Br. at 29. But it is Petitioners' burden to show DEQ's failure to comply with a legal obligation. And there are no such Idaho Air Rules because the rules do not require these documents in the application or in the public review process. The Hearing Officer was correct in finding DEQ did not violate the Idaho Air Rules and that "the language of Air Rule 211.01 provides DEQ with wide discretion regarding appropriate permit terms." REC 3406.

C. DEQ's decision for Perpetua to develop and submit the work plans for approval before starting construction was not arbitrary or capricious.

Contrary to Petitioners' accusations, DEQ is not "shielding" work plans from public review. Opening Br. at 32. Petitioners contend that DEQ failed to develop important permit conditions for work plans. However, DEQ included permit conditions prescribing great specificity for Perpetua's work plans. *See* REC 375-376 (Condition 2.6 detailing specific requirements of the FDCP and Condition 2.7 detailing specific requirements of the AMP), 378-380 (Condition 2.20 detailing specific requirements of the O&M Manual), 385-386 (Condition 3.13 detailing specific requirements of the HRCP), 932-933. DEQ also requires that the work plans "ensure compliance" with pertinent requirements. *See*, *e.g.*, REC 375 (Condition 2.6: "The Permittee shall develop and maintain a FDCP to ensure compliance with fugitive dust requirements (Permit Conditions 2.1-2.5) and also fugitive dust best management practices…in accordance with IDAPA 58.01.01.799.").

In addition, while the work plans are not required by any rule to be submitted at all, DEQ will exercise oversight, review and approve the work plans, and publish the final plans on its website. *Id*. Perpetua shall submit the plans to DEQ for approval at least 30 days prior to startup. REC 375-376 (Condition 2.6 (FDCP) and Condition 2.7 (AMP)), 378-380 (Condition 2.20 (O&M Manual)), 385-386 (Condition 3.13 (HRCP)); *see also* REC 932. Furthermore, elements

of the work plans, including recordkeeping and reporting requirements, will be incorporated and enforceable through the Final Permit. *Id*.

The method by which DEQ addressed the work plans in the Final Permit is consistent with DEQ's practice and is reasonable. *See* REC 1265 [Simon Decl. at 10]. It allows the permittee to prepare a specific plan or manual based on information that is not available at the permit to construct phase, such as the actual equipment purchased and operational characteristics of the facility. *Id*. Petitioners disagree with the approach executed by DEQ, but disagreement is not the legal standard. DEQ exercised reasonable discretion in developing the permit conditions related to the work plans. *See* REC 3406-3407. DEQ's approach did not violate the CAA governing SIPs, nor the Idaho Air Rules governing sources.

D. Petitioners' legal authority from the Clean Water Act is distinguishable and inapplicable to DEQ's preconstruction permitting process.

Petitioners fail to cite any case law to support their position that public review is required for work plans under the CAA or Idaho Air Rules for permits to construct. *See* Opening Br. at 29-34. This is not an oversight. There is no legal authority for Petitioners to reference. The relevant CAA jurisprudence affords broad discretion to states to develop permit conditions. *See Train*, 421 U.S. at 79. As demonstrated above, to issue the Final Permit lawfully, the work plans need not be included with applications or published for public comment and review as part of the preconstruction review process. In the absence of such authority, Petitioners cite two Clean Water Act cases to support their position on the work plans ignoring the distinct statutory requirements of that statute. Opening Br. at 31-32, 34.

In the first case, *Waterkeeper Alliance, Inc. v. U.S. EPA*, the plaintiff sought review of the National Pollution Discharge Elimination System Permit Regulation and Effluent Limitation Guidelines and Standards for Concentrated Animal Feeding Operations (the "CAFO Rule"). 399

F.3d 486, 492 (2d Cir. 2005). The plaintiff argued that the permitting scheme established by the CAFO Rule violated the Clean Water Act's public participation requirements because it did not require nutrient management plans, which constitute effluent limitations, to be made available to the public. *Id.* at 503. Under the Clean Water Act, effluent limitations are specifically identified in the list of items that public participation should be provided for. 33 U.S.C. § 1251. As such, the Second Circuit held the CAFO Rule "violates the plain dictates of 33 U.S.C. § 1251(e)." *Waterkeeper Alliance*, 399 F.3d at 504.

Similarly, in *Environmental Defense Center, Inc. v. EPA,* the Ninth Circuit held that Notices of Intent ("NOI") are functional equivalents to permits under the Clean Water Act's general permit option, and EPA's failure to require review of NOIs available to the public contravened the express requirements of the Clean Water Act. *Env't Def. Ctr., Inc. v. EPA*, 344 F.3d 832, 858 (9th Cir. 2003).

The Board should not give any weight to *Waterkeeper Alliance* and *Environmental Defense Center* because they are factually distinguishable and inapposite. Both relate to an entirely different federal law and permitting scheme and address information that is expressly required by the Clean Water Act to be provided to the public. The facts underlying these decisions are clearly different from Perpetua's work plans, which are not required by any express provision of the Idaho Air Rules (or the CAA) to be included in the application, the Final Permit, or any part of the public comment process. Rather, the Idaho Air Rules and relevant CAA jurisprudence provide that DEQ has broad discretion in development of permit conditions. *Train*, 421 U.S. at 79; IDAPA 58.01.01.211.01.

***

In sum, the Idaho Air Rules do not require DEQ to review and approve work plans during

the preconstruction permit review process, nor is public review appropriate for the specific operational choices implemented by the permittee in those plans. Moreover, DEQ placed the specific requirements for content of the work plans in plain sight within the Final Permit. As the Hearing Officer held, the Idaho Air Rules support DEQ's decision and discretion not to require Perpetua to develop work plans before issuance of the Final Permit. *See* REC 3406-3407.

III. The Hearing Officer correctly held that DEQ acted reasonably in determining that a 93.3% control efficiency for fugitive dust emissions from the Project's haul roads will meet the PM_{10} NAAQS and arsenic AACC (Claims 2 and 8).

To satisfy the requirements of Section 203 of the Idaho Air Rules, DEQ's evaluation included estimates of fugitive dust emissions from the Project's haul roads, including a dust control efficiency of 93.3%. *See* REC 431, 456, 917. Petitioners insist DEQ lacked a reasonable basis to determine that Perpetua will achieve a 93.3% control efficiency.[6] Opening Br. at 35-40. The Hearing Officer disagreed and found DEQ's selected control efficiency was reasonable and that the Final Permit includes enforceable limits and conditions to achieve that level of control. REC 3399-3403. The record fully supports the reasonableness of DEQ's determinations and the Hearing Officer's ruling. Petitioners' objections are simply a difference of opinion and provide no basis to conclude DEQ acted unreasonably.

A. DEQ acted reasonably and within its discretion in determining that 93.3% control efficiency for fugitive dust from haul roads is attainable.

Contrary to Petitioners' contention, the Final Permit includes a specific requirement to achieve 93.3% control of fugitive dust on the Project's haul roads. *See* Opening Br. at 35-36. The requirement is set forth in Conditions 1.2 and 3.2 of the Final Permit. REC 369, 384; *see also* REC 3399-3400. And as the Hearing Officer ruled, DEQ reasonably established the 93.3%

[6] Before the Hearing Officer, Petitioners also argued that DEQ's fugitive dust determinations violated the Idaho Air Rules. *See* REC 344, 2340. Petitioners do not present that argument here.

control efficiency based on a combination of dust suppressant chemical application (90% control) and watering (33% control) to increase road surface moisture.[7] *See* REC 3401-3402 (citing REC 917, 923-924). Petitioners do not offer alternative values; nor do they contest that chemical suppressant and water are commonly used together to control fugitive dust emissions from unpaved roads. *See generally* REC 912, 917, 924, 1245 [Schilling Decl. at 13], 1838.

Rather, Petitioners suggest, without argument or support, that it is "highly questionable whether 93.3% fugitive dust control is realistically attainable." Opening Br. at 35; *see also id*. at 36-37. They also make much of DEQ's recognition that meeting the 93.3% control efficiency for fugitive dust from the haul roads "requires conscientious efforts, vigilant inspection and monitoring, and a comprehensive [Fugitive Dust Control Plan]." *See id*. at 37, 39 (citing REC 456). Petitioners simply ignore DEQ's robust, reasoned, and rational analysis and decision making reflected in the permit record. DEQ relied on two sources to conclude a 93.3% control efficiency was achievable.

The first source was EPA's AP-42 guidance, which is commonly used for emission factor information for air pollution sources. DEQ relied on studies referenced in AP-42 Section 13.2.2, Unpaved Roads (2006), which supports a control efficiency over 90% when chemical and water suppressants are used in combination. *See* REC 917, 912, 1260-1261 [Simon Decl. at 5-6], 1838. As DEQ noted, the referenced test reports show that chemical suppressant alone can achieve 90% to 99% control efficiency and 98% for magnesium chloride in particular. REC 546-547.

[7] 93.3% control = (1-90%) * (1-33%). DEQ explained in its response to comments that it could have listed the control efficiencies separately for chemical (90% control) and water (33.3% control), but it chose to combine the control efficiency as 93.3% to emphasize the importance of using chemical and water suppressants in combination. REC 923-924.

Section 13.2.2 of AP-42 also provides that watering alone can achieve 75% to 95% control efficiency. REC 548, 808 (Figure 13.2.2-2), 1838.

To bolster its analysis, DEQ also reviewed a second source, EPA's RACT/BACT/LAER Clearinghouse ("RBLC") database. REC 924. The RBLC database identifies 10 major stationary source projects using chemical dust suppressants or a combination of chemical suppressants and watering with 90% to 98% control efficiency. REC 912-913. While Petitioners sought to discredit most of the 10 projects as unrepresentative, DEQ found the database provided additional support that a 90% or greater control efficiency is achievable, in various states with similar operations, by treating unpaved roads with chemical suppressants. REC 923-925.

To be sure, the RBLC database reports the *minimum* control efficiency required for the 10 projects, not the projects' achieved maximum control efficiency. REC 912-913. When using chemical suppressants alone, two of the RBLC projects identified a 90% control efficiency and one of the projects a 98% control efficiency. REC 913. As the permitting authority familiar with the database, DEQ concluded the database identified projects—including gold, cement and concrete, steel, and quarry projects—referencing control efficiency of 90% *or greater* for unpaved roads. REC 924, 912-913. DEQ found those and the other projects representative of circumstances presented by Perpetua. REC 924.

DEQ also found that fugitive dust from the haul roads was likely to be controlled at levels greater than 93.3% during wintertime conditions when the site receives an average snow depth of 21-68 inches and 6 inches of average precipitation. REC 924-925. Petitioners ignore all this work by DEQ. Ultimately DEQ chose to rely on empirical data gleaned from AP-42 and the RBLC database rather than Petitioners' unsupported critiques of DEQ's professional analyses. *See* REC 917, 924, 986 (noting that Petitioners did not demonstrate that their assumptions "were more

accurate or appropriate than data provided" and accepted by DEQ). DEQ reasonably supported its finding that the 93.3% control efficiency for chemical dust suppression and watering was both achievable and conservative. As the Hearing Officer correctly ruled, Petitioners have not shown that DEQ's conclusion was unsupported or unreasonable. *See* REC 3401-3402.

B. DEQ acted within its discretion to impose daily monitoring and other substantive conditions to ensure a 93.3% control efficiency.

The Hearing Officer also rejected Petitioners' contention that the Final Permit lacks sufficient and enforceable conditions to ensure a 93.3% level of control of fugitive dust from the haul roads will be met. REC 3402-3403. Petitioners argue that DEQ should have accepted EPA's advice and included conditions on the type, quantity, application rate, and frequency of dust suppressants. Opening Br. at 37-40. But as the Hearing Officer noted, they cite to no legal authority that DEQ was *required* to include those conditions, because there is none. REC 3403. Further, DEQ developed numerous permit conditions to ensure the 93.3% control efficiency is maintained on a daily and annual basis, and as the Hearing Officer held, Petitioners have not shown those conditions are unsupported, unreasonable, or unenforceable. *See id*.

1. DEQ imposed daily monitoring, dust control application, and other conditions to ensure the 93.3% control efficiency will be met.

Under the Idaho Air Rules, DEQ has the discretion to impose "any reasonable conditions upon an approval." IDAPA 58.01.01.211.01; *see also* IDAPA 58.01.01.651 ("All reasonable precautions must be taken to prevent particulate matter from becoming airborne."). Petitioners simply want different conditions to control haul road fugitive dust emissions from those imposed by DEQ and ask the Board to substitute their choices for DEQ's. Yet they cannot prove by a preponderance of the evidence that the conditions imposed in the Final Permit are arbitrary and capricious or unreasonable. Moreover, Petitioners ask the Board to view each condition in isolation for adequacy, without considering how the Final Permit's numerous conditions operate

together to require and verify compliance with the 93.3% fugitive dust control efficiency.

According to EPA guidance, for source-specific permit provisions to be practically enforceable, they must specify: (1) a technically accurate limitation and the portions of the source subject to the limitation; (2) the time period for the limitation (hourly, daily, monthly, annually); and (3) the method to determine compliance including appropriate monitoring, recordkeeping and reporting. REC 1157. DEQ ensured those enforceability criteria were met with respect to the 93.3% control efficiency. Not only did DEQ include that level of control in the Final Permit and find it achievable (as just explained), the Final Permit required, among other things, the proper application of dust suppressant chemicals and watering as verified through daily visible emission monitoring and recordkeeping. REC 917, 921, 923, 934, 937.

DEQ's conclusion is amply supported by the record and reasonable. Conditions 2.2, 2.4, 2.5, 2.6, and 2.8 provide enforceable conditions for achieving 93.3% haul road dust control by the proper application of dust suppressant chemicals and watering. Condition 2.2 requires Perpetua to monitor the frequency and methods used to control fugitive dust at least once every 12 hours and maintain those records. REC 374. Condition 2.4 requires daily facility-wide inspections of hauling activities to ensure the expected control efficiency is achieved. *Id*. Condition 2.5 requires fugitive dust control measures at all times to ensure no more than 10% opacity and immediate corrective action if the limit is not met. REC 375. The daily inspection and haul road opacity requirements are more stringent than in other permits that DEQ has issued. REC 1261 [Simon Decl. at 6].

Those conditions also refute Petitioners' complaints that DEQ did not include "vigilant inspection and monitoring" to ensure compliance. *See* Opening Br. at 37-40. As for monitoring, Condition 2.4 again establishes a daily monitoring time interval. REC 374. As for recordkeeping,

chemical suppressant and water applications must be recorded every 12 hours under Condition 2.2, dust complaints must be recorded under Condition 2.3, and all inspections and corrective actions must be recorded under Condition 2.4. *Id*. In addition, Condition 3.13 requires haul road inspections and silt content sampling. REC 385-386. And Condition 7.10 establishes detailed recordkeeping requirements for monitoring records, and Condition 7.11 requires documentation and reporting of excess opacity emissions. REC 406-407.

Moreover, Conditions 2.6 and 2.8 require a FDCP, which must be submitted to DEQ for approval 30 days prior to startup, and once approved, will be incorporated into the permit and enforceable. REC 375-376. The FDCP itself ensures compliance with the Final Permit's fugitive dust requirements. Condition 2.6 establishes and details minimum and substantive requirements for the FDCP, including:

- posting and limiting the maximum speed of haul trucks;
- applying water or suitable dust suppressant chemicals to haul roads during the dry season and at other times as necessary to control fugitive dust;
- prior to onset of winter conditions, maintenance of the roads and any preventative dust suppression activities before the roads are frozen;
- developing specific criteria to determine what frequency and type (water and/or chemical) of dust suppressant and appropriate suppressant application rates;
- applying chemical dust suppressants consistent with manufacturer's instructions and recommendations;
- providing training to all relevant employees and conducting visible emissions evaluations by certified employees who are visible emission observers; and

- at least once each year, evaluating FDCP requirements to identify additional requirements and evaluating the effectiveness of practices.

REC 375-376 (Condition 2.6). Thus, DEQ did not give "vague direction" to consider type, quantity, and rates of dust suppressants later in its FDCP. *See* Opening Br. at 38. As DEQ explained in response to Petitioners' criticisms, the Final Permit requires Perpetua to apply dust suppressants in proper amounts and proper frequencies as local conditions dictate and also requires daily inspections to ensure the 93.3% control efficiency is met. REC 917, 921, 923, 934, 937. Ultimately, the Final Permit "requires a more comprehensive and detailed FDCP than in any other minor source permit DEQ has issued." REC 1263 [Simon Decl. at 8].

DEQ rightly recognized the challenge of achieving fugitive dust controls at the 93.3% control efficiency. REC 456. As noted, Petitioners attempt to use DEQ's acknowledgment against it, *see* Opening Br. at 37, 39-40, but it illustrates that DEQ's choices in establishing Conditions 2.1 to 2.8 were deliberate, rational, and reasonable. For instance, DEQ reasoned that frequent inspections "once every 12 hours ensures that both daytime and nighttime operations will be observed, to confirm that sufficient fugitive dust control measures are applied as assumed in demonstrations of compliance with NAAQS on a 24-hour basis." REC 724. DEQ also considered the Final Permit's surrogate production limits (discussed below) and that a 93.3% level of control could be met and likely exceeded during wintertime conditions, when modeling showed possible violations of the PM_{10} NAAQS. REC 924-925, 995-996.

Rather than affording passing consideration to achieving 93.3% control levels, DEQ directly confronted the challenge and developed robust permit conditions to assure future permit compliance. DEQ's imposition of minimum and substantive requirements in the Final Permit and through the FDCP was reasonable. DEQ understood how uncommon and impractical it would be

to establish specific numeric limits to control efficiency variables advocated by Petitioners. Instead, the Final Permit requires that chemical suppressants be applied in accordance with the manufacturer's instructions and recommendations and that the control effectiveness of the combination of dust suppressant chemicals and watering be verified daily. As the Hearing Officer concluded, Petitioners have not satisfied their burden to show that the many permit conditions imposed by DEQ will not achieve the expected control efficiency. REC 3403.

2. DEQ also established surrogate production limits and other requirements to ensure the 93.3% control efficiency is achievable.

Petitioners also ignore the other enforceable conditions DEQ imposed to control fugitive dust emissions from the haul roads. As DEQ explained, emissions limits and parameters associated with estimating emissions are not commonly included in permits for fugitive dust sources. REC 923, 939-940. Instead, DEQ uses production limits and monitoring and recordkeeping requirements, which it did here. *Id*. In Condition 3.5, DEQ established daily hauling and excavation limits of 180,000 tons/day and 135,000 tons/day on a five-year rolling basis. REC 385; *see also* REC 917, 939. It did so because daily production limits directly limit "hauling operations and associated emissions" and "serve as surrogate emissions limits for PM, PM_{10}, $PM_{2.5}$, HAP and TAP from fugitive sources." REC 722, 923, 939-940.

DEQ also recognized the importance of the silt content parameter in estimating fugitive dust emissions and ensuring compliance with the PM_{10} NAAQS. REC 918. In response to Petitioners' and EPA's comments, DEQ imposed Condition 3.13, which requires Perpetua to cap haul roads with material having a maximum of 4% silt content and to develop a HRCP to ensure the limit is met. REC 385-386; *see also* REC 918, 938-939. Further, as just discussed, DEQ imposed Conditions 2.1 to 2.8 to require fugitive dust emission limits (to ensure that visible

emissions do not exceed 10% opacity) and control requirements (such as the application of water and chemical dust suppressants to haul roads). REC 374-376, 456.

Equally important are the monitoring and recordkeeping requirements DEQ imposed. As DEQ explained, "[s]uch monitoring includes the monitoring of maximum road silt content [and] monitoring of production levels to verify estimated vehicle miles traveled (VMT) used in fugitive road dust emission calculations." REC 928. Indeed, Condition 3.13 requires sampling and monitoring of the maximum road silt content, and Condition 3.16 requires daily, monthly, and yearly hauling and excavating monitoring. REC 386. And, again, Condition 2.6 requires Perpetua to develop and maintain the FDCP to ensure compliance with Conditions 2.1 to 2.5. REC 375-376. The FDCP must include precautions to minimize fugitive dust emissions, such as maximum speed limits, monitoring and maintenance of haul roads, and frequency of chemical dust suppressant and watering. *Id*.

Finally, Petitioners overlook the conservative assumptions that overestimated fugitive dust emissions from the haul roads and modeled maximum PM_{10} impacts. EPA's method for estimating haul road fugitive dust emissions predicts higher emissions for more miles traveled and a heavier vehicle weight. *See* REC 1163-1164. Thus, DEQ also justified its choice of conditions because the emissions were "[c]alculated at maximum daily processing rates" and "would tend to be conservatively estimated." REC 431. At the 180,000 tons/day production limit (or 65,700,00 tons/year), DEQ modeled all hauling scenarios to capture the maximum case hauling distance of 16,415 miles per day (or approximately 500,000 miles per month). *Id*. But the Project's peak production rate is actually 116,964 tons/day (or 42,692,000 tons/year), *id*., and the peak hauling mileage is approximately 116,700 miles per month, far less than modeled, REC

722. And where the conservatism of some emissions calculated was questioned, "DEQ required enhanced monitoring and record-keeping," such as Conditions 3.13 and 3.16. REC 92.

In sum, the entire premise of Petitioners' challenge is wrong–there is no legal requirement for DEQ to include the type, quantity, application rate, and frequency of dust suppressants to control fugitive dust emissions from the haul roads. Petitioners also ignore the actual conditions DEQ chose to impose and its justification for establishing fugitive dust controls, surrogate production limits, and enhanced monitoring and recordkeeping requirements. Petitioners may disagree with DEQ's choices, but they have not shown that DEQ lacked a reasonable basis for such conditions.

***

After exhaustive review (much of it in response to Petitioners' public comments), DEQ concluded that fugitive dust emissions from the Project's haul roads will neither cause nor contribute to violations of the PM_{10} NAAQS and the arsenic AACC. *See* IDAPA 58.01.01.203. Petitioners disagree with DEQ's assessments and prefer that it use a lower control efficiency and add more permit limits and conditions to control operations. The Hearing Officer was correct in ruling that Petitioners have not shown that DEQ's choices were unreasonable, unsupported, or irrational. REC 3399-3403.

IV. The Hearing Officer correctly held that DEQ reasonably exercised its discretion in evaluating the health risks from arsenic (Claim 9).

Petitioners argue that "[t]he Hearing Officer ignored the plain language of the Air Rules" by holding that DEQ appropriately found that emissions of arsenic would not injure or unreasonably affect human health or the environment. Opening Br. at 40. However, it is Petitioners who ignore the plain language of the Idaho Air Rules. Petitioners fault DEQ for using a "project specific adjustment factor" to account for the actual operational life of the Project, but

ignore that this project specific adjustment is envisioned by the Idaho Air Rules and well within DEQ's discretion. *See id.*

Following the second public comment period and in response to Petitioners' comments, Perpetua modeled carcinogenic TAPs emissions using an emission inventory that included T-RACT controls, as authorized by Section 210 of the Idaho Air Rules. *See* REC 1944. Typically a source will have an indefinite or unknown operational life, so the Idaho Air Rules require that the source's TAP emissions do not exceed the T-RACT adjusted AACC, which is 10x the AACC listed in Section 586 of the Idaho Air Rules.[8] Section 210.12. This ensures that over a 70-year human life, the ambient air cancer risk from the source's emissions over that period do not exceed one in 100,000. REC 1243 [Schilling Decl. at 11].

However, here the Project does not have an indefinite operational life. Instead, the Project will only operate for 16 years. *See* REC 698, 710, 1947. Accordingly, DEQ used a project specific adjustment factor, authorized under the authority granted to it by Section 210.12, to evaluate whether the TAP emissions from the Project, and specifically arsenic emissions, from the Project would be less than the TAP Standards established in Section 210 and Section 586. REC 710-711.

Arsenic is the primary TAP of concern from the SGP. REC 435. Arsenic is a carcinogen, and the concerns for health impacts from arsenic exposure are from a long-term exposure basis. *See* REC 698, 1243 [Schilling Decl. at 11]. Thus, to reflect the long-term health impacts from sources with indefinite operational spans, the carcinogenic increments reflected in Section 586 are based on a 70-year lifetime exposure. REC 963, 1242-1243 [Schilling Decl. at 10-11].

[8] The Idaho Air Rules were established primarily to regulate well-defined, consistent pollutant emitting processes of an indefinite life. REC 1240 [Schilling Decl. at 8], 1243 [Schilling Decl. at 11].

Notably, before the rules were updated in 2022,[9] the Idaho Air Rules defined "Toxic Air Pollutant Carcinogenic Increments (AACCs)" as "[t]hose ambient air quality increments based on the probability of developing excess cancers over a seventy (70) year lifetime exposure to one (1) microgram per cubic meter (1 μg/m3) of a given carcinogen and expressed in terms of a screening emission level or an acceptable ambient concentration for a carcinogenic toxic air pollutant." IDAPA 58.01.01.006.125 (2022); REC 1243. So, while the AACC is stated in annual averages, these values were developed to be protective where a facility emits at the level reflected in the AACC over the entire 70-year exposure period. *See* REC 963, 1242-1243. In other words, when adjusted for T-RACT, the concentration established by the AACC assumes that if 100,000 people spend a lifetime (24 hours per day, every day, for 70 years) at the maximum receptor point, one person "may" develop cancer.

Again, here, the Project will operate, and potentially generate arsenic emissions, for only 16 years. REC 698. Thus, there will be no arsenic generating activity at the Project after year 16. To account for the actual operational period, DEQ evaluated whether arsenic emissions from the Project would, when evaluated over a 70-year period, be less than or equal to the AACC as required by Section 210.12. REC 69, 719. Conservatively, DEQ took the highest annual modeled concentration of arsenic and assumed that that concentration would be repeated for each year of operations, 16 years. REC 710, 1243. DEQ then averaged this exposure across 70 years, which is the lifetime exposure period that forms the basis of the AACCs and which is required to be evaluated by the Idaho Air Rules. REC 710, 963, 1243. DEQ then compared the lifetime arsenic exposure from the Project, on an annual basis, to the AACC for arsenic, as provided in Section

[9] *See* Executive Order No. 2020-01 (requiring State rules to be streamlined).

586, and determined that the maximum lifetime exposure would be approximately 41% of the AACC. REC 714.

When interpreting a rule, such as Section 210.12, "[t]he language of the rule … should be given its plain, obvious and rational meaning." *Wheeler v. Idaho Transp. Dep't*, 148 Idaho 378, 384, 223 P.3d 761, 767 (Ct. App. 2009) (citing *Mason v. Donnelly Club*, 135 Idaho 581, 586, 21 P.3d 903, 908 (2001)). Petitioners fault DEQ for ensuring that its evaluation of arsenic emissions from the Project was equivalent to the AACC. But DEQ's approach is envisioned and permitted by the plain language of Section 210.12, which requires that DEQ must:

> Compare the source's or modification's approved T-RACT ambient concentration at the point of compliance for the toxic air pollutant to the amount of the toxic air pollutant that would contribute an ambient air cancer risk probability of less than one to one hundred thousand (1:100,000) (which amount is equivalent to ten (10) times the applicable acceptable ambient concentration listed in Section 586).

IDAPA 58.01.01.210.12.b. Following this evaluation, then

> [i]f the source's or modification's approved T-RACT ambient concentration at the point of compliance is less than or equal to the amount of the toxic air pollutant that would contribute an ambient air cancer risk probability of less than one to one hundred thousand (1:100,000), no further procedures for demonstrating preconstruction compliance will be required for that toxic air pollutant as part of the application process.

IDAPA 58.01.01.210.12.c. Thus, under Section 210.12.b and c, DEQ must evaluate the arsenic emissions and determine if they are less than or equal to the amount of TAP that would contribute to an ambient air cancer risk probability of less than one to 100,000.

As described by Section 210.12, this air cancer risk probability is equivalent to the AACC listed in Section 586. However, the AACC was based on a 70-year exposure period, while the life of the Project is only 16 years. To determine whether the emissions from the 16-year Project were actually equivalent to the AACC, DEQ applied a project specific adjustment

factor to evaluate the arsenic emissions from the Project on the same basis as the AACC – 70 years. REC 710-11; REC 1243 [Schilling Decl. at 11].

Importantly, unlike the other subsections of Section 210 that require the source to demonstrate that its TAP emissions will be at or below the AACC, Section 210.12 contains no such explicit requirement.[10] For instance, Section 210.06 requires that the source's "uncontrolled ambient at the point of compliance" be "*less than or equal to the applicable acceptable ambient concentration*." IDAPA 58.01.01.210.06.b (emphasis added); *see also* IDAPA 58.01.01.210.08.b, 210.10.b, 210.11.c. Had DEQ intended to require that annual emissions from the Project meet the AACC each and every year, it would have said as much in Section 210.12. It did not.

Instead, Section 210.12 requires that DEQ evaluate the acceptable air cancer risk that is "equivalent to" the value found in the AACC. "Equivalent" does not mean "exactly." It means "equal in value, force, amount, effect, or significance." *Equivalent, Black's Law Dictionary* (11th ed. 2019). So here, DEQ must determine whether the Project's arsenic emissions, released over 16 years, have the same cancer risk value as the value found in the AACC that is based on emissions over 70 years. Petitioners can hardly argue that 16 years is equivalent to 70 years. DEQ appropriately conducted its evaluation of the arsenic emissions from the Project by annualizing the worst-case modeled emissions from the Project for the 16-year operational life over the 70-year period upon which the AACCs are based. When DEQ applied the project

[10] Petitioners conveniently ignore the portions of Section 210.12.b and c that require DEQ to compare arsenic emissions to the amount of emissions that would "contribute an ambient air cancer risk probability of less than one to one hundred thousand." *See* Opening Br. at 42. Instead, Petitioners rewrite Section 210.12 to make it seem like DEQ must determine whether the arsenic emissions are less than or equal to the AACC in every year that the Project operates. *Id.* This is not what Section 210.12 requires.

specific adjustment factor, it complied with the plain language of the Idaho Air Rules to determine that the Project met the requirements of Section 210.12.

Not only did DEQ comply with the plain language of the Idaho Air Rules, it also complied with the intent of the Idaho Air Rules. When interpreting a rule, the Board must construe the rule as a whole to give effect to DEQ's intent in enacting the rule. *See State v. Besaw*, 155 Idaho 134, 142, 306 P.3d 219, 227 (Ct. App. 2013). Section 161 demonstrates DEQ's intent in requiring a preconstruction compliance demonstration for TAPs–that TAP emissions do not "injure or unreasonably affect human or animal life or vegetation." Section 586 establishes acceptable levels of carcinogenic air pollutants: if a receptor were exposed to each year for 70 years, this would not result in an increased cancer risk. These AACCs are designed to be both protective and enforceable for projects that have an indefinite operating life. REC 1243 [Schilling Decl. at 11]. Section 210.12 requires that arsenic emissions from the Project not exceed an ambient concentration that would be greater than one to 100,000.

Clearly then, the intent of the Idaho Air Rules is to ensure that emissions from a source do not create an unacceptable cancer risk and are not otherwise injurious to life and health. However, Petitioners ignore the intent of the Idaho Air Rules and argue that unless the ambient concentration in each year of the Project meets the exact value of the AACC, DEQ erred, irrespective of the relative cancer risk of the arsenic emissions from the Project. Opening Br. at 43.[11]

[11] Petitioners focus on DEQ's explanation at the hearing on summary judgment to argue that DEQ made up a new regulatory exception to evaluate arsenic emissions from the Project. That is not what occurred. As explained by DEQ in the record, REC 710-711, 719, and Kevin Schilling's declaration, REC 1242-1243, DEQ used a project specific adjustment factor to ensure that its comparison of arsenic emissions from the Project was equivalent to the AACC. Part of the confusion regarding this claim is caused by Petitioners' ever-shifting theory of how DEQ

DEQ conducted a thorough review of Perpetua's potential arsenic emissions and determined that the Project would comply with Section 210.12. DEQ made repeated requests for additional information related to TAPs emissions from the Project. *See* REC 419-420, 1926. At DEQ's request, Perpetua prepared a TAP Addendum that analyzed TAP emissions using T-RACT controls, production limits,[12] and emission inventory refinements. REC 1944. Also, at DEQ's request, Perpetua conducted an arsenic modeling analysis comparing the worst-case modeling analysis, used to determine preconstruction compliance, and an assessment of the actual arsenic concentrations expected from the actual mining operations. REC 1949. The arsenic emissions produced from the actual operating analysis are only 19% of the worst-case scenario. REC 1950. This searching evaluation demonstrates that DEQ complied with the intent of the Idaho Air Rules.

Here, DEQ complied with both the plain language of Section 210.12 and the intent of the Idaho Air Rules in finding that the arsenic emissions from the Project would have a lifetime ambient air cancer risk less than or equal to one to 100,000. *See* REC 1244 [Schilling Decl. at 12]. As the Hearing Officer recognized, DEQ provided "a thoughtful and conservative approach

---

erred. In their opening summary judgment brief Petitioners seemed to argue that DEQ violated the Idaho Air Rules, although they never explicitly stated as much. REC 361-362. In their reply brief, Petitioners changed tack and argued that DEQ's arsenic analysis was arbitrary and capricious, apparently abandoning their previous position. REC 2368. Now, they shift again and attempt to make more explicit their theory that DEQ violated the Air Rules. Opening Br. at 40. Perpetua and DEQ have been required to respond to Petitioners' ever evolving argument, which is reflected in the past explanations of why the Final Permit was lawfully issued.

[12] DEQ set the life-of-mine hauling and excavating limit at 788.4 million tons of ore and development rock. Whether this amount is mined in 16 years, the life of the mine, or 70 years, the lifetime exposure period, the total arsenic emissions will be the same, they would just be spread out over more time. Thus, the total arsenic exposure to public receptors will be the same irrespective of how long the mine is in operation.

to ensuring arsenic emissions will not exceed the 1-in-100,000 lifetime cancer risk standard when T-RACT is used." REC 3421. That is all the Idaho Air Rules require, nothing more.

In sum, as the Hearing Officer concluded, DEQ complied with both the letter and the intent of the Idaho Air Rules in evaluating arsenic emissions from the Project. REC 3415-3422. DEQ concluded, after extensive evaluation of the potential arsenic emissions, that the Project would not result in impacts to ambient air that exceed TAP increments of Section 586. *See* REC 719. The Board should uphold DEQ's well-reasoned determination as consistent with the Idaho Air Rules.

CONCLUSION

The Board should deny Petitioners' Amended Petition for Review of Preliminary Orders and affirm the Hearing Officer's Amended Memorandum Decision on Motions for Summary Judgment and Preliminary Order.

Case Docket No. 0101-22-01
OAH Case No. 23-245-01

JOINT MOTION TO SUPPLEMENT RECORD WITH DEQ RESPONSE TO EPA LETTER

Respondent Idaho Department of Environmental Quality ("DEQ") and Intervenor-Respondent Perpetua Resources Idaho, Inc. ("Perpetua") jointly move to supplement the administrative record with DEQ's response to a letter the United States Environmental Protection Agency ("EPA") sent to DEQ's Director. Previously, the Hearing Officer granted Petitioners' motion to supplement the record with the EPA letter, subject to certain limitations. Fairness and completeness dictate that the Board of Environmental Quality (the "Board") supplement the record with DEQ's response, subject to the same limitations. This motion is supported by the Declaration of Tiffany Floyd ("Floyd Decl.") and brought pursuant to Idaho Code § 67-5245(7) and IDAPA 04.11.01.600.

BACKGROUND

Petitioners filed a contested case petition challenging DEQ's issuance of Permit to Construct No. 2019.0047 (the "Final Permit"). REC 1-27, 263-292.[1] The Final Permit is a preconstruction permit that authorizes Perpetua to construct the Stibnite Gold Project (the "Project"). After the Board assigned a hearing officer to hear the contested case, the Hearing Officer heard the parties' competing motions for summary judgment and on October 31, 2023, issued a Preliminary Order dismissing the contested case petition. REC 3280-3327. The Hearing Officer later issued an Amended Preliminary Order. REC 3372-3424. On March 14, 2024, the Board is scheduled to hear Petitioners' Amended Petition for Review of Preliminary Orders.

This motion arises because once discovery and summary judgment briefing was completed before the Hearing Officer, Petitioners moved to supplement the administrative record with an August 10, 2023 letter sent by EPA Region 10 to the Director of DEQ, regarding EPA's concerns with the Final Permit. REC 3137-3142. Over DEQ and Perpetua's objections, *see* REC

[1] Citations to "REC" are references to the Agency Record, which was certified and transmitted to the Board on December 15, 2023.

3236-3257, the Hearing Officer partially granted Petitioners' motion to supplement the record, REC 3271-3273. While allowing the admission of the EPA letter, the Hearing Officer limited the purposes for which it could be considered. The EPA letter cannot be used (1) to add new allegations of error, (2) to add factual information that was not already part of the record, or (3) "as a proxy for expert testimony from the Petitioners." REC 3272. Petitioners have not asked the Board to review of the Hearing Officer's rulings. Neither have DEQ and Perpetua.

There is more to the story, however.

On October 13 and 23, 2023, DEQ and EPA staff met to discuss EPA's concerns with the Final Permit. Floyd Decl. at ¶ 4. On November 22, 2023, DEQ's Director formally responded to the EPA letter with a 31 page "Response to the August 10, 2023 EPA Region 10 Letter to Idaho DEQ." *Id*. at ¶ 5, Ex. A. In the transmittal letter, the DEQ Director explained that the supporting materials detailed the information DEQ and EPA staff discussed in the technical meetings and that "[i]t is our understanding that through those meetings and conversations, DEQ addressed all of EPA's concerns that were identified in your August 10, 2023, letter and that the PTC issued by DEQ to Perpetua Resources on June 17, 2022, is protective of the National Ambient Air Quality Standards and meets the requirement of the Clean Air Act." *Id*., Ex. A.

DEQ and Perpetua now move the Board to supplement the administrative record with DEQ's response to ensure DEQ's response to the EPA letter is fairly and completely reflected.

ARGUMENT

When reviewing a Preliminary Order, "[t]he head of the agency … for the review of preliminary orders shall exercise all of the decision-making power that he would have had if the agency head had presided over the hearing." Idaho Code § 67-5245(7). Thus the Board has the authority to take evidence to assist in the development of the administrative record. *See* IDAPA

04.11.01.600; *see also* IDAPA 04.11.01.413 (allowing a hearing officer to accept evidence in the record), 606 (allowing the agency head to rule on objections to the admission of evidence).[2]

Supplementing the record before the Board to include DEQ's response to the EPA letter is necessary to ensure fairness and the completeness of the record. The EPA letter concerned four issues: (1) whether the Project is a major stationary source under the CAA; (2) whether fugitive dust from the Project's haul roads will cause or contribute to a violation of the PM_{10} NAAQS; (3) whether Perpetua has the legal right to exclude the general public for purposes of the ambient air boundary; and (4) whether the Permit includes sufficient measures to exclude the general public from the entirety of the Project for the ambient air boundary.

Only two of those issues—the second and the third issues—are raised in Petitioners' Amended Petition for Review of Preliminary Orders. Petitioners reference the EPA Letter in their Amended Petition, REC 3429, and their opening brief, *see* Opening Br. at 13-14, and contrary to the Hearing Officer's order, rely on EPA's "public comments and other submissions to DEQ" as "expert testimony," *Id*. at 36. *See also Id*. at 8, 33, 35-36, 38. Having come after the Hearing Officer's Preliminary Order, DEQ's response is not part of the administrative record. Thus Petitioners do not acknowledge DEQ's response to the EPA letter, which thoroughly addressed and rejected each of EPA's concerns. *See* Floyd Decl. at ¶ 5, Ex. A.

If the EPA letter is relevant to these proceedings, then DEQ's response is equally relevant. It is only fair and equitable to supplement the administrative record with DEQ's response to ensure the record is complete and accurately reflects the resolution of the EPA letter. For those reasons, the Board should allow the admission of DEQ's response under the same

[2] The Board's contested case rules incorporate Section 413 and Sections 600-606 of IDAPA 04.11.01. *See* IDAPA 58.01.23.003.08., 13.

conditions the Hearing Officer allowed consideration of the EPA Letter. Just as the EPA letter cannot be used to add new allegations of error or factual information that was not already part of the record or "as a proxy for expert testimony from the Petitioners," neither can DEQ's response to the EPA letter. *See* REC 3272.

Thus, DEQ's response should only be considered to the extent it is relevant to alleged errors that are already within the scope of this contested case proceeding and includes factual information or data that is already within the existing the record. Again, that includes only the second and the third issues raised in the EPA letter, which DEQ addressed during the Final Permit's multiple public comment periods and addressed again in the response to the letter. Thus no new factual information or data are raised. To that end, supplementing the record to include DEQ's response to the EPA letter does not require additional hearings, further factual development, or remand to the Hearing Officer. Nor will the admission of DEQ's response prejudice Petitioners.

CONCLUSION

In sum, because Petitioners were allowed to supplement the record with the EPA letter, the Board should be aware of DEQ's thorough response and dismissal of the EPA letter. To ensure fairness and the completeness of the record, the Board should supplement the record with DEQ's response, subject to the same limitations the Hearing Officer admitted the EPA letter.

DECLARATION OF TIFFANY FLOYD IN SUPPORT OF JOINT MOTION TO SUPPLEMENT RECORD WITH DEQ RESPONSE TO EPA LETTER

I, TIFFANY FLOYD, hereby declare under penalty of perjury and pursuant to the law of the State of Idaho that the following is true and correct:

1. My name is Tiffany Floyd, and I am employed by the State of Idaho, Department of Environmental Quality (the "Department") as the Air Quality Division Administrator ("Air Administrator").

2. I have been working for the Department as the Air Administrator for 11 years.

3. On August 10, 2023, DEQ's Director received a letter from the United States Environmental Protection Agency ("EPA") Region 10 regarding Permit to Construct No. 2019.0047, an air quality preconstruction permit DEQ issued to Perpetua Resources Idaho, Inc. on June 17, 2022.

4. On October 13 and 23, 2023, I and other DEQ staff met with EPA staff to discuss concerns raised in the EPA letter.

5. On November 22, 2023, DEQ's Director formally responded to the EPA letter with a transmittal letter and document entitled "Response to the August 10, 2023 EPA Region 10 Letter to Idaho DEQ," a true and correct copy of which is attached hereto as **Exhibit A.**

DATED: February 7, 2024.

Brad Little, Governor
Jess Byrne, Director

November 22, 2023

Mr. Casey Sixkiller
Regional Administrator, Region 10
United States Environmental Protection Agency
1200 Sixth Avenue, Suite 155
Seattle, WA 98101

Dear Mr. Sixkiller,

This letter, and its attachment, are a follow-up, and hopefully conclusion, to your letter dated August 10, 2023, regarding Perpetua Resources of Idaho, Inc's ("Perpetua") permit to construct. As my September 8, 2023, letter indicated, the Idaho Department of Environmental Quality (DEQ) takes our responsibility to protect air quality and public health, through implementation of our federally approved state air quality program, very seriously. We are also extremely proud of our history of success in carrying out this responsibility. As such, we do not take the concerns and accusations raised in your letter lightly—which is demonstrated by the thoroughness of the attached information, particularly considering this effort was on top of the multi-year permit development process we undertook when developing the Perpetua permit.

I'd like to take this opportunity to personally recognize and thank the DEQ and Environmental Protection Agency (EPA) staff that participated in the technical meetings held on October 13 & 23, 2023, where EPA's concerns with the Perpetua permit were discussed. I know that DEQ staff went to great lengths to further explain how the Perpetua application was evaluated, and permit conditions developed. The meetings were very productive and collaborative. That said, it is my sincerest hope that we can avoid the need for similar meetings moving forward. I believe there is a mutual recognition of that being possible through better communication during the permit development process.

The attached supporting documentation details the information that staff discussed during the day and a half of meetings. It is our understanding that through those meetings and conversations, DEQ addressed all of EPA's concerns that were identified in your August 10, 2023, letter and that the PTC issued by DEQ to Perpetua Resources on June 17, 2022, is protective of the National Ambient Air Quality Standards and meets the requirement of the Clean Air Act. If you or your staff have any additional questions regarding the materials provided, please reach out to Tiffany Floyd, Air Quality Division Administrator.

I look forward to building upon this experience as both agencies strive to work together to carry out our respective responsibilities.

Sincerely,

Jess Byrne

Jess Byrne

Kelli Wetzel, Permit Writer
AIR QUALITY DIVISION

EPA Allegation 1. The production limits in the PTC do not restrict the SGP's PTE to below major stationary source permitting thresholds under the prevention of significant deterioration (PSD) or Title V programs

EPA Comment 1a. Underestimation of Emissions from Ore Processing Emission Units

In its prior comment letters, EPA advised IDEQ that the emission factors relied upon in the draft permits were not representative of emissions. For instance, EPA's March 16, 2022, comment letter stated: "Some of the PTE limitations may not be technically accurate because they are not based on emission factors that are representative of the emission sources. For example, AP-42 Section 11.24 Metallic Minerals Processing emission factors applies to the processing of hard ores including gold. However, the application uses AP-42 emissions factors from Section 11.19.2 Crushed Stone Processing that is applicable to non-metallic mineral processing. The permitting record does not provide a reasoned explanation as to why emission factors from Section 11.24 were selected over those from Section 11.19.2."[20]

IDEQ's Response to Comment did not provide any additional information or rationale for decision making. Instead, IDEQ stated, "Representativeness of these parameters was discussed with and reconfirmed by PRI at various points during review and the estimates of emissions and underlying assumptions were supported to the satisfaction of IDEQ."[21]

Even if a permitting authority was unable to find more accurate emission factors than AP-42, the introduction to Section 11.19 states, "The construction aggregate industry covers a range of subclassifications of the nonmetallic minerals industry (see Section 11.24, Metallic Minerals Processing, for information on that similar activity)." IDEQ did not follow the listed instructions to see Section 11.24 for Metallic Minerals Processing.

IDEQ did not state that it performed any analysis of other emission information. IDEQ did not state that it sought out emission factor information of higher quality than AP-42, as required by IDEQ Guidance[22] (Guidance) which states, "When estimating emissions, emissions data that *best* reflects emissions from a stationary source must be used" (emphasis added). IDEQ did not make a determination that the emission factor chosen meets the Guidance. Similarly, the Guidance states "The rating of the AP-42 factor must be considered…" However, IDEQ did not state how it considered the rating of the factor chosen or if IDEQ considered other factors with higher ratings. For reference, AP-42 Section 11.24 has a rating of "77C" for primary crushing emission factor. AP-42 Section 11.19 has no emission factor for primary crushing, but states that tertiary crushing can be used for primary and secondary crushing and the rating for tertiary crushing is "E", the lowest rating assigned by AP-42. Setting aside the choice of using an emission factor for Non-Metallic Minerals instead of the Metallic Minerals, IDEQ has not evaluated the available emission factors based on the rating, as required by its own Guidance.

EPA's document AP-42 Metallic Mineral Processing Plants – Background Information for Proposed Standards Volume 2 Appendices (EPA-450/3-81.009b) lists visits and emission testing at various mineral processing and mining operations. Appendix C – Summary of Test Data includes data on nine plants that processed metallic minerals. Table C-1 specifically includes testing at processing equipment at a gold mine with baghouse control. Thus, the metallic mineral processing plants evaluated and tested to form the basis for the emissions factors in AP-42 Section 11.24 are most similar to the metallic mineral processing emission units at the SGP. These background documents clearly indicate that the emissions factors in Section 11.24 are most appropriate for estimating emissions from the SGP.

Multiplying the emission factor found in AP-42 Section 11.24 by the production limitation on the primary crusher (OC7) results in an emission estimate over 90 tons of PM per year for that unit alone. Similarly, if AP-42 Section 11.24 emission factors are multiplied by the production limits for the remaining emission units OC1 through OC13, potential PM emissions from that collection of units *exceeds 800 tons PM per year*. Given the PSD threshold of 250 tons per year and the fact that even Section 11.24 is an average emission factor (and approximately half of all emission units will emit above an average rate), the PTC fails to restrict emissions below major source thresholds.

Based on the above information, IDEQ did not follow IDEQ Guidance, did not support the use of the chosen emission factor, and was arbitrary when choosing emission factors for the ore processing emission units. Accordingly, the PTC does not restrict the Facility's PTE below major source thresholds as a legal and practical matter.

IDEQ Response

EPA contends that IDEQ did not follow its own guidance in the Emissions Data Hierarchy Guidance document when choosing emission factors for the ore processing emission units located at Perpetua Resources Idaho (PRI) Stibnite site, aka Stibnite Gold Project (SGP). A thorough review of the administrative record reveals that IDEQ did follow its own guidance precisely. IDEQ's guidance states that when estimating emissions, emissions data that best reflects emissions from a stationary source must be used in the following hierarchy:

1. Continuous Emissions Monitoring (CEM) data from the stationary source
2. Performance test data from the stationary source
3. Manufacturer emission guarantee
4. CEM data from a similar stationary source or sources
5. Performance test data from a similar stationary source or sources
6. AP-42 or industry-derived emission factors.

In this case, the data described in numbers 1-5 were unavailable. Therefore, IDEQ employed the AP-42 emission factors to estimate emissions.

Introduction of emission factor selection. IDEQ endeavors to issue legally defensible permits that protect Idaho's air quality to the greatest extent possible. In doing so, IDEQ relies upon permit applicants to supply site-specific data that account for real-world parameters and processes. IDEQ therefore seeks to apply emission factors that actually reflect the permit applicant's plans and processes. In comparing Sections 11.19.2 and 11.24 of AP-42, IDEQ found that applying section 11.19.2 would be most applicable to the SGP proposal. Conversely, Section 11.24 is largely inapplicable – despite its misleading title – and applying it to the SGP would likely be considered arbitrary and capricious. A thorough review of the background materials, underlying AP-42 emission factors, along with the administrative record, demonstrates that EPA's concern is unsupportable and lacks a rational basis.

AP-42 emission factors for ore processing reside in Section 11.19.2 for non-metallic mineral processing and Section 11.24 for metallic minerals processing. Section 11.24 emission factors are from 1982 with primary to tertiary crushing ratings ranging from C to E (with E being the lowest rating). Section 11.24 also only lists emission factors for PM and PM_{10} but not $PM_{2.5}$.

Table 11.24-2 (English Units). EMISSION FACTORS FOR METALLIC MINERALS PROCESSING[a,b]

EMISSION FACTOR RATINGS: (A-E) Follow The Emission Factor

Source	Filterable[b,c]

Section 11.19.2 includes major processing for rock types such as limestone, granite, dolomite, traprock (basalt), sandstone, quartz, and quartzite. Section 11.19.2 emission factors are from 2004 which are approximately 20 years newer than those from Section 11.24. The facility's emission inventory includes crushers and conveyors controlled by water sprays. EPA's AP-42 11.19.2 provides representative emission factors for these specific processes and controls for PM, PM_{10}, and $PM_{2.5}$. These emission factors also range from C to E.

A thorough review of the various AP-42 sections was conducted and the AP-42 emission factors that match the PRI ore crushing process equipment and controls was selected. The emission factors selected and resulting minor source designation are entirely consistent with other gold mining permits issued in Region 10 and Nevada.

For further confirmation that use of the newest emission factors are appropriate for PRI to use, additional resources were consulted. The State of Nevada has approximately 30 gold mines that are currently active and permitted by the Nevada Division of Environmental Protection (NDEP). The NDEP Bureau of Air Pollution Control (BAPC) has published a document entitled *Guidance on Emission Factors for the Mining Industry* dated May of 2017. This guidance document provides a compilation of various particulate matter emission factors for common processes in the mining industry. In Table 2.3 of the document, primary crushing and associated transfers in or out use an emission factor from Section 11.19.2 for tertiary crushing. In the Notes/Comments it states that the BAPC has determined that the use of AP-42 Chapter 11.19.2-2 is appropriate for the gold mining industry given the very low fraction of gold contained in the rock and the tertiary crushing emission factor is utilized as a conservative estimate because there is no primary crushing emission factor.

PRI estimated emissions based on metal concentration profiles from approximately 55,000 onsite core samples of ore taken primarily from the more mineralized zones of the SGP pits (i.e., in and around gold ore deposits).[1] The median metal concentration of gold is 0.1 ppm which is a very small fraction of metal contained in the ore.

[1] "Geochemistry Statistics" email R. McCluskey to E. Memon, Stibnite Gold Project, Air Sciences, September 26, 2017. (ref. PRI 2017c; 2020AAG205)

Below is a list of permitted gold mines in both Region 10 and Nevada with throughputs and permitted status. Of the 33 mines found that use some sort of control on the crushing system, 4 are PSD major and all major facilities have either a power plant or ore roasting at the facility. Stibnite would be the only facility to be a potentially major source without either of those sources if emission factors from 11.24 were used in the analysis. Using the emission factor from 11.24 would make 7 more minor sources potentially major sources that are smaller than Stibnite.

The below figure shows the AP-42 section used for determining the PM_{10} and PM emissions from each gold mine. The majority of the gold mines used AP-42 Section 11.19.2 (19 of 23). Only 4 gold mines used AP-42 Section 11.24, and in each case, the gold mines had very low primary crushing rates. At these low rates, the use of either AP-42 section characterizes the sources as minor. Note that no AP-42 section is required for baghouse and wet scrubber controlled crushers as these are based on performance data.

Source Designations (NSR Minor or NSR Major) and AP-42 Emission Factors

A comparitive analysis of AP-42 Sections 11.19.2 and 11.24 for emission units OC1 through OC13 is provided below. This analysis compares the key emission parameters of equipment, controls, material, and emission type of the SGP emission units to the emission units in the test programs for the two AP-42 sections.

Analysis of AP-42 Section 11.19.2 vs. 11.24		AP-42 Section 11.19.2		AP-42 Section 11.24		Determination
Source Parameter	SGP	11.19.2 Represetative	11.19.2 Test Program Source Parameter	11.24 Represetative	11.24 Test Program Source Parameter	Emission Factor Detemination
Equipment	Primary Crusher (OC7) and Pebble Crusher (OC12), No Screens	Yes	Tertiary crushing (controlled)	No	Primary crushing operations as a whole: a hopper or ore dump, screen(s), crusher, surge bin, apron feeder, and conveyor belt transfer points	11.19.2, Tertiary Crushing (controlled), is representative. Use of this factor is conservative for primary and secondary crushers 11.24 is determined unrepresentative and does not provide factors for individual units and includes screens
Controls	Water sprays	Yes	Water sprays	No	Baghouse or wet scrubber (measured at inlet)	
Material	Primarily granite, quartzite, and marble, with lesser amounts of quartz, calcareous marl, and slate, containing microscopic gold (0.1 ppm median)	Yes	Limestone, granite, dolomite, traprock, sandstone, quartz, and quartzite. Minor types include calcareous marl, marble, shell, and slate	Yes	Hard (copper, gold, iron, and molybdenum ores) and soft (uranium, bauxite, and titanium/zirconium ores) ores	
Emission Type	Fugitive	Yes	Fugutive	No	Captured, non-fugitive (Method 5 testing conducted at the inlet of the baghouse or wet scrubber)	
If more than one emission factor is representative, then consider the date and rating for each factor						
Published Date		-	8/2004	-	8/1982 (Reformatted 1/1995)	Rating not applicable, only 11.19.2 is representative
Rating			C/E		C/D	

Source Parameter	SGP	11.19.2 Represetative	11.19.2 Test Program Source Parameter	11.24 Represetative	11.24 Test Program Source Parameter	Emission Factor Detemination
Equipment	Conveyor and other transfers (OC1-6, OC8-11, OC13)	Yes	Conveyor transfer point (controlled)	No	Material handling and transfer--all minerals except bauxite The material handling and transfer factors do not apply to small hoppers, surge bins, or transfer points that are integral with crushing, drying, or grinding operations.	11.19.2, Conveyor transfer point (controlled), is representative and provides factors for individual transfers 11.24 is determined unrepresentative, and combined with the 11.24 primary crushing operations emission factors, it would double count emissions
Controls	Water sprays and Moisture carry over, and enclosures for some transfers	Yes	Water sprays and Moisture carry over	No	Baghouse or wet scrubber (measured at inlet)	
Material	Primarily granite, quartzite, and marble, with lesser amounts of quartz, calcareous marl, and slate, containing microscopic gold (0.1 ppm median)	Yes	Limestone, granite, dolomite, traprock, sandstone, quartz, and quartzite. Minor types include calcareous marl, marble, shell, and slate	Yes	Hard (copper, gold, iron, and molybdenum ores) and soft (uranium, bauxite, and titanium/zirconium ores) ores	
Emission Type	Fugitive	Yes	Fugutive	No	Captured, non-fugitive (Method 5 testing conducted at the inlet of the baghouse or wet scrubber)	
If more than one emission factor is representative, then consider the date and rating for each factor						
Published Date		-	8/2004	-	8/1982 (Reformatted 1/1995)	Rating not applicable, only 11.19.2 is representative
Rating			D/E		C	

AP-42 Section 11.19.2 more closely reflects the equipment, controls, material, and emission type of the SGP emission units.

Equipment and Controls

AP-42 Section 11.19.2 provides emission factors for crushers and conveyors, both controlled with water sprays or uncontrolled, which reflect the SGP emission units. In contrast, AP-42 Section 11.24 does not provide emission factors that are similar or representative of SGP equipment and controls. The emission factors in AP-42 Sections 11.24 "are for the process as a whole" which includes screens not utilized by the SGP. Individual emission factors for OC1 through OC13 were necessary for NAAQS compliance modeling because the emission units are spread out over a large area, and each has unique dispersion characteristics. The single "whole process" emission factor in AP-42 Section 11.24 cannot be split between the individual SGP emission units for modeling.

Section 11.24 states that emission factors are provided in Tables 11.24-1 and 11.24-2 for two types of dry grinding operations: those that involve air conveying and/or air classification of material and those that involve screening of material without air conveying. Grinding operations that involve air conveying and air classification usually require dry cyclones for efficient product recovery. The factors in Tables 11.24-1 and 11.24-2 are for emissions after product recovery cyclones. The facility does not have the conditions specified for using the emission factors in Section 11.24.

Material

AP-42 Section 11.19.2 describes the major material types as "limestone, granite, dolomite, traprock, sandstone, quartz, and quartzite" and minor material as "calcareous marl, marble, shell, and slate". The SGP gold deposits are primarily granite, quartzite, and marble, with smaller amounts of calcareous marl, and slate.

At gold mines, microscopic gold is disseminated throughout all the rock types within the pits. The difference between ore (which EPA characterizes as metallic mineral) and development rock (nonmetallic mineral) is simply the value of the microscopic gold contained within the rock. The SGP gold ore concentration is approximately 0.1 ppm. It would be unreasonable, inaccurate, and arbitrary to choose emission factors from AP-42 based simply on the title of the AP-42 section and ignoring other key emission parameters.

Emission Type

The AP-42 Section 11.19.2 test program was specfically designed to accurately measure fugitive emissions "a quasi-stack system" from individual units. This measurement approach reflects the fugitive emissions from the SGP emission units. In contrast, the emission factors in AP-42 Section 11.24 were derived from whole processes ducted and controlled by wet scrubbers or baghouses (non-fugitive emissions). Measurements were taken at the inlet of the control equipment to develop the uncontrolled emission factors published in AP-42 11.24. Because the emissions from these sources are non-fugitive, EPA test Method 5 was used to measure the non-fugitive emissions in the inlet ducting.

EPA contends that applying AP-42 Section 11.24 for the primary and secondary crushing circuit results in over 800 tons per year of PM emissions, and over 90 tons per year from OC7 (the primary crusher). Although EPA did not provide their calculations, it was determined that EPA used AP-42 Section 11.24 emission factors for high moisture ore primary crushing, secondary crushing, and material handling. EPA's application of these factors is incorrect resulting in a significant overestimation of alleged emissions.

Per AP-42 Section 11.24: The emission factors in Tables 11.24-1 and 11.24-2 are for the process operations as a whole. At most metallic mineral processing plants, each process operation requires several types of equipment. A single crushing operation likely includes a hopper or ore dump, screen(s), crusher, surge bin, apron feeder, and conveyor belt transfer points. Emissions from these various pieces of equipment are often ducted to a single control device. The emission factors provided in Tables 11.24-1 and 11.24-2 for primary, secondary, and tertiary crushing operations are for process units that are typical arrangements of the above equipment.

For example, the single primary crushing emission factor estimates emissions from the crusher, screens, and all transfers. EPA applied AP-42 Section 11.24 factors to each piece of equipment resulting in double counting of emissions and also did not backout the emissions predicted by the factor for screens which do not exist at SGP at the primary and secondary crushing circuit. Screens are the largest source of emissions.

Applying AP-42 Section 11.24 emission factors to the equipment at SGP is not representative. If IDEQ tries to apply Section 11.24 emission factors to the process and then uses Section 11.19 for screening emission factors to backout the emissions for screens, total emissions are well below PSD thresholds but not representative of the process at SGP.

Review of Background documents for AP-42 Section 11.24

EPA does not identify a "Background Document" for Section 11.24 on the webpage for AP-42 Chapter 11: Mineral Products Industry, whereas a Background Document is provided for Sections 11.17 Lime Manufacturing, and 11.19.2 Crushed Stone Processing and Pulverized Mineral Processing. EPA's Comment 1 references a document *Metallic Mineral Processing Plants – Background Information for Proposed Standards Volume 2 Appendices* (EPA-450/3-81.009b). IDEQ obtained a copy of this document, dated August 1982, which was prepared to support development of a New Source Performance Standard for the Metallic Mineral Processing Industry. This document may be the final version of reference 9 listed in AP-42 Section 11.24. Reference 9 is *Metallic Mineral Processing Plants –*

Background Information for Proposed Standards (Draft). EPA Contract No. 68-02-3063, TRW, Research Triangle Park, NC, 1981.

Documents EPA-450/3-81.009a, and EPA-450/3-81.009b were reviewed. As discussed in document (a), page 3-2, "As shown in Table 3-1, most metallic ores are composed primarily of nonmetallic constituents. The metals and metallic compounds of economic interest are usually less than 10% of the total mined product….Thus the particulate emissions from most metallic mineral processes are composed primarily of nonmetallic constituents".

Document (a), page 3-49, Section 3.2.13, Emission Factors for Related Industries, states, "Engineering estimates of uncontrolled emissions for crushed stone or rock handling facilities have been made (EPA, 1979). These factors, included in Table 3-14, are suggestive of the range of emissions that might be expected from the metallic minerals processing industries that employ similar processes." The uncontrolled Primary crushing emisson factor in Table 3-14 is 0.5 lb PM/ton material entering the primary crusher, which is the same factor currently in AP-42, Table 11.24-2 that EPA Region 10 proposes should be used by PRI.

Table 3-14. PARTICULATE EMISSION FACTORS FOR ROCK-HANDLING PROCESSES[a]

Type of process	Uncontrolled total[b] lb/ton	Uncontrolled total[b] kg/Mg	Settled out in plant, %	Suspended emission lb/ton	Suspended emission kg/Mg
Dry crushing operations					
Primary crushing	0.5	0.25	80	0.1	0.05
Secondary crushing and screening	1.5	0.75	60	0.6	0.3
Tertiary crushing and screening (if used)	6	3	40	3.6	1.8
Recrushing and screening	5	2.5	50	2.5	1.25
Fines mill	6	3	25	4.5	2.25
Miscellaneous operations					
Screening, conveying, and handling	2	1			
Storage pile losses					

[a] U.S. EPA, 1979.

[b] All values are based on raw material entering primary crusher, except those for recrushing and screening, which are based on throughput for that operation.

Document (a), page 4-3, states, "In order to broaden the range of conditions considered for the performance of the control equipment, test data for non-metallic mineral processing facilities are also included in the data base discussed in this chapter." "Data from the non-metallic mineral industries may be appropriately transferred to the metallic mineral industries for several reasons. As noted in Chapter 3, much of the process equipment of interest in this document is similar in the metallic and non-metallic processing industries. Because the ores from which metallic elements are extracted are primarily non-metallic in character, the emissions from metallic mineral processing operations are primarily non-metallic mineral constituents. Furthermore, the similarity of emissions from metallic and non-metallic processes in

key parameters such as particle size distribution and mass loading provide additional evidence of similarity between the two industries. These measurements were routinely made during the testing of both metallic and non-metallic processing facilities and form the basis for extrapolating control efficiency from one industry, whether metallic or non-metallic, to another."

Document (a), page 4-78, Section 4.10, Conclusions from Test and Modelling Data states, "Several conclusions are justified after a review of the test data in this chapter. A comparison of particle size ranges for the metallic and non-metallic facilities indicates similar distributions."

Document (b), Appendix C, Summary of Test Data – indicates that Emissions data included in Appendix C were gathered from 17 mineral processing plants. Of the 17, nine process metallic minerals and eight process non-metallic minerals. The test summary tables indicate Method 5 particulate sampling was conducted at the inlet and outlet of scrubber and baghouse control equipment. Fugitive emissions were evaluated for opacity using Method 9.

Review of Background documents for AP-42 Section 11.19.2

The background document for Section 11.19.2, available on EPA's AP-42 web page, is dated May 12, 2003, and presents the background information that was used to develop the revised AP-42, Section 11.19.2 on crushed stone processing and pulverized mineral processing. As noted in the document introduction, emission data from nine emission tests conducted at stone (granite and limestone) processing plants were used to develop emission factors for various, crushing, screening, and conveying operations. For several tests, the uncontrolled emission data from crushers, screens and conveyor transfer points was measured by using EPA reference test methods on the exhaust of a track-mounted hood system that was used to capture fugitive emissions, which is described as a "quasi-stack system". The date of the emission tests is not directly provided in the background document, though the references in background document indicate that many of the tests were conducted between 1992 and 2001.

Section III. Results of Data Analysis, states, "Emission factors were developed for conveyer transfer points, screening, tertiary crushing, fines crushing, and fines screening operations. The only data available for secondary crushing were of questionable quality and were not consistent with the emission tests included in this review. Therefore, the revised AP-42 section does not include emission factors for primary and secondary crushing of stone. However, the emission factors for tertiary stone crushing can be used as an upper limit to primary and secondary crushing."

Page 19 states that, "All of the PM emission factors have been rated as E due to the limited test data and the need to estimate emission factors using extrapolations of the $PM_{2.5}$ and PM_{10} data. The $PM_{2.5}$ emission factors for tertiary crushing screening, conveyor transfer, and fines crushing (all controlled using wet suppression) were assigned an E rating because data from a single A-rated test were used for each source."

After a thorough review of the various AP-42 sections, background document, and administrative record, the AP-42 emission factors that match the PRI ore crushing process equipment and controls was selected. The emission factors selected and resulting minor source designation are entirely consistent with other gold mining permits issued in Region 10 and Nevada.

EPA Comment 1b. Underestimation of Emissions from Lime Plant Emission Units

EPA previously commented that IDEQ's emission estimates for the lime production emission units are not technically accurate because they do not appear to be based on emission factors that are representative of the emission sources. For example, EPA commented that AP-42 Section 11.17 Lime Manufacturing

emission factors applies to the processing of lime derived from marble. However, IDEQ used AP-42 emissions factors from Section 11.19.2 Crushed Stone Processing. In addition, the limestone excavating emission estimates (Material Load & Unload) appear to use emission factors from Section 11.19.2 Crushed Stone Processing instead of Section 11.9 Western Surface Coal Mining emission factors that are representative and specific to mining excavation activities. The permitting record does not explain why emission factors from AP-42 Section 11.19.2 were selected over those from Sections 11.17 and 11.9. If IDEQ does not have a good technical reason for their selection of emission factors, the most conservative emission factor should be used for emission units.[23]

IDEQ responded to EPA and other commenters that: "As described previously in the Representativeness and Uncertainty of Emissions section, although some degree of uncertainty is present in all emission factors used in estimating emissions, all emission factors were adequately supported and the approach of estimating potential to emit (PTE) at design capacity was considered a conservative approach. Emission factors with control efficiencies built into them were adequately supported by that corresponding control device listed in the permit. Representative emission factors from EPA's AP-42 Section 11.17, 11.19.2 and 11.9 were used to estimate emissions from the lime plant, lime plant support equipment, and marble overburden mining, respectively. The facility's emission inventory includes crushers, screens, and conveyors controlled by water sprays. EPA's AP-42 11.19.2 (08/2004) provides representative emission factors for these specific processes and controls."[24]

Consistent with the evaluation in Section 1.a., above, IDEQ failed to apply appropriate emission factors to the lime plant emission units, did not follow IDEQ guidance specific to emission factor use in permits and failed to create an enforceable restriction on the lime plant's potential to emit below major source thresholds (e.g., 100 tons PM per year).

IDEQ's selection of emissions factors for the lime plant and basis therefore suffer from the same deficiencies as the ore processing units evaluated in Section 1.a., above. IDEQ relied upon sections of AP-42 that are not specific to the process units being permitted. For instance, IDEQ relied upon non-metallic mineral processing emission estimates in EPA's AP-42 Section 11.19 instead of evaluating EPA's emission factors for lime manufacturing, Section 11.17. A single example of how important it is to accurately estimate emissions is illustrated by a process unit in the Lime Plant, LS3/LS4 (primary Screen/Secondary Crusher). If the emission factor for secondary crushers (0.62 lb/ton) in Section 11.17 is applied to those production units, potential emissions would exceed 100 tons PM per year from those units alone. The same result applies to emission unit LS5 (secondary screen), resulting in an additional 128 tons PM per year. These two simple examples highlight the importance of accurately estimating future emissions from the proposed SGP.

Based on the above and corresponding issues highlighted in Section 1.a., IDEQ did not follow IDEQ Guidance, did not support the use of the chosen emission factor and was arbitrary when choosing emission factors for the lime processing emission units, and did not restrict the lime plant's PTE below major source thresholds.

IDEQ Response

EPA contends that emission factors from AP-42 Section 11.19.2 are not accurate for lime production emission units and that IDEQ should have selected emission factors from AP-42 Section 11.17. PRI used emission factors from Section 11.17 for the lime kiln, lime silo loading, and lime silo discharge. PRI used emission factors from Section 11.19.2 for the crushers, screens, and conveyors used in the lime production process.

IDEQ seeks to apply emission factors that actually reflect the permit applicant's plans and processes. In comparing Sections 11.19.2 and 11.17, IDEQ found that applying 11.19.2 would be most applicable to

the PRI proposal for the limestone crushing process and applying 11.17 would be most applicable for the lime kiln, lime silo loading, and lime silo discharge. A thorough review of the background materials, underlying AP-42 emission factors, along with the administrative record, demonstrates that EPA's concern is unsupportable and lacks a rational basis.

AP-42 emission factors for Section 11.17 are from 1998 with primary crushing ratings listed as E (with E being the lowest rating). Section 11.17 also only lists emission factors for PM with no emission factors listed for PM_{10} or $PM_{2.5}$. Additionally, there are no emission factors listed for secondary or tertiary crushing.

Table 11.17-3 (Metric Units). EMISSION FACTORS FOR LIME MANUFACTURING RAW MATERIAL AND PRODUCT PROCESSING AND HANDLING[a]

Source	Filterable[b]			
	PM	EMISSION FACTOR RATING	PM-10	EMISSION FACTOR RATING
Primary crusher[c] (SCC 3-05-016-01)	0.0083	E	ND	
Scalping screen and hammermill (secondary crusher)[c] (SCC 3-05-016-02)	0.31	E	ND	
Primary crusher with fabric filter[d] (SCC 3-05-016-01)	0.00021	D	ND	
Primary screen with fabric filter[e] (SCC 3-05-016-16)	0.0030	D	ND	
Crushed material conveyor transfer with fabric filter[f] (SCC 3-05-016-24)	4.4×10^{-5}	D	ND	
Secondary and tertiary screen with fabric filter[g] (SCC 3-05-016-25)	6.5×10^{-5}	D	ND	
Product transfer and conveying (SCC 3-05-016-15)[h]	1.1	E	ND	
Product loading, enclosed truck (SCC 3-05-016-26)[h]	0.31	D	ND	
Product loading, open truck (SCC 3-05-016-27)[h]	0.75	D	ND	

In the process description for Section 11.19.2, crushed stone processing includes major processing for rock types such as limestone, granite, dolomite, traprock (basalt), sandstone, quartz, and quartzite.

A thorough review of the various AP-42 sections was conducted and the AP-42 emission factors that match the PRI lime plant equipment was selected. The emission factors selected and resulting minor source designation are entirely consistent with other lime plants issued in Utah and Nevada.

A search was conducted for permitted lime plants in surrounding states. The Nevada Division of Environmental Protection (NDEP) Bureau of Air Pollution Control (BAPC) has permitted Graymont Western US Pilot Peak Plant, a lime manufacturing facility. The facility uses emission factors from AP-42 Section 11.19.2 for most transfers and conveyors that are uncontrolled at the facility but uses the guidance default grain loading emission factors for crushers and screens with baghouse control. No emission factors from AP-42 Section 11.17 were found to be used in the application.

Utah Department of Environmental Quality has permitted Graymont Western US Incorporated – Cricket Mountain Plant, a lime processing plant. This facility also uses emission factors from AP-42 Section 11.19.2 for most transfers and conveyors that are uncontrolled at the facility.

A comparitive analysis of AP-42 Sections 11.19.2 and 11.17 for emission units LS1 through LS12, LSBM, and LCR is provided below. A comparitive analysis of AP-42 Sections 11.19.2 and 11.9 is also provided. This analysis compares the key emission parameters of equipment, controls, material, and

emission type of the PRI emission units to the emission units in the test programs for the two AP-42 sections.

Analysis of AP-42 Section 11.19.2 vs. 11.17		AP-42 Section 11.19.2		AP-42 Section 11.17		Determination
Source Parameter	**SGP**	**11.19.2 Representative**	**11.19.2 Test Program Source Parameter**	**11.17 Representative**	**11.17 Test Program Source Parameter**	**Emission Factor Determination**
Equipment	**Primary Crusher (LS2) and Secondary Crusher (LS4)**	Yes	Tertiary crushing (uncontrolled)	Yes	Primary crusher	11.19.2, tertiary crushing (uncontrolled), is representative. The use of this factor is conservative for primary and secondary crushers.
Controls	Uncontrolled	Yes	Uncontrolled	No	Fabric filter (inlet)	11.17 is determined unrepresentative.
Material	Limestone	Yes	Limestone and other rock types	Yes	Limestone	11.17 recommends the use of 11.19: "Section 11.19, Construction Aggregate Processing, also includes stone processing emission factors that are based on more recent testing, and, therefore, may be more representative of emissions from stone crushing, grinding, and screening." (EPA 1998.02, p. 11.17-4)
Emission Type	Fugitive	Yes	Fugitive	No	Captured non-fugitive (Method 5 testing conducted at the inlet of the fabric filter)	
If more than one emission factor is representative, then consider the date and rating for each factor

Rating		E		E		

The use of AP-42 Section 11.19.2 for the PRI limestone processing units (LS1 through LS12) conforms with the guidance provided in both AP-42 sections. AP-42 Section 11.17 specifically recommends the use of Section 11.19.2 for stone crushing, grinding, and screening over Section 11.17: “Section 11.19, Construction Aggregate Processing, also includes stone processing emission factors [11.19.2 Crushed Stone Processing] that are based on more recent testing, and therefore, may be more representative of emissions from stone crushing, grinding, and screening.”

AP-42 Section 11.19.2 was also used for lime product crushing unit (LCR). Use of 11.19.2 factors for the LCR unit is highly conservate compared to Section 11.17 factors.

The use of AP-42 Section 11.19.2 for limestone excavation, specifically haul truck loading and unloading, conforms with the guidance provided in both Sections 11.19.2 and 11.9. The loading and unloading emission factors in AP-42 Section 11.9, Table 11.9-4 were developed for a specific geographical area, and use of these factors is not recommended for other locations unless they have very similar characteristics. These factors were developed from source testing at Mine V in northeast Wyoming, with a surface soil type described as: “Loamy, sandy, clayey, and clay loamy”. This is not similar to the limestone excavated at the SGP for the lime plant.

Review of Background documents for AP-42 Section 11.17

The background document provided on the AP-42 web page for Emission Factor Documentation for Lime Manufacturing is dated April 28, 1994. The document notes, on page 15, that the emission factor quality rating system is somewhat subjective and depends to an extent on the individual reviewer. Table 4.1, Summary of Emission Test Reports used to Develop Emission Factors, identifies one test (reference 2) for “Primary crusher, screens, hammermill, and final sizing screens” conducted in 1974 at J.M. Brenner Company in Lancaster, PA. Of the approximately 30 tests listed in the table, that is the only test that identifies a crusher and screens as being the source tested. The vast majority of the tests were on lime plant rotary kiln emissions. One report (reference 50) also identifies the source as “six raw material processing sources”, conducted in 1993 at Chemstar Lime in Bancroft, Idaho. The document includes analysis of Reference 2, on page 33. The analysis includes, in part, “The sources tested include a primary crusher, final sizing screens, and combination of scalping screens and a hammermill. The tests were

conducted in 1974 and were sponsored by EPA as part of the information gathering effort for an NSPS for stone crushing. Emissions from the primary crusher, scalping screens, and hammermill are controlled with a common fabric filter. Emissions from the final sizing screens are controlled with a separate fabric filter." "Method 5 (front and back halves) was used to measure PM emissions. Although back half PM catches are reported in the results, these processes operate at ambient temperature and should not emit condensable PM. Therefore, it is assumed that the back half catches are the result of an anomaly in the sampling and analytical procedures used. The test report does not include adequate information to determine the origin of this apparent anomaly. Three runs were conducted on the outlets of the two fabric filters, but only two inlet runs were conducted." "Emission factors were developed for filterable PM emissions from all of the sources tested."

"The emission factors for uncontrolled emissions from the primary crusher are rated C because only two test runs were conducted, and the emission factors for uncontrolled emissions from the scalping screens/hammermill are rated D because only two runs were conducted and the filterable PM data varied by more than three orders of magnitude."

Regarding test Reference 50, "This report documents measurements of emissions of filterable PM from six raw material processing sources…" The raw material processing sources tested included: primary crushing, including the scalping screen, scalping screen discharges, primary crusher discharges: primary screening including the screen feed, screen discharge, and surge bin discharge; two conveyor transfer points on the conveyor from the primary crusher to the primary stockpile; secondary and tertiary screening, including the conveyor transfer point for the primary stockpile underflow to the secondary screen, and tertiary screening. "Fabric filters are used to control emissions from each of the sources tested, and only controlled emissions were tested."

The emission factor provided in Table 4-5 for Primary Crushing (uncontrolled) for the Reference 2 test is 0.017 lb/ton of filterable PM. This is the same emission factor provided in AP-42 Table 11.17-4 for Lime Manufacturing primary crusher emissions. Therefore, it appears the current AP-42 emission factor for uncontrolled lime plant primary crusher PM emissions is based on one test (consisting of two runs) conducted in 1974 on the inlet side of a baghouse.

After a thorough review of the various AP-42 sections, background documents, and administrative record, the AP-42 emission factors that match the PRI lime production equipment and controls were selected. The emission factors selected and resulting minor source designation are entirely consistent with other lime plants in EPA Region 9.

EPA Comment 1c. Lack of Emission Limits

IDEQ's permit imposes only production limits for the ore processing units while relying on the unrepresentative emission factors that significantly underestimate emissions. While use of production limits alone to limit PTE may be acceptable in certain circumstances, such as when the limits are derived from conservative emission factors, this is not the case here.

In addition to inadequate production limits derived from unrepresentative emission factors, the Final Permit lacks emissions limits for several emission units, including the ore crushers, screens, and conveyors. This further undermines the enforceability of the synthetic minor limits. EPA advised IDEQ of this problem in its March 19, 2021, letter (Comments 1-4). Despite these comments, the Final Permit does not contain either source-wide emission limits applicable to all emission units or unit-specific limits on the mining and ore processing emission units.[25] As a result, enforcement of the synthetic minor limits is constrained to the inaccurate production limits with no corresponding limitation on the emissions from those units. As discussed above, IDEQ used emission factors that significantly underestimate the emissions from the ore processing units as well as the lime plant units. Based on the analysis above,

IDEQ's permit does not restrict the SGP's PM PTE to below PSD or Title V major source thresholds as a legal and practical matter.

IDEQ Response

IDEQ believes that the appropriate emission factors were used in representing PRI's emissions and that emissions were not underestimated. Likewise, the production limits and emission limits established in the permit were appropriate to limit the facility's PTE to below major source thresholds.

EPA contends that the permit lacks emission limits for several emission units including the ore crushers, screens, and conveyors. Permit condition 3.7 is the primary crusher limit in the Mining and Ore Processing section of the permit. The primary crushing process is limited to 25,000 tons per day. Permit condition 3.8 limits the pebble crusher to 27,600 tons per day. As shown below in the screen capture from the emissions inventory spreadsheet, subsequent equipment from both crushers do not need an individual limit because no new ore is introduced at these points and the same throughput is conservatively used to estimate emissions from the crushers and conveyors. The annual PTE, as shown in the statement of basis, is calculated using the daily throughput limit, emission factor, and 8,760 hours per year.

SOURCE DESCRIPTION		OPERATING LIMITS					
Model	Source Description	Design Throughput					
ID		unit/hr	unit/day	unit/yr	units	Material	hr/yr
OC1	Loader Transfer of Ore to Grizzly	1,042	25,000	9,125,000	ton	Ore	8,760
OC2	Grizzly to Apron Feeder	1,042	25,000	9,125,000	ton	Ore	8,760
OC3	Apron Feeder to Dribble Conveyor	1,042	25,000	9,125,000	ton	Ore	8,760
OC4	Apron Feeder to Vibrating Grizzly	1,042	25,000	9,125,000	ton	Ore	8,760
OC5	Dribble Conveyor to Vibrating Grizzly	1,042	25,000	9,125,000	ton	Ore	8,760
OC6	Vibrating Grizzly to Primary Crusher or Coarse Ore Stockpile Feed Conveyor	1,042	25,000	9,125,000	ton	Ore	8,760
OC7	Primary Crusher and Associated Transfers out to Coarse Ore Stockpile Feed Conveyor	1,042	25,000	9,125,000	ton	Ore	8,760
OC8	Coarse Ore Stockpile Feed Conveyor Transfer to Stockpile	1,042	25,000	9,125,000	ton	Ore	8,760
OC9	Stockpile Transfers to Reclaim Conveyors	1,150	27,600	10,074,000	ton	Ore	8,760
OC10	Reclaim Conveyors to SAG Mill Feed Conveyor	1,150	27,600	10,074,000	ton	Ore	8,760
OC11	SAG Mill Feed Conveyor Transfer to SAG Mill	1,150	27,600	10,074,000	ton	Ore	8,760
OC12	Pebble Crusher and Associated Transfers in (from SAG Mill) and out (to Pebble Discharge Conveyor)	1,150	27,600	10,074,000	ton	Ore	8,760
OC13	Pebble Discharge Conveyor to SAG Mill Feed Conveyor	1,150	27,600	10,074,000	ton	Ore	8,760

The same is true for the limestone crushing process. The primary crushing process is limited to 1,130 tons per day. No new limestone is introduced in the process at subsequent points and the same throughput is conservatively used to estimate emissions from secondary crushing and conveyors. It should be noted that hourly emission limits exist in the permit for the lime, aggregate, and concrete production plants.

The potential to emit (PTE) for all emission units at the site is calculated using continuous throughput and the design throughput for the equipment with a few exceptions as noted below.

Emission unit ACB, the POX boiler, is limited to autoclave start-up operation only (Permit condition 4.7) and PTE is calculated at 30 hours per year. POX boiler operation monitoring is required in Permit condition 4.20. Emission units MR and MF, the mercury retort and induction melting furnace, use a batch

process and the PTE is calculated for 21 batches per year. The mercury retort and induction melting furnace are limited to 1,000 pounds per batch and 21 tons per year in Permit conditions 4.9 and 4.10. Monitoring and recordkeeping is described in Permit conditions 4.22 and 4.23.

The PTE for the emergency generators and fire pump are calculated at 100 hours per year. Permit condition 6.3 limits these units to 100 hours per year for non-emergency purposes.

The mine site gasoline and diesel tanks (TG1, TG2, TD4 – TD10) PTE is calculated using design throughput and EPA Tanks 4.0.9d.

After a thorough review of the various AP-42 emission factors and the production limits and emission limits established in the permit, it is determined that the production and emission limits established in the permit are appropriate to limit the facility's PTE to below major source thresholds.

EPA Comment 1d. Lack of Sufficient Monitoring, Recordkeeping and Reporting

EPA previously commented that the Draft Permit lacked sufficient monitoring, recordkeeping and reporting (MRR) to ensure the production and emission limits are enforceable as a practical matter.[26] EPA commented that the Final Permit did not include core monitoring, recordkeeping, and reporting (MRR) requirements directly, but rather allowed the permittee to develop these MRR requirements post permit issuance in an Operations and Maintenance Manual (O&M Manual). EPA, as well as many other commenters, raised procedural and substantive concerns with IDEQ's approach to incorporating MRR requirements into the permit. Procedurally, EPA commented that the O&M Manual ought to be developed and available for public comment prior to permit issuance and that any changes to the O&M Manual ought to be reviewed and approved by IDEQ prior to the change. Substantively, EPA commented that the permit condition specifying the minimum requirements for the O&M Manual lacked the necessary specificity to ensure the permit includes adequate MRR.

IDEQ's RTC included some responses to EPA's comments. IDEQ revised PTC Condition 2.20 from draft to final to require that the O&M Manual be developed 30 days prior to startup of any process equipment. Condition 2.20 also states: "The requirements in the O&M Manual shall be incorporated by reference to this permit and shall be enforceable permit conditions." In addition, PTC Condition 2.21 requires: "The O&M manual shall be submitted for approval to DEQ 30 days prior to startup of any ore processing, ore concentration and refining, lime production, or aggregate production emission source regulated by this permit (as identified in Table 1.1) at the address provided (Permit Condition 2.26), and shall remain onsite at all times. Any changes to the O&M manual shall be submitted to DEQ for review, comment, and approval 30 days prior to the change."[27]

These conditions in the Final PTC and Idaho's RTC do not fully address EPA's concerns regarding the development and approval of the O&M Manual. IDEQ did not require the applicant to develop and submit the O&M Manual as part of its application. Accordingly, the O&M Manual will not be subject to public review and comment, even though the Manual will establish enforceable conditions in the permit. In addition, Conditions 2.20 and 2.21 do not mandate IDEQ *approval* prior to startup or a change to the O&M Manual, only that the Permittee submit the O&M Manual to IDEQ for approval. Finally, Condition 2.20 specifies that the O&M Manual shall be incorporated by reference into the permit. However, this condition does not make clear whether only the approved O&M Manual is incorporated by reference or any version of the O&M Manual submitted by the permittee. Moreover, given that the O&M Manual establishes permit conditions that bear on emission and compliance, revisions to the O&M Manual constitute permit revisions that ought to be subject to public review and comment.[28]

Condition 2.20 contains the minimum content requirements for the O&M Manual. In response to commenters questioning the sufficiency of these minimum requirements, IDEQ reasserted that Condition

2.20 contains the minimum requirements for the O&M Manual and that Condition 2.20 requires the permittee to describe various methods, procedures, and schedules to monitor emission units and control equipment.[29] Neither the Final Permit nor IDEQ's RTC adequately address EPA's concerns.

At the outset, these minimum requirements are vague and may not compel specific, enforceable conditions in the ultimate O&M Manual. For many critical monitoring and operational requirements, Condition 2.20 merely requires the permittee to "describe" the procedures and/or schedule. In addition, the requirement to "Describe the schedule and procedures for routine inspection (Permit Condition 2.10), maintenance, repair, and replacement of control equipment" does not specify any particular method (e.g. EPA Test Methods 9, 22) for visual observation of opacity or fugitive emissions. Accordingly, this vague condition will not lead to sufficient MRR in the O&M Manual.

In addition to these overarching concerns with Condition 2.20, numerous permit conditions reference the O&M Manual to satisfy MRR requirements. However, as illustrated in Table 1, below, Condition 2.20 does not mandate specific MRR for all of these corresponding production or emission limits.[30]

In addition, the Permit does not require testing for the ore processing or lime production emission units to confirm the accuracy of emission factors. As discussed above, IDEQ used inaccurate emission factors to derive production limits for ore processing and lime production emission units. In its RTC, IDEQ acknowledges the uncertainty present in emission factors. However, IDEQ did not require initial or routine testing to confirm the accuracy of the emissions factors used to establish production and emission limits. Given the low quality of the emissions factors used, such testing is critical to ensuring the adequacy of the synthetic minor limits. However, the Final Permit does not require any testing.

Given the absence of sufficient MRR requirements for the corresponding production limits, emission limits, and control equipment requirements, many of the synthetic minor emission limits are not enforceable as a practical matter.

IDEQ Response

The permittee is required to develop an O&M manual per permit condition 2.20. The purpose of the O&M manual is to ensure that the permittee has a detailed manual for complying with the PTC conditions for all sources and control devices. The PTC conditions for monitoring, recordkeeping, and reporting makes PTE limitations enforceable as a practical matter. There are numerous recordkeeping and monitoring requirements and the minimum requirements are contained. Specific equipment operations are not known at this time because equipment hasn't been procured by the permittee. There has to be flexibility for brand of equipment, specific operating requirements, etc. according to the manufacturer recommendations. In addition, requiring a source test on ore processing and lime production emission units when they are fugitive in nature is not practical.

EPA Comment on Permit Conditions 2.20, 3.11-3.12 (From Table 1)

The MRR for drill rigs and rock crushing equipment is inadequate. The O&M manual contains no provisions regarding water sprays. While Condition 2.20 does require incorporation of certain manufacturer's guarantees, this requirement is specific to certain control devices: wet scrubber, vent gas cleaning tower, venturi scrubber, carbon filter, baghouse and bin vent filter cartridge control device.

IDEQ Response

The MRR for drill rigs, rock crushing equipment, water sprays, etc. is contained within the O&M manual. Permit condition 2.6 contains the requirements that water sprays must be used for control of fugitive dust. Permit condition 3.12 contains the requirement that the permittee shall install, operate, and maintain water

sprays in accordance with the O&M manual (Permit Condition 2.20) to control PM emissions from each ore processing crusher and conveyor. Water sprays shall operate according to the FDCP (Fugitive Dust Control Plan) when this equipment is operated to ensure compliance with Fugitive Dust requirements (Permit Conditions 2.1–2.6).

In addition, drill rig requirements are contained in Permit Condition 3.11 which states that the permittee shall install and operate dust collection systems with a minimum control efficiency of 90% on all drilling rigs in accordance with the O&M manual (Permit Condition 2.20). The dust collection systems shall be in operation at all times when the drilling rigs are operated.

EPA Comment on Permit Conditions 2.20, 3.16-3.20 (From Table 1)

This condition lacks specificity with respect to the scale used to determine the weights of materials, particularly daily ore loading conditions in 3.16-3.20. In order for these daily limits to be practically enforceable, the permit must contain monitoring, recordkeeping and reporting of total daily weights of ore. This necessitates use of an accurate scale. Condition 2.20 does not mandate the use of any particular scale, or that the permittee maintain the scale within a certain percent accuracy. Without these minimum conditions in Condition 2.20, IDEQ has limited grounds to disapprove an O&M Manual that allows for inappropriate or inaccurate scales. See the regulation at 40 CFR 63.11646(a)(8)-(10) for detailed requirements for the measuring and recording of weights.

Neither Condition 2.20 nor Conditions 3.16-3.20 contain required calculations for summing daily weights to demonstrate continuous compliance.

In its response to comments, IDEQ stated that the permittee will use a weighometer to measure weights.[31] While this may be true, no condition in the permit requires the use of a weighometer.

IDEQ Response

In Permit Condition 2.20, the requirements for the O&M manual, it specifically states to describe each monitoring device and methodology used to measure weight rates of materials to demonstrate compliance with each material throughput limit (Permit Conditions 3.5–3.9, 4.8–4.11, and 5.4–5.8). Procedures for proper installation, calibration, and maintenance shall be included. In Permit Condition 2.21, the O&M manual shall be submitted for approval to IDEQ 30 days prior to startup. Any changes to the O&M manual shall also be submitted for IDEQ review, comment, and approval 30 days prior to the change.

EPA Comment on Permit Conditions 2.20, 4.13-4.17 (From Table 1)

No conditions specify any specific methods for see-no-see inspections, e.g. Method 22 observations. Without referencing the method, the compliance determination is subjective and likely unenforceable.

IDEQ Response

Permit condition 2.10 requires a facility-wide inspection of potential sources of visible emissions. The inspection shall consist of a see/no see evaluation for each potential source of visible emissions. To perform a see/no see evaluation, no specific reference method is required. If any visible emissions are present from any point of emission the permittee is to take appropriate corrective action as expeditiously as possible and/or perform a Method 9 opacity test in accordance with IDAPA 58.01.01.625. Method 9 opacity test does require certification to perform this test.

EPA Comment on Permit Conditions 2.20, 4.8, 4.13, 4.21-4.23 (From Table 1)

Condition 2.20 does not contain MRR requirements specific to Venturi Scrubber (VS1), Vent Gas Cleaning Tower (ST1), or Vent Gas Steam Condensation Tower (CT1) used to control emissions from the Autoclave.

Condition 2.20 contains a requirement to describe the schedule for taking corrective action if visible emissions are present, but does not mandate any specific corrective actions.
NESHAP Subpart EEEEEE contains detailed MRR requirements at 40 CFR 63.11646(a)(8)-(10), including maintenance and calibration requirements. However, Condition 4.21 does not require maintenance or calibration in accordance with NESHAP Subpart EEEEEE, only installation in accordance with NESHAP Subpart EEEEEE.

IDEQ Response

Permit condition 4.13 contains the requirements to install, operate, and maintain venturi scrubber (VS1), vent gas cleaning tower (ST1), vent gas steam condensation tower (CT1), and carbon filter (CA5) systems in accordance with the O&M manual (Permit Condition 2.20) and consistent with manufacturer's recommendations.

As described in the previous response, Permit Condition 2.10 requires a facility-wide inspection of potential sources of visible emissions. The inspection shall consist of a see/no see evaluation for each potential source of visible emissions. If any visible emissions are present from any point of emission the permittee is to take appropriate corrective action as expeditiously as possible and/or perform a Method 9 opacity test in accordance with IDAPA 58.01.01.625.

The detailed MRR requirements contained in NESHAP Subpart EEEEEEE will be included in the required Title V operating permit that the facility will apply for within 12 months of operation. All of the requirements of Subpart EEEEEEE are incorporated into the permit by reference in Permit condition 2.22.

EPA Comment on Permit Conditions 2.20, 5.11-5.16 (From Table 1)

Condition 2.20 does not contain any specific minimum requirements for water sprays. Thus, the permit lacks sufficient MRR for these conditions.

IDEQ Response

As described previously, Permit condition 2.6 contains the requirements that water sprays must be used for control of fugitive dust. Permit condition 3.12 contains the requirement that the permittee shall install, operate, and maintain water sprays in accordance with the O&M manual (Permit Condition 2.20) to control PM emissions from each ore processing crusher and conveyor. Water sprays shall operate according to the FDCP when this equipment is operated to ensure compliance with Fugitive Dust requirements (Permit Conditions 2.1–2.6).

EPA Comment on Permit Condition 5.3 (From Table 1)

The permit does not contain any requirements to calculate emissions to demonstrate ongoing compliance with these emission limits. The permit does not contain any formulas, data reduction methods, or periodic calculation requirements to demonstrate continuous compliance with these emission limits.

IDEQ Response

The monitoring and recordkeeping requirements to demonstrate compliance with the emission limits listed in Permit Condition 5.3 are contained in Permit Conditions 5.17 through 5.26.

EPA Comment on Permit Conditions 5.17-5.26 (From Table 1)

Same evaluation as Conditions 3.16-3.20. (This condition lacks specificity with respect to the scale used to determine the weights of materials, particularly daily ore loading conditions in 3.16-3.20. In order for these daily limits to be practically enforceable, the permit must contain monitoring, recordkeeping and reporting of total daily weights of ore. This necessitates use of an accurate scale. Condition 2.20 does not mandate the use of any particular scale, or that the permittee maintain the scale within a certain percent accuracy. Without these minimum conditions in Condition 2.20, IDEQ has limited grounds to disapprove an O&M Manual that allows for inappropriate or inaccurate scales. See the regulation at 40 CFR 63.11646(a)(8)-(10) for detailed requirements for the measuring and recording of weights.

Neither Condition 2.20 nor Conditions 3.16-3.20 contain required calculations for summing daily weights to demonstrate continuous compliance.)
In its response to comments, IDEQ stated that the permittee will use a weighometer to measure weights. While this may be true, no condition in the permit requires the use of a weighometer.)

IDEQ Response

As stated in a previous response, in Permit Condition 2.20, the requirements for the O&M manual, it specifically states to describe each monitoring device and methodology used to measure weight rates of materials to demonstrate compliance with each material throughput limit (Permit Conditions 3.5–3.9, 4.8–4.11, and 5.4–5.8). Procedures for proper installation, calibration, and maintenance shall be included. In Permit condition 2.21, the O&M manual shall be submitted for approval to DEQ 30 days prior to startup. Any changes to the O&M manual shall also be submitted for DEQ review, comment, and approval 30 days prior to the change. As stated in Permit Condition 2.20, the requirements in the O&M manual are incorporated by reference into the permit and are enforceable.

Permit Conditions 5.17 through 5.22 all include the specific language that the devices and methodologies used to measure weights shall be identified in the O&M Manual.

EPA Comment on Testing Ore Processing and Lime Production

EPA's Evaluation: In addition, the Permit does not require testing for the ore processing or lime production emission units to confirm the accuracy of emission factors. As discussed above, IDEQ used inaccurate emission factors to derive production limits for ore processing and lime production emission units. In its RTC, IDEQ acknowledges the uncertainty present in emission factors. However, IDEQ did not require initial or routine testing to confirm the accuracy of the emission factors used to establish production and emission limits. Given the low quality of the emissions factors used, such testing is critical to ensuring the adequacy of the synthetic minor limits. However, the Final Permit does not require any testing.

Given the absence of sufficient MRR requirements for the corresponding production limits, emission limits, and control equipment requirements, many of the synthetic minor emission limits are not enforceable as a practical matter.

IDEQ Response

The emission factors used in the ore processing and lime production are from AP-42 Sections 11.19.2 and 11.17. These emission factors are for fugitive emissions that are either uncontrolled or incorporate water sprays. Requiring a source test on ore processing and lime production emission units when they are fugitive in nature is not practical or reasonable.

IDEQ contends the permit does require sufficient monitoring, recordkeeping and reporting (MRR) to ensure the production and emission limits are enforceable as a practical matter. The purpose of the O&M manual is to ensure that the permittee has a detailed manual for complying with the PTC conditions for all sources and control devices. The PTC conditions for monitoring, recordkeeping, and reporting makes PTE limitations enforceable as a practical matter. The O&M manual, along with other plans such as the Fugitive Dust Control Plan (FDCP), Haul Road Capping Plan (HRCP), and Access Management Plan (AMP), will be posted to IDEQ's website with the final permit and statement of basis when completed.

EPA Allegation 2. The SGP, as permitted, will cause or contribute to a violation of the PM10 NAAQS

EPA Comment 2a. Unsubstantiated estimates of fugitive dust control

EPA, as well as several other commenters, questioned the basis for IDEQ's determination that PRI could achieve a 93.3% control efficiency to control fugitive dust from haul roads at the SGP. Specifically, EPA commented that IDEQ did not provide a reasoned analysis demonstrating that the studies showing that 90% control efficiency is achievable using magnesium chloride reflect conditions at the SGP. EPA also commented that IDEQ did not include specific details necessary to support such a demonstration in the permitting record.[32]

In its RTC, IDEQ responded stating that 93.3% is an aggressive level of control and that PRI has committed to undertaking all measures to achieve this level of control. IDEQ further stated that, based on a review of test studies, the 93.3% level of control can be achieved using water and magnesium chloride dust suppressants (citing PRI's application). IDEQ explained that chemical and water dust suppressants are used in combination for the control of dust from haul roads, and that achieving the target combined control efficiency of 93.3% is ultimately important to ensure compliance with applicable standards. According to IDEQ, it is for this reason that the combined control efficiency was listed in the permit in lieu of separate chemical (90% control) and water (33.3%) dust suppressant control efficiencies.[33]

IDEQ's responses do not adequately address EPA's comments. IDEQ did not proffer further evidence that conditions at the SGP are comparable to areas where studies indicating a 90% control efficiency on fugitive dust is achievable. Even so, these studies do not support IDEQ's contention that a control efficiency of *93.3%* is achievable. Ultimately, IDEQ appears to have back-calculated the control efficiency necessary to demonstrate NAAQS compliance, rather than determine a control efficiency that is achievable in practice.[34]

IDEQ Response

The EPA allegation that IDEQ has back-calculated the control efficiency necessary to demonstrate NAAQS compliance is simply unfounded and presumptuous. As answered in the Response to Comments, IDEQ relied on chemical (90% control) and water (33.3%) dust suppressant control efficiencies.

The 90% chemical control efficiency is found to be both achievable and conservative based on EPA's AP-42 13.2.2 referenced test reports, which show that a chemical dust suppressant alone can achieve 90 to

99% control efficiency for PM_{10}. The control efficiency of 33% for watering was found to be both achievable and conservative based on EPA's AP-42 Section 13.2.2, which states 95% control for increasing the surface moisture by only 1%. The AP-42 section contains no discussions regarding potential parameters or other aspects of unpaved roads that must be quantified for the purpose of estimating the control efficiency from chemical suppressants.

An exhaustive review was conducted based on the best available information. The references listed in Appendix G, Table 10 from the EPA's own RBLC database were provided as additional supporting information of approved control technologies and control efficiencies. The references illustrate that a control efficiency of 90% is achievable by treating unpaved roads with chemical suppressant in various states.

A permit issued within EPA Region 10, The Alaska Donlin Gold Project highlighted above, specifically uses a 90% control efficiency for chemical suppressants with additional control for water (precipitation) in the emission factor equation for unpaved roads which similarly reflects a 93.3% control efficiency. In reviewing EPA's comments on the recently issued permit (7/1/2023), EPA did not submit a comment regarding the control efficiency of water and chemical suppression used for the project. EPA did comment that the annual precipitation correction factor is not appropriate for 24-hour PM_{10} assessments. Alaska DEC responded that "Donlin applied corrective factors in estimating their PM-10 impacts to account for the use of both chemical dust suppression and watering of unpaved roads. They indicate that a single corrective factor of 35-percent was observed to address surface watering by both naturally occurring precipitation and direct-mechanical application. The net reduction in estimated short- and long-term PM-10 impacts attributable to assumed chemical and wet suppression together is greater than 90-percent." In addition, Alaska responded with "A review of literature, however, suggests that watering may be assumed to ensure greater than 90-percent control efficiencies, with other conditions remaining the same. Assumed control efficiencies are likely to rise when taken in context along with the contemporaneous use of environmentally persistent chemical dust suppressants. It is worth noting that Table 13.2.2-2 of AP-42 Section 13.2.2 indicates nearly 95-percent of control from watering is realized with a surface moisture content of approximately 2.5-percent."

IDEQ seeks to apply a control efficiency that can actually be achieved, reflects the permit application, and can demonstrate compliance with the PM_{10} NAAQS. After a thorough review of the background materials, RBLC database, and AP-42 guidance, along with the administrative record, IDEQ contends that a 93.3% control efficiency along with a robust FDCP is achievable.

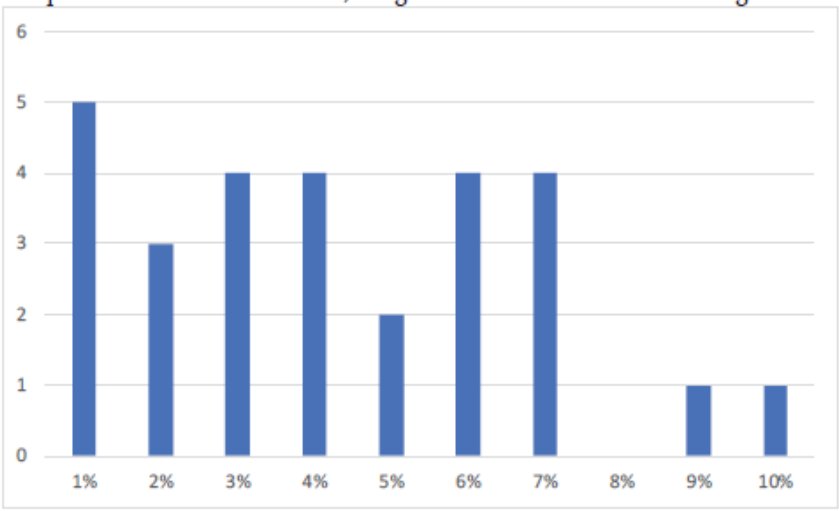
EPA Comment 2b. Underestimation of Fugitive Dust Emissions

With respect to demonstrating NAAQS compliance, EPA commented that IDEQ's use of a median silt content of 4.0% underestimates fugitive dust emissions from haul roads. EPA commented that the arithmetic average silt content for haul roads based on Perpetua's site-specific data is 4.3%. Use of the

4.3% average value results in about 7% more fugitive dust emissions from the haul roads than estimated using the median value. IDEQ's modeling sensitivity study showed values just below the NAAQS, such that an 7% increase in fugitive dust from haul roads would have resulted in 24-hour PM_{10} NAAQS violations.[35]

In response, IDEQ stated the use of site-specific median values for silt content is commonly accepted by IDEQ, and the values used in calculations were supported by PRI.[36] This response does not adequately justify why a median value rather than the arithmetic average is more appropriate taking into consideration the site-specific sampling. Given that a small difference in the silt content will result in an exceedance of the NAAQS, IDEQ's insistence on using a median silt content appears arbitrary and unreasonable and indicates that PRI has not demonstrated that the emissions will not cause or contribute to a NAAQS violation. On the contrary, operation of the SGP will likely cause or contribute to a violation of the PM_{10} NAAQS.

IDEQ Response



The median value of silt content of 4% was determined to be appropriate and representative for the unpaved road emission factor equation. This value is slightly more conservative than the geometric mean of 3.5% and similar to the arithmetic mean of 4.3%. The geometric mean and arithmetic mean both round to 4%, consistent with the precision of the raw data. In general, the arithmetic mean is used when the data has a normal number of distributions which have a low amount of outliers. The median is used to return the central tendency for skewed number distributions. With the silt data at SGP being skewed, it is appropriate to use the median value. EPA has routinely used median, geomean, and arithmetic mean in analyzing environmental data. For example, EPA's AP-42 Section 11.9, Western Surface Coal Mining, recommends the use of the geometric mean for silt content.

As described in Appendix A (page 336) of PRI's application: The silt value is derived from site-specific soil data: a geomean of 3.5% and a median value of 4.0% (Midas Gold 2015). As noted in the background documentation for EPA AP-42 Section 13.2.2, EPA uses the geomean to average environmental measurements, as these measurements vary widely and do not yield a normal distribution curve (MRI 1998) (MRI 2006); however, this application uses the higher median value for a more conservative estimate. Below is a capture of PRI's silt data.

Soil Resources Baseline Study (Midas Gold 2015)

Geomean	3.5%		

Graph illustrates skewed dataset; use geomean or median for the average silt.

Applying a median silt content value of 4.0% is neither arbitrary or unreasonable. After a thorough review of the background materials and statistical analysis, along with the administrative record, IDEQ contends that a 4.0% silt content value is reasonable and conservative.

EPA Comment 2c. Lack of Conditions to Ensure Continuous Compliance with PM_{10} NAAQS

EPA, along with several other commenters, commented that the permit lacks conditions sufficient to ensure continuous compliance with the PM_{10} NAAQS. Specifically, EPA raised concerns with the adequacy and practical enforceability of the Fugitive Dust Control Plan (FDCP). Specifically, EPA raised concerns that the permit did not contain specific conditions necessary to ensure continuous compliance with the 93.3% control efficiency, but rather allowed the permittee to develop these conditions as part of an FDCP after permit issuance and allowed the permittee to change the FDCP without IDEQ approval. EPA also commented that the permit lacks conditions necessary to make the 93.3% control efficiency

practically enforceable, such as frequency of dust suppression, requirements for when to use chemical dust suppression, amount of dust suppression that must be applied, vehicle weight, vehicle speed, vehicle daily miles traveled, and road silt content.[37] With respect to Condition 2.5 requiring PRI to apply fugitive dust control measures such that visible emissions are below 10% opacity, EPA also commented that permitting record does not support a correlation of the 10% opacity requirement in Condition 2.5 with a 93.3% control efficiency.[38]

In response to these comments, IDEQ updated permit condition 2.8 to require IDEQ approval of the FDCP 30 days prior to startup and after any subsequent changes. IDEQ also responded that the permit contains activity rate limits that serve as surrogate limits for fugitive sources. IDEQ also stated that it typically does not include vehicle speed, type, and miles traveled in permits. IDEQ also asserted that Conditions 2.1-2.6 contain the minimum requirements for the contents of the fugitive dust plan.[39] Finally, IDEQ responded that "An instantaneous 10% opacity limit for vehicle traffic on haul roads is considered a very conservative control trigger level to ensure that an appropriate control measure is taken to reasonably control emissions of fugitive dust (Permit condition 2.5)."[40]

These responses do not fully address EPA's comments with respect to the practical enforceability of emission limits necessary for NAAQS compliance. Condition 2.8 does not require that IDEQ approve the FDCP prior to startup, only that the permittee submit the FDCP 30 days prior to startup. Similarly, Condition 2.8 does not clearly require IDEQ approval of FDCP changes prior to the permittee making the changes.

Conditions 2.1 through 2.6 are insufficient to ensure the permittee achieves 93.3% fugitive dust control efficiency on haul roads. First, the permitting record indicates that application of magnesium chloride is necessary to achieve up to 90% control of fugitive dust. However, Conditions 2.1 through 2.6 do not require the permittee to use magnesium chloride for dust suppression. Rather, Condition 2.6 merely requires that the FDCP contain reasonable precautions including: "apply water or suitable dust suppressant (e.g. magnesium chloride, calcium chloride) to disturbed areas, haul roads, equipment staging areas, parking areas, and storage piles during the dry season and at other times as necessary to control fugitive dust." Moreover, magnesium chloride degrades over time. However, the permit does not require the permittee to reapply magnesium chloride at regular intervals.

Similarly, IDEQ assumed a combined control efficiency of water and chemical dust suppression to achieve 93.3%. However, Conditions 2.1 through 2.6 contain no explicit requirements that the permittee use both water and chemical dust suppression in a manner necessary to achieve the 93.3% control efficiency. Magnesium chloride does not perform as a dust suppressant in dry conditions. Therefore, supplemental watering will be necessary. However, the permit does not require supplemental watering to ensure the magnesium chloride performs as a dust suppressant.

With respect to vehicle weight and vehicle miles traveled, compliance with the NAAQS is dependent on vehicle miles traveled staying at or below 7,758 per day.[41] However, the permit contains no such limit. IDEQ also did not make clear how the activity limits, including Condition 2.4 (Blasting Limits) and Condition 3.5 (Daily Hauling and Excavating Limits), would necessarily restrict vehicle miles traveled to at or below 7,758 per day. There are no requirements or restrictions on the manner the permittee uses the haul roads.

Regarding the silt content, the permit does not contain conditions to ensure the silt content on haul roads remains at or below 4%. Condition 3.13 contains the minimum requirements for the Haul Road Capping Plan (HRCP). According to IDEQ, Condition 3.13 limits maximum silt content to 4.0%. This is not accurate. Condition 3.13 states that "The permittee shall use capping material with a maximum of 4.0% silt content." This condition does not require the permittee to maintain the haul road silt content to at or below 4.0%. Nor does the requirement account for mixing of the capping material with the base or wearing of the

cap over time. Condition 3.13 also contain no explicit sampling or compliance demonstration methods. Rather, Condition 3.13 allows the permittee to develop a "silt content sampling plan including standard operational procedure for sampling, frequency of sampling, and ASTM (or equivalent) method of analysis for silt content."

Finally, IDEQ's response to EPA's comment on the basis for the 10% opacity limit in Condition 2.5 does not provide additional basis for a correlation between opacity and the 93.3% control.

The permit contains no testing requirements to establish a correlation between fugitive dust control and opacity. Nor does the permit contain any specific method for determining opacity or the frequency or location of opacity observations.

IDEQ Response

The Fugitive Dust Control Plan (FDCP) as required by permit condition 2.6, states that at a minimum, the FDCP shall contain a list of all potential sources of fugitive dust emissions and reasonable precautions to minimize fugitive dust emissions with a bulleted list encompassed in the permit condition. One of the bullets is to develop specific criteria to determine what frequency and type (water and/or chemical) of dust suppressant must be applied, and appropriate suppressant application rates. Chemical dust suppressants shall be applied consistent with manufacturer's instructions and recommendations. Permit condition 2.5 is but one of the monitoring methods required to ensure effective dust control of the unpaved roads. The 10% opacity threshold is an aggressive threshold for prompting corrective action.

Permit condition 2.8 does require approval of the FDCP as stated: Copies of the FDCP and AMP shall be submitted to IDEQ for approval 30 days prior to startup at the address provided (Permit Condition 2.26) and shall remain onsite at all times. Any changes to the FDCP or the AMP shall be submitted to IDEQ for review, comment, and approval 30 days prior to the change.

Similar to the FDCP, the Haul Road Capping Plan (HRCP) is also a permit required plan and incorporated into the permit with some minimum requirements included in the permit as existing permit conditions with IDEQ approval. Permit Condition 3.13 includes the frequency of inspection of the haul roads and maintenance procedures. These maintenance procedures include the wearing of the haul roads over time which will be developed in the HRCP.

With respect to vehicle weight and vehicle miles traveled (VMT), the facility and IDEQ have modeled a very conservative scenario of 20 CAT 789D trucks and 12 CAT 740B trucks with a weighted average of 182.6 tons. The daily hauling limit of 180,000 tons per day inherently limits the amount of truck loads per day and VMT. An analysis was done to ensure that the most conservative approach was taken. VMT was calculated by using the farthest distance that a truck will travel (3.07 miles between the West End Pit and the West End DR Storage Facility), the daily hauling limit of 180,000 tons per day, the payload of both small and large trucks, and the number of large and small trucks throughout the life of mine. Actual VMTs will decrease over time as mining locations change. When increasing the number of large trucks, emissions decrease and when increasing the payload for both large and small trucks, emissions decrease ensuring that the most conservative approach was used in the analysis for SGP. Therefore, specific VMT limits do not need to be placed in the permit nor is this a common practice in IDEQs evaluation of all other gold mine permits in Nevada and Region 10.

IDEQ contends that the permit as issued ensures continuous compliance with the PM_{10} NAAQS with the development of a IDEQ approved FDCP and HRCP. Both the FDCP and the HRCP are practically enforceable and incorporated into the permit as enforceable requirements.

EPA Allegation 3. Neither the permit record nor permit conditions demonstrate that the entirety of the SGP ought to be excluded from the scope of "ambient air."

"Ambient air" is defined as that portion of the atmosphere, external to buildings, to which the general public has access."[42] General public includes "any person(s) other than those who are permitted access to the property as employees or business invitees of a specific stationary source (including trespassers)."[43] EPA interprets access to encompass two key concerns: legal access and physical or practical access.[44] Legal access concerns whether the general public has the right or permission to enter a specific property. Physical access addresses whether the general public is able to, under actual circumstances, enter a particular parcel of land. In order to preclude physical access to a parcel of land, the source must employ measures, which may include physical barriers, that are effective in precluding access to the land by the general public.[45] Such measures can include video surveillance, monitoring, clear signage, and routine security patrols.[46] Measures can be effective even if there is not 100 percent certainty that they will prevent public access.[47] Measures must be reasonable taking into consideration the nature of the measure used, source location, type and size of source and property to be excluded, and surrounding area.[48]

EPA Comment 3a. Legal Right to Exclude General Public

As stated above, legal access concerns whether the general public has the right or permission to enter a specific property. IDEQ asserts in the SOB and RTC that PRI has "complete and sole authority to control access to or through the facility, granting access at their discretion to anyone wishing to visit the site or pass through the site."[49] Neither the SOB nor the RTC, however, evaluate PRI's claims. In light of the fact that the SGP encompasses the East Fork South Fork Salmon River and is located within National Forest lands, the permitting record ought to contain a more thorough evaluation of PRI's legal authority and members of the general public's right of access to the SGP area of operations.

IDEQ Response

IDEQ's standard practice is to review asserted conditions and proposed methods, data, and procedures in the permit application to a degree that ensures that the general public are not exposed to unacceptable levels of air pollution, and then to establish requirements that reasonably assure implementation of those methods. It is not IDEQ's standard practice to verify all details of an applicant's assertion of property rights in a permitting action unless there are questionable claims and those claims are key to ensuring NAAQS compliance. PRI asserted in their permit application that modeling receptors were included in all areas that could be considered as ambient air. Although the application focused on roadway and trail access because of the unique circumstance these represent, IDEQ's upcoming review of the permit-required Access Management Plan (AMP) will provide for a more detailed assessment and ultimate assurance of both the legal and practical ability to preclude public access from all areas excluded from ambient air. Considering the quantity and characteristics of potential emissions, the conservatism of analyses supporting permit issuance, and the probability for public exposure to air pollutant levels in excess of NAAQS for a duration that endangers health and safety, IDEQ strongly disagrees with EPA's criticism that the permitting record ought to contain a more thorough evaluation of PRI's legal authority to preclude public access to the site. Perpetua asserted in their permit application that modeling receptors were included in all areas that could be considered as ambient air. Although the application focused on roadway and trail access, IDEQ's review of the permit-required Access Management Plan (AMP) will provide a more detailed review of both the legal and practical ability to preclude public access from all areas excluded from ambient air.

EPA Comment 3b. Measures to Exclude General Public as a Practical Matter

EPA commented that the permit lacks conditions to ensure PRI employs sufficient measures such that the entirety of the SGP is appropriately excluded from the definition of ambient air. Specifically, EPA raised

concerns that the general public may be able to access the SGP, regardless of their legal right to do so.[50] The basis for EPA's comment was that the permit does not contain specific measures the permittee will take to exclude members of the public from the SGP. Rather, the permit allows the permittee to develop an Access Management Plan ostensibly designed to exclude members of the public. In response, IDEQ asserted that Condition 2.7 contains the requirements for the ACP, including adequately informing anyone approaching an access point that travel beyond the established gate involves entering an active mine site as a guest of the permittee and providing verbal and written requirements that must be followed while on the SGP site.[51] The SOB also states that the primary and secondary access points are controlled by adjacent natural features, such as streams and creeks, steep topography, and areas of thick vegetation and undergrowth.[52] In addition, the SOB states that PRI will place boulders across trails and adjacent to the train to prevent vehicle access.[53] Finally, according to the SOB, PRI security personnel will routinely patrol mine facilities and roadways for unauthorized individuals.[54]

IDEQ's responses and statements in the SOB do not adequately address EPA's concerns. As permitted, the general public will likely have physical or practical access to portions of the SGP. The SGP operations area boundary covers 2,372 acres of land within the Payette and Boise National Forests. The SGP is located in Valley County, Idaho. The nearest settlement is the village of Yellow Pine, Idaho, approximately 14 miles by road.[55] The Payette National Forest includes the Frank Church River of No Return Wilderness. The Salmon River runs through the Payette National Forest. The SGP is surrounded by numerous recreation areas in the Payette and Boise National Forests.[56] National Forest roads 374, 440, and 640 provide vehicle access to the site.[57]

Given the scale of the SGP, proximity to recreation opportunities, and multiple access points, the permittee should employ multiple measures to preclude public access. However, condition 2.7 is vague and leaves the permittee considerable latitude on the methods used to exclude members of the general public. While the SOB indicates that placement of boulders on secondary roadways is necessary to prevent access, Condition 2.7 contains no such requirement. Also, Condition 2.7 does not specify a minimum patrol frequency or minimum signage requirements. Nor does Condition 2.7 require the permittee to post or monitor the vast operations boundary to effectively preclude recreators from entering the site. Condition 2.7 only requires the permittee to employ measures to "discourage" access to secondary roadways and trails. This does not meet the standard to effectively exclude members of the general public. Similarly, EPA questions whether the entire boundary surrounding the operations area incorporates natural features that preclude access. Given the numerous recreational opportunities in the surrounding wilderness areas, access by recreators off trail appears possible. Therefore, the Final PTC does not ensure that the entirety of the SGP is appropriately excluded from the definition of ambient air. This implicates IDEQ's determination that the SGP will not cause or contribute to a violation of the PM_{10} NAAQS.

IDEQ Response

Perpetua has certified in their permit application materials their legal authority to preclude public access to areas excluded from ambient air. This certification by the applicant establishes the air impact analyses supporting issuance of the PTC. To ensure adequate measures are in place to effectively preclude access to areas excluded from ambient air, the PTC requires submission and approval of an Access Management Plan (AMP). Adequacy of measures will depend on the following factors: 1) likelihood of the public to attempt access; 2) physical ease of access; 3) potential for specific area to expose the public to impacts exceeding NAAQS or TAP increments; 4) extent to which the area is obviously not public; 5) effectiveness of access preclusion measures taken.

The IDEQ Ambient Air Quality Impact Analyses Review Memorandum (Modeling Review Memorandum), included as Appendix B of the IDEQ Statement of Basis, provides a description of general measures that will be taken to preclude public access. This description will guide the development of the AMP. The Modeling Review Memorandum lists the following measures:

- Primary Access Points: The Stibnite Road (north) and Burntlog Route (south) access points will include locked gates. Guard shacks will be located at each gate to monitor all vehicle ingress/egress. Each gate also will include appropriate adjacent barriers (i.e., fencing, bollards, boulders, or other barriers) to prevent any vehicle from circumventing the gate and gaining site access. These primary access points are also controlled by adjacent natural features, such as streams and creeks, steep topography, and areas of thick vegetation and undergrowth that serve as natural barriers or impediments to access.

- Secondary Access Points: Other potential access points, such as secondary roadways and trails, will include posted signs warning the public against entry into the site. At these locations, boulders will be placed across the trail and at an appropriate width adjacent to the trail to prevent any vehicle from circumventing the barrier. These secondary access points also incorporate adjacent natural features, such as streams and creeks, steep topography, and areas of thick vegetation and undergrowth that serve as natural barriers or impediments to access. Some mine features, such as the TSF and process plant areas, will include perimeter fencing.

- Surveillance: PRI security personnel will routinely patrol mine facilities and roadways for unauthorized individuals. In addition, all onsite personnel will be trained on the necessity of restricting public access to areas within the operations boundary. Any suspected trespassing by unauthorized individuals will be reported immediately to security, and trespassers will be escorted off the site.

The Modeling Review Memorandum also provides general measures to manage access through the site on the Stibnite Road access route, stating the following:

Persons wishing to traverse the SGP site on the Stibnite Road access route will be required to check in at the security gate to receive a safety briefing and to alert mine staff of their presence. Travelers will be required to check out upon exiting the site to ensure passage through the site in a safe and timely manner. Travelers will not be allowed to stop or loiter while traveling though the operations area. Along its full length, the Stibnite Road access route would have appropriate signage to direct travelers and would be separated from mine haul roads and areas of mine operations by fencing, berms, or gates to prevent travelers from straying from the route. When possible and to the degree practicable, anticipated public access restrictions will be communicated to the public in a timely manner so that they may plan appropriately.

The Access Management Plant will be developed and approved by IDEQ prior to mining operations. It will establish more detailed methods and procedures to manage and monitor access to the site at an appropriate level to preclude public access to areas exclude from consideration as ambient air.

A. Violations Of Air Rule Section 202 Requirements For What Must Be Included In An Application 8

B. Violations Of Section 209 Public Comment Requirements 12

III. DEQ Had No Reasonable Basis to Conclude Perpetua Will Achieve 93.3% Dust Control As Opposed to Some Other High But Insufficient Level, Such as 90%. 15

IV. THE "PROJECT SPECIFIC ADJUSTMENT" DEQ GRANTED PERPETUA VIOLATES THE AIR RULES, AND THREATENS PUBLIC HEALTH 19

CONCLUSION 23

INTRODUCTION

Petitioners Nez Perce Tribe, Idaho Conservation League, and Save the South Fork Salmon submit this Reply Brief in support of their Amended Petition for Review of Preliminary Orders. For the reasons set forth in Petitioners' Opening Brief, and as further explained below, the Idaho Department of Environmental Quality ("DEQ") committed multiple errors when it issued the permit to construct ("the Permit") to Perpetua Resources Idaho, Inc. ("Perpetua") for the proposed Stibnite Gold Project ("SGP" or "Project"): a 16-year proposal to construct and operate a large open-pit gold mine in Valley County, Idaho.

These errors threaten to expose the public to unhealthy concentrations of particulate matter ("PM") and arsenic air pollution. These errors also render DEQ's approval of the permit arbitrary, capricious, and not in accordance with the Rules for the Control of Air Pollution in Idaho ("Air Rules"), IDAPA 58.01.01 *et seq.* The Board should set aside the Permit, and remand to DEQ to correct these errors, comply with the Air Rules, and protect the public from the SGP.

ARGUMENT

I. DEQ CANNOT EXCLUDE THE STIBNITE ROAD ACCESS ROUTE FROM AMBIENT AIR PROTECTIONS.

DEQ cannot exclude the Stibnite Road Access Route from ambient air protections because Perpetua does not and will not have the legal authority to preclude the public from traveling on the Route. Its impermissible creation of a "guest of the mine" category to strip away ambient air protections from the public is not supported by EPA policy, DEQ guidance, the Idaho Air Rules, or the Clean Air Act, and should be rejected.

A. DEQ Unreasonably Relied on Perpetua's Statement that It Has Legal Control to Preclude Public Access Over the Stibnite Road Access Route.

It is incredulous that despite the established legal precedent that an agency's decision must be based on the record before it,[1] conflicting evidence in the record, and questions raised by the public during the comment period, DEQ and Perpetua continue to advance the argument that it was reasonable for DEQ to rely on one assertion by Perpetua to determine that Perpetua had legal authority to *preclude* the public from the Stibnite Road Access Route. *See* PRI at 20-21; DEQ at 9-10. But that is their argument, and it is wrong.DEQ argues that it "cannot be expected to fact check every individual averment made by a permittee," DEQ at 9, but that is not what Petitioners are asking here. Petitioners, instead, ask that the Board find that DEQ's determination, that was based on one statement in the record and ignored other evidence in the record, was not reasonable, and should be remanded to DEQ for further consideration.

Given the context of this air permit, DEQ's contention that it was appropriate to rely on one statement in the application flies in the face of reasoned decision-making.

First, the truth and accuracy of Perpetua's statement that it has legal control to preclude public access is central to the determination of whether the Route can be excluded from ambient air protections and consistency with EPA's policy on ambient air that states that an owner or operator must have "the right to preclude the general public's access." REC 1142. This is a threshold question for the ambient air boundary determination, and would not be unreasonable for DEQ to verify the truth of the statement.[2]

[1] *State Ins. Fund v. Hunnicutt*, 110 Idaho 257, 261(1985).
[2] As discussed further below, Perpetua's representation can be read several ways, but what it does not state in no uncertain terms is that Perpetua will have the legal right to "preclude" public access from the Stibnite Road Access Route.

The Ninth Circuit in the "*Rosemont*" case faced a similar situation regarding a mining company's claims of rights to use public land. *Ctr. for Biol. Diversity v. U.S Fish & Wildlife Serv.*, 33 F.4th 1202 (9th Cir. 2022) There, the threshold issue centered around the 1872 mining law allowing a mining company to dump its waste on Forest Service land if it holds a "valid" mining claim on those lands. *Id.* at 1210. The Forest Service relied on Rosemont Copper Company's statements that it had valid mining claims, but failed to verify that assumption. *Id.* at 1221. The Ninth Circuit found the Forest Service "improperly assumed their validity" and reversed the Forest Service's approval of the Rosemont's project. *Id.* at 1222.

Second, has Petitioners brought up during the public comment period and throughout this contested case, there was substantial evidence in the record (and in conflict with Perpetua's representation) to indicate that, although Perpetua may have (once the mine plan is approved) the legal to "control" public access, it will not have the legal right to "preclude" access. Given that Perpetua's legal right to preclude public access was an issue throughout the administrative process, it was unreasonable for DEQ to not question Perpetua's statement "when viewed in the light that the record in its entirety furnishes, including the body of evidence opposed to the [agency's] view." *Hunnicutt*, 110 Idaho at 261.

DEQ makes light of the issue, calling it an "oversimplification" and "irrelevant" to the ultimate issuance of the permit. DEQ at 10. But it is neither. Setting the ambient air boundary is central to the entire permit and establishes the point of compliance for which all modeling of air pollutant emissions is based, and central to the protection of public health by ensuring that the public does not breathe air that does not comply with the NAAQS established by the EPA. *See* PRI at 21 ("Perpetua's application for a permit to construct and DEQ's approval of the Final

Permit is based on the proposed operational [or ambient air] boundary."); *see also* REC 415 ("This operations boundary also defines the ambient air boundary used in all ambient air quality impact analyses.").

As stated above, Perpetua's legal rights over the Route is a central and threshold issue as to whether it can even think about excluding the Route from ambient air protections. In that vein, DEQ still refuses to look at the record before it, arguing "[i]t is unclear what Petitioners are referring to." DEQ at 10. However, Petitioners' briefs have cited many instances in the record that demonstrate that no matter what mine plan alternative the Forest Service approves, the Route will remain open as a public access route to access important recreational and other sites on public lands. *See* REC 895; REC 2624-25; Pet'rs' Opening Br. at 20-21. Having the legal right to preclude public access, as stated above, is central to EPA's determination whether an area external to a source's buildings are afforded ambient air protections or excluded from them. REC 1142.

"Voluneer[ing]" to build the Stibnite Road Access Route around mining features (note that a road through the proposed mine site, Stibnite Road, currently exists) is an inaccurate characterization of the case at hand, and still does not give Perpetua the right to preclude public access. *See* PRI at 22. The record demonstrates that Perpetua attempted to exclude public access in its mine plan, but the Forest Service–after receiving numerous public comments indicating that a change in access "was of significant concern–directed Perpetua to evaluate "access options for the [Stibnite Gold Project] that provided access similar to existing conditions and travel times." REC 895. As a result, the only alternative under consideration that can be approved by

the Forest Service is a mine plan that would "provide access similar to that provided by the existing Stibnite Road." REC 895.

"[D]eterminations concerning the adequacy of measures to preclude public access should be made on a case-by-case basis *after consideration of information in the relevant administrative record*." REC 1148 (emphasis added). DEQ did not do this. As such, this Board should not, and can not, allow DEQ to refuse to provide ambient air protections to the general public, and should reverse the Hearing Officer's order, vacate the permit, and remand it back to DEQ for further consideration.

B. The General Public Are Not "Guests Of The Mine" and Must Be Provided Ambient Air Protections.

If the mine plan is approved by the Forest Service, the only alternative, as demonstrated above, is a mine whereby the Stibnite Road Access Route will remain open to the public for through travel to access public recreation sites on Forest Service land. Without the legal right to preclude public access and the inability to provide ambient air protections over the Route, which traverses right through the center of the mine site, Perpetua and DEQ needed to create a new category of the public that will not longer be the public, but will be "guests of the mine." Calling the public "guests of the mine" in this manner and based on the public's use of the Route, is inconsistent with EPA's ambient air policy and DEQ's guidance, and strips the public of any ambient air protections afforded by the Clean Air Act.

Perpetua's and DEQ's briefs, and the Hearing Officer's order attempt to misdirect the issue by focusing on whether the physical measures that Perpetua proposes to use to control public access, such as a manned access and warning signs, are adequate to control public access

under EPA's policy on ambient air. *See* DEQ at 11-12; PRI at 23-26; REC 3392. To be sure, they could be, if they were used to actually physically "preclude" the public from access.[3]

But what Perpetua's and DEQ's briefs and the Hearing Officer's order fail to address is DEQ and Perpetua's legal sleight of hand which strips the public of its status as the public–and thus ambient air protections–with a single signature on a "waiver" that requires the public to agree to be "guests of the mine" despite the fact that they were never invited to be a guest of the mine, and have no intentions of visiting the mine. *See* PRI at 24; DEQ at 12.

Neither Perpetua nor DEQ claim that the Clean Air Act allows the public to waive its right to ambient air protections in this way. And that would be inconsistent with both EPA's policy on ambient air and DEQ's guidance which distinguish those people that can be excluded from ambient air protections by virtue of their defined activity, but not the effectiveness of physical or non-physical barriers.

For example, EPA's policy states that the EPA

> recognize[s] that some persons that have both legal and practical access to the source's property are not necessarily considered as members of the general public, such as employees or the owner or operator who work at the site, or "business invitees," such as contractors or delivery persons.

REC 1142. These classes of people may not require ambient air protections because they are at the facility for the purpose of the facility–to work at the facility, to provide services to the

[3] *See, e.g.*, PRI at 24 (discussing manned gates, physical barriers, posting signs, etc.). Perpetua relies on an unofficial statement from Jay McAlpine, Regional Modeling Contact at EPA, that provides an opinion as to whether the Route is not ambient air, but clearly qualifies his statement with "we need to confirm th[is] with the policy division." PRI at 24; REC 1350. A year and a half later, McAlpine provided a similar opinion regarding the Route, but still "[could]not provide an approval." REC 1496. And yet, despite these questions from DEQ staff, the EPA, and Petitioners on whether exclusion of the Route from ambient air protections is consistent with EPA's policy, DEQ never submitted the question for EPA's review. REC 1038.

facility; the public traveling over the Route is not there for the purpose of the facility, and so under this policy, should be afforded ambient air protections.

Similarly, DEQ's guidance states,

> The facility-proposed ambient air boundary must include justification that demonstrates the facility has reasonable control of the area and effectively *precludes public access on a routine basis*. * * * *For the purpose of defining ambient air, the "general public" is considered anyone not directly associated with the facility. In general, if someone present at the site would be subject to [the Occupational Safety and Health Administration], then they are considered as the general public.*

REC 743 (emphasis added). DEQ and Perpetua can't credibly claim that persons traveling over the Stibnite Road Access Route–who may not even be aware that they would be passing through an active mine site–to access public lands are "directly associated with the facility" or are subject to the federal Occupational Safety and Health Administration's jurisdiction.

DEQ's and Perpetua's plan to strip the public from ambient air protections by calling them "guests of the mine" is disingenuous at best. It is not consistent with EPA's ambient air policy, DEQ's guidance, or the Idaho Air Rules that adopt the federal regulatory definition of ambient air. The Board should reject DEQ and Perpetua's

II. BY DEFERRING PERMIT DETAILS TO BE DETERMINED LATER, OUTSIDE THE PTC PROCESS AND WITHOUT PUBLIC COMMENT, DEQ VIOLATED THE AIR RULES AND THE CAA.

Under the Permit, Perpetua is allowed to submit the following plans in the future: the Fugitive Dust Control Plan ("FDCP"); the Haul Road Capping Plan ("HRCP"); the Operation and Maintenance Manual ("O&M"); and the Stibnite Road Access Management Plan ("AMP"). *See* REC 0375–76, 0378–80, 0385–86 (Permit conditions). The FDCP, HRCP, and AMP will include numerous Project details, some of which significantly affect PM_{10} and arsenic emissions, as well as the public's access and exposure to emissions. *See id.* Yet, because DEQ already

issued the Permit, DEQ will review the plans behind closed doors and outside of the PTC permitting process set forth in the Air Rules. As explained in Petitioners' Opening Brief (pp. 25-34) and further explained below, this violates the Air Rules Section 202 requirements for what information must be included in a PTC application, and it violates the Section 209 public comment requirements.

A. Violations of Air Rule Section 202 Requirements for What Must Be Included in an Application.

DEQ's deferral of the plans violates Section 202 requirements for what must be included in a PTC application. "Required Information" that the applicant must provide includes: "Site information, plans, descriptions, specifications, and drawings showing the design of the . . . facility, . . . the nature and amount of emissions . . . , and the manner in which it will be operated and controlled." Air Rules Section 202.01.a.i (emphasis added). Additionally, a PTC application "must . . . be accompanied by all information necessary to perform any analysis or make any determination required under Sections 200 through 227," which includes the requirement to determine whether the facility will cause or contribute to a violation of the NAAQS. Air Rules Section 202.

Here, the FDCP, HRCP, O&M Manual, and AMP are themselves and/or will include "plans," "information," "descriptions," and "specifications" required to be in an application under Section 202.01.a.i. They will also include "information necessary" under Section 202 for DEQ to analyze and determine compliance with the PM_{10} NAAQS. DEQ and Perpetua argue that because DEQ has allowed some plans for some other projects to be deferred like this in the past, it was fine to defer all of these plans here. While it may be appropriate under the Air Rules for some project to allow some of plans and project details to be submitted later after the project has

already been approved, it runs afoul of Air Rules Section 202 to defer plans that include "information necessary" for DEQ to analyze and determine compliance with Sections 200 through 227. Here, DEQ has impermissibly allowed important project details including "information necessary" under Section 202 for DEQ to determine compliance with the NAAQS, as explained below.

1. Fugitive Dust Control Plan

Under Permit Condition 2.6, Perpetua is required to prepare a Fugitive Dust Control *Plan*. REC 0375-76. The FDCP is a "plan" under Section 202.01.a.i because it includes details related to the nature and amount of the SGP's fugitive dust emissions, and the manner in which Perpetua will operate the mine and control fugitive dust. Among other Permit requirements of the FDCP, Perpetua is required to develop "specific criteria to determine what frequency and type (water and/or chemical) of dust suppressant must be applied, and appropriate suppressant application rates". REC 0376. The frequency, type, and rate at which Perpetua will apply dust suppressants are "information," "descriptions," and/or "specifications" on the manner in which the facility will be operated and how Perpetua will control fugitive dust under Section 202.01.a.i and, therefore, must be included in the PTC application--not developed after the PTC has already been approved.

The FDCP also includes the type of "information necessary" under Section 202 for DEQ to analyze and determine whether the Project complies with the PM_{10} NAAQS and, therefore, this information must be in the PTC application. Project PM_{10} emissions come mostly from haul roads, and applying dust suppressants is the primary way Perpetua plans to achieve 93.3% dust control on the roads. Achieving only slightly less than the targeted 93.3% dust control will

violate the hourly PM_{10} NAAQS, as was found in the modeling supporting the Permit Statement of Basis. *See* REC 0691–92. The frequency, type, and application rates of dust suppressants Perpetua will use is information which is critical to understanding how and whether the SGP will comply with the PM_{10} NAAQS. Thus, this is the type of "necessary information" under Section 202 which should have been considered as part of the application, when DEQ had to make its determination that the Project would not violate the NAAQS. Deferring these critical project details to later violates the Air Rules.

2. Haul Road Capping Plan

Under Permit Condition 3.13, Perpetua is required to prepare, submit, and follow a Haul Road Control *Plan*. REC 0385-86. The HRCP is a "plan" under Section 202.01.a.i because it is a plan related to the nature and amount of the mine's fugitive dust emissions, and the manner in which Perpetua will operate the mine and prevent dust emissions by capping some Project roads. Among other conditions in the Permit, the HRCP is required to include: a silt content sampling plan (including standard procedures for sampling, sampling frequency, and sampling analysis method); a sampling plan for low-arsenic quartzite rock; and specifications for how frequently haul roads will be inspected and maintained. REC 0386.

These required plans and specifications within the HRCP are "information," "plans," "descriptions," and/or "specifications" on the manner in which the facility will be operated and how Perpetua will prevent fugitive dust required to be in the application under Section 202.01.a.i, not deferred to later. Furthermore, these plans and other information which will be in the HRCP include "information necessary" under Section 202 for DEQ to analyze and determine

whether the Project will achieve the PM_{10} NAAQS. Therefore, these plans and information must be included in the PTC application—not developed after the PTC is already approved.

3. Operation & Maintenance Manual

Petitioners are willing to concede for purposes of this Petition for Review that the O&M Manual required at Permit Condition 2.20 is the type of plan DEQ might reasonably allow Perpetua to submit later. Permit Condition 2.20 provides: "The O&M manual shall be a permittee-developed document based upon, but independent from, manufacturer-supplied operating manuals." REC 0378. The requirements of the O&M Manual relate primarily to the operation, maintenance, and monitoring for specific control equipment, and none of which bear meaningfully on DEQ's determination and analysis that the Project will satisfy ambient PM10 and arsenic limits. *See* REC 0378-79. By contrast, and as already stated above, parts of the FDCP and HRCP will include plans, descriptions, specifications, and other information and details regarding how Perpetua will control fugitive dust emissions, details which are not yet determined, which do not depend on manufacturer specifications, and which are critical to analyzing and determining compliance with the PM_{10} NAAQS.

4. Access Management Plan

Under Permit Condition 2.7, Perpetua is required to prepare, submit, and follow an Access Management *Plan*. REC 0376. In the AMP, Perpetua is required to "identif[y] the facility boundary and all primary and secondary access points, and clearly specif[y] measures used to discourage public access to the facility." *Id.* Moreover: "*Plans* shall be described in the AMP, including identifying the access points monitored, the frequency of patrol, and measures employed to discourage access." *Id.* (emphasis added). The AMP itself is a "plan," and the

contents of the AMP are "information," "plans," "descriptions," and "specifications" of the facility and of the manner in which it will be operated and controlled regarding access, making them "required information" under Section 202.01.a.i. Moreover, these details in the AMP are "information necessary" for DEQ's analysis and determination as to what the proper ambient air boundary is for the SGP, making them required information under Section 202.

In summary, while it might be appropriate for DEQ to allow some types of information to be submitted later (such as things like the specifications related to purchased equipment called for in the O&M Manual), DEQ went too far here when it allowed important project details concerning the nature of the facility, its operations, its dust control measures, its ability comply with the NAAQS, and its ambient air boundary to be developed and submitted by Perpetua later. The Board should remand the Permit, and direct DEQ to require Perpetua to prepare and submit the FDCP, HRCP, and AMP first, and for DEQ to factor each plan into its analyses and determinations as to whether the Project satisfies the requirements of the Air Rules.

B. Violations of Section 209 Public Comment Requirements.

DEQ's deferral of the FDCP, HRCP, and AMP separately but relatedly violates the Air Rules Section 209 public comment requirement. Not only do the Air Rules require public comment, but they require that during public comment, the "Department's proposed action, together with the information submitted by the applicant and the Department's analysis of the information, *will* be made available to the public . . . ." Air Rules Section 209.01.c.i. (emphasis added). The FDCP, HRCP, and AMP will include "information submitted by the applicant" under 209.01.c.i. And when DEQ reviews each plan (as the Permit requires it to do), DEQ will perform an "analysis of that information" under 209.01.c.i. But the public comment periods already occurred, and the information Perpetua will submit in these plans, and DEQ's analysis of that

information, will happen in the future, without public comment. This violates the plain language of the public comment provisions at Section 209.01.c.

The Clean Water Act ("CWA") cases Petitioners presented in their Opening Brief support this. Pet'rs' Opening Br., pp. 31-32. Perpetua and DEQ try to distinguish these cases on the grounds that those cases concerned rulemakings for specific types of CWA permits instead of CAA permits. But neither DEQ nor Perpetua points to any cases or other authorities to offer any principled basis for determining what types of project information need to be subjected to public comment as part of pollution permitting versus which project information can be appropriately withheld from the public. These CWA cases are instructive and highly persuasive on this point.

In *Environmental Defense Center v. U.S. EPA*, 344 F.3d 832, 856 (9th Cir. 2003), the Ninth Circuit considered whether Notices of Intent ("NOI") prepared by applicants seeking coverage under the CWA's general permit option were required to be subject to EPA review and to public comment. The Ninth Circuit held that because the NOI at issue "establishes what the discharger will do to reduce discharges to the 'maximum extent practicable,' the [] NOI crosses the threshold from being an item of procedural correspondence to being a substantive component of a regulatory regime" and require EPA review. *Id.* at 853. The Ninth Circuit also held that because "the NOIs . . . contain the substantive information about how the operator . . . will reduce discharges to the maximum extent practicable", the NOIs are subject to the CWA's public availability and public hearing requirements. *Id.* at 857.

Similarly here, the FDCP, HRCP, and AMP are more than mere procedural correspondence between Perpetua and DEQ. Each plan will include critical details as to how Perpetua will control emissions in order to comply with the "substantive components" of the Air

Rules. Again, the FDCP will set the criteria for determining types, frequencies, and application rates of dust suppressants necessary to achieving 93.3% dust control, as is necessary for the Project to comply with the PM10 NAAQS. Again, the HRCP will include sub-plans with numerous details as to how Perpetua will cap roads to reduce fugitive emissions. And again, the AMP will include details as to how Perpetua will exclude the public and maintain its ambient air boundary. Moreover, the details specified in the FDCP, HRCP, and AMP will "be incorporated by reference" into the Permit and will become"enforceable permit conditions." *See* REC 0375 (FDCP), 0376 (AMP), 0386 (HRCP). These plans include the type of substantive information, plus enforceable permit limits, for how Perpetua will control emissions to required levels that should be subject to the Air Rule Section 209 public comment requirements.

The FDCP, HRCP, and AMP are also similar to the Nutrient Management Plans ("NMP") at issue in *Waterkeeper Alliance, Inc. v. EPA*, 399 F.3d 486 (2d Cir. 2005). There, the Second Circuit recognized that CWA permitting schemes that do not allow for public review of best management practices set forth in NMPs, where those NMPs are then incorporated into permits, violate the CWA. *Id.* at 503-504. The Second Circuit noted that the NMPs are "a critical indispensable feature of" the plan to regulate the pollution discharges from the type of facilities at issue. *Id.* at 504. The Second Circuit explained that a permit that relies on best management practices in an NMP but does not specifically list those best management practices in the permit itself "deprives the public of the opportunity for the sort of regulatory participation that the Act guarantees because [such a permit] effectively shields the . . . management plans from public scrutiny and comment." *Id*. at 503.

Here, like the NMPs in *Waterkeeper*, the FDCP, HRCP, and AMP are critical and indispensable features of the Permit. For example, DEQ modeling staff stating "it is *critical* for NAAQS compliance that this high level of control [(93.3% dust control)] be achieved." REC 0641 (emphasis added); *see also* REC 0691 (same). Yet, the FDCP is where Perpetua will select the types, rates, and frequencies for which it will try to achieve 93.3% dust control. And here, like the EPA in *Waterkeeper*, DEQ has shielded the FDCP, HRCP, and AMP from public scrutiny and comment and has deprived the public of the sort of regulatory participation the Air Rules Section 209 guarantees.

Perpetua cites *Train v. NRDC*, 421 U.S. 60, 79 (1975) for the proposition that "CAA jurisprudence affords broad discretion to states to develop permit conditions." Perpetua Opp'n at 31. Petitioners do not dispute that DEQ has broad discretion to develop permit conditions. The problem here is that DEQ has *not* developed a number of important permit conditions yet and is letting Perpetua develop them later, outside of the Air Rules PTC process, and without public inolvement. Thus, *Train*, *Environmental Defense Center*, and *Waterkeeper* all underscore that DEQ's use of work plans here to leave numerous details and conditions to be decided later, outside the PTC permitting and public comment processes, violates the Air Rules Section 209.01 public participating requirements.

The Board should remand the Permit, and order that the FDCP, HRCP, and AMP must be subject to public comment before DEQ can issue any permit.

III. DEQ HAD NO REASONABLE BASIS TO CONCLUDE PERPETUA WILL ACHIEVE 93.3% DUST CONTROL AS OPPOSED TO SOME OTHER HIGH BUT INSUFFICIENT LEVEL, SUCH AS 90%.

Under the Air Rules, DEQ cannot issue a PTC unless it determines that the facility "would not cause or significantly contribute to a violation of any ambient air quality standards"

(i.e., the NAAQS). Air Rules Section 203. A critical factor affecting the SGP's fugitive dust emissions, and therefore whether DEQ can make the required determinations under Air Rules Section 203 that the Project will comply with the PM_{10} NAAQS, is the degree to which Perpetua will effectively control dust from haul roads.[4]

There is no dispute that 93.3% is a very high and aggressive level of dust control, and no dispute that achieving 93.3% is critical to meeting the PM_{10} NAAQS. Among other examples in the record, DEQ modeling staff stated "it is *critical* for NAAQS compliance that this high level of control [(93.3% dust control)] be achieved." REC 0641 (emphasis added); *see also* REC 0691 (same); REC 0921 (EPA saying the same). Nor is there any dispute that if Perpetua fails to achieve this high level control, even by just a little bit, then it will cause exceedances of the PM_{10} NAAQs. For example, Perpetua's and DEQ's modeling showed that if Perpetua cut its operations by a third (hauling just 120,000 tons per day instead of the authorized 180,000 tons per day) yet achieved only 90% dust control, this slightly lower dust control—even when combined with a major cut in mining activity—would cause exceedances of the PM_{10} NAAQS. REC 0691–92.

At this stage in the proceedings, Petitioners do not challenge DEQ's determination that 93.3% dust control could technically be possible. Rather, Petitioners challenge DEQ's determination that this Project, based on the terms and conditions in the Permit, will actually achieve 93.3% and thus comply with the NAAQS, as opposed to achieving some slightly lesser control, such as 90%, which would violate the NAAQS. Thus, even removing the "conservative" (as DEQ and Perpetua put it) ways the modeling was conducted (by assuming higher activity

[4] There are other sources of fugitive dust emissions at the facility, including "drilling and blasting activities, crushing and ore handling equipment, ore and rock storage piles, and unpaved roadways." REC 0430. However, fugitive dust emission from unpaved roadways represents a majority of the estimated PM10 (and arsenic) emissions from the facility. REC 0427, 0429 (Table 3).

than Perpetua and DEQ says is likely to occur), if Perpetua underperforms just slightly on dust control, it will violate the NAAQS.

First, the Permit does not include an enforceable condition to achieve 93.3% dust control. Perpetua appears to acknowledge this reality in its Brief. But in its Brief, DEQ claims otherwise, pointing to a table in the permit that has "93.3%" in it to argue that this is an enforceable permit limit. In fact, there are two such tables in the Permit. But neither of these tables includes enforceable permit conditions. Table 1.1 merely "lists all sources of regulated emissions in this permit" and describes the "Control Equipment" for each regulated emission source. REC 0369. Similarly, Table 3.1 "contains a description of control equipment used to control emissions from mining and ore processing activities." REC 0384. "Excavating and hauling activities" are listed in both tables as an emission source whose "Control Equipment" includes chemical and water sprays with a control efficiency of "93.3%" for haul roads. *Id.* These tables merely list the 93.3% *target or goal* for haul road fugitive dust control, they do not list enforceable permit conditions.

Even if this 93.3% dust control goal was a permit limit or condition, it is not enforceable. Perpetua is not required to prove, by testing or monitoring, the actual percent dust control it achieves once operations are underway. Perpetua is not required to monitor ambient air to ensure the SGP complies with the NAAQS. Under the terms of the Permit, there is no way DEQ will ever know whether Perpetua actually achieves 93.3% dust control and whether it violates the NAAQS. And there is, thus, no way for DEQ to try to enforce any supposed 93.3% limit (which doesn't exist anyway).

To DEQ's credit, the Permit does include a number of enforceable terms and conditions related to dust control. These include terms and conditions that will be included in the

forthcoming FDCP and HRCP, and other conditions, which generally require Perpetua to develop various plans, require following a variety of best practices, and require corresponding monitoring to ensure that those plans and best practices are indeed followed. These terms and conditions are all well and good, for what they are worth. But none of these terms and conditions have any bearing on whether the Project will achieve 93.3% dust control as opposed to, say, 90% (or even less) dust control.

It might be within DEQ's technical expertise to conclude that the dust control conditions in the Permit are adequate to ensure a high level of dust control for the SGP. But the finding that Perpetua will achieve a whopping 93.3% dust control and not, say, 90% (which is still very high, but is not sufficient to meet the NAAQS) is entirely speculative and untethered from any enforceable conditions in the Permit. Again, the Permit does not require testing or monitoring the actual dust control achieved, nor does it require any ambient air boundary monitoring to ensure the NAAQS are being met. Under the Air Rules, DEQ has authority under Section 211 to require any reasonable conditions in the Permit, and authority under Section 211.01(d) specifically to require ambient air boundary monitoring. Had DEQ exercised either or both of these authorities here to require dust control testing or monitoring, or to require ambient air boundary monitoring, then it could ensure the "high" and "aggressive" 93.3% will be achieved. But DEQ did not.

As a result, Perpetua could submit the plans as called for in the Permit, DEQ could approve those plans, Perpetua could operate and follow the plans and all other permit conditions to a tee, and Perpetua could achieve a high level of dust control; yet, that high level of dust control might be only, say, 90%, meaning the SGP would cause NAAQS violations over the next 16 years. If this happens, neither DEQ, Perpetua, nor the public will ever know. Perpetua will be

in compliance with the Permit. And there will be no way to take any enforcement action against Perpetua to bring its dust control up to the necessary 93.3%.

For these reasons, DEQ lacked a reasonable basis for concluding that the SGP will not cause or contribute to an exceedance of the NAAQS. The Board should, thus, set aside and remand the Permit and order DEQ not to approve the Permit unless DEQ imposes enforceable monitoring and/or testing to ensure 93.3% control is achieved, or otherwise limits or alters Perpetua's mining or emissions controls so that it will comply with the PM_{10} NAAQS.

IV. THE "PROJECT SPECIFIC ADJUSTMENT" DEQ GRANTED PERPETUA VIOLATES THE AIR RULES, AND THREATENS PUBLIC HEALTH.

Deference to agency expertise cannot overcome an attempt at a regulatory overhaul allowing project-specific adjustments, methods never before used for any other permit application in DEQ's history, REC 1201, and not found in the Air Rules. As Petitioners explained in the Opening Brief (pages 40-47), DEQ must follow the Air Rules as written, and cannot deviate from those rules, as it did here when it granted Perpetua a "project specific adjustment factor." Under the Air Rules, "no permit to construct shall be granted" unless DEQ determines that the applicant has shown: "Using the methods provided in Section 210, the emissions of toxic air pollutants from the . . . source . . . would not injure or unreasonably affect human health or animal life or vegetation as required by Section 161." Air Rules Section 203.03 (emphasis added). Section 210 does not allow for project specific adjustment factors like DEQ used here to artificially dilute the amount of arsenic it actually modeled to result from the project annually by spreading it out by 16/70s (the life of the mine, divided by the average human lifetime). Perpetua's and DEQ's opposition briefs provide no convincing evidence or argument that such a project-specific adjustment is "envisioned by the Air Rules," "authorized" under the

Air Rules, or "well within DEQ's discretion" to use, or squared with DEQ's "mission to protect public health and the environment." PRI at 43; DEQ at 32. For that reason, the Board must thus grant Petitioners' Amended Petition, reverse the Hearing Officer's order, vacate the permit, and remand to DEQ for further consideration.

DEQ and Perpetua argue that this project specific adjustment factor is warranted here because the Air Rules, they argue, are designed for facilities that have an "indefinite or unknown operational life" which could emit pollutants over a 70-year human life, and because, they also argue, this a unique situation where the mine's operational life is known and is shorter than 70 years. *See* PRI at 43-44. This is wrong. There is nothing novel about a short-term source, and the Air Rules explicitly address short-term sources in Section 210.

The Air Rules define short-term source as "[a]ny new stationary source . . . with an operational life no greater than five (5) years from the inception of any operations to the cessation of actual operations." Air Rules 007.08. Under Section 210.15, such short-term sources may utilize a short-term adjustment factor of ten times to demonstrate compliance with the acceptable ambient concentrations of arsenic. Thus, the methods in Section 210 specifically address short term sources. DEQ and Perpetua, however, apparently disagree with the way DEQ previously (when it adopted the Air Rules) chose to define short-term sources. But again, DEQ is not free to deviate from the rules or to rewrite them by redefining what qualifies as a short-term source. DEQ must follow the methods in Section 210.

Perpetua also argues that the use of the word "equivalent" in Section 210.12 somehow gives DEQ wiggle room to grant Perpetua a project-specific adjustment factor. But it does not. By way of background, in addition to allowing a 10 times leniency for short-term sources that

are five or less years (Section 210.15), the Air Rules also allow a 10 times leniency for sources that demonstrate "T-RACT" (Section 210.12). The T-RACT rules explain how to determine whether a source like Perpetua's which has been granted T-RACT complies with the TAPs requirements:

> Compare the source's . . . approved T-RACT ambient concentration at the point of compliance for the toxic air pollutant to the amount of the toxic air pollutant that would contribute an ambient air cancer risk probability of less than one to one hundred thousand (1:100,000) (which amount is equivalent to ten (10) times the applicable acceptable ambient concentration listed in Section 586).

Air Rules, 210.12.b (emphases added).

Here, DEQ granted Perpetua's T-RACT, but when it compared the SGP's annual average ambient arsenic concentrations to 10 times the annual acceptable ambient concentration for arsenic listed in Section 586 (as 210.12.b instructs DEQ to do), DEQ and Perpetua determined that the SGP would exceed that value. *See* Pet'rs' Opening Br. pp. 41-42. This is when DEQ made up the "project specific adjustment factor." This never-before-used tactic artificially reduces the apparent concentration of arsenic to a mere 23% (16/70 x 100) of what the arsenic concentration will actually be (based on Perpetua and DEQ's modeling) each year during the Project.

Perpetua argues that where Section 210.12.b directs DEQ to compare the ambient arsenic concentration to the "equivalent" of 10 times the value listed in Section 586, that use of the term "equivalent" instead of "equal" gives DEQ the option to compare the SGP's arsenic concentrations to something else. The plain reading of 201.12.b is clear: compare the ambient arsenic concentrations for Perpetua's project to 10 times the acceptable ambient arsenic concentration in Section 586. The idea that the use of term "equivalent" creates an ambiguity that

allows DEQ to grant even more than a 10 times leniency to Perpetua is absurd. By being granted T-RACT, Perpetua was already given a large leniency: 10 times the arsenic concentrations that would otherwise be allowable. T-RACT does not allow additional leniency beyond that.

Ultimately, DEQ's use of the project specific adjustment factor here was not made "[u]sing the methods provided in Section 210;" yet that it was Section 203.03 requires DEQ to do. Using the methods in Section 210, including granting Perpetua's T-RACT demonstration, the SGP was modeled to cause ambient arsenic concentrations that exceed 10 times the acceptable arsenic value in Section 586. *See* Pet'rs' Opening Br. pp. 41-42. To get around this problem, instead of limiting the SGP's throughput, or imposing other conditions to reduce arsenic emissions, DEQ made up a new approach that deviates from the specific numeric methods set forth in Section 210.

Additionally, DEQ argues that arsenic emissions won't be that high because it used the worst-case scenario: the permit bases emissions on "total ore production" which "is <u>over fifty percent greater</u> than the actual potential mine production." DEQ at 30 (emphasis in original). But DEQ cannot reasonably base its decision that arsenic emissions will not exceed the AAAC (or adjusted AAAC) based on emissions calculations it did not perform and certainly against the mandate that agency's make decisions based on substantial evidence in the record and not in an arbitrary and capricious manner. Furthermore, any limitations to ore production limits that are placed in the permit are based on the modeling. If DEQ is going to rationalize that arsenic emissions won't exceed the adjusted AAAC because production won't be as high as was modeled, it needs to put those production limits as enforceable limitations in the permit. There is no indication that it has done that. *See* DEQ at 30-31.

In summary, DEQ failed to follow its own rules. Agencies are not afforded deference to deviate from the plain language of their rules. What is more concerning is the precedent that will be set for future projects in Idaho if this Board sanctions DEQ's deviation from the Idaho Air Rules by the use of project-specific methods, procedures, and adjustments, shielded from review in the name of agency deference. The Board therefore must set aside the permit, and remand to DEQ to ensure the Project complies with the Air Rules' arsenic protections.

CONCLUSION

For the foregoing reasons, Petitioners request that the Board issue an order reversing the Office of Administrative Hearing's preliminary order, vacating or setting aside the Permit, and remanding it back to DEQ for further consideration.

Attorney for Save the South Fork Salmon

BEFORE THE BOARD OF ENVIRONMENTAL QUALITY
STATE OF IDAHO

IN THE MATTER OF AIR QUALITY PERMIT TO CONSTRUCT P-2019.0047	)	Agency Case No. 0101-22-01
	)	OAH Case No. 23-245-01
NEZ PERCE TRIBE, IDAHO CONSERVATION LEAGUE, and SAVE THE SOUTH FORK SALMON	)	**PETITIONERS' OPPOSITION TO DEQ AND PERPETUA'S JOINT MOTION TO SUPPLEMENT RECORD WITH DEQ RESPONSE TO EPA LETTER**
Petitioners,	)	
v.	)	
IDAHO DEPARTMENT OF ENVIRONMENTAL QUALITY,	)	
Respondent,	)	
and	)	
PERPETUA RESOURCES IDAHO, INC.	)	
Intervenor-Respondent.	)	

Petitioners Nez Perce Tribe, Idaho Conservation League, and Save the South Fork Salmon submit this brief in opposition to Respondent Idaho Department of Environmental Quality ("DEQ") and Respondent-Interventor Perpetua Idaho Resources, Inc. ("Perpetua") Joint Motion to Supplement Record with the DEQ's Response to the August 10, 2023 EPA Region 10 Letter to Idaho DEQ ("Mtn. to Suppl.").

ARGUMENT

Although the Board may take evidence "to assist the parties' development of the record," the Board "may exclude evidence that is irrelevant [or] unduly repetitious." IDAPA 40.11.01.600. Here, neither DEQ nor Perpetua cite the November 22, 2023 DEQ Letter to Mr. Casey Sixkiller, EPA Regional Administrator for Region 10 ("DEQ Response Letter") in their briefs before this Board; DEQ and Perpetua also claim that the DEQ Response Letter only "includes factual information or data that is already within the existing record." Mtn. to Suppl. at 5. The letter, thus, lacks probative value and provides nothing but repetitious information that is already available in the extensive administrative record submitted by Petitioners, DEQ, and Perpetua through the petition process in front of the Office of Administrative Hearings that includes:

- A 505-page Statement of Basis that provides DEQ's rationale for approving the Permit, REC 410-914;
- An 86-page Response to Comments that provides DEQ's response specific to Petitioners' concerns raised in their comment letters, REC 915-1000;
- Over 2,000 pages of documents that were before DEQ in making its decision and are part of the agency record in this case; and
- An additional, post-decisional declaration submitted by DEQ further rationalizing its decision to approve the Permit during briefing in front of the Office of Administrative Hearings. REC 1233-55.

The DEQ Response Letter should thus not be admitted into the record for that reason alone.

What is more, instead of ensuring fairness and completeness, supplementing the record with DEQ's Response Letter risks unfairness, incompleteness, and prejudices Petitioners by introducing the agency's post-hoc justification for approving the Permit, shielded from public scrutiny. *See* Mtn. to Suppl. at 4, 5.

The final Permit was approved on June 17, 2022, and DEQ's decision to approve the Permit based on the information before DEQ from Perpetua, Petitioners, and other commenters during the three-year long public process. REC 367; Pet'rs' Opening Br. at 5-6 (references cited therein). Between that date DEQ issued the Permit and the date of the DEQ Response Letter–about 18 months–the following occurred: DEQ received a letter from EPA regarding its concerns about the Permit approval; DEQ and EPA had two meetings in October 2023, to discuss EPA's concerns; and DEQ wrote a response letter which it submitted to EPA on November 22, 2023, which provides EPA with DEQ's justification for approval of the Permit. Mtn. to Suppl., Decl. of Tiffany Flody ¶ ¶ 3-5. The DEQ Response Letter contains post-hoc rationalizations of DEQ's year-and-a-half old decision.

Moreover, these rationalizations were made behind closed doors and were not part of the public comment periods for the Permit, depriving the public of the opportunity to comment that is granted under the Air Rules.

Finally, admitting the DEQ Response Letter would be unfair and incomplete because this is just a single document post-dating the issuance of the Permit. There may be other new data, communications, meeting notes, and other information that may be probative of the rationale (or lack thereof) for the justifications in the DEQ Response Letter have not been submitted or

offered as part of the agency record in this case.Without opening this contested case up to further discovery on this issue, allowing supplementation of the record with the DEQ Response Letter alone is not fair, creates an incomplete agency record, is prejudicial to Petitioners' case, and undermines the Board's review.

CONCLUSION

Supplementation of the record with the DEQ Response Letter, even with DEQ and Perpetua's suggested limitations on its consideration, does not alleviate either concern that the letter is "unduly repetitive" or risks consideration of evidence without the underlying agency record that purportedly supports the statement in the letter. Hence, the Board should deny DEQ and Perpetua's motion to supplement the record.

Petitioners,

v.

IDAHO DEPARTMENT OF ENVIRONMENTAL QUALITY,

Respondent,

and

PERPETUA RESOURCES IDAHO, INC.,

Intervenor-Respondent.

Case Docket No. 0101-22-01
OAH Case No. 23-245-01

JOINT MOTION TO SUPPLEMENT RECORD WITH MARCH 12, 2024 EPA LETTER

Respondent Idaho Department of Environmental Quality ("DEQ") and Intervenor-Respondent Perpetua Resources Idaho, Inc. ("Perpetua") jointly move to supplement the administrative record with a letter dated March 12, 2024, from the U.S. Environmental Protection Agency ("EPA") to DEQ's Director. EPA's March 12, 2024 letter responds to DEQ's response to EPA's August 10, 2023 letter to DEQ's Director. The history of EPA's August 10, 2023 letter, DEQ's response thereto, and the genesis of the March 12 EPA letter are described in DEQ and Perpetua's joint motion to supplement the record with DEQ's response. REC 3161. This motion is supported by the Declaration of Tiffany Floyd ("Floyd Decl.") and brought pursuant to Idaho Code § 67-5245(7) and IDAPA 04.11.01.600.

ARGUMENT

When reviewing a Preliminary Order, "[t]he head of the agency … for the review of preliminary orders shall exercise all of the decision-making power that he would have had if the agency head had presided over the hearing." Idaho Code § 67-5245(7). Thus, the Board has the authority to take evidence to assist in the development of the administrative record. *See* IDAPA 04.11.01.600; *see also* IDAPA 04.11.01.413 (allowing a hearing officer to accept evidence in the record), 606 (allowing the agency head to rule on objections to the admission of evidence).[1]

Supplementing the record before the Board to include EPA's March 12, 2024 letter is necessary to ensure fairness and the completeness of the record. DEQ and Perpetua have moved to supplement the record with DEQ's response to the August 10, 2023 EPA letter. REC 3161. The March 12, 2024 EPA letter refers to EPA's concerns raised in the August 10, 2023 EPA letter and acknowledges DEQ's work in support of critical assumptions in the Final Permit, technical justifications, and agency processes for the Final Permit. If the August 10, 2023 EPA

[1] The Board's contested case rules incorporate Section 413 and Sections 600-606 of IDAPA 04.11.01. *See* IDAPA 58.01.23.003.08., 13.

letter is relevant to these proceedings, then DEQ's response, and EPA's subsequent correspondence is equally relevant. It is only fair and equitable to supplement the administrative record with the March 12, 2024 EPA letter to ensure the record is complete and accurately reflects the resolution of the August 10, 2023 EPA letter. For those reasons, the Board should allow the admission of March 12, 2024 EPA letter under the same conditions the Hearing Officer allowed consideration of the August 10, 2023 EPA Letter. Just as the August 10, 2023 EPA letter cannot be used to add new allegations of error or factual information that was not already part of the record or "as a proxy for expert testimony from the Petitioners," neither can EPA's subsequent March 12, 2024 letter. *See* REC 3272.

Supplementing the record to include the March 12, 2024 EPA letter does not require additional hearings, further factual development, or remand to the Hearing Officer. Nor will the admission of March 12 2024 EPA letter prejudice Petitioners.

CONCLUSION

In sum, because Petitioners were allowed to supplement the record with the August 10, 2023 EPA letter, the Board should be aware of DEQ's thorough response, and EPA's subsequent communication concluding EPA's concerns. To ensure fairness and the completeness of the record, the Board should supplement the record with the March 12, 2024 EPA letter, subject to the same limitations the Hearing Officer admitted the August 10, 2023 EPA letter.

APPENDIX A

REGION 10 ADMINISTRATOR

SEATTLE, WA 98101

March 12, 2024

Mr. Jess Byrne
Director
Idaho Department of Environmental Quality
1410 North Hilton Street
Boise, Idaho 83706

Dear Mr. Byrne:

Thank you for your letter dated November 22, 2023, in response to my letter dated August 10, 2023, regarding the permit to construct issued to Perpetua Resources Idaho, Inc. With your letter, you included (1) a substantial amount of information and references supporting Idaho Department of Environmental Quality's choice of emission factors for the mining operation and lime manufacturing plant, (2) information and documentation supporting the achievable control efficiencies for fugitive dust control measures and (3) additional information about Perpetua's plans to restrict public access to the site. I appreciate the additional information and you and your staff's time in meeting with me last October.

The U.S. Environmental Protection Agency, Region 10's staff have reviewed and assessed the information you provided. Overall, we believe that this information provides a reasonable basis for IDEQ's emissions estimates for ore processing, lime processing and haul road emission units in the Stibnite Gold Project.

IDEQ's permit relies on permittee-developed plans to ensure the practical enforceability of critical emission limits. In this circumstance, it is particularly important to affirm the adequacy and practical enforceability of emission limits in the permit designed to limit the source's potential to emit to ensure that the National Ambient Air Quality Standards are not violated.

For example, the permit requires that the source submit a fugitive dust control plan for approval, and to operate in compliance with that plan. The permit incorporates the plan prospectively into the permit to make the elements of the plan enforceable. Although the permit outlines the types of measures that need to be addressed in the plan, the permit does not include language requiring that the control measures in the plan, along with the associated monitoring, recordkeeping and reporting needed to make them enforceable, achieve the level of control relied upon in the permitting record. While the EPA acknowledges IDEQ's intent to rigorously review each of these plans for adequacy, the permit language does not require that outcome. The EPA understands that not all details of an approvable plan can be known in advance, but without permit conditions requiring the source to demonstrate that the plans will achieve the required level of control, IDEQ may have limited ability to reject, or require improvements to, a plan that falls short.

With respect to the ambient air boundary designation, the EPA continues to have concerns with IDEQ's acceptance of Perpetua's assertion that members of the general public do not have a legal right of access to areas within the operations area boundary. Regarding the practical exclusion of the general public aspect of the ambient air boundary designation, the permit conditions outlining the requirements for the Access Management Plan, as well as the measures enumerated in the Statement of Basis, are generally consistent with the EPA's December 2, 2019, *Revised Policy on Exclusions from "Ambient Air."* However, the permit conditions may not adequately manage public use of the access road (i.e., where Perpetua is allowing access). The approved plan should include measures to maintain continuous monitoring of the public's movements while they are using the road to traverse the mine site.

The information that you submitted on November 22, 2023, along with the subsequent staff level conversations, have improved the EPA's understanding of the Permit. This information is the basis for emission estimation of critical processes at Perpetua Resources Idaho, Inc., and as support for certain critical assumptions underlying the permit, such as the high level of fugitive dust control. We encourage IDEQ to make this information available to the public. We also encourage the permittee-developed plans, as required by the permit for fugitive dust and access control, be made available to the public, after those are approved by IDEQ.

Moving forward, we expect that all information relied upon to issue permits by the State of Idaho's permitting program be made available for public review at the time that draft permits are made available for public comment.

Finally, as we previously discussed, I will continue to work with other federal agencies to determine whether any changes to the permit would be needed to address the Nez Perce Tribe's treaty rights. If you would like additional information, please feel free to contact me or have your staff contact Dr. Karl Pepple, Branch Manager, Air Permits and Toxics Branch, at (206) 553-1778 or pepple.karl@epa.gov.

Sincerely,

CASEY SIXKILLER Digitally signed by CASEY SIXKILLER Date: 2024.03.12 11:47:27 -07'00'

Casey Sixkiller

BEFORE THE BOARD OF ENVIRONMENTAL QUALITY
STATE OF IDAHO

IN THE MATTER OF AIR QUALITY PERMIT TO CONSTRUCT P-2019.0047 NEZ PERCE TRIBE, IDAHO CONSERVATION LEAGUE, and SAVE THE SOUTH FORK SALMON, Petitioners, v. IDAHO DEPARTMENT OF ENVIRONMENTAL QUALITY, Respondent, and PERPETUA RESOURCES IDAHO, INC., Intervenor-Respondent.	Agency Case No. 0101-22-01 OAH Case No. 23-245-01 **NOTICE OF SPECIAL MEETING OF THE BOARD OF ENVIRONMENTAL QUALITY | APRIL 8, 2024**

NOTICE IS HEREBY GIVEN that the Board of Environmental Quality has scheduled a special meeting for the purpose of holding an executive session pursuant to Idaho Code § 74-206(1)(f) to communicate with legal counsel to discuss the ramifications of and legal options regarding this pending contested case. Because the Board will not take any action at this meeting, the parties are invited but not required to attend.

The special meeting will be held on April 8, 2024, at 11:00 a.m. Mountain Time in conference rooms A and B at the Department of Environmental Quality State Office, 1410 N. Hilton, Boise, Idaho, with a Microsoft Teams link available for remote attendance. The meeting location and Teams link are available in the Meeting Notice posted at https://www.deq.idaho.gov/board-of-environmental-quality/.

Dated this 22nd day of March, 2024.

BEFORE THE BOARD OF ENVIRONMENTAL QUALITY

STATE OF IDAHO

IN THE MATTER OF AIR QUALITY PERMIT TO CONSTRUCT P-2019.0047	Case Docket No. 010-22-01 OAH Case No. 23-245-01
NEZ PERCE TRIBE, IDAHO CONSERVATION LEAGUE, and SAVE THE SOURTH FORK SALMON, Petitioners, v. IDAHO DEPARTMENT OF ENVIRONMENTAL QUALITY, Respondents, and PERPETUA RESOURCES IDAHO, INC., Intervenor-Respondent.	FINAL ORDER

I. INTRODUCTION

On July 22, 2022, the Nez Perce Tribe, the Idaho Conservation League, and Save the South Fork Salmon (collectively "Petitioners"), filed a *Petition to Initiate Contested Case: Air Quality Permit to Construct P-2019.0047 (Jun. 17, 2022)*, seeking review of the Idaho Department of Environmental Quality's ("DEQ") issuance on June 17, 2022 of Air Quality Permit to Construct P-2019.0047 ("PTC"), to mining company Perpetua Resources Idaho, Inc.

("Perpetua") for its proposed Stibnite Gold Project ("SGP"). REC 0001–0028. Perpetua filed a Petition to Intervene in the matter on August 12, 2022. REC 0040–0043. A Hearing Officer was appointed and the parties participated in discovery and ultimately filed cross-motions for summary judgement. REC 319–322, REC 1204–1206, REC 1276–1278. On October 31, 2023, the Hearing Officer issued a *Preliminary Order*. REC 3280–3328. On November 14, 2023, the Petitioners filed a *Petition for Review* of the *Preliminary Order.* REC 3342–3356. On December 5, 2023, the Hearing Officer issued an *Amended Preliminary Order*. REC 3372–3425. In response, the Petitioners filed an *Amended Petition for Review* that requested review by the Board of Environmental Quality of both the October 31, 2023 *Preliminary Order* and the December 5, 2023 *Amended Preliminary Order*. REC 3426–3441.

The *Amended Petition for Review*, claims the following errors with the PTC:

1. That DEQ erred in finding Perpetua has legal control of the Stibnite Road Access Route such that the Route need not comply with ambient air quality standards.

2. That DEQ erred in finding Perpetua will be able to practically and physically preclude the general public from accessing locations within the ambient air boundary.

3. That DEQ violated the Air Rules[1] by allowing Perpetua to submit plans with project details after the PTC was issued and without allowing for public comment on the plans.

4. That the PTC does not include enforceable conditions that will achieve 93.3% dust control.

5. That DEQ violated the Air Rules when calculating the ambient arsenic concentrations attributable to the SGP by diluting them by 16/70.

REC 3427–3428.

[1] The "Air Rules" are found at IDAPA 58.01.01.

The Board of Environmental Quality has the authority to review Preliminary Orders pursuant to I.C. § 67-5245(2) and IDAPA 58.01.23.730. The Parties presented briefs on the issues in this matter and participated in oral argument on March 14, 2024.

II. STANDARD OF REVIEW

In making its decision on the *Amended Petition for Review* the Board of Environmental Quality "shall exercise all the decision-making power that [it] would have had if the agency head had presided over the hearing." I.C. § 67-5245(7). This means that the Board of Environmental Quality can take a "de novo" or completely new look at the facts and issues. The Board of Environmental Quality must determine whether DEQ "has acted reasonably and in accordance with law" when issuing the Permit. *See* I.C. §§ 67-5248(a) and 67-5279; *In the Matter of Sunnyside Park Utilities' Application for Sewage Disposal Permit*, Final Order on Petition for Review of Preliminary Order, at p. 10 (BEQ Dkt. 0103-07-02, April 7, 2009).

The case before the Hearing Officer was decided on summary judgment. A motion for summary judgment must be granted if "the movant shows that there is no genuine dispute as to any material fact and the movant is entitled to judgment as a matter of law." I.R.C.P. 56(a). Facts relied on by the parties must be supported by "citing to particular parts of materials in the record, including depositions, documents, electronically stored information, affidavits or declarations, stipulations . . . admissions, interrogatory answers, or other materials . . .." I.R.C.P. 56(c)(1). If the Board of Environmental Quality determines that a party has failed to "properly support an assertion of fact or fails to properly address another party's assertion of fact as required by Rule 56(c) . . . [it may] (1) give an opportunity to properly support or address the fact; (2) consider the fact undisputed for purposes of the motion; (3) grant summary judgment if the motion and

supporting materials, including the facts considered undisputed, show that the movant is entitled to it; or (4) issue any other appropriate order." I.R.C.P. 56(e).

III. ANALYSIS

1. DEQ Acted Reasonably and in Accordance with Law when it Found Perpetua has Legal and Practical Control of the Stibnite Access Route such that it Could be Excluded from the Ambient Air Boundary.

Petitioners assert that there was insufficient evidence in the record for DEQ to determine that Perpetua has legal and practical control over the Stibnite Access Route such that the Route could be excluded from the ambient air boundary. Under the federal Clear Air Act, EPA is required to establish national ambient air quality standards ("NAAQS") for "criteria" pollutants, which include particulate matter PM_{10}.[2] *See generally* 42 U.S.C. § 7602(t); 40 C.F.R. § 50.6. When DEQ evaluates an application for permit to construct, it must determine that the "stationary source or modification would not cause or significantly contribute to a violation of any ambient air quality standard." IDAPA 58.01.01.203.02. Ambient air is "[t]hat portion of the atmosphere, external to buildings, to which the general public has access." IDAPA 58.01.01.006.05. Any portion of the atmosphere that is not ambient air need not comply with NAAQS.

The EPA has issued guidelines that further elucidate the meaning of "ambient air". REC 1138–1149. The EPA Guidelines provide that the "general public" includes "any person(s) other than those who are permitted access to the property as employees or business invitees of a specific stationary source (including trespassers)." REC 1145 The EPA Guidelines also describe two aspects to consider when determining whether there will be access by the general public. The "first aspect of the access element (i.e. legal access) concerns whether the general public has

[2] PM_{10} is "all particulate matter in the ambient air with an aerodynamic diameter less than or equal to ten (10) micrometers." IDAPA 58.01.01.006.35.

the right or permission to enter a specific property . . . (i.e. the source has legal authority, via ownership or control to preclude access by the public)." REC 1145. The "second aspect of the access element (i.e. physical or practical access) addresses whether the general public is able to, under actual circumstances, enter a particular parcel of land." REC 1145. A "rule of reason" should be used to evaluate whether physical or practical access will be restricted. REC 1147. The evaluation should include consideration of relevant factors:

> [S]uch as the nature of the measure used (e.g. physical or non-physical), source location, type, and size of the source and property to be excluded, surrounding area (including the proximity, nature, and size of the population in the area), and other factors affecting whether the members of the general public would readily be able to trespass upon or otherwise have access to the sources' property.

REC 1147.

a. There is Sufficient Evidence to Demonstrate Perpetua Will have Legal Control Over Access to the Ambient Air Boundary.

The land ownership within the SGP is a patchwork of federal and private ownership. REC 415. The parties do not appear to dispute that Perpetua will have legal control over the lands in private ownership. The federal lands within the project boundary are owned by the United States Forest Service ("USFS"). Perpetua will have to obtain permission from the USFS, to operate the mine. Part of obtaining permission from the USFS will involve an evaluation of the project under the National Environmental Policy Act ("NEPA"). During the NEPA process, the USFS will evaluate continuing access to the SGP by the general public. The record demonstrates that "[o]ne of the alternatives currently being evaluated in the Draft environmental impact statement (EIS), Alternative 2, would provide continuing access through the SGP site on a realigned Stibnite Road during mine operations." REC 893. However, it is noted that the "implementation of this Plan [Alternative 2 with continuing public access through the site] is

contingent upon the selection of the applicable alternative by the USFS as the preferred alternative for the SGP and inclusion of the proposed Stibnite Road access route as a component of the approved SGP." REC 893, *see also* REC 895–896 (describing alternatives for alignment of the access route.).

The NEPA process is not yet complete, and no final EIS has been issued by the USFS. Transcript p. 38, ln. 12. Thus, the record does not contain any evidence that the USFS will require continuing public access through the SGP. DEQ recognized at oral argument that, should the USFS ultimately require public access through the SGP, the ambient air boundary analysis will have to be reevaluated. Transcript p. 88 ln. 19–p.89 ln. 17. The Board of Environmental Quality will not speculate as to the outcome of the USFS NEPA process and finds there is not sufficient evidence to support a conclusion that Perpetua will not have legal authority to control access to the federal lands within the project boundaries.

Petitioners additionally argue that it was impermissible for DEQ to rely on the following statement in Perpetua's application form when it determined Perpetua would have legal control over access to the SGP: "Midas Gold [Perpetua] will legally control the SGP, an active industrial site where mining activities will occur, such as heavy equipment operation. . . . Midas Gold [Perpetua] has established an operations boundary to identify the area where public access will be excluded." REC 1807. The Air Rules require that "all documents, including but not limited to, application forms for permits to construct . . . must contain a certification by a responsible official. The certification must state that, based on information and belief formed after reasonable inquiry, the statements and information in the document are true, accurate, and complete." IDAPA 58.01.01.123. The Air Rules also provide: "Persons are prohibited from

knowingly making any false statement, representation, or certification in any form, notice, or report. . . ." IDAPA 58.01.01.125.

It was reasonable for DEQ to rely on Perpetua's representations in its application form that it would have legal control over access to the Stibnite Road Access Route. Other than the USFS NEPA process addressed above, Petitioners have cited no evidence suggesting that Perpetua will not have legal authority to prevent the general public from accessing the ambient air boundary. Therefore, the Board of Environmental Quality finds DEQ acted reasonably in relying on Perpetua's representations in its PTC application that it would have legal authority over access to the SGP.

b. The PTC Contains Enforceable Conditions that Will Preclude Practical Access to the Ambient Air Boundary by the General Public.

Petitioners also assert that Perpetua will not have physical or practical control over access to the SGP property. However, the Board of Environmental Quality finds that there are substantial conditions in the PTC that require Perpetua to implement practical and physical restrictions on access to the SGP by the general public. Permit Condition 2.7 requires Perpetua to "observe all primary access points to preclude unauthorized public access" including providing "onsite personnel" for that purpose. REC 376. It further requires monitoring of primary public access to the facility "by use of security escort vehicles or manned guardhouses or . . . by the use of locked gates, barriers, or equivalent measures." REC 376. Condition 2.7 also requires monitoring secondary public access to the facility by "post[ing] warning signs and periodically patrol[ling]" the secondary access points and providing "onsite personnel" for that purpose. REC 376. Perpetua is also required to describe its plans for precluding access in an Access Management Plan ("AMP") that includes "identifying the access points monitored, the frequency of patrol, and measures employed to discourage access (e.g., locked gates, barriers,

natural features, etc.)." REC 376. Condition 2.7 also provides: "Only registered guests of the facility will be allowed access to or through the facility. Those seeking to be a guest for the sole purpose of passing through the facility to another destination shall be provided a registration sheet that explains Perpetua's requirements for accessing the site and identifies potential hazards of the site." REC 376. Finally, Condition 2.8 requires that Perpetua file an AMP with DEQ for approval 30 days before startup.

At least one version of an AMP was provided to DEQ in April 2020. REC 893–897. That version provides additional details of the types of access control that Perpetua plans to provide. REC 896–897. That plan specifically addresses measures to be taken with regard to persons wishing to pass through the SGP:

> Signage would be placed at the North Security Gate . . . and the Main (South) Security Gate . . . entry points to provide information to travelers, and guard shacks would be located at each SGP Site entry gate to monitor all vehicle ingress/egress. To ensure passage through the site in a safe and timely manner, persons wishing to traverse the SGP site on the Stibnite Access Road access route would be required to check in at the security gate upon entry to receive a safety briefing and to alert mine staff to their presence. After passing through the SGP site, travelers would also be required to stop at the guard shack upon exiting to check out. Travelers would not be allowed to stop or loiter while traveling through the operations area. Along its full length, the Stibnite Road access route would have appropriate signage to direct travelers and would be separated from mine haul roads and areas of mine operations by fencing, berms, or gates to prevent travelers from straying from the route.

REC 896. This description makes clear that access to the SGP and the Stibnite Access Road Route will only be available under a very limited basis and not to the "general public." Allowing some access by non-employees to facilities, such as the SGP, is common. *See e.g.* Transcript pg. 83 ln. 16–pg. 85 ln. 10. Those persons who are allowed limited access are subject to additional measures that would not apply to the "general public." *See e.g.* REC 896. Therefore, the mere

fact that some limited access through the SGP over the Stibnite Access Road will be allowed does not mean that access will be provided to the "general public" such that the road should be considered ambient air.

Thus, Conditions 2.7 and 2.8 require Perpetua to maintain physical and practical control of access to the SGP. Petitioners have provided no evidence demonstrating that these conditions are unenforceable. Therefore, the Board of Environmental Quality finds that there is sufficient evidence in the record to support DEQ's conclusion that Perpetua has physical and practical control over the Stibnite Road Access Route such that it may be excluded from consideration as ambient air.

2. DEQ Acted Reasonably and in Accordance with Law When it Allowed Perpetua to Submit Some Plans After the PTC was Issued.

Petitioners assert that DEQ violated the Air Rules by allowing Perpetua to submit some plans after the PTC was issued. The Air Rules provide the types of information that must be submitted with an application for PTC:

> Depending upon the proposed size and location of the new or modified stationary source or facility, the application for a permit to construct must include all information required by one or more of the following provisions:
>
> a. For any new or modified stationary source or facility:
>
> i. Site information, plans, descriptions, specifications, and drawings showing the design of the stationary source, facility, or modification, the nature and amount of emissions (including secondary emissions), and the manner in which it will be operated and controlled.

IDAPA 58.01.01.202.01.a.i. The rules require that an "opportunity for public comment will be provided on all applications requiring a permit to construct." IDAPA 58.01.01.209.c. The Air Rules further provide: "Any additional information, plans, specifications, evidence or documents

that the Department may require to make the determinations required under Section 200 through 225 shall be furnished upon request." IDAPA 58.01.01.202.03.

Petitioners focus on the requirement that the application include information about "the manner in which it [the project] will be operated and controlled," arguing that this language means that any plans describing operation and control must be submitted with the application and before the PTC is issued. Petitioners assert that DEQ erred in allowing a Fugitive Dust Plan, Haul Road Capping Plan, Operation and Maintenance Manual, and Access Management Plan to be submitted after the PTC was issued. *Petitioner's Opening Brief* at 29.

Rule 202 requires the applicant provide sufficient information with its application for DEQ to develop the PTC. IDAPA 58.01.01.202.01.a.i. In this case, Perpetua submitted considerable information with its application for PTC. *See* REC 1506–1643. This included information about its emissions units (REC 1512–1592), emissions unit control systems (REC 1593-1620), the nature and amount of emissions (REC 1621–1628), air emission modeling (REC 1634–1643), emission controls (REC 1771–1773), and proposals for T-RACT (REC 1952-1958). This information was subject to scrutiny by the public. Transcript pg. 97, ln. 11–20. After evaluating this information, allowing for public comment, and responding to public comment, DEQ issued the PTC. Transcript pg. 97, ln. 11–20, *see also* REC 921–982 (DEQ's responses to public comments).

It was reasonable for DEQ to allow certain plans and information to be submitted after the PTC is issued. This common DEQ practice is not in violation of Air Rule 202.03 because certain details simply cannot be known at the time an application is filed. For instance, it would be impractical to require an applicant to provide detailed information regarding the application of T-RACT dust control measures before the T-RACT has been evaluated and approved by DEQ.

The applicant must first know that it will be required to use water and chemical suppressants to achieve 93.3% dust control before it is able to submit a detailed plan regarding its methods for applying the water and chemical suppressant to achieve that requirement. Requiring all plans to be submitted up front with the application form is not practical and is not required by the Air Rules. To the contrary, IDAPA 58.01.01.202.03 specifically provides that DEQ has the discretion to require additional information be "furnished upon request." Therefore, the Board of Environmental Quality finds that DEQ did not violate the Air Rules by allowing some information and plans to be submitted after the PTC was issued.

3. The PTC Contains Enforceable Conditions that Will Achieve 93.3% Dust Control.

Petitioner's do not argue that the 93.3% dust control analysis performed by DEQ was inadequate or that it is not possible to achieve 93.3% dust control for the SGP. Transcript pg. 69 ln. 8– ln. 14; *see also* Transcript pg. 99 ln. 18–24, Transcript pg. 137 ln. 1– ln. 8. Rather, Petitioners assert that the PTC does not contain enforceable conditions that will ensure that 93.3% dust control is achieved. Transcript pg. 69 ln. 15–ln. 21.

The PTC, however, contains multiple conditions that require Perpetua to take specific steps to achieve 93.3% dust control. Condition 2.1 provides for specific precautions to be used to control fugitive dust including use of water and chemicals for dust control during demolition of existing buildings and on road surfaces, installation, where practical, of hoods and fans, covering open body trucks, and paving roadways. REC 374. Condition 2.2 provides that, every 12-hours, Perpetua must monitor and record the "frequency and methods used (e.g. water chemical dust suppressants) to reasonably control fugitive dust emissions." REC 374. Condition 2.3 requires Perpetua to "maintain records of all fugitive dust complaints received . . . [and] take appropriate corrective action as expeditiously as practicable after receipt of a valid complaint."

REC 374. Condition 2.4 requires daily inspection of potential sources of fugitive dust emissions, taking action to remedy any dust discovered, and keeping records of each inspection. REC 374. Condition 2.5 requires fugitive dust control measures be applied to haul roads "such that visible emissions from vehicle traffic . . . do not exceed 10% opacity." REC 375. Condition 2.6 requires development of a Fugitive Dust Plan to ensure compliance with fugitive dust requirements and provides an extensive list of measures and precautions that should be implemented. REC 375–376. And finally, a requirement in Table 3.1 specifically states that 93.3% dust control is required: "Control efficiency: 93.3% for PM/PM10 (haul roads)." REC 384.

The conditions in the permit are control efficiencies. As explained at oral argument, the conditions set forth certain steps that must be taken to control fugitive dust emissions. Transcript pg. 103 ln. 20–pg. 105 ln. 21; pg. 136 ln. 6–ln. 19. If the measures listed in Conditions 2.1–2.6 are taken, then the outcome will be 93.3% dust control. If those steps are not taken, Perpetua would be in violation of its PTC. And Table 3.1 makes clear that the control efficiencies must result in 93.3% dust control. REC 384. Therefore, the Board of Environmental Quality finds that the PTC contains numerous enforceable conditions that will result in 93.3% dust control.

4. DEQ Did Not Act Reasonably and in Accordance with Law When it Analyzed the Ambient Arsenic Air Concentrations for the SGP.

Petitioners assert that DEQ acted unreasonably when it diluted the ambient arsenic air concentrations by applying a 16/70 factor in its calculations. The Board of Environmental Quality agrees that there was insufficient evidence to support DEQ's analysis of the ambient arsenic air concentrations.

a. Overview of the Air Rules Requirement for Determining Ambient Arsenic Concentrations.

The Air Rule requirements for toxic pollutants begin with IDAPA 58.01.01.161. Section 161 is the over-arching policy or qualitative standard that should be applied to the emission of toxic contaminants such as arsenic. It provides: "Any contaminant that is by its nature toxic to human or animal life or vegetation ***must not be emitted in such quantities or concentrations as to alone, or in combination with other contaminants, injure or unreasonably affect human life or vegetation.***" (emphasis added). To obtain a permit to construct an applicant must demonstrate, to the satisfaction of the Department:

> ***Using the methods provided in Section 210***, the emissions of toxic air pollutants from the stationary source or modification would not injure or unreasonably affect human or animal life or vegetation ***as required by Section 161***. Compliance with all applicable toxic air pollutant carcinogenic increments and toxic air pollutant non-carcinogenic increments demonstrates preconstruction compliance with Section 161 ***with regard to the pollutants listed in Section 585 and 586.***

IDAPA 58.01.01.203.03 (emphasis added). Thus, if a toxic air pollutant is listed in IDAPA 58.01.01.585 or 586, ("Section 586") it must be evaluated under the methods provided in Section 210.

Arsenic is listed in Section 586 of the Air Rules which consists of a table that lists each carcinogenic[3] toxic air pollutant that is covered by the rules. Section 586 includes "the screening emissions levels (EL) and acceptable ambient concentrations (AACC)" for each toxic carcinogenic pollutant listed. The EL listed for arsenic is "1.5E-06 lb/hr" and the AACC for arsenic is "2.3E-04 µg/m^3." The AACC is the carcinogen concentration in air in which daily exposure would limit the risk of cancer to 1 in 1 million over a lifetime, which is identified as 70

[3] A carcinogen is an agent capable of inducing cancer. Cancer is a disease of heritable, somatic mutations affecting cell growth and differentiation, characterized by an abnormal, uncontrolled growth of cells.

years. The AACCs listed in the table in Section 586 are based on "annual averages." IDAPA 58.01.01.586.

Section 210.01 provides that the applicant must first identify what toxic air pollutants will be emitted by the project. IDAPA 58.01.01.210.01. Then the applicant must use "standard scientific and engineering principles and practices to estimate the emission rate" of the pollutant. IDAPA 58.01.01.210.02.a.[4] If the EL exceeds the levels listed in Section 586, then the applicant must continue with further analysis under Section 210.

The Applicant must then use "the modeling methods provided in Subsection 202.02 to estimate the ambient concentrations at specific receptor sites for any toxic air pollutant emitted from the point(s) of emission." IDAPA 58.01.01.210.03.a.[5] The "point of compliance is the receptor site that is estimated to have the highest ambient concentration of the toxic air pollutant of all the receptor sites . . .." IDAPA 58.01.01.210.03.b. Preconstruction compliance for toxic pollutants can be demonstrated using any of the methods "described in Subsection 210.05

[4] The "uncontrolled emissions rate" is "calculated using the maximum capacity of the source . . . without the effect of any physical or operational limitations." IDAPA 58.01.01.210.02.b.

The "controlled emissions rate" is "calculated using the maximum capacity of the source . . . with the effect of any physical or operational limitations that has been specifically described" by the applicant and submitted to DEQ. IDAPA 58.01.01.210.02.c.

The "T-RACT emissions rate" is "calculated using the maximum capacity of the source . . . with the effect of any physical or operational limitation other than control equipment that has been specifically described" by the applicant" and "an emission standard that is T-RACT." IDAPA 58.01.01.210.02.d.

[5] Section 202.02 provides that modeling "must be based on the applicable air quality models, data bases, and other requirements specified in 40 CFR Part 51, Appendix W (Guideline on Air Quality Models). Where an air quality model specified in the "Guideline on Air Quality Models" is inappropriate, the model may be modified or another model substituted, subject to written approval of the EPA Administrator and public comment pursuant to Subsection 209.01.c; provided that modifications and substitutions or models used for toxic air pollutants will be reviewed by the Department."

through 210.08 and may use any applicable specialized method described in Subsection 210.09 through 210.12." IDAPA 58.01.01.210.04.[6]

Most applicable here are the compliance methods described in Section 210.12, which provides for the use of T-RACT to demonstrate preconstruction compliance for toxic pollutants listed in Section 586. T-RACT stands for "Toxic Air Pollutant Reasonably Available Control Technology" and "is an emission standard based on the lowest emission of toxic air pollutants that a particular source is capable of meeting by the application of control technology that is reasonably available, as determined by the Department, considering technological and economic feasibility." IDAPA 58.01.01.210. The applicant must comply with IDAPA 58.01.01.210.13 and 210.14 to first get the T-RACT approved by DEQ before it can be used in the modeling. If T-RACT is used it allows for a comparison of:

> [T]he source's . . . approved T-RACT ambient concentration at the point of compliance for the toxic air pollutant to the amount of the toxic air pollutant that would contribute an ambient air cancer risk probability of less than one to one hundred thousand (1:100,000) (which amount is equivalent to ten (10) times the applicable acceptable ambient concentration listed in Section 586).

IDAPA 58.01.01.210.12.b. Thus, if the source's approved T-RACT ambient concentration meets the AACC listed in Section 586 times 10, then "no further procedures for demonstrating preconstruction compliance will be required for that toxic air pollutant as part of the application process." IDAPA 58.01.01.210.12.c. DEQ must then include appropriate conditions in the permit to ensure that the T-RACT is implemented so that the 10-times ambient concentrations

[6] Section 210.05 Uncontrolled Emissions; Section 210.06 Uncontrolled Ambient Concentration; Section 210.07 Controlled Emissions, Section 210.08 Controlled Ambient Emissions; Section 210.09 Net Emissions; Section 210.10 Net Ambient Concentration; Section 210.11 Toxic Air Pollutant Offset Ambient Concentration; Section 210.12 T-RACT Ambient Concentration for Carcinogens.

can be met. IDAPA 58.01.01.210.12.d. Thus, the Air Rules establish two acceptable cancer risk levels—1 in 1,000,000 (the AACC level) and 1 in 100,000 (the T-RACT level).

Section 210 provides one further analysis that has bearing in this case. Section 210.15 provides that "short term" projects "may utilize a short-term adjustment factor of ten (10). For a carcinogen, multiply either the applicable acceptable ambient concentration (AACC) or the screening emission rate, but not both, by ten (10), to demonstrate preconstruction compliance." IDAPA 58.01.01.210.15. "Short Term Source" is defined as any new stationary source "with an operational life no greater than five (5) years from the inception of any operations to the cessation of actual operations." IDAPA 58.01.01.007.08. Thus, short term sources are also allowed 10 times the AACC, which would represent a 1 in 100,000 cancer risk, as long as the operational source life is no greater than five (5) years.

b. Overview of the Ambient Air Concentration for Arsenic Analysis Performed by DEQ.

DEQ performed its analysis of ambient arsenic levels by first determining that the levels of arsenic that would be generated by the project exceeded the EL levels found in Section 586. REC 1760. Then DEQ modeled the arsenic levels using the "simple" method described by Kevin Schilling in his declaration. *See* REC 1241. Even after some refinements to this "simple" method, however, DEQ determined that "compliance could not be demonstrated using the typical approach . . .." REC 1241.

DEQ then "undertook the task of evaluating whether a more refined approach could be used to demonstrate compliance with TAP rules of Section 210." REC 1242. The first step in the refinement was to apply the T-RACT analysis under Section 210.12. REC 1242. However, after applying the T-RACT analysis, DEQ determined that: "[c]onsideration of T-RACT in the analyses still resulted in modeled arsenic impacts exceeding a value of 10 times the AACC."

REC 1242, *see also* REC 1242–1243 ("A worst-case conservative but simplistic approach used for the SGP did not show compliance with the arsenic AACC, or even the AACC multiplied by a factor of ten to reflect the allowable impact when using T-RACT.") DEQ went on to explain:

> Faced with this problem, there were effectively two options: 1) revision of the emission calculation and modeling methods, using those that would be less conservative (less of a tendency to overestimate emission quantities that could occur) and perhaps more complicated; or 2) refine the exposure calculation to better account for the dynamic nature of emission-generating activities and the limited project lifetime.

Ultimately, DEQ decided to use the latter method. REC 1243–1244, *see also* REC 698–706.

Rather than returning to the model, DEQ applied an additional analysis that focused on the length of time the project would operate—16 years. DEQ justified this additional analysis using IDAPA 58.01.01.210.15, which allows for an adjustment of the AACC when a project is determined to be "short term" (operating for five years or less). IDAPA 58.01.01.007.08. The applicant stated that the operational lifetime of the mine would be 16 years. REC 1243. However, the AACC levels listed in Section 586 are based on a 70-year lifetime exposure rate. DEQ reasoned, if an adjustment of 10 times is allowed for a short-term (5 year or less) project, then a similar adjustment should be allowed to account for a 16-year project. REC 1243–1244. Using this reasoning DEQ calculated a "project-based arsenic concentration representative of the project, appropriate for comparison to the AACC (based on a 70-year exposure), the modeled impact was adjusted by the factor 16/70." REC 1243.

The mathematical equation used to make this calculation is as follows:

$$LifeExpose_{Wi,j,n} = \left[\left(WEPExpose_{Wi,n}\right)(50\%) + \left(nonWEPExpose_{Sj,n}\right)(50\%)\right]\left[\frac{16\ year\ LOM}{70\ year\ exposure}\right]$$

where:

W*i*	=	West End Pit scenario, where *i* = 1 to 4.
S*j*	=	non West End Pit scenario, where *j* = B1, B2, H1, H2, H3, H4, Y1, Y2, and Y3.
n	=	specific receptor.
$LifeExpose_{Wi,j,n}$	=	lifetime exposure in µg/m^3 for West End Pit scenario *i*, non West End Pit scenario *j*, at receptor *n*.
$WEPExpose_{Wi,n}$	=	annual maximum impact in µg/m^3 for West End Pit scenario *i* at receptor *n*.
$nonWEPExpose_{Sj,n}$	=	annual maximum impact in µg/m^3 for non West End Pit scenario *j* at receptor *n*.
16 year LOM	=	maximum life-of-mine.
70 year exposure	=	Lifetime exposure used for development of AACCs in *Idaho Air Rules*.

REC 710–711.

This equation includes the use of a five-year rolling average and T-RACT adjustments made to the production levels of the West End Pit and the non-West End Pit, as well as the 16/70 adjustment for the life of the mine. These adjustments will be discussed in detail below.

c. DEQ did not Act Reasonably in Using a Five-Year Rolling Average for T-RACT that was not Properly Supported by Permit Conditions.

The AACC's listed in Section 586 are based on annual averages, however, DEQ used a 5-year rolling average when performing its arsenic ambient air concentration calculations. The 135,000 T/day five-year rolling average was added as a T-RACT control. REC 939. As described below, the modeled ambient arsenic concentration calculations were based on the 135,000 T/day, not on 180,000 T/day. REC 710. In the PTC, DEQ limited the daily hauling and excavating limits to "no more than 180,000 tons per day (T/day) of ore and DR" and "not more than 135,000 T/day of ore and DR, based on a 5-year rolling average." REC 385. These conditions, however, would not prevent Perpetua from hauling more than 135,000 T/day, so long

as the overall average is achieved. Perpetua must only achieve the 135,000 T/day over a five-year rolling average period. This means that it could, theoretically, run the mine at 180,000 T/day for a shorter period of time (i.e. one calendar year), but still achieve the overall requirement of 135,000 T/day over the five-year rolling period.[7]

Thus, the five-year rolling average allows for a smoothing out of the peak concentrations of ambient arsenic. For the AACC and T-RACT-AACC to limit cancer risk to 1 in 1 million and 1 in 100,000 respectively, the rule specifies compliance on an annual basis. A five-year rolling average allows considerable daily and annual increases in exposures which are contrary to limits set forth in the Air Rules.

The AACC limits set forth in Section 586 are based on annual averages, and there was no evidence in the record explaining how the five-year rolling average comports with the annual AACC limits. Therefore, the Board of Environmental Quality was unable to determine if a five-year rolling average would be equally protective of ambient air as the AACC limits set forth in Section 586. In addition, use of the five-year rolling average as a T-RACT control was not properly supported by the PTC conditions. As explained above, the PTC conditions were inadequate to ensure that the 135,000 T/day used in the ambient arsenic air concentration analysis would not be exceeded for some portion of the five-year rolling period. Therefore, the Board of Environmental Quality finds that there was insufficient evidence to support use of the five-year rolling average in the ambient arsenic air concentration analysis.

d. There was Insufficient Evidence to Support the T-RACT Analysis Limiting the Non-West End Pit Production Limit.

[7] The PTC also contains a condition limiting the overall lifetime production of the mine to 788.4 million tons. This figure is based on the 135,000 T/day over 16 years. REC 710. Similar to the five-year rolling average, however, the overall limitation to 788.4 million tons would not provide a limitation on the daily amount of hauling that could occur, so long as the total 16-year amount is not exceeded.

As part of the T-RACT analysis, DEQ also limited the West End Pit production as a means of controlling ambient arsenic concentrations. REC 710. As shown in the mathematical equation above, the West End Pit exposure was adjusted by 50%. REC 710. This adjustment is properly reflected in PTC Condition 3.6 which requires that the permittee "shall haul no more than 394.2 MT [million tons] of ore and DR from the West End deposit over the life of the mine." REC 385.

However, the equation listed above shows that the non-West End Pit production was also limited by 50%. REC 710. The Board of Environmental Quality was unable to determine from the record where this 50% reduction came from or whether it was actually applied when doing the calculation. Other than the equation, the Board of Environmental Quality could not identify any evidence discussing a 50% reduction in the non-West End Pit production. In addition, the PTC does not contain any conditions limiting the non-West End Pit production to 50%. PTC Condition 3.6 makes clear that all production (both West End and Non-West End Pit) is limited to 788.4 million tons, which is based on 135,000 T/day over the 16 year life of the mine. REC 710. And, as noted above, Condition 3.6 also makes clear that the West End Pit production is limited to 50%. *See* REC 385 ("The permittee shall haul no more than 788.4 million tons (MT) of ore and DR from all deposits over the life of the mine and no more than 349.2 MT of ore and DR from the West End deposit over the life of the mine."). However, the Board of Environmental Quality could not identify a PTC condition that would limit the non-West End Pit production by 50%. Therefore, there was insufficient evidence in the record to demonstrate exactly how or whether the non-West End Pit production was limited and, if it was, the Board of Environmental Quality could not find any PTC conditions able to enforce that reduction.

e. DEQ Did Not Act Reasonably and in Accordance with Law When it Applied the 16/70 Calculation to the Ambient Arsenic Air Concentration Analysis.

As noted above, the AACC levels found in Section 586 "conservatively represents a long-term exposure (70 years) that would result in a 1 in 1,000,000 cancer risk." REC 1242. These levels could not be met for the SGP, so the T-RACT of reducing the production of the mine to 135,000 T/day on a five-year rolling average and reducing the production of the West End Pit was applied to the analysis. The T-RACT amount allowed for in Section 210.12 represents a 1 in 100,000 lifetime cancer risk. IDAPA 58.01.01.210.12.b. But even using T-RACT, the AACC levels, as adjusted to 10-times higher by IDAPA 58.01.01.210.12.b, still could not be met. REC 1243–1244. It was at that point, that DEQ decided to apply the 16/70 adjustment to the calculation. REC 1243–1244, *see also* REC 698–706.

The Air Rules clearly provide an AACC standard in Section 586. They then clearly provide an adjustment to that AACC standard when T-RACT can be used to control emissions. IDAPA 58.01.01.210.12.b. The Air Rules also clearly allow for a 10-times adjustment to the AACC when a project is going to operate for 5 years or less. IDAPA 58.01.01.210.15. But nowhere in the Air Rules does it provide that a project that will operate more than 5 years but less than 70 years may be adjusted in proportion to the amount of time it will operate.

In addition, the Board of Environmental Quality cannot find sufficient evidence in the record to support the proposition that a higher exposure to arsenic for a shorter period of time is equally or more protective than a lower annual lifetime average exposure. Application of the 16/70 factor artificially results in 41.3% of the T-RACT-modified AACC. REC 714. The equation above demonstrates that DEQ calculated the lifetime exposure ($\mu g/m^3$) by including a variable which multiplied the results by 16/70, which takes a 16-year life of mine dividing by the 70-year exposure

limit used to set the AACC. REC 710–711. The impact of this additional variable in the equation ultimately results in over a 75% reduction in the calculated exposure.

DEQ provided the following explanation of the cancer risk vis-à-vis its 16/70 analysis:

> AACCs were established in Idaho Air Rules to protect against a project-caused lifetime excess cancer risk of more than 1-in-1,000,000, or 1-in-100,000 where T-RACT is used to control emissions from sources. Prior to a regulatory clean up in 2022, Idaho Air Rules Section 006.125 defined Toxic Air Pollutant Carcinogenic Increments (AACCs) as, "Those ambient air quality increments based on the probability of developing excess cancers over a seventy (70) year lifetime exposure to one (1) microgram per cubic meter (1 $\mu g/m^3$) of a given carcinogen and expressed in terms of a screening emission level or an acceptable ambient concentration for a carcinogenic toxic air Pollutant. They are listed in Section 586." Although a lifetime risk is the benchmark, DEQ listed annual averages for the AACCs in Idaho Air Rules because that timeframe 1) is long enough to establish a good representation of long-term impacts for most sources requiring a permit, 2) is short enough to provide compliance assurance early in the life of the industrial operation, and 3) is convenient for compliance monitoring and reporting, providing a practically enforceable limit on operations. Use of an annual limit is not key to attaining a limit on the lifetime cancer risk; and, since a lifetime risk is the benchmark, use of annual averaged emissions to show compliance with the AACC on an annual basis could be unnecessarily restrictive where processes vary considerably year-to-year and have a project lifetime substantially shorter than 70 years, such as mining processes.

REC 1242–1243. DEQ's discussion of the cancer risk is couched in terms of annual averages, but as discussed above, a five-year rolling average was used for the analysis. The Board of Environmental Quality could find no other evidence in the record discussing the 16/70 adjustment in relation to human toxicology and cancer risk. Therefore, DEQ did not provide sufficient evidence in the form of an expert opinion from a toxicologist or other qualified expert regarding the cancer risk associated with the 16/70 adjustment.

The arsenic analysis performed by DEQ must be viewed within the wider lens of IDAPA 58.01.01.161 and 203 which require that toxic pollutants must "not be emitted in such quantities

or concentrations as to alone, or in combination with other contaminants, injure or unreasonably affect human or animal life or vegetation." *see also* IDAPA 58.01.01.203.03. The Board of Environmental Quality has not found sufficient evidence in the record to convince it that the 16/70 analysis performed by DEQ was equally or more protective of human and animal life and vegetation as what is provided for by the Air Rules. Therefore, the Board of Environmental Quality remands this matter back for the development of further evidence regarding the ambient air concentrations of arsenic that will be produced by the SGP and whether those levels comply with the Air Rules.

IV. CONCLUSION

Based on the foregoing, it is hereby ordered:

1. DEQ Acted Reasonably and in Accordance with Law When it Determined that Perpetua Will have Legal Control of the Stibnite Road Access Route Such that it Could Properly be Excluded from Consideration as Ambient Air.

2. DEQ Acted Reasonably and in Accordance with Law When it Determined that Perpetua Will have Physical and Practical Control of the Stibnite Road Access Route Such that it Could Properly be Excluded from Consideration as Ambient Air.

3. DEQ Acted Reasonably and in Accordance with Law When it Allowed Perpetua to Submit Some Plans After the PTC was Issued.

4. The PTC Includes Enforceable Conditions that Will Achieve 93.3% Dust Control.

5. DEQ Did Not Act Reasonably and in Accordance with Law When it Analyzed the Ambient Arsenic Air Concentrations for the SGP.

The Board of Environmental Quality remands this matter to the Hearing Officer for further factual development in accordance with the terms of this order.

Dated this 9TH day of May, 2024

Mark Bowen
Chairman, Idaho Board of Environmental Quality

CERTIFICATE OF SERVICE

I HEREBY CERTIFY that on this 9th day of May 2024, I caused to be served a true and correct copy of the foregoing FINAL ORDER by transmitting a copy thereof in the manner listed below:

EXPLANATORY INFORMATION TO ACCOMPANY A FINAL ORDER

The accompanying order is a "**Final Order**" issued by the Board of Environmental Quality pursuant to section 67-5246, Idaho Code.

PETITION FOR RECONSIDERAQTION

Any party may file a petition for reconsideration of a final order within fourteen (14) days of the service date of this order as shown on the certificate of service. **Note: The petition must be received by the Board of Environmental Quality within this fourteen (14) day period.** The Board of Environmental Quality will act on a petition for reconsideration within twenty-one (21) days of its receipt, or the petition will be considered denied by operation of law. See Section 67-5246(4), Idaho Code.

APPEAL OF FINAL ORDER TO DISTRICT COURT

Pursuant to Section 67-5270 and 67-5272, Idaho Code, any party aggrieved by a final order or orders previously issued in a matter before the Board of Environmental Quality may appeal the final order and all previously issued orders in the matter to district court by filing a petition in the district court of the county in which:

i. A hearing was held,
ii. The final agency action was taken,
iii. The party seeking review of the orders resides, or
iv. The real property or personal property that was the subject of the agency action is located.

The appeal must be filed within twenty-eight (28) days of: a) the service date of the final order, b) the service date of an order denying a petition for reconsideration, or c) the failure within twenty-one (21) days to grant or deny a petition for reconsideration, whichever is later. See Section 67-5273, Idaho Code. The filing of an appeal to district court does not in itself stay the effectiveness or enforcement of the order under appeal.

INTRODUCTION

Petitioners Nez Perce Tribe, Idaho Conservation League ("ICL"), and Save the South Fork Salmon ("SSFS") hereby seek clarification and/or reconsideration from the Idaho Board of Environmental Quality (the "Board") regarding the relief granted in the May 9, 2024 Final Order. In the Order, the Board found three ways DEQ acted unreasonably and violated the Rules for the Control of Air Pollution in Idaho, IDAPA 58.01.01 ("Air Rules"), when it analyzed arsenic ambient air concentrations for the Stibnite Gold Project. First, DEQ unreasonably used a five-year rolling average in its arsenic calculations allowing for "considerable daily and annual increases in exposures which are contrary to the limits set forth in the Air Rules." REC 3713. Second, there was insufficient evidence to support a 50% reduction in emissions from non-West End Pit production and no enforceable permit conditions to support that reduction. REC 3714. Third, DEQ violated the Air Rules by using a project-specific adjustment factor for arsenic emissions and failed to provide sufficient evidence of the cancer risk from using the adjustment factor. REC 3715-17. Based on these errors, the Board "remand[ed] this matter to the Hearing Officer for further factual development in accordance with the terms of this order." REC 3717.

Petitioners respectfully request that the Board clarify, or order on reconsideration, that the Permit to Construct ("PTC") approved by DEQ is set aside or vacated while on remand for DEQ to reevaluate the PTC application, or an amended application, in accordance with the terms of the Order. While the effect of the Order seems to mean that the PTC is not valid unless and until DEQ corrects the deficiencies the Board identified, the Order does not specifically say so. This creates a risk that, without clarification or reconsideration, Perpetua might begin construction and operation of the Stibnite Gold Project before DEQ resolves the Board's concerns on remand or even without DEQ ever resolving those concerns. Surely this cannot be.

BASIS FOR CLARIFICATION AND/OR RECONSIDERATION

Clarification or Reconsideration Is Warranted to Set Aside or Vacate the PTC Approval Until DEQ Issues a New Decision

Throughout the proceedings before the Board, Petitioners requested that if the Board ruled in Petitioners' favor on any issue, including the arsenic issue, then DEQ's approval of the PTC must be set aside or vacated (effectively, the same thing) and remanded. *See* REC 3432, 3433, 3435, 3437, 3439 (Amended Petition); REC 3475, 3480, 3483, 3490, 3493, 3499, 3506-07 (Pet'rs' Opening Br.); C-REC 3649, 3653, 3667, 3668, 3671 (Pet'rs' Reply); Tr. 66:15-17, 74:13-17, 76:17-21 (Mar. 14, 2024 Hearing). Neither DEQ nor Perpetua contested the propriety of this relief, nor did they argue for any alternative relief. *See* C-REC 3512-44 (DEQ Opp. Br.); C-REC 3546-601 (Perpetua Opp. Br.); Tr. (Mar. 14, 2024 Hearing). While the Board ruled in Petitioners' favor on the arsenic issue and remanded for further proceedings, the Order never addressed whether or not DEQ's issuance of the PTC was set aside or vacated.

Setting aside agency action is not just an appropriate remedy, it is required by the Idaho Administrative Procedure Act ("Idaho APA"). Under the Idaho APA, agency action must be affirmed unless the agency's decision was "(a) in violation of constitutional or statutory provisions; (b) in excess of the statutory authority of the agency; (c) made upon unlawful procedure; (d) not supported by substantial evidence on the record as a while; or (e) arbitrary, capricious, or an abuse of discretion." I.C. § 67-5279(3). "If the agency action is not affirmed, it shall be set aside, in whole or in part, and remanded for further proceedings as necessary." *Id.* (emphasis added). Here, the Board did not affirm DEQ's action in issuing the PTC. It found that DEQ "Did Not Act Reasonably and in Accordance with the Law When it Analyzed the Ambient Arsenic Air Concentrations for the [Stibnite Gold Project]." REC 3717. Thus, under the Idaho APA, DEQ's action should be set aside.

Setting aside DEQ's action is in line with the Board's practice.[1] For example, in *Sunnyside Park*, after DEQ denied Sunnyside's permit application to expand its subsurface sewage system, and after a hearing officer issued a preliminary order upholding DEQ's denial, the Board issued a Final Order reversing DEQ for not acting reasonably and in accordance with law under the Idaho APA and setting aside and vacating DEQ's action. *In re Sunnyside Park Utilities' Application For Sewage Disposal Permit*, Docket No. 0103-07-02 (Apr. 7, 2009). The Board explained:

> Setting aside the permit denial will allow DEQ to process the application again, or to process an amended application should Sunnyside decide to submit one, and in so doing, identify the facts and circumstances that should be considered, apply its expertise to the facts and circumstances that should be considered, apply its expertise to the facts and issues, and provide adequate explanation for its decision.

Id. at 12.

Here, setting aside DEQ's issuance of the PTC will allow DEQ to process the application again, or process an amended application should Perpetua decide to submit one. This will allow DEQ to apply its expertise to the facts and circumstances; to determine whether to issue, issue with conditions, or deny the application;[2] and to provide an adequate explanation with supporting information and analysis for its decision consistent with the Board's Order.

---

[1] Vacating and remanding is also consistent with the practice of the Idaho Supreme Court. *See In re Variance ZV2011-2*, 156 Idaho 491, 496 (vacating and remanding arbitrary agency action for further proceedings consistent with the Court's opinion).

[2] Under the Air Rules, DEQ has three options when evaluating a PTC application: approve the application; conditionally approve the application; or deny the application. *See* Air Rules 209.01.b & c.v. Additionally, DEQ "may impose any reasonable conditions" on the facility in the PTC. Air Rules 211.01. On remand, DEQ should have this full suite of options available when it reviews the PTC application (or an amended application) consistent with the Board's Order. Without clarification or reconsideration to explicitly set aside or vacate the PTC, the Order might be interpreted as limiting DEQ's options on remand to just one predetermined outcome: develop additional facts to support the approved PTC as is.

Finally, setting aside or vacating DEQ's approval of the PTC is also required to comply with the Air Rules. Section 203 prohibits DEQ from issuing a PTC unless the applicant shows that the source "would comply with all applicable local, state or federal emissions standards" and using the methods in Section 210 "the emissions of toxic air pollutants . . . would not injure or unreasonably affect human or animal life or vegetation." Air Rules 203.01. The Board held that DEQ unreasonably determined that the Stibnite Gold Project would comply with applicable arsenic standards and would not injure or unreasonably affect health. The Board remanded the permit "for the development of further evidence regarding ambient air concentrations of arsenic" and to consider "whether those levels comply with the Air Rules." REC 3717. If Section 203 prohibits DEQ from issuing a PTC in the first instance when applicable Air Rules requirements are not met, then surely an already-issued PTC cannot remain valid when, like here, the Board finds that those same Air Rules requirements have not been met.

In summary, leaving the PTC in place during remand when the Board found that it fails to comply with arsenic standards is at odds with the Idaho APA, *Sunnyside Park*, and the Air Rules. It also puts public health at risk. Without clarifying or ordering on reconsideration that DEQ's approval of the PTC is set aside or vacated, the Order could be interpreted to allow Perpetua to begin construction and operations during remand before DEQ determines—or without DEQ ever determining—that the Stibnite Gold Project complies with the Air Rules.

CONCLUSION

For the reasons above, Petitioners respectfully request that the Board clarify or reconsider the remedy in its May 9, 2024 Final Order and now order that the PTC, while on remand, is set aside, vacated, or otherwise invalid until DEQ makes a new decision on the PTC application, or an amended application, consistent with the Board's order.

JOINT MOTION FOR RECONSIDERATION AND/OR CLARIFICATION OF FINAL ORDER

The Idaho Department of Environmental Quality ("DEQ") and Perpetua Resources Idaho, Inc. ("Perpetua") respectfully submit this Joint Motion for Reconsideration and/or Clarification of the Final Order issued by the Board of Environmental Quality (the "Board") on May 9, 2024. This motion is brought pursuant to Idaho Code § 67-5246(4), IDAPA 04.11.01.740.02, and IDAPA 04.11.01.770. This motion is supported by the memorandum in support filed herewith and the administrative record in this matter.

As set forth more fully in the supporting memorandum, DEQ and Perpetua respectfully request that the Board reconsider its decision that DEQ did not act reasonably and in accordance with the law when it analyzed the ambient concentration for arsenic. Alternatively, DEQ and Perpetua request that the Board reconsider and/or clarify the remand instructions to the Hearing Officer for "development of further evidence."

DATED: May 23, 2024.

MEMORANDUM IN SUPPORT OF JOINT MOTION FOR RECONSIDERATION AND/OR CLARIFICATION OF FINAL ORDER

TABLE OF CONTENTS

INTRODUCTION AND BACKGROUND 3

RELIEF REQUESTED 4

STANDARD OF REVIEW 5

ARGUMENT 6

I. The Board must reconsider its holding that DEQ did not act reasonably and in accordance with law when it analyzed arsenic ambient concentrations. 6

A. There is sufficient evidence in the record to support the T-RACT analysis limiting production from the non-West End Pits. 6

1. Relevant background on DEQ's T-RACT ambient concentration analysis. 7

2. A 50% limit for the non-West End Pits is unnecessary because the total production from the SGP cannot exceed 788.4 million tons. 9

B. The record supports that DEQ acted reasonably and in accordance with the law when it adjusted the exposure duration for the arsenic ambient concentration analysis to reflect the 16-year life of the mine 10

1. Compliance with the AACCs is not demonstrated based on an annual average but on EPA's lifetime inhalation unit risk factors. 11

2. Adjusting the T-RACT ambient concentration to reflect exposure duration is consistent with the Air Rules. 13

C. The record supports that DEQ acted reasonably in using a five-year rolling average for T-RACT that was properly supported by permit conditions. 17

II. If the Board remands to the Hearing Officer to conduct additional hearings, DEQ and Perpetua seek reconsideration and/or clarification of the remand instructions. 18

CONCLUSION 19

INTRODUCTION AND BACKGROUND

On May 9, 2024, the Board of Environmental Quality (the "Board") issued a Final Order in this contested case. *See* REC 3695-3720. On four of the five claims presented, the Board found the Idaho Department of Environmental Quality ("DEQ") acted reasonably and in accordance with the law in issuing a Permit to Construct ("PTC") to Perpetua Resources Idaho, Inc. ("Perpetua") for the Stibnite Gold Project ("SGP"). REC 3698-3706. On the fifth issue, the Board held DEQ did not act reasonably and in accordance with the law when it analyzed ambient concentrations of arsenic from the SGP and determined those levels were less than the amount of arsenic that would contribute to an ambient air cancer risk probability of less than one to one hundred thousand (1:100,000). REC 3706-3717.

Specifically, the Board found that (1) there was insufficient evidence to support the T-RACT analysis limiting production from the non-West End Pits; (2) DEQ did not act reasonably and in accordance with the law when it applied an exposure duration of 16/70 to calculate the arsenic ambient concentration; and (3) DEQ did not act reasonably in using a five-year rolling average for T-RACT. *Id*. The Board's findings are factually and legally incorrect and are based on misunderstandings of DEQ's acceptable ambient concentrations for carcinogens ("AACCs") and the lifetime exposure risk represented in Section 586 of the Rules for the Control of Air Pollution in Idaho, IDAPA 58.01.01 (2022) (the "Air Rules").[1]

DEQ and Perpetua move the Board to reconsider and/or clarify its holding that DEQ's analysis of arsenic ambient concentrations was unreasonable and unlawful. The record before the Board confirms that DEQ issued the PTC in accordance with the Air Rules, that arsenic emissions from the SGP do not present an unacceptable risk to human health or the environment,

[1] Because the PTC was issued in June 2022, the 2022 version of the Air Rules applies.

and that the PTC as issued is a valid authorization to construct. If the Final Order stands, the Board will have improperly altered the meaning and interpretation of the Air Rules in a manner that is inconsistent with analytical methods and permitting tools that DEQ has utilized for over 30 years to implement its toxic air pollutant program. To ensure DEQ's toxic air pollutant program is administered consistently, correctly, and in compliance with the Air Rules, the Board must grant DEQ and Perpetua the relief requested.

RELIEF REQUESTED

Before addressing the relief requested, DEQ and Perpetua must first raise a procedural error in the Board's issuance of a "final order" that affords judicial review under I.C. § 67-5270. The Board issued the Final Order under I.C. § 67-5246 and also remanded this matter back to the Hearing Officer "for the development of further evidence" on DEQ's analysis of ambient concentrations of arsenic. REC 3717, 3720. The Board's issuance of a "final order" subject to I.C. § 67-5270 was error for two reasons.

First, a final order in a contested case is one that constitutes a final determination of the parties' rights. *In re Johnson*, 153 Idaho 246, 250 n.5, 280 P.3d 749, 753 n.5 (Ct. App. 2012). "If issues necessary for a final determination of the parties' rights remain unresolved, there is no final order." *Id*. Second, in reviewing a preliminary order, the Board can take one of three actions: "(a) Issue a final order in writing …; (b) Remand the matter for additional hearings; or (c) Hold additional hearings." I.C. § 67-5245(6). The word "or" in the statute is disjunctive, meaning that each item is considered an alternative to the others. *State v. Herren*, 157 Idaho 722, 726, 339 P.3d 1126, 1130 (2014). Having remanded this matter for additional, albeit narrow proceedings before the Hearing Officer, the Board cannot also issue a "final order."

That leads to DEQ and Perpetua's requested relief for reconsideration and/or clarification and the Board's options under I.C. § 67-5245(6):

- DEQ and Perpetua ask the Board to reconsider its decision regarding DEQ's analysis of arsenic ambient concentrations and issue a final order that finds DEQ acted reasonably and in accordance with law. The Board has the authority to do so under I.C. §§ 67-5246(4) and 67-5245(6)(a).
- Alternatively, DEQ and Perpetua ask the Board to reconsider its decision regarding DEQ's analysis of arsenic ambient concentrations and reopen the proceedings before the Board and hold an additional hearing on the analysis before issuing a final order. The Board has the authority to do so under I.C. §§ 67-5246(4) and 67-5245(6)(c).
- If, however, the Board remands for additional hearings before the Hearing Officer under I.C. § 67-5245(6)(b), DEQ and Perpetua ask the Board to reconsider and/or clarify its instructions on remand so that the Hearing Officer and the parties directly address the sufficiency of evidence the Board seeks in order to affirm the PTC.

In the event the Board decides to hold additional hearings or remand for additional hearings before the Hearing Officer, the Board must issue a non-final order finding that DEQ acted reasonably and in accordance with law on the first four issues considered and instructing the parties on the issues to be heard before the Board or on remand.

STANDARD OF REVIEW

Parties to a contested case may seek reconsideration or clarification of a final order within 14 days of the service date of the order. I.C. § 67-5246(4); IDAPA 04.11.01.740.02; IDAPA 04.11.01.770. While the Idaho Administrative Procedure Act and contested case rules do not address the standard for reconsideration, Idaho courts are well versed in such motions. The "purpose of a motion for reconsideration is to reexamine the correctness of an order." *Int'l Real Est. Sols., Inc. v. Arave*, 157 Idaho 816, 819, 340 P.3d 465, 468 (2014). A "'reconsideration in

the trial court usually involves new or additional facts, and a more comprehensive presentation of both law and fact. Indeed, the chief virtue of a reconsideration is to obtain a full and complete presentation of all available facts, so that the truth may be ascertained, and justice done, as nearly as may be.'" *Coeur d'Alene Mining Co. v. First Nat'l Bank of N. Idaho*, 118 Idaho 812, 823, 800 P.2d 1026, 1037 (1990) (citation omitted).

Here DEQ and Perpetua do not introduce new or additional facts but present a more comprehensive presentation of the law and facts in the record before the Board that bear on the incorrectness of the Final Order.

ARGUMENT

I. The Board must reconsider its holding that DEQ did not act reasonably and in accordance with law when it analyzed arsenic ambient concentrations.

For the reasons below, DEQ and Perpetua request that the Board reconsider the Final Order and either issue a final order that is factually and legally correct or hold additional hearings before the Board. *See* I.C. § 67-5246(4); I.C. § 67-5245(6)(a) and (c).

A. There is sufficient evidence in the record to support the T-RACT analysis limiting production from the non-West End Pits.

The Board erred in finding there was insufficient evidence to support the T-RACT analysis limiting production from the non-West End Pits. *See* REC 3713-3714. The Board misunderstood the life-of-mine production limits in PTC Condition 3.6 and the air emissions modeling and calculation supporting the T-RACT ambient concentration analysis for arsenic. As a result, the Board incorrectly concluded that the PTC must limit production from the non-West End Pits by 50% to demonstrate preconstruction compliance with the arsenic AACC.

1. Relevant background on DEQ's T-RACT ambient concentration analysis.

Petitioners did not challenge the absence of a production limit on the non-West End Pits. *See* REC 0263-0292, REC 3451-3507, C-REC 3647-3671. Thus, DEQ and Perpetua did not provide the Hearing Officer or the Board with the relevant background. We do so now.

DEQ initially modeled 14 hypothetical operating scenarios to evaluate the potential maximum hourly, daily, and annual emissions from all feasible origin and destination combinations for mining ore and development rock. REC 0431. As DEQ explained in the Statement of Basis, "Although drilling, blasting, excavating, and hauling activities are not expected to be confined to a single scenario in practice, emissions in each scenario were conservatively estimated at the maximum daily proposed processing rate … to allow for maximum operational flexibility, and to evaluate potential air quality impacts." *Id*. The operating scenarios for the West End Pit are identified as modeling scenarios W1-W5. *See id*. The operating scenarios for the non-West End Pits (Yellow Pine, Hangar Flats, and Bradley) are identified as modeling scenarios Y1, Y2, Y3, H1, H2, H3, H4, B1, and B2. *See id*.

To analyze the risk of carcinogenic toxic air pollutants, including arsenic, DEQ conducted modeling for the same operational scenarios using an emissions inventory that included T-RACT controls and long-term production limits that could be imposed in the PTC. REC 0701, 0714. The operating adjustments DEQ made include:

- The removal of modeling scenario W5 after Perpetua decided not to construct the West End developmental rock storage facility; and
- Limiting the West End Pit's life-of-mine production to 50% of SGP's total life-of-mine production of 788.4 million tons (50% * 788.4 million tons = 394.2 million tons).

REC 0699, 0710. SGP's total life-of-mine production limit is based on DEQ limiting the project's total production to 135,000 tons per day over the 16-year life of the mine. *See id*. To ensure compliance with the Air Rules' toxic air pollutant provisions, DEQ included PTC Condition 3.6, which limits the total life-of-mine production for SGP to 788.4 million tons from all deposits and 394.2 million tons from the West End Pit. REC 0385, 0421.

As a result, the West End Pit is limited to 394.2 million tons of production, the non-West End Pits are each individually limited to 788.4 million tons of production, and total maximum production from the SGP is limited to 788.4 million tons. DEQ's modeling of carcinogenic toxic air pollutants was based on the production limits in Condition 3.6. At those maximum production rates, DEQ modeled the remaining 13 operating scenarios on a receptor-by-receptor basis: the non-West End Pits (modeling scenarios B1, B2, H1, H2, H3, H4, Y1, Y2, and Y3) and the West End Pit (modeling scenarios W1-W4). REC 0710-0711, 0714, 1944-1945, 2144.

The non-West End modeling scenarios were based on 788.4 million tons of production for each operating scenario and showed compliance with the arsenic AACC. *See* REC 0710, 0714, 2144. West End modeling scenarios were based on 394.2 million tons of production for each modeling scenario, with the remaining 50% of production coming from the non-West End Pits. REC 0710-0711. Worst-case impacts for arsenic were associated with the West End modeling scenarios, due to the proximity of the West End Pit to the location of the maximum arsenic impact. REC 0714-0715. The West End modeling was performed on a receptor-by-receptor basis to identify the receptor site with the highest T-RACT ambient concentration of arsenic of all the receptor sites and all the modeling scenarios. REC 0711. That turned out to be West End modeling scenario W2. REC 0714.

2. A 50% limit for the non-West End Pits is unnecessary because the total production from the SGP cannot exceed 788.4 million tons.

The Board was unable to determine why and how the production of the non-West End Pits was adjusted and limited by 50% in the West End modeling scenarios. REC 3714. In particular, the Board cited the equation at REC 0710-0711 and reproduced at page 18 of the Final Order:

$$LifeExpose_{Wi,j,n} = \left[\left(WEPExpose_{Wi,n}\right)(50\%) + \left(nonWEPExpose_{Sj,n}\right)(50\%)\right]\left[\frac{16\ year\ LOM}{70\ year\ exposure}\right]$$

REC 3712. Referring to this equation, the Board asked where the 50% reduction for the non-West End Pits came from and why the PTC did not limit production from the non-West End Pits by 50%. REC 3714. The answers lie in DEQ's worse-case T-RACT modeling analysis, *see* REC 0699-0720 and the fact that the equation was used to calculate the lifetime arsenic exposure from the West End operating scenarios (W1-W4)—not the non-West End operating scenarios—on a receptor-by-receptor and scenario-by-scenario basis, REC 0710-0711.

Again, to ensure compliance with the highest modeled T-RACT ambient concentration (W2), the West End modeling scenarios were based on a maximum of 394.2 million tons (50% of 788.4 MT) of production as set forth in Condition 3.6, with the remaining 50% of production coming from the non-West End Pits. REC 0710-0711. This 50%–50% split is shown in the equation above. That is reasonable and logical: if the West End Pit is mined to its maximum allowed production of 394.2 million tons (which results in maximum modeled concentrations to demonstrate compliance under the W2 operating scenario), then total production from the non-West End Pits is limited to the remaining 50%. Further, if less than 50% production occurs from the West End Pit, then the production from the non-West End Pits will be more than 50%. And as noted, all non-West End operating scenarios demonstrated compliance with the PTC maximum production limit of 788.4 million tons.

In sum, with the West End Pit production limited by 50% in Condition 3.6, a second 50% limit for the non-West End Pits is unnecessary and would be redundant considering the total production from the SGP cannot exceed 100% (788.4 million tons). It follows that there is no need to establish a second 50% limit for the non-West End Pits. Contrary to the Board's decision, there was sufficient evidence in the record to demonstrate how the production of non-West End Pits was limited and why a permit condition limiting production from the non-West End Pits to 394.2 million tons was unnecessary to support the T-RACT ambient concentration analysis. The Board should grant reconsideration.

B. The record supports that DEQ acted reasonably and in accordance with the law when it adjusted the exposure duration for the arsenic ambient concentration analysis to reflect the 16-year life of the mine.

The Board erred in finding that the Air Rules do not allow consideration of an exposure duration of 16 years in determining preconstruction compliance with the AACCs under Sections 210.12 and 586. According to the Board, the Air Rules do not "provide that a project that will operate more than 5 years but less than 70 years may be adjusted in proportion to the amount of time it will operate." REC 3715. The Board could also not find sufficient evidence in the record to support DEQ's analysis and presumed a toxicologist or other qualified expert is needed to cure perceived evidentiary gaps. REC 3715-3717. The Board's conclusions are factually and legally incorrect and jeopardize the lawful, efficient, and effective permitting of toxic air emission sources in Idaho. The Board misinterpreted Rule 210.12 and 586 to require an annual compliance demonstration and ignored that the arsenic AACC is calculated based on 70 years of continuous exposure. The evidence in the record shows DEQ properly adjusted the T-RACT ambient concentration analysis for 16 years of exposure duration.

1. Compliance with the AACCs is not demonstrated based on an annual average but on EPA's lifetime inhalation unit risk factors.

DEQ and Perpetua first address the Board's flawed understanding of the cancer risk associated with carcinogenic exposure and misunderstanding that compliance with the AACCs is "based on annual averages." *See* REC 3708, 3712, 3713. Under its enabling statute, DEQ has the authority to utilize the best available peer reviewed science and supporting studies when adopting the Air Rules. *See* I.C. § 39-107D. DEQ did that here. DEQ adopted the AACCs and Unit Risk Factors ("URFs") in Section 586 based on EPA published toxicity values. As explained below, AACCs are derived from URFs. The Air Rules specifically identify "URF" to mean "Unit Risk Factor from the US Environmental Protection Agency." *See* IDAPA 58.01.01.106.19, .586 (2022).

Thus URFs and AACCs are not developed by DEQ. EPA develops toxicity values resulting from chronic exposure to chemicals and publishes them in the Integrated Risk Information System ("IRIS"), a database maintained by EPA and accessible at https://www.epa.gov/iris.[2] In the IRIS database, EPA refers to URFs as "inhalation unit risks" or "IURs," which it defines as "an estimate of the increased cancer risk from inhalation exposure to a concentration of 1 µg/m^3 for a lifetime. The IUR can be multiplied by an estimate of lifetime exposure (in µg/m^3) to estimate the lifetime cancer risk."[3]

[2] All websites were last visited on May 23, 2024.

[3] U.S. EPA, Basic Information about the Integrated Risk Information System, IRIS Toxicity Values, https://www.epa.gov/iris/basic-information-about-integrated-risk-information-system#process; *see also* U.S. EPA, IRIS Glossary, Inhalation Unit Risk, https://www.epa.gov/iris/iris-glossary (defined as: "The upper-bound excess lifetime cancer risk estimated to result from continuous exposure to an agent at a concentration of 1 µg/m³ in air. The interpretation of inhalation unit risk would be as follows: if unit risk = 2×10^{-6} per µg/m³, 2 excess cancer cases (upper bound estimate) are expected to develop per 1,000,000 people if exposed daily for a lifetime to 1 µg of the chemical per m³ of air.").

EPA uses 70 years to represent a lifetime.[4] Thus, a lifetime cancer risk of 1 in 1,000,000 means that, if 1 million people are continuously exposed to a defined level of a pollutant (the IUR) continuously for 70 years (*i.e.*, 24 hours a day exposure for 365 days a year for 70 years), one person may develop cancer.[5] *See also* REC 1242. For inorganic arsenic, EPA determined the IUR is 4.3E-3 per µg/m^3 (0.0043 / µg/m^3) based on respiratory cancer mortality observed in smelter workers. *See* U.S. EPA, Arsenic, Inorganic; CASRN 7440-38-2 at pp. 16-17.[6] This IUR estimates an increase in cancer risk of 1 in 1,000,000 cases at an arsenic air concentration of 2.3E-4 µg/m^3 (0.00023 µg/m^3) assuming continuous lifetime (70 year) exposure. *See id*. at p. 16. Because both the numerator and denominator of the IUR assume a 24 hour per day exposure for 365 days per year for 70 years, the calculation of EPA's arsenic air concentration is simply the risk divided by the IUR: 0.000001/.0043 per µg/m3 = 0.00023 µg/m3. *See id*.

Having originated from EPA's IRIS database, DEQ's arsenic URF (4.3E-3 per µg/m^3) and expression of the acceptable risk in the AACC (2E-4 µg/m^3) are the same as EPA's IUR and air concentration risk level for arsenic. *See* IDAPA 58.01.01.586 (2022). DEQ's definition of "toxic air pollutant carcinogenic increments" also makes clear that DEQ has adopted EPA's toxicity values and risk assessment methodology:

> Those ambient air quality increments based on the probability of developing excess cancers over a seventy (70) year lifetime exposure to one (1) microgram per cubic meter (1 ug/m3) of a given carcinogen and expressed in terms of a screening emission level or an acceptable ambient concentration for a carcinogenic toxic air pollutant. They are listed in Section 586.

IDAPA 58.01.01.006.125 (2022); *see also* REC 1242-1243. Without question, continuous exposure for a 70-year lifetime is accounted for and incorporated in the calculation of the AACCs. The value assumes the exposure duration and the lifetime are equal. The AACCs reflect that a person is exposed 24 hours per day for 365 days a year for 70 years at the AACC level.

Thus, the Board's finding the AACCs "are based on annual averages" is wrong. *See* REC 3708, 3712, 3713. The AACCs are not an annual standard. They are an expression of risk represented in DEQ's modeling analyses as an annual average concentration. As Section 586 states, "The AACC in this section *are* annual averages." IDAPA 58.01.01.586 (2022) (emphasis added). The rule does not specify compliance on an annual basis. Nor does Section 210.12. *See* IDAPA 58.01.01.210.12 (2022). Rather, *the AACCs are modeled as annual averages*, as opposed to daily or hourly averages, *for each year of the exposure duration*. The AACCs, as derived from EPA's published IUR values, do not prompt or require demonstration of compliance on an annual basis. Compliance is measured over the exposure duration.

2. Adjusting the T-RACT ambient concentration to reflect exposure duration is consistent with the Air Rules.

By adopting EPA's URFs, DEQ adopted EPA's implementation and application methods for analyzing toxic air pollutant ambient concentrations. That includes EPA's recognition that exposure duration is not always 70 years. When the exposure duration is less than 70 years, EPA describes how adjustments are made to correctly use the values, just as DEQ did here. EPA's "toolbox for exposure assessors" (called EPA ExpoBox)[7] explains that "[e]stimating exposure from inhalation requires information on the concentrations of contaminants in the air and *the*

[7] *See* U.S. EPA ExpoBox (A Toolbox for Exposure Assessors) (explaining that EPA ExpoBox "is a toolbox created to assist individuals from within government, industry, academia, and the general public with assessing exposure. It is a compendium of exposure assessment tools that links to guidance documents, databases, models, reference materials, and other related resources").

timeframe over which inhalation exposure occurs." Exposure Assessment Tools by Routes – Inhalation (emphasis added).[8] EPA also explains: "Using EPA's current methodology, it is unnecessary to calculate an inhaled dose when using dose-response factors from IRIS in a risk assessment. However, *inhalation risk assessments may require that an adjusted air concentration be used to represent continuous exposure*." *Id*. (emphasis added).

Thus, for AACCs to be applied properly, the ambient concentration being evaluated must be adjusted to reflect the exposure duration (ED). Otherwise, the comparison to the AACC will be incorrect. EPA uses an equation to determine the adjusted air concentration ($C_{air\text{-}adj}$), where for carcinogens the exposure is averaged over the assumed 70-year lifetime:

$$C_{air-adj} = C_{air} \times ET \times \frac{1\ day}{24\ hours} \times EF \times ED/AT$$

Where:
C_{air} = Concentration of contaminant in air (mg/m^3)
ET = Exposure time (hours/day)
EF = Exposure frequency (days/year)
ED = Exposure duration (years)
AT = Averaging time (days)

Id. In the equation, the concentration in air (C_{air}) is either a measured or modeled value. *Id*. The temporal parameters in the equation include:

- Exposure time (ET) and exposure frequency (EF), which "refer to the frequency with which the exposure occurs and might be provided in hours per day and days per year, respectively."

[8] *See* EPA ExpoBox, https://www.epa.gov/expobox/exposure-assessment-tools-routes-inhalation.

- Exposure duration (ED), which "is the amount of time that an individual or population is exposed to the contaminant being evaluated and is typically given in years."
- Averaging time (AT), which is the amount of time over which exposure is averaged for chronic assessments (*e.g.*, cancer).

Id. Since EPA's URF values are adopted at Section 586 as AACCs with an expected 70-year lifetime exposure, DEQ must adjust the arsenic concentration to reflect the exposure duration to ensure the comparison to the AACC is correct.

DEQ's evaluation followed EPA's framework to adjust the air concentration ($C_{air\text{-}adj}$) for an exposure duration known to be less than 70 years. *See* REC 0710. For the exposure duration, DEQ used the 16/70 adjustment following EPA tools established for URF values. *See id*. Specifically, again, the highest modeled T-RACT ambient concentration of arsenic resulted from West End modeling scenario W2. This is the C_{air} in EPA's equation above. That annual average modeled concentration was 0.00414 µg/m^3. *See* REC 2144.[9] Using EPA's equation for proper implementation of the URF to reflect exposure duration, the arsenic T-RACT ambient concentration (or $C_{air\text{-}adj}$) is:

$C_{air\text{-}adj}$ = 0.00414 µg/m^3 x 24 hours/day x 365 days/year x 16 years /
24 hours/day x 365 days/year x 70 years = 0.00095 µg/m^3

This is the correct T-RACT ambient concentration (0.00095 ug/m3) to compare to the T-RACT AACC representing a 1:100,000 risk probability (0.0023 ug/m3). *See* IDAPA 58.01.01.210.12 (2022). Further, using the arsenic URF in accordance with EPA, the risk probability is calculated from the highest modeled T-RACT ambient concentration (C_{air} of 0.00414 µg/m^3) using the exposure duration and averaging time:

[9] REC 2144 shows an adjusted ambient concertation of 0.00095 µg/m3, which is 0.00414 µg/m^3 * 16/70.

Risk = (0.00414 ug/m3 x 24 hours/day x 365 days/year x 16 years /
24 hours/day x 365 days/year x 70 years) x (4.3E-3 per $\mu g/m^3$) = 4.1E-06

A risk of 4.1E-06 is a risk of 4:1,000,000 or 1:246,056. In other words, DEQ's comparison demonstrated a risk probability of less than 1:100,000. REC 0710.

Using the correct T-RACT ambient concentration (or $C_{air\text{-}adj}$) to compare to the T-RACT AACC is required by the Air Rules. Section 210.12.b requires that DEQ *compare* the T-RACT ambient concentration to the T-RACT AACC to show compliance:

> Compare the source's or modification's approved T-RACT ambient concentration at the point of compliance for the toxic air pollutant to the amount of the toxic air pollutant that would contribute an ambient air cancer risk probability of less than one to one hundred thousand (1:100,000) (which amount is equivalent to ten (10) times the applicable acceptable ambient concentration listed in Section 586).

IDAPA 58.01.01.210.12.b (2022). By adopting the URF and EPA's methods for proper toxicity assessment, the T-RACT ambient concentration ($C_{air\text{-}adj}$) must reflect the exposure duration to make a proper comparison to the T-RACT AACC. If not, as the Hearing Officer recognized, the "comparison of emissions that will only take place for 16 years to a standard that is based on an assumed 70-year exposure period is an 'apples to oranges' comparison." REC 3418.

Thus, DEQ acted in accordance with the Air Rules and followed the proper framework for adjusting the exposure concentration for the actual exposure duration when the inhalation exposure is less than 70 years. REC 0710. DEQ demonstrated preconstruction compliance because the SGP's approved T-RACT ambient concentration at the point of compliance is less than or equal to an ambient air cancer risk probability of less than one to one hundred thousand (1:100,000). IDAPA 58.01.01.210.12.b and c (2022). DEQ compared the T-RACT ambient concentration to the T-RACT AACC, considering exposure duration (16 years) consistent with adoption of the URF-based arsenic concentration that defaults to lifetime exposure (70 years).

Contrary to the Board's holding, DEQ complied with the Air Rules by comparing the T-RACT ambient concentration (or $C_{air\text{-}adj}$) to the T-RACT AACC. *See* REC 3715.

For the same reasons, the record before the Board includes sufficient evidence to support how the exposure duration adjustment relates to human toxicology and cancer risk. REC 3715, 3717. No additional evidence from a toxicologist or other qualified expert regarding the protectiveness of the analysis performed by DEQ is necessary. *See* REC 3716. Sufficient evidence resides in the record and is grounded in the URF and AACC values selected by DEQ from EPA published toxicity values. DEQ's determination of acceptable risk is consistent with the adoption of those values and the framework to assess the acceptable risk from ambient air concentrations. All the information needed to perform these calculations is in the record before the Board. DEQ's 16/70 adjustment aligns with EPA's framework to reflect the exposure duration in carcinogenic risk reviews.

For those reasons, the Board should reconsider its decision that DEQ did not act reasonably and in accordance with the law when it applied an exposure duration of 16/70 to calculate the worst-case T-RACT arsenic ambient concentration.

C. The record supports that DEQ acted reasonably in using a five-year rolling average for T-RACT that was properly supported by permit conditions.

The Board also misunderstood the T-RACT production limits imposed in the PTC and how DEQ used those limits in modeling ambient concentrations of arsenic. REC 3712-3713. PTC Condition 3.5 limits the production of the SGP to 135,000 tons per year based on a five-year rolling average. REC 0385. The Board found "no evidence in the record explaining how the five-year rolling average comports with the annual AACC limits," assuming the AACCs "are based on annual averages" and the five-year rolling average "allows for a smoothing out of the peak concentrations of ambient arsenic." REC 3713.

As already explained, the Board erred in finding the arsenic AACC is an annual standard under Section 586 requiring a demonstration of compliance on an annual basis. The AACC is an expression of risk over a lifetime (70 years) of continuous exposure represented as an annual average. After confirming compliance with the 16-year exposure duration, DEQ determined that a five-year rolling average production limit ensured the mine is operated in a manner described in the compliance demonstration under Section 210.12.d. DEQ selected the five-year averaging period to provide Perpetua operational flexibility and ensure compliance with the 16-year exposure duration. Any averaging period on the production limit that is equal to or less than the exposure duration of 16 years is consistent with Sections 210.12 and 586 and will not increase or decrease the cancer risk.

The Board overlooked sufficient evidence in the record to determine that a five-year rolling average would be protective of the arsenic AACC. The Board should also reconsider its finding that DEQ acted unreasonably in using a five-year rolling average for T-RACT.

II. If the Board remands to the Hearing Officer to conduct additional hearings, DEQ and Perpetua seek reconsideration and/or clarification of the remand instructions.

In the event the Board remands for additional hearings before the Hearing Officer, DEQ and Perpetua also seek reconsideration and/or clarification of the Hearing Officer's role to develop and consider further evidence. In remanding this matter "for the development of further evidence," the Board specifically referenced evidence "regarding the ambient air concentrations of arsenic that will be produced by the SGP and whether those levels comply with the Air Rules." REC 3717. Those instructions seeming conflict with the Board's finding that the Air Rules do not allow a project operating more than 5 years but less than 70 years to "be adjusted in proportion to the amount of time it will operate." REC 3715. The Board should reconsider and/or clarify if the Hearing Officer can decide whether DEQ's analysis complies with the Air Rules.

In addition, as discussed above, the Board made multiple findings of insufficient evidence "to support DEQ's analysis of the ambient arsenic air concentrations." REC 3706. The Board found insufficient evidence to support the use of the five-year rolling average, REC 3713, and to demonstrate how or whether the non-West End Pit production was limited, REC 3714. Regarding DEQ's consideration of exposure duration, the Board found insufficient evidence to support DEQ's analysis using the exposure duration of the SGP (which it thought resulted in a higher exposure to arsenic for a shorter period of time) that is equally or more protective of human and animal life and vegetation than what is provided for by the Air Rules. REC 3715, 3717. The Board also found insufficient evidence "in the form of an expert opinion from a toxicologist or other qualified expert regarding the cancer risk associated with the 16/70 adjustment." REC 3716.

DEQ and Perpetua seek clarification and confirmation that the Hearing Officer can hear additional testimony on those issues from DEQ staff, for example Kevin Schilling and Mike Simon, who the Hearing Officer found were qualified to give expert testimony. S*ee* REC 3833-3834, 3918-3922. In addition, DEQ and Perpetua seek to confirm that the parties can retain a toxicologist or other qualified expert regarding the acceptable cancer risk associated with the arsenic URF and AACC. The Board should clarify if the Hearing Officer is empowered to add to the existing record regarding the specific areas of insufficient evidence found by the Board, make findings with respect to the sufficiency of the evidence presented, and determine whether DEQ's arsenic ambient concentration analysis complies with the Idaho Air Rules.

CONCLUSION

This contested case involves a complex and complicated PTC for operations that are varied in activity and location throughout the SGP mine site. It also involves a dense record compiled over years of DEQ review and the need to understand toxic air pollutant carcinogenic

increments and technical analyses using modeling to demonstrate compliance with those increments. The Board's Final Order includes factual and legal mistakes that cannot be left to influence this proceeding or DEQ's future toxic air pollutant permitting. The Board's conclusions are unjustified scientifically and undermine the expertise and experience of DEQ professionals implementing the toxic air pollutant program for over 30 years.

For those reasons, the Board must grant reconsideration and address the mistakes raised here. The Board has the authority to either issue a final order that is factually and legally correct or hold additional hearings before the Board. Should, however, the Board remand for additional hearings before the Hearing Officer, it should clarify the Hearing Officer's role in developing and considering further evidence on remand to ensure the Hearing Officer and the parties directly address the sufficiency of evidence the Board seeks in order to affirm the PTC.

Attorney for Save the South Fork Salmon

BEFORE THE BOARD OF ENVIRONMENTAL QUALITY
STATE OF IDAHO

IN THE MATTER OF AIR QUALITY PERMIT TO CONSTRUCT P-2019.0047	)	Agency Case No. 0101-22-01
	)	OAH Case No. 23-245-01
NEZ PERCE TRIBE, IDAHO CONSERVATION LEAGUE, and SAVE THE SOUTH FORK SALMON	)	**PETITIONERS' RESPONSE OPPOSING DEQ/PERPETUA'S MOTION FOR RECONSIDERATION**
Petitioners,	)	
v.	)	
IDAHO DEPARTMENT OF ENVIRONMENTAL QUALITY,	)	
Respondent,	)	
and	)	
PERPETUA RESOURCES IDAHO, INC.	)	
Intervenor-Respondent.	)	

Petitioners Nez Perce Tribe, Idaho Conservation League, and Save the South Fork Salmon hereby oppose the Joint Motion for Reconsideration and/or Clarification of Final Order filed by DEQ and Perpetua on May 23, 2024. Petitioners respectfully request that the Board deny DEQ and Perpetau's request to reevaluate the merits, as the merits issues should be fairly and fully considered on remand, not on a one-sided motion for reconsideration.

This matter has been pending since June 17, 2022, when Petitioners filed the Petition to Initiated Contested Case. In that very first filing, Petitioners alleged that DEQ's arsenic averaging tactics violated the Air Rules because the Air Rules require meeting an annual arsenic concentration (the acceptable ambient concentrations of carcinogen or "AACC"). REC 0016, 19, 25–26. Throughout the proceedings before the Hearing Officer, Petitioners repeatedly and consistently argued that the AACC is an annual average that Perpetua must meet. REC 0335-36, 0360-62 (Opening SJ Br.); REC 2363-68 (Reply SJ Br.); TR 0019 (SJ Hearing). Petitioners made the same allegation and argument to the Board. REC 3437 (Am. Pet. for Rev.); REC 3469-506 (Opening Br.); C-REC 3667–71 (Reply Br.); TR 0070–71, 95 (Board Hearing).

On reconsideration, DEQ and Perpetua suggest that the Board made a mistake when it assumed that the arsenic AACC is an annual value, and they submit "new evidence" for the Board to correct this alleged oversight.[1] But DEQ and Perpetua could have presented this "new evidence" in any of their many filings over the last two years.[2] Instead, they try to introduce it now on reconsideration and without a full and fair opportunity for Petitioners to respond.

---

[1] The annual nature of the AACC underlies each of the three ways the Board found DEQ acted unreasonably and failed to follow the Air Rules, as Petitioners intend to show on remand.

[2] Though DEQ and Perpetua now file their motion for reconsideration together, they filed separate responses to the petitions and filed separate briefs on the merits, totaling eight such written filings on the merits before the Hearing Officer and the Board. *See* Corrected Record Docs 021, 028, 038, 043, 054, 055, 096, 097.

DEQ and Perpetua's "new evidence" is that the toxic air pollutants ("TAPs") and AACCs in the Air Rules were based on EPA's Unit Risk Factors ("URFs"), which were based on a 70-year lifetime. While the URFs did inform the TAPs rulemaking, DEQ and Perpetua ignore evidence from the TAPs rulemaking which confirms that the Board rightly concluded: the AACCs are annual averages; and there are specific, limited exceptions to meeting the AACCs, including the short-term source exception for facilities that operate for five years or less.

For example, DEQ explained in a July 13, 1992 meeting package in support of the TAPs rulemaking:

> For short term sources (usually less than five years in duration), such as remediation projects, a probability of greater than one in a million risk (over [ ] 70 years) will generally be acceptable to account for the decreased term of exposure. <u>It is not acceptable however, for exposed individuals to receive a full 70 year exposure during the life of a short term project</u>.

See Exh. 1 to Tiedemann Decl. (filed herewith) at Attach. 7 (emphasis added). Allowing a full 70-year exposure during the life of the 16-year Stibnite Gold Project is exactly what DEQ did here. This is "not acceptable" under the Air Rules, and the Board rightly rejected this in its Final Order.

DEQ and Perpetua's effort to introduce "new evidence" to the Board on a one-sided motion for reconsideration following years of litigation underscores that revisiting the merits without a remand and a full and fair opportunity to respond is prejudicial to Petitioners and undermines the Board's ability to reach the correct result. For these reasons, the Board should deny DEQ and Perpetua's motion for reconsideration and should allow these issues to be developed on remand with equal opportunities for the parties to provide evidence, argument, and response.

Dated: June 3, 2024

Respectfully submitted,

/s/ Bryan Hurlbutt

5318

IDAHO DIVISION of

ENVIRONMENTAL QUALITY

MONDAY, JULY 13, 1992

Our Goal for Air Toxics Policy/Rule Making:

To protect the public health and the environment from the harmful effects of toxic air pollutants (TAP) per our responsibilities set forth in IDAPA 16.01.1011,01 and 1601.1952,02. and provide regulated industries with a reasonable, flexible, minimally burdensome framework with which to work.

Our Goal for this meeting:

To successfully negotiate air quality rules revisions that will satisfy the regulated industries need to have reasonable, flexible regulations that do not place an unwarranted impediment to their ability to do business in Idaho, while at the same time providing adequate protection to the public from the harmful effects of TAP. We hope that these revisions will provide industry with an awareness of what DEQ considers harmful and provide the basis for a straight forward and efficient permitting process.

Brief History of the DEQ TAP List

The DEQ TAP list (hereafter referred to as the list), was conceived as part of the New Source Review Policy, which was a response to the need to control the emissions of airborne toxic chemicals in the absence of effective EPA regulations. NESHAP (National Emmision Standards for Hazardous Air Pollutants, §122 of the 1970 Clean Air Act) had proven to be an ineffective means of of controling TAP as only seven pollutants were ever regulated after 17 years of the NESHAPS program.

It was the position of the DEQ that given the resources that we had available to us, that we would only attempt to hold the line on air quality and try to insure that new sources of air pollution did not "injure or unreasonably affect human or animal life or vegetation." One of the principal ways that we chose to do this was the development of a comprehensive list of TAP and, where possible, health based emissions limits and or acceptable ambient concentrations.

Our list was developed from a combination of sources. We surveyed what other states were doing and found that New Mexico had the most logical, straight approach to air toxics. The New Mexico list was chosen as the basis for our own TAP list. In addition, we looked at the Occupational Health and Safty Administration (OSHA), American Conference of Government and Industrial Hygenests (ACGIH) and National Institute for Occupational Safty and Health (NIOSH) occupational exposure limits (OEL) and threshold limit values (TLV) for non-carcinogens. For carcinogens we looked at the

data from the International Agency for Research on Cancer (IARC) and the Carcinogen Assesment Group of the EPA (CAG). In addition, we reviewed data from the Agency for Toxic Substances and Disease Registry of the Public Health Service. As many who have received periodic updates know, we have tried to continuously refine the list to reflect new data and to correct inaccuracies.

The DEQ list of regulated air toxics is quite large in scope. However, this was not done to burden industry. Quite the contrary. It was done in order, to the maximum extent possible, to provide industry with a ready reference to acceptable screening levels of these various compounds. This enables new sources to review their processes and see if controls, may be needed early on in the planning process, there by maximixing start up budget planning. In addition, it allows existing sources to review their emissions and see how they compare to the screening levels that the DEQ considers reasonably protective of human health and the environment. Please see appendix 6 for the derivation of emissions limits (EL) and acceptable ambient concentrations (AALC).

DEQ Position on the EPA "198" List

The EPA list of 189 compounds to be regulated represents a political process by the congress, rather than being put together by any environmental agency. This list is inadequate in and of it self to protect the air quality of Idaho or other specific location in the nation. This opinion is based on the following:

* The EPA 189 list is not an attempt to protect people or the environment of any specific area but a compromise list to address some of the major nation-wide sources of air pollution. The original proposed list contained 224 compounds, including ammonia and hydrogen sulfide which were later removed. We do not believe that this nation-wide effort can be effectively applied to Idaho and be adequate to address the unique Idaho situation. All along, EPA admitted that their agenda was not to protect all communities completely, rather their intent and design has been to address only pollutants and source catagories that are national in scope.

* The EPA 189 list does not include all the well documented carcinogens that have been assigned unit risk factors[1], let alone most possible and suspected carcinogens as listed in DEQ Appendix A2 of the New Source Review Policy. State and local agencies need to have the flexibility to protect public health by regulating the emission into the air of these very dangerous compounds should they be present locally.

* From only a partial inventory, we have found that there are currently being emitted into the ambient air of Idaho three known or suspected carcinogens which are not addressed by the EPA 189 list. In addition there are about 35 non-carcinogens of varying toxicity levels currently being emitted or being reviewed for new source permits.

* While it is not possible to predict the future, in a fast growing state like Idaho it is very reasonable to assume that new industries will be moving to Idaho as our work force expands with new residents. In addition, as environmental regulations in California and other states become more restrictive, Idaho will look more attractive to many of these regulated industries. This is already occurring in Nevada. While we certainly want the jobs and incomes that these industries may represent, just as certainly, we do not want to become a "toxic magnet" for polluting industries that other states don't want.

---

[1] Unit Risk Factors for a known or suspected carcinogen describes the possibility of developing excess cancers over a 70 year lifetime of exposure to 1 microgram per cubic meter of that substance.

* Title III of the Clean Air Act Amendments of 1990 (CAAA) requires EPA to publish a list of source categories and then promulgate maximum achievable control technology (MACT) for the first 40 categories. MACT standards are then required for the rest of the categories on a phased in schedule. Even if this time schedule was adhered to, the first MACT standards would not be available before November of 1992. Without its own TAP policy or rules and regulations, Idaho is thus without any appropriate air toxics regulation until EPA is finished. EPA is already late in publishing the first source category list.

* If a particular source in Idaho is not addressed in the first 40 source categories, the DEQ could be unable to address toxic emissions from that source no mater how toxic the emissions might be or in what quantity the emissions may be emitted until EPA finally promulgates MACT standards. Given the past history of EPA deadlines, this is a very real concern. Even if EPA adhered to all deadlines, some sources would conceivably still be able to emit unregulated toxics until the year 2000, if that source was in the last group to have standards promulgated. It should also be noted that not all sources are covered by these MACT standards. As a consequence, sources not covered by this MACT standard would be essentially unregulated in Idaho. Further, the majority of covered sources are associated with surface coating and manufacturing of the regulated chemicals, while fore most sources of TAP in Idaho, the TAP in question is used in or produced as a by-product of their processes.

* Finally, Congress itself apparently felt that this list was not final. Congress required the EPA to periodically review the list and add pollutants "...which present or may present ...a threat of adverse human health effects (including but not limited to, substances which are known to be, or may be reasonably be anticipated to be, carcinogenic, mutagenic, teratogenic, neurotoxic, which cause reproductive dysfunction, or which are acuity or chronically toxic) or adverse environmental effects..." The EPA 189 list should be considered to be a starting point for toxics regulations.

* It is not the intent of DEQ to require sources to do an emissions inventory of every compound on the DEQ list. It is quite reasonable to assume that any source, including the small sources, be familiar with their own processes. There are common, readily available sources of information, such as Material Safty Data Sheets (MSDS)[2] that will assist a source

---

[2] MSDS provides data concerning the nature and concentrations of hazardous or toxic components of substances used by a source. These sheets are available from the manufacturers of all compounds with hazardous or toxic components.

to ascertain what compounds can be reasonably assumed to be present in their process. They then need only inventory those compounds that can reasonably assumed to be emitted. In addition, the DEQ will be happy to assist sources in identifying potential TAP.

Some Options for Discussion

Option 1: Maintain current situation.
Pros: Would, of course, make DEQ happy; require no further legislation; all ready in place and functional.
Cons: Could make several in industry unhappy; may be seen as burdensome by industry; a policy is not as clear as a standard.

Option 2: Go with Maximum Achievable Control Technology (MACT) as per the 1990 CAAA or Best Available Control Technology (BACT) or Lowest Achievable Emissions Reduction (LAER) or Adaqualtly Demonstrated Control Technology (ADCT) or some other control technology based standard.
Pros: No EL or AALC; single consistent standard.
Cons: MACT/BACT etc. difficult to define: must be industry and chemical specific; lack flexibility esp. for relatively "clean" industries; no provision for new pollutants; may not adequately protect human health and the environment, esp. in the case where MACT/BACT has not been defined for various toxic chemicals.

Option 3: Regulate EPA "189 List" only
Pros: Would reduce the list in size; could possibly speed up permitting process
Cons: Not protective enough of human health and the environment; lacks flexibility; would not address many pollutants that are commonly emitted by modern industry; no provision for new pollutants; somewhat pointless as the EPA is already doing it; could complicate and slow the permitting process by increasing public comment over pollutants not covered.

Option 4: Regulate EPA "189 list" plus currently known TAP
Pros: list would be somewhat shorter and simpler;
Cons: no provision for adding new pollutants; could require more extensive and costly emissions inventories.

Option 5: Regulate EPA "189 List" plus any thing that has been identified elsewhere as toxic, hazardous or a carcinogen
Pros: Would be comprehensive; would regulate only pollutants that have been demonstrated to be of concern; would be similar to current policy, require little or no new legislation;
Cons: Could be a large list; May be seen as burdensome by some in industry; no provision for adding pollutants.

Option 6: Develop a series of "source specific" TAP lists
Pros: Would be easier for specific industries to know what to report on; A number of useful references available See Appendix 9.
Cons: Could require emissions inventories of some regulated industries; no provision for variation among industries of the same type; MSDS will not reflect bi-product compounds.

Option 7: Options 1 and 3 through 6 with the addtion of a method out side of DEQ to add TAP to lists. (Pros and Cons would, of course depend on the method for adding to the list, but in general, a board or review panel of some sort seems to be a common notion.)
Pros: Would provide DEQ with industry input on additions to lists; would provide DEQ with industry input on standards; would provide DEQ and industry with input by public interest groups;
Cons: Could slow down the process of adding new toxics and there for probably slow down the permitting process because of the public particapation process; could cause a political battle over the structure of the addition process; could convert the health based process for additions to list into a political one; depending on the make up of the committee/board, could be less protective of the public health.

Appendix 1

The following are known or possible carcinogens that have a URF but are not listed by EPA on the list of 189 toxics but are listed on Appendix A2 (carcinogens)

Aldrin* insecticide
Bis(2-chloroethyel)ether solvent
chloromethane methyl chloride
DDT insecticide, most uses banned; used for Tussock moth
1,2-dibromoethane solvent chemical industry
1,1-dichloroethane solvent
1,2-dichloroethane degreaser, ore flotation, solvent, paint, finish removers
1.1-dichloroethylene solvent
Dieldrin* insecticide
diethylstilbestrol synthetic estrogen
dimethylnitrosamine solvent
heptachlor epoxide insecticide
hexachlorodibenzo-p-dioxin (1:2 mixture) Possible. herbicide, a contaminant, poison
hydrazine sulfate mineral analysis, determination of arsenic in metals, fungicide, fumigant
3-methylcholanthrene biochemical research
N-nitroso-n-butylamine**
N-nitrosopyrrolidine**
pronamide herbicide
reserpine antihypertensive [lowers blood pressure], tranquilizer
thiourea photography, analytical reagent chemical intermediate

* part of current permit analysis at INEL Chem. Lab.
** no reference located
Benzo(a)pyrene, dibenz(a,h)anthracene, chrysene and other polynuclear aromatic hydrocarbons can be regulated under polycyclic organic mater (POM) which, as a category, is listed on the EPA list of 189.

Only two of these chemicals are currently under review. However, many of these chemicals are solvents which would seem to have the potential for use in industries common to Idaho (light manufacturing, electronics and so forth).

Appendix 2

The following are carcinogenic substances that are or have been reviewed in conjunction with permit applications in Idaho. These substances are not on the EPA 189 list but are on Appendix A2 (carcinogens):

Aldrin and **Dieldrin** as noted above
dimethyl sulfide from craft pulping black liquor

Appendix 3

The following are non-carcinogenic substances that are or have been reviewed in conjunction with permit applications in Idaho. These substances are not on the EPA 189 list but are on Appendix A1 (non-carcinogens): Note: many of these compounds are on the EPA Extremely Hazardous substances list, and the Community Right to Know list.

hydrogen sulfide: rotten eggs smell, human poison by inhalation, severe irritant, violent reaction with various metals & chemicals
methyl mercaptan: poison by inhalation,
turpentine: toxic by inhalation, irritant, experimental tumorigen
methanol: toxic by inhalation, experimental teratogen, reproductive effects, human mutagenic data.
fluorine: toxic by inhalation, irritant, mutagenic data
aluminum: possible cause of pulmonary fibrosis by inhalation
copper: tumorigen, teratogen, experimental reproductive effects
iron: potentially toxic by inhalation (arc welders lung)
magnesium: toxic by inhalation
zinc: relatively nontoxic
terphenyl: little toxicological data available
nitric acid: poison, corrosive, experimental teratogen and reproductive effects
isophorone diiysocyanate: poison by inhalation,
methyl ethyl ketone peroxide: moderately toxic by inhalation, experimental tumorigen
cyclohexanone: moderately toxic by inhalation, irritant
acetone: moderately toxic by various routes, irritant
hydrogen peroxide, 90%: moderately toxic by inhalation, skin contact, corrosive irritant, experimental tumorigen, suspected carcinogen
dimethyl disulfide: poison by inhalation
dimethyl sulfide: volitile liquid, gas odorant, solvent

Appendix 4

The following are non-carcinogenic substances that are or have been listed on the Toxic Release Inventory (TRI)[3] for Idaho. These substances are not on the EPA 189 list but are on Appendix A1 (non-carcinogens). Note: many of these compounds are on the EPA Extremely Hazardous substances list, and the Community Right to Know list.

sodium hydroxide: corrosive irritant, mutagenic data
methanol: toxic by inhalation, experimental teratogen, reproductive effects, human mutagenic data.
nitric acid: poison, corrosive, experimental teratogen and reproductive effects
hydrofluoric acid: human poison by inhalation, corrosive irritant, experimental teratogenic, reproductive effects, mutagenic data
chlorine: Moderately toxic by inhalation, irritant, human mutagenic data
ammonia: experimental poison by inhalation, irritant, mutagenic data
phosphoric acid: human poison, corrosive irritant
copper: tumorigen, teratogen, experimental reproductive effects
Methylene diphenyl diisocyanate (MDI): poison by inhalation, irritant, mutagenic data
Freon 113: most uses will be fazed out by 1995
ammonium sulfate: moderately toxic by several routes
ammonium nitrate: powerful allergen
zinc compounds: relatively nontoxic
barium compounds: low toxicity
hydrochloric acid: poison by unspecified route, mildly toxic by inhalation, corrosive irritant
manganese compounds: toxic by inhalation

The following substances are non-carcinogenic substances that are being reviewed in conjunction with permit applications or field inspections. These substances are not on the EPA 189 or currently on the DEQ list. ***This points out the need to be able to respond to changing circumstances.***

Acenaphthylene: irritant, mutagenic data
Amino functional Siloxane: organosilicon oxide polymer, mild to severe irritant
Busan 1127D (2-(thiocyanomethylthio)benzothiazole): mist is considered moderatly to highly toxic.
Carbitol Acetate (2-(2-Ethyoxyethoxy) Ethyl Acetate): solvent and placticizer
dimethyl disulfide: poison by inhalation

---

[3] The TRI is a report of all emissions of compounds required to be disclosed under SARA Title III.

Appendix 5

The following are examples of sources now existing in Idaho that have air releases of substances not on the EPA 189 list:

American Micro systems Inc.
Basic American Foods
Blount Industries
Borden Inc. Dairy
Del Monte Foods USA #130
Deming Industries
Fiberglass Systems Inc.
FMC Corp.
Gustafson
Hewlett Packard
IBP Inc.
INEL
J.R. Simplot
J.R. Simplot Food Di.
John E. Quinn
Kerr McGee Vanadium Facility
Kraft Inc.
MIcron Technology
Monsanto
N.A Degerstrom Inc.
Nu-West Industries Inc
Ore-Ida Foods
Peabody Spunstrand
Penford Products Co.
Pondarosa Paint Mfg. Inc.
Post Falls Particalboard
Potlatch
Spears Manufacturing Inc.
Unitech Composites Inc.
Zilog

Appendix 6

In developing emissions limits for new permitted facilities, the Idaho DEQ uses the terms Unit Risk Factors and Threshold Limit Values. The following is an explanation of these terms and how they are used.

UNIT RISK FACTOR

A unit risk factor (URF) is used to describe the possibility of developing excess cancers over an average 70 year lifetime. This is based on being exposed to concentration of one microgram of a carcinogenic (cancer causing) substance in one cubic meter ($1\ ug/m^3$) of air over 70 years. The term excess cancers means cases of cancers in excess of what would be normal for a given population. For example, if there was normally 5 cases of a given type of cancer in Anytown USA before a given exposure to some substance and 7 after the exposure, there would be 2 excess cancers.

Inhalation URFs are developed for carcinogenic substances by the EPA. Each URF represents months of research and often years of policy process. Teams of toxicologists gather toxicological data for each known or suspected carcinogen. The available data are then rated or point factored per the quality of the research involved. A URF is then a probability statement derived from this process. Each URF proposed by EPA is extensively reviewed and debated in public by scientists, health officials and industry representatives. Every URF represents a consensus of the best science and health opinion of the potency of a given carcinogen.

URFs are usually expressed as a number times 10 to some negative power. For example, benzene, an organic hydrocarbon found in various petroleum products and cigarette smoke has a unit risk factor of 8.3×10^{-6}. This means that are 8.3 chances in one million of getting cancer if a person is exposed to $1\ \mu g/m^3$ 24 hours a day for 70 years.

Another example would be asbestos. Asbestos has a URF of 2.3×10^{-1}. That means that if exposed to $1\ ug/m^3$ concentration for 70 years, the chances of getting cancer would be .23 in 10.

Within IAQB New Source Review (NSR) policy, URFs are used to calculate acceptable ambient levels for a given carcinogen. IAQB generally establishes that an ambient concentration which causes no more excess cancers than one in a million (1×10^{-6}) is acceptable. Once an acceptable ambient level is established, IAQB can then back calculate via engineering equations to an acceptable emission rate (in pounds per hour) for a given stack.

THRESHOLD LIMIT VALUE

Threshold Limit Value (TLV) is a time weighted exposure limit developed by the Occupation and Safety Administration or the American Council of Government Industrial Hygienists. This value is used to limit the exposure of informed workers to a given toxic substance in the work place. The value is based on exposure of adult males working an eight hour shift. The DEQ uses TLV information to screen proposed new source emissions levels. The DEQ divides the TLV first by a value of 10 due to the fact that an ambient air exposure of a carcinogen means people are usually living under that exposure longer than eight hours out of 24. This value is then again divided by 10 to compensate for the fact that not everyone who is potentially exposed is an adult male. Other people may be more sensitive. The TLV thus is divided by a total of 100 for use in setting an acceptable ambient level.

For example, the TLV for cyanide is 5 milligrams per cubic meter (mg/m^3). An acceptable ambient level under DEQ policy would be 5 divided by 100 or 0.05 mg/m^3. For another example, the TLV for Lindane (an insecticide) would be 0.5 mg/m^3 concentration. The acceptable ambient level would be 0.5 divided by 100 or 0.005 mg/m^3. As with carcinogens, the TLV derived acceptable ambient levels are used by the DEQ engineers to back calculate an acceptable stack emission rate for any proposed new source.

EL and AAL(C) as listed in the TAP list are *screening levels*, not standards. If a proposed source, at any level of review is shown to be under the screening level for the TAP in question then the source goes forward in the permitting process. If, on the other hand, the source is shown to likely exceed the screening level, then there is a number of options such as further analysis or enhanced controls that can be pursued. See: Idaho DEQ Procedures for Modeling Impacts of Toxic Air Emissions and Assessing Associated Risk Appendix 7, and the General Summary of DEQ's New Source Review Policy for Toxic Air Pollutants, Appendix 8 for a more complete discussion of this topic.

APPENDIX 7

DRAFT

Idaho DEQ Procedures for Modeling Impacts of Toxic Air Emissions and Assessing Associated Risk

Procedures for modeling the dispersion of air emissions are consistent for criteria pollutants and toxics.

Emissions are calculated for the specific operation, with EPA's AP-42 as the standard guidance document. Impacts for any toxic air pollutant (TAP) emitted in potentially significant amounts are estimated through a three tiered evaluation approach, using the Division of Environmental Quality (DEQ) TAP list and models approved by EPA for regulatory use.

The emissions screening levels as listed on the DEQ TAP list are a quick way to determine if modeling is needed. If a toxic air pollutant has the maximum potential to be emitted at levels below the screening emission level, the proposed emission is typically approved by the DEQ.

If the maximum potential emissions are above the screening levels, then modeling is performed. The models most commonly used for the first modeling run are TSCREEN and SCREEN for single emission points, or ISC with worst case meteorological data for multiple emission points. In "screening modeling", quantified emissions and stack (or fugitive) data are required, as well as distance to property boundary or, with DEQ approval, an off site receptor. Estimates of off site concentrations of the pollutant(s) are output by the model, which assumes a variety of worst case dispersion conditions. Model output is typically in one hour averages. Persistence factors are usually used to estimate worst case impacts for other averaging periods. Unit risk factors are then applied to translate the predicted off site concentrations to determine risk to those exposed.

If, after "screening modeling", unacceptable risks still are shown to be possible, refined modeling may be done. Refined modeling replaces many worst case assumptions in screening modeling with actual conditions. In refined modeling, a more realistic three dimensional simulation of emissions, topography, meteorology, and receptors is supplied. Actual on site meteorological data typically helps the applicant, since the alternative is a worst case meteorological data file like that used in screening modeling. The most commonly used models are ISC, COMPLEX1, and FDM. Refined modeling provides the most detailed and accurate assessment of potential air quality impacts.

After ambient concentrations are determined, these ambient levels are, in the case of known or suspected carcinogens (TAP list Appendix A2), converted to annual concentrations using persistence factors as mentioned above. They are then multiplied by the EPA

unit risk factor (URF) to obtain a risk level. A risk level of one in a million is generally considered acceptable for a long term or permanent emissions source. The acceptable ambient levels for a carcinogen (AALC) listed in the TAP list Appendix A2 reflect this one in a million risk level for carcinogens with established URFs.

For short term sources (usually less than five years in duration), such as remediation projects, a probability of greater than one in a million risk (over a 70 years) will generally be acceptable to account for the decreased term of exposure. It is not acceptable however, for exposed individuals to receive a full 70 year exposure during the life of a short term project. In addition, first impacts at receptor sites farther from the source than property boundaries may be considered for short duration projects.

For non-carcinogens (TAP list Appendix A1) the risk assessment procedures are similar. Ambient concentrations are compared with 1/100 of the published American Council of Government and Industrial Hygienists (ACGIH) Occupational Exposure Limits (OEL) or other ambient standard adopted by the DEQ in the absence of a published ACGIH OEL.

The 1/100 factor was derived to accommodate two levels of extrapolation of potential risk to the general public:

1. ACGIH factors assume an eight hour exposure; source exposures are generally continuous (24 hrs.).

2. ACGIH factors are derived from historical data that comes essentially from a work force of healthy adult males.

Thus we have used an uncertainty factor of 100 (10X for each of the above conditions) to accommodate the more sensitive populations.

In the absence of any published URF or OEL. the acceptable ambient concentration will be considered the detection limit unless it can be demonstrated to the satisfaction of the DEQ that an ambient level higher than the detection limit will not have an adverse effect on human health or the environment. In such cases we have allowed the toxicological profiles of like chemicals or compounds to be substituted for the unknowns.

General Summary of Idaho Air Quality Bureau's New Source Review Policy for Toxic Air Pollutants

Regulation Summary

January 1991

Toxic substances within ambient air are regulated in Idaho by IDAPA 16.01.1011,01. Toxic Substances, which states:

> *Any contaminant which is by its nature toxic to human or animal life or vegetation, but is not specifically controlled elsewhere in Idaho Department of Health and Welfare Rules and Regulations, Title 1, Chapter 1, "Rules and Regulations for the Control of Air Pollution in Idaho," shall not be emitted in such quantities or concentrations as to alone, or in combination with other contaminants, injure or unreasonably affect human or animal life or vegetation. As information becomes available, limits will be specified for concentration of toxic materials in the ambient air and emission limits will be set accordingly.*
>
> *(1-24-69)*

Any new source of air pollutants (including toxic pollutants) not specifically covered by the thirteen (13) specific New Source Performance Standards is regulated by IDAPA 16.01.1952,02 Sources Not Specifically Regulated which states:

> *Sources not specifically regulated under Idaho Department of Health and Welfare Rules and Regulations Sections 01.1955 through 01.1999 shall achieve the greatest degree of emission reduction that has been adequately demonstrated.*
>
> *(1-1-75)*

Idaho Air Quality Bureau (IAQB) has developed a method for permitting new sources of toxic air pollutants consistent with our responsibilities and authority under the Rules and Regulations for the Control of Air Pollution in Idaho. For that method, IAQB compiled a list of toxic air pollutants (TAP) and screening level emission limits for those substances.

Permit Decisions

If the Bureau finds that an eight-hour average ambient concentration of a toxic air pollutant will likely not exceed one hundredth (.01) of the OEL for non carcinogens, or is below detection levels for a compound without an OEL or URF, the Bureau shall grant the permit.

Similarly, if the Bureau can substantiate that ambient concentrations due to emissions of known or suspected carcinogens are not likely to cause excess cancers of more than one in a million (10^{-6}) then the bureau shall grant a permit.

If potential new source emissions are shown to likely cause ambient concentrations:

1. in excess of 1/100 of the OEL or
2. which could cause cancers in excess of one in one hundred thousand (10^{-5}) or
3. which exceed minimum detection levels for TAP without an OEL or URF,

the Bureau may grant the permit if the applicant implements the best available control technology (BACT) for that source or pollutant and after considering other factors.

If the TAP screening level is shown to likely be exceeded the Bureau will make a final decision considering the following factors:

(a) the health and environmental assessment prepared by the applicant (if one is required by the Bureau);

(b) the nature of the toxic air pollutant and the susceptibility and proximity of the human population;

(c) other health and environmental impacts associated with the anticipated level of exposure.

The Bureau may grant a permit for a new source to emit carcinogens which are likely to cause excess cancers between 1/100,000 and 1/1,000,000 (between 10^{-5} and 10^{-6}) after the applicant proves that additional controls would be a severe hardship.

Appendix 9

Samples of Industry Specific TAP Emissions Data for an Example Industry; the Asphalt Paving Mixtures and Block Industry, SIC Code 2951

This appendix contains excerpts from:

Toxic Air Pollutant Emission Factors - A Compilation for Selected Air Toxic Compounds and Sources, Second Edition EPA-450/2-90-011

4.5 CUTBACK ASPHALT, EMULSIFIED ASPHALT AND ASPHALT CEMENT

4.5.1 General[1-3]

Asphalt surfaces and pavements are composed of compacted aggregate and an asphalt binder. Aggregate materials are produced from rock quarries as manufactured stone or are obtained from natural gravel or soil deposits. Metal ore refining processes produce artificial aggregates as a byproduct. In asphalt, the aggregate performs three functions. It transmits the load from the surface to the base course, takes the abrasive wear of traffic, and provides a nonskid surface. The asphalt binder holds the aggregate together, preventing displacement and loss of aggregate and providing a waterproof cover for the base.

Asphalt binders take the form of asphalt cement (the residue of the distillation of crude oils) and liquified asphalts. To be used for pavement, asphalt cement, which is semisolid, must be heated prior to mixing with aggregate. The resulting hot mix asphalt concrete is generally applied in thicknesses of from two to six inches. Liquified asphalts are (1) asphalt cutbacks (asphalt cement thinned or "cutback" with volatile petroleum distillates such as naptha, kerosene, etc.) and (2) asphalt emulsions (nonflammable liquids produced by combining asphalt and water with an emulsifying agent, such as soap). Liquified asphalts are used in tack and seal operations, in priming roadbeds for hot mix application, and for paving operations up to several inches thick.

Cutback asphalts fall into three broad categories: rapid cure (RC), medium cure (MC), and slow cure (SC) road oils. SC, MC and RC cutbacks are prepared by blending asphalt cement with heavy residual oils, kerosene-type solvents, or naptha and gasoline solvents, respectively. Depending on the viscosity desired, the proportions of solvent added generally range from 25 to 45 percent by volume.

Emulsified asphalts are of two basic types. One type relies on water evaporation to cure. The other type (cationic emulsions) relies on ionic bonding of the emulsion and the aggregate surface. Emulsified asphalt can substitute for cutback in almost any application. Emulsified asphalts are gaining in popularity, because of the energy and environmental problems associated with the use of cutback asphalts.

4.5.2 Emissions[1,2]

The primary pollutants of concern from asphalts and asphalt paving operations are volatile organic compounds (VOC). Of the three types of asphalts, the major source of VOC is cutback. Only minor amounts of VOC are emitted from emulsified asphalts and asphalt cement.

VOC emissions from cutback asphalts result from the evaporation of the petroleum distillate solvent, or diluent, used to liquify the asphalt cement. Emissions occur at both the job site and the mixing plant. At the job site, VOCs are emitted from the equipment used to apply the asphaltic product and from the road surface. At the mixing plant, VOCs are released during mixing and stockpiling. The largest source of emissions, however, is the road surface itself.

For any given amount of cutback asphalt, total emissions are believed to be the same, regardless of stockpiling, mixing and application times. The two major variables affecting both the quantity of VOC emitted and the time over which emissions occur are the type and the quantity of petroleum distillate used as a diluent. As an approximation, long term emissions from cutback asphalts can be estimated by assuming that 95 percent of the diluent evaporates from rapid cure (RC) cutback asphalts, 70 percent from medium cure (MC) cutbacks, and about 25 percent from slow cure (SC) asphalts, by weight percent. Some of the diluent appears to be retained permanently in the road surface after application. Limited test data suggest that, from rapid cure (RC) asphalt, 75 percent of the total diluent loss occurs on the first day after

REC 3792

application, 90 percent occurs within the first month, and 95 percent in three to four months. Evaporation takes place more slowly from medium cure (MC) asphalts, with roughly 20 percent of the diluent being emitted during the first day, 50 percent during the first week, and 70 percent after three to four months. No measured data are available for slow cure (SC) asphalts, although the quantity emitted is believed to be considerably less than with either rapid or medium cure asphalts, and the time during which emissions take place is expected to be considerably longer (Figure 4.5-1). An example calculation for determining VOC emissions from cutback asphalts is given below:

Example: Local records indicate that 10,000 kg of RC cutback asphalt (containing 45 percent diluent, by volume) was applied in a given area during the year. Calculate the mass of VOC emitted during the year from this application.

To determine VOC emissions, the volume of diluent present in the cutback asphalt must first be determined. Because of density of naptha (0.7 kg/l) differs from that of asphalt cement (1.1 kg/l), the following equations should be solved to determine the volume of diluent (x) and the volume of asphalt cement (y) in the cutback asphalt:

$$10{,}000 \text{ kg cutback asphalt} = (x \text{ liter, diluent}) \cdot \left(\frac{0.7 \text{ kg}}{\text{liter}}\right) + (y \text{ liter, asphalt cement}) \cdot \left(\frac{1.1 \text{ kg}}{\text{liter}}\right)$$

and

$$x \text{ liter, diluent} = 0.45\ (x \text{ liter, diluent} + y \text{ liter, asphalt cement})$$

From these equations, the volume of diluent present in the cutback asphalt is determined to be about 4900 liters, or about 3400 kg. Assuming that 95 percent of this is evaporative VOC, emissions are then: 3400 kg x 0.95 = 3200 kg (i.e., 32% by weight, of the cutback asphalt eventually evaporates).

These equations can be used for medium cure and slow cure asphalts by assuming typical diluent densities of 0.8 and 0.9 kg/liter, respectively. Of course, if actual density values are known from local records, they should be used in the above equations rather than typical values. Also, if different diluent contents are used, they should also be reflected in the above calculations. If actual diluent contents are not known, a typical value of 35 percent may be assumed for inventory purposes.

In lieu of solving the equations in the above example, Table 4.5-1 may be used to estimate long term emissions from cutback asphalts. Table 4.5-1 directly yields long term emissions as a function of the volume of diluent added to the cutback and of the density of the diluents and asphalt cement used in the cutback asphalt. If short term emissions are to be estimated, Figure 4.5-1 should be used in conjunction with Table 4.5-1.

No control devices are employed to reduce evaporative emissions from cutback asphalts. Asphalt emulsions are typically used in place of cutback asphalts to eliminate VOC emissions.

REC 3793

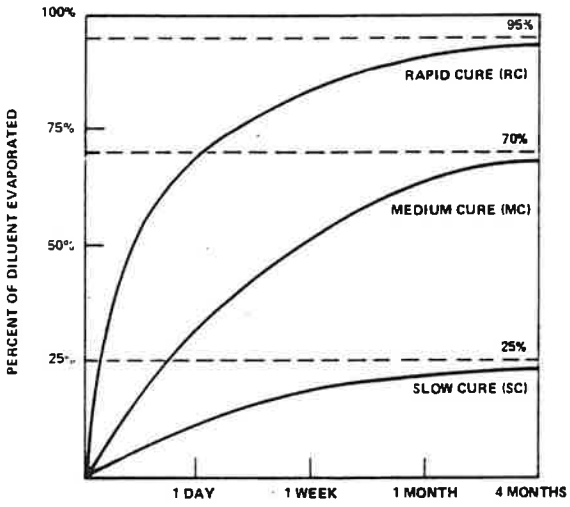

Figure 4.5-1. Percent of diluent evaporated from cutback asphalt over time.

TABLE 4.5-1. EVAPORATIVE VOC EMISSIONS FROM CUTBACK ASPHALTS AS A FUNCTION OF DILUENT CONTENT AND CUTBACK ASPHALT TYPE[a]

EMISSION FACTOR RATING: C

Type of Cutback[b]	Percent, by Volume, of Diluent in Cutback[c]		
	25%	35%	45%
Rapid cure	17	24	32
Medium cure	14	20	26
Slow cure	5	8	10

[a]These numbers represent the percent, by weight, of cutback asphalt evaporated. Factors are based on References 1 and 2.

[b]Typical densities assumed for diluents used in RC, MC and SC cutbacks are 0.7, 0.8 and 0.9 kg/liter, respectively.

[c]Diluent contents typically range between 25-45%, by volume. Emissions may be linearly interpolated for any given type of cutback between these values.

4 - Severe

HAZARDOUS INGREDIENTS

Ingredients	CAS #	Percent	PEL	STEL	TLV
Asphalt cement	8052-42-4	65-70%	N/A	10mg/m	5mg/m
Naptha	8032-32-4	0-3%	100ppm	N/A	400ppm
Emulsifier	TSCA	0.15-0.5%	N/A	N/A	N/A

PHYSICAL DATA

Boiling Point - 212f
Vapor Pressure - <1
Vapor Density - >0.062
Specific Gravity @ 60f - 1.025 to 1.06
Melting Point - N/A
Evaporation Rate - <1
Solubility in water - up to 100%
Appearance and Odor - Viscous brown to black liquid ; odor of amines and hydrocarbons

FIRE AND EXPLOSIVE DATA

Flash Point - N/A
Autoignition Temperature NFPA - N/A
Extinguishing Media - CO2, Class "B" extinguisher, foam and water fog.
Special Fire Fighting Procedures - Avoid breathing vapors, wear self-contained breathing apparatus.
Unusual Fire Explosion Hazards - DO NOT heat material above 212f to avoid generating excessive steam pressure.

REACTIVITY DATA

Stable: X Unstable:

Conditions to Avoid	-	DO NOT HEAT ABOVE 212f, Ignition sources.
Incompatible Materials	-	Avoid strong oxidizing agents
Hazardous Decomposition Products	-	Combustion may form CO2, CO, and sulfur oxide.
Hazardous Polymerization	-	Will not occur.

HEALTH HAZARD DATA

Route of Exposure	Primary Route	Signs and Symptoms
Inhalation	[X]	Use with good ventilation. May cause respiratory tract irritation
Skin Absorption	[ ]	No significant symptoms indicative of skin absorption expected.
Skin Irritation	[X]	Will cause burns when product is hot. May cause dermatitis and acne like lesions on prolonged exposure.
Ingestion	[ ]	May cause nausea and diarrhea.
Eye Contact	[X]	Will burn and irritate.

Listed as Carcinogen? Not listed by NTP, IARC, or OSHA.

EMERGENCY FIRST AID

Inhalation:	Remove to fresh air. Give oxygen or artificial respiration as needed Obtain medical attention promptly.
Eye Contact:	Flush eyes with low pressure water for at least 15 minutes and obtain medical attention immediately.
Skin Contact:	If product is hot, cool with cold water. Otherwise wash thoroughly with soap and water.
Ingestion:	Call physician. Do not induce vomiting.

PROTECTIVE EQUIPMENT / CONTROL MEASURES

Respiratory Protection:	Avoid breathing vapors in confined spaces. NIOSH approved respirators may be required if TLV's are exceeded.
Eye Protection:	Use safety glasses, goggles or face shields.
Skin Protection:	Use rubber gloves, coveralls and impervious footwear.
Engineering controls:	Local exhaust ventilation may be required to meet exposure standards in confined areas.
Handling Precautions:	Avoid heating over 212f.

SPILL AND DISPOSAL

Spill or Release:	Stop release, prevent flow from entering sewers or public waters. Allow to cool. Recover large spill. Let product cure or soak up with sand on smaller spills.
Waste Disposal Method:	Handle in accordance with federal, state and local regulations.

REVISION #1

LABEL INFORMATION

Chemical name: Asphalt Cements
Common name: Penetration Graded Asphalt AASHTO M-20;
Viscosity Graded Asphalt AASHTO M-226.

DANGER! VAPOR HARMFUL
DO NOT INTRODUCE WATER

Keep away from flames and other sources of ignition
Stable unless moisture is introduced
Extinguishing media - CO_2 or Class 'B' extinguisher
DO NOT APPLY WATER
Avoid breathing vapors. May contain low concentrations of hydrogen sulfide. Wear self-contained breathing apparatus when fire fighting. May cause dermatitis and acne lesions on prolonged and repeated exposure. Can cause severe burns when hot material contacts unprotected skin. Wear chemical resistant gloves, goggles or face shield, long sleeve shirt and pants. Use NIOSH approved respirator if TVL's are exceeded.

FIRST AID

Inhalation - Remove victim to fresh air. Start artificial resuscitation if necessary. Call a physician.

Eyes - Flush eyes with water for at least 15 minutes. Call a physician.

Skin- If hot material contacts skin, place affected part in cold water. Have a physician remove material or for small amounts use mineral oil for removal.

Ingestion - If ingested call a physician.

For further information refer to data sheet for Asphalt Cements.

Asphalt Cements
Quick Identifier

MATERIAL SAFETY DATA SHEET

The information contained herein is based on data considered accurate, however, no warranty is expressed or implied regarding the accuracy of these data or the results to be obtained from the use thereof. Vendor assumes no responsibility for injury to vendee or third person proximately caused by the material if reasonable safety procedures are not adhered to as stipulated in the data sheet. Additionally, vendor assumes no responsibility for injury to vendee or third persons proximately caused by abnormal use of the material even if reasonable safety procedures are followed. Furthermore, vendee assumes the risk in his use of the material.

SECTION 1 GENERAL

Manufacturer's Name: Farmers Union Central Exchange, Inc. (CENEX)

Emergency Telephone No. 406/628-4518 | Information Telephone No. 406/628-4311

Chemical Name: Asphalt Cements | Date Prepared: 9/20/85

Chemical Family: Petroleum Asphalt Cements

Common Name(s): Penetration graded asphalt AASHTO M-20; Viscosity graded asphalt AASHTO M-22(

SECTION 2 HAZARDOUS INGREDIENTS/IDENTITY

This product, when heated above the softening point, may contain low concentrations of hydrogen sulfide. This gas, at low concentrations, may be irritating to eyes, skin and respiratory tract.

OSHA PEL: Petroleum Asphalt Cement Not Available

ACGIH TLV'S: Asphalt Cements - 5mg/m^3 Fumes; STEL - 10mg/m^3

SECTION 3 PHYSICAL/CHEMICAL CHARACTERISTICS

Boiling Point	Above 1050°F	Specific Gravity	1.02-1.06
Vapor Pressure	<1	Melting Point	Unknown
Vapor Density	>1	Evaporation Rate	Unknown

Solubility in Water: No

Appearance and Odor: Black semi-solid thermoplastic material; odor of hydrocarbon.

Becomes liquid above 90-130°F

SECTION 4 FIRE AND EXPLOSION HAZARD DATA

Flash Point in Degrees F (Method Used)	Above 325°F COC (D-92)	Flammable Limits in air % by volume	LEL Unknown	UEL Unknown

Extinguishing Media: CO_2 and Class 'B' extinguisher

Special Fire Fighting Procedures: Avoid breathing vapors, wear self-contained breathing apparatus. DO NOT APPLY WATER.

Unusual Fire and Explosion Hazards: Flammable at temperatures above 500°F.

DO NOT MIX WITH WATER.

SECTION 5 REACTIVITY DATA

Stability	Unstable		Conditions to Avoid	Stable unless moisture is introduced
	Stable	X		Flames and other sources of ignition

Incompatability (Materials to Avoid): Water, hydrocarbon solvents, strong oxidizing agents

Hazardous Decomposition Products: Fumes, smoke, carbon monoxide in the case of incomplete combustion

Hazardous Polymerization	May Occur	REC 3811	Conditions to Avoid	
	Will Not Occur	X		

SECTION 6 HEALTH HAZARDS

Acute Will cause severe burns if hot material contacts unprotected skin.

Chronic Respiratory tract irritation

Signs & Symptoms of Exposure May cause dermatitis and acne like lesions on prolonged and repeated exposure to dust or vapors.

Medical Conditions Generally Aggravated by Exposure Respiratory disease and infection; cardiovascular diseases

Chemical Listed as Carcinogen or Potential Carcinogen	National Toxicology Program	Yes	No	X	IARC	Yes	No	X	OSHA	Yes	No	X

ROUTES OF ENTRY WITH EMERGENCY & FIRST AID PROCEDURES

1. Inhalation Remove victim to fresh air. Start artificial resuscitation if necessary. Call a physician.
2. Eyes Flush eyes with water for at least 15 minutes. Call a physician.
3. Skin If hot material contacts skin, place affected part in cold water. Have a physician remove material or for small amounts use mineral oil for removal.
4. Ingestion If ingested call a physician.

SECTION 7 SPECIAL PRECAUTIONS

Precautions to be Taken in Handling and Storing Never introduce water when hot. Avoid skin exposure to hot material. Avoid breathing vapors in confined spaces. Avoid sources of ignition.

Shipping Information DOT ID #NA1999 - No Placard Required

Steps to be Taken in Case Material is Spilled or Released In case of spillage allow to cool and pick up when solid or semi-solid. Have proper extinguishing media present.

Waste Disposal Methods Handle in accordance with federal, state and local regulations.

SECTION 8 CONTROL MEASURES

Ventilation 1. Local Exhaust 2. Mechanical — If possibility of vapor or fume accumulation exists, utiliz explosion proof ventilating equipment, to avoid toxic or explosive concentrations.

Protective Gloves Chemical Resistant

Eye Protection Goggles or Face Shield

Respiratory Protection (Specify Type) Use appropriate NIOSH approved respirator if TLV's are exceeded.

Other Protective Clothing or Equipment Long sleeve shirt and pants to minimize skin contact.

Work & Hygienic Wash exposed skin with soap and water after work periods and before

Air Permitting Screening Policy for Air Strippers used in the Cleanup of Petroleum Contaminated Groundwater

DRAFT

This policy is designed to quickly identify air stripper cleanups of petroleum contaminated ground water which pose limited risk to the public through the air pathway, and to expedite the approval for such air emissions. This policy is designed to work together with DEQ's Screening Model and Risk Assessment Procedures For Air Quality Permitting of Vapor Extraction Systems and Air Stripping Used for Leaking Underground Storage Tank Cleanup. Version 1.0 of that document is being updated to include this screening policy for air stripping.

The policy is implemented through a simple question and answer form (a copy of which follows), which conservatively estimates the significance of the emissions given the distance to the nearest property boundary or receptor. Sources with relatively insignificant emissions, as determined by answering the questions on the form and documented as required on the form, are offered DEQ review and final action within two weeks of the date of receipt. This significantly accelerates DEQ turnaround time to expedite the cleanup, since the timeline on processing air permit applications is typically 90 days or more.

For the purposes of this policy, a sensitive receptor is defined as any building or location occupied or frequented by persons who, due to age, infirmity or other health based criteria as defined by the Division of Environmental Quality, may be more susceptible to the deleterious effects of a toxic air pollutant(s) than the general population. Examples of sensitive receptors include but are not limited to: elementary and secondary schools, licensed day care centers, playgrounds and parks, hospitals, clinics and nursing homes.

The existence of a sensitive receptor within 500 feet of the proposed action will not necessarily result in a permit denial, but will trigger tighter DEQ scrutiny of risks to the surrounding population.

This screening policy does not supersede any other DEQ policies or requirements, but instead complements existing DEQ policies by identifying low risk sources, removing them from the standard air permit workload, and accelerating their review. Sources not approvable through this screening policy still may be approvable through the DEQ air quality permitting program. In those cases, a more thorough risk assessment will be required and DEQ review will remain on traditional timelines.

DRAFT

AIR PERMIT SCREENING TEST FOR AIR STRIPPING PETROLEUM CONTAMINATED WATER

Company/facility name _____
Facility address _____

A. PRESENCE OF SENSITIVE RECEPTORS

Is the proposed air stripping site located within 500 feet of a sensitive recepto: defined in the attached Air Permitting Screening Policy for Air Strippers used i: Cleanup of Petroleum Contaminated Ground water?

YES _____ NO _____

B. CALCULATE UNCONTROLLED BENZENE LEVELS IN AIR EMISSIONS

1. Flow rate of water into Air Stripper in gallons per minute. The proposed flow must have DEQ approval. The proposed flow rate must be sufficient to adequ: control, contain, and remove the petroleum contamination. Please a: documentation verifying DEQ approval of the proposed flow rate.

_____ gal./min.

2. Convert flow rate to liters per minute.
Multiply line 1 by 3.785. _____ *l*/min.

3. Determine Benzene concentration in ground water.

Is free product present in any ground water well associated with this petroleum release site? YES _____ NO _____

a. If you marked YES, you must conduct a pilot test to determine expected ber concentrations. See the attached "Directions for Conducting a Pilot Tes Determine Benzene Concentrations in Ground Water" for more information. I the benzene concentration here.

Benzene concentration from pilot test = _____ ppb (ug,

b. If you marked NO and free product is <u>not</u> present in any well, determine benzene concentration in the ground water by one of the following two meth

i. Enter the Benzene concentration from a ground water well with the hic benzene concentration. Use only the most recent analysis.

Benzene concentration from single well = _____ ppb (ug,

ii. Conduct a pilot test to determine benzene concentrations following directions of the attached "Directions for Conducting Pilot a Tes Determine Benzene Concentrations in Ground Water."

Benzene concentration from pilot test = _____ ppb (ug,

4. Calculate benzene flow rate to air stripper.
Multiply line 2 by line 3a or 3b, whichever is appropriate. _____ ug/min.

5. Convert uncontrolled benzene air emission rate from ug/min to lbs/day. Multiply line 4 by 3.18E-6. _____ lbs./day

B. CALCULATION OF MAXIMUM ALLOWABLE BENZENE EMISSION RATE

6. a. Distance to nearest property line. _____ ft
b. Distance to nearest offsite structure serving as a workplace or residence _____ ft

DRAFT

7. **Allowable Benzene emission level.**

a. Divide Line 6a by 100. _____
b. Divide line 6b by 200. _____
c. Enter the larger of line 7a or Line 7b _____
d. Enter the value 1.5 or the result from 7c, whichever is smaller. _____ lbs./day

The result in line 7d is the maximum allowable benzene emission rate for the proposed stripping operation at this site. Is the uncontrolled emission rate for benzene in li less than the maximum allowable benzene emission level in line 7d?

Yes ____ Control of benzene air emissions shall not be required. You ay skip Sec C. of this form and proceed directly to Section D. Document all data ent and enclose complete set of most recent water sampling results, a site map c to scale showing monitoring wells, and your monitoring plan. Send them with form to Division of Environmental Quality, Permits and Enforcement Program, N. Hilton, Boise, ID 83706.

No ____ Control of benzene air emissions shall be required. Call (208) 334-5898 review air quality permit requirements or proceed to the following page complete questions on emissions controls.

C. **CALCULATE CONTROLLED BENZENE LEVELS IN AIR EMISSIONS**
(please complete lines 1 to 7 before proceeding with this section)

8. Describe the type of emissions control you propose to use.

_____
_____
_____

9. Control Efficiency (0 < eff. < 1) 0.

10. 1.0 - Control Efficiency 0.

11. Enter uncontrolled benzene air emission rate from line 7 on reverse side. _____ lbs/day

12. Controlled benzene emissions Multiply lines 10 and 11. _____ lbs/day

Is the controlled emission rate for Benzene in line 12 less than the maximum allow Benzene emission rate calculated in line 7d?

Yes ____ Document all data entries and enclose complete set of most recent water samp results, a site map drawn to scale showing monitoring wells, your monito plan, and documentation on the control equipment (manufacturer's specificatio its application at the proposed site, and its efficiency if credit is take emission controls through this process. Send them with this form to Div of Environmental Quality, Permits and Enforcement Program, 1410 N. Hilton, Bo ID 83706.

No ____ Call (208) 334-5898, to review air quality permit requirements with DEQ staff

D. **SIGNATURE AND CONTACT INFORMATION**

Applications approved through this process will be required to document emissions rat DEQ during the initial two months of operation. Emissions rates exceeding those calcu above may result in further emissions limitations. DEQ may, in its sole discretion, rec modification to any project plans in order to protect public health.

Directions for Conducting a Pilot Test to Determine Benzene Concentrations in Ground Water (Air Stripping)

Benzene emission rates in air associated with air stripping operations are estimated using a benzene concentration in ground water. These data are then used to determine whether air emissions from the air stripping equipment require controls. The Division of Environmental Quality (DEQ) has determined that a short-term, full-scale pumping test with ground water sampling is an appropriate method for determining the benzene concentration in ground water in some cases. This procedure is required for determining benzene concentrations in ground water when free product is present in monitoring or recovery wells. It is also an acceptable, but not required, method of determining benzene concentrations when free product is not present.

For purposes of this guidance, the term "pilot test" shall mean the process of pumping ground water from the contaminated subsurface in the area targeted for remediation. Water samples shall be collected for laboratory analysis to determine benzene concentrations prior to treatment by the air stripping equipment. The criteria contained herein are designed specifically as a means of determining the concentration of benzene in pumped ground water. It may be possible to modify an aquifer test (designed to determine subsurface hydraulic parameters) conducted during site investigation work to obtain the same data. Alternatively, it may be appropriate to design or modify the pilot test so that subsurface hydraulic parameters are determined along with the expected benzene concentration.

Note that DEQ does not require air stripping equipment to be installed prior to conducting the pilot test. The pilot test may be conducted at any time within the site investigation as long as the benzene concentration is not likely to increase appreciably over time and site conditions are expected to be comparable between the time of sampling and cleanup. The criteria to be followed in performance of an acceptable pilot test are:

- Pumping shall take place from recovery well(s) expected to be used in the full-scale cleanup.

- The pumping rate shall be the same rate used in the full-scale cleanup. Usually, the pumping rate is approved by DEQ

REC 3818

through submission of a written cleanup plan. The pumping system shall operate continuously at the desired rate for a minimum of two (2) hours and a maximum of twelve (12) hours. Upon completion of pumping, one (1) grab sample shall be collected and analyzed for benzene, toluene, ethylbenzene, and xylenes (BTEX).

- One (1) duplicate sample shall be collected and analyzed for BTEX. Duplicate sample analyses must result in a relative percent difference (RPD) of 25% or less.

- Samples shall be collected from the pumping system at a location representative of inflow to the air stripper but after any preliminary treatment equipment (i.e., oil/water separators, etc.).

- The laboratory analysis method must be an EPA-approved method and must have a lower detection limit of no greater than one (1) ug/l (ppb). Sampling must be conducted in accordance with the RCRA Ground Water Monitoring Technical Enforcement Guidance Document (National Water Well Association, 1986) or equivalent.

- Contaminated water generated during the pilot test must be treated or disposed of in a safe and acceptable manner. On-site storage prior to treatment system completion is acceptable as long as all applicable regulations and ordinances are followed. The treatment and disposal of all generated wastes are the sole responsibility of the person(s) conducting the pilot test.

C. List appropriate soil sample analytical results from excavated contaminated soil. Samples collected shall be representative of the respective stockpiled PCS. If the petroleum is not gasoline or fuel oil, attach separate table.

col.1 Stockpile volume (yd^3)	col.2 Sample I.D.	col.3 Sample type TPH-Gas TPH-Diesel	col.4 Grab or composite sample?	col.5 Sample TPH (ppm)	col.6 Average TPH per stockpile	col.7 Multiply average TPH (col. 6) by stockpile volume (col. 1)

sum of col. 1 _____ sum of col. 7 = _____

Note: Copies of lab results and chain of custody forms must be included.

IV. **Screening test for air emissions.**

A. Calculate average TPH for all PCS to be treated.

1. Enter TOTAL TPH x VOL. (sum of col. 7) here. _____
2. Enter TOTAL VOLUME (sum of col. 1) here. _____
3. Calculate AVERAGE TPH. Divide line 1 (TOTAL TPH x VOL.) by line 2 (TOTAL VOLUME) and enter quotient here. _____

B. Refer to table 2 to determine setback requirement based upon the TOTAL VOLUME and AVERAGE TPH values calculated above. Enter the setback requirement here. _____

Note: If the setback requirement is greater than the distance to the nearest building or residential property line appearing in line II.D, then the land-treatment proposal will not be approved under this expedited format and further review of the land-treatment proposal will be required.

V. **Include the following figures:**

A. Copy of county soil survey map (if the county has been mapped) with copies of the interpretation tables or sheets. CLEARLY MARK location of site on the soil map.

B. Map with exact land treatment site location marked.

VI. **Proposed end use of PCS:** _____

Case Docket No. 0101-22-01
OAH Case No. 23-245-01

JOINT MOTION TO STRIKE PETITIONERS' RESPONSE

The Idaho Department of Environmental Quality ("Department") and Perpetua Resources Idaho, Inc. ("Perpetua"), through undersigned counsel, pursuant to IDAPA 58.01.23.162, respectfully moves to strike Petitioners' Nez Perce Tribe, Save the South Fork Salmon, Inc., and Idaho Conservation Leage (collectively "Petitioners") Response Opposing DEQ/Perpetua's Motion for Reconsideration filed on June 3, 2024 ("Response").

On May 23, 2024, the Department and Perpetua filed a Joint Motion for Reconsideration and/or Clarification of Final Order requesting that the Board of Environmental Quality ("Board") reconsider its holding that the Permit to Construct be remanded to the Hearing Officer. On June 3, 2024, Petitioners filed the Response in opposition to Department and Perpetua's motion for reconsideration. Notably, Petitioners fail to identify any authority authorizing the filing of a response to a motion for reconsideration. Indeed, none exists.

Neither the Idaho Rules of Administrative Procedure of the Attorney General,[1] nor Idaho Code authorize the filing of a response brief to a motion for reconsideration. I.C. § 67-5246(4); IDAPA 04.11.01.740. This is particularly notable, because the Rules *do* specifically authorize and provide for a response brief when a party appeals to the Board. *See* IDAPA 04.11.01.730.02.c. Had the Department intended to authorize responses to motions for reconsideration it would have included a provision in the rules. Therefore, Petitioners' Response should be struck and not considered.

Irrespective of whether Petitioners' Response is struck, the document attached as Exhibit 1 to Mr. Tiedemann's declaration fully supports the Department's and Perpetua's motion for reconsideration. *See* Tiedemann Decl., Ex. 1, App'x 6. This document explains that the TAPs screening levels were just that, screening levels, not standards. *Id.* The Department used unit risk

[1] The relevant Rules of Administrative Procedure, IDAPA 04.11.01, are incorporated by reference in the Department's Contested Case Rules. IDAPA 58.01.23.003.18.

factors ("URF") from the U.S. Environmental Protection Agency to set these screening levels, which it converted to annual concentrations now set forth as acceptable ambient concentrations for carcinogens ("AACCs") in IDAPA 58.01.01.586. *Id.*; see also id., App'x 7. However, as the document explains, the ultimate question is not whether a source meets the screening level on an annual basis, but whether the source is likely to cause an unacceptable cancer risk evaluated based on a lifetime exposure of 70 years. *Id.*, App'x 8. Petitioners' reference to short term sources is consistent with this interpretation. Even though the screening level was increased for short term sources, DEQ still needed to assure itself that the risk from these projects would be less than one in one million, and therefore limited the duration of exposure for screening purposes. As explained in the Department's and Perpetua's Motion for Reconsideration, utilizing the URFs and AACCs, the Stibnite Gold Project does not cause an unacceptable cancer risk.

For the foregoing reasons, Perpetua respectfully requests that the Board strike Petitioners' Response. To the extent that the Board is inclined to consider Petitioners' Response, the Department and Perpetua request that the Board read the entirety of the 1992 meeting packet and not just the isolated excerpt from Petitioners' Response.

DATED: June 4, 2024.

IDAHO DEPARTMENT OF ENVIRONMENTAL QUALITY,	)	
Respondent,	)	
and	)	
PERPETUA RESOURCES IDAHO, INC.	)	
Intervenor-Respondent.	)	

Petitioners Nez Perce Tribe, Idaho Conservation League, and Save the South Fork Salmon hereby oppose the Joint Motion to Strike filed by the Idaho Department of Environmental Quality ("DEQ") and Perpetua Resources Idaho, Inc. ("Perpetua") on June 4, 2024. The Idaho Rules of Administrative Procedure of the Attorney General neither specifically authorize nor prohibit the filing of a response to a motion for reconsideration. Moreover, those rules provide:

> The rules in this chapter will be liberally construed to secure just, speedy and economical determination of all issues presented to the agency. Unless prohibited by statute, the agency may permit deviation from these rules when it finds that compliance with them is impracticable, unnecessary or not in the public interest.

IDAPA 04.11.01.052. Considering Petitioners' short response to DEQ and Perpetua's Joint Motion for Reconsideration and/or Clarification of Final Order ("Reconsideration Motion") will allow for just, speedy, and economical determination of the issues. The Reconsideration Motion relied on "new" evidence that was in existence both during the three years DEQ was reviewing Perpetua's application for a permit to construct and during the two years of this contested case proceeding, but was never presented to DEQ, the Hearing Officer, or this Board until the eleventh-hour scramble requesting this Board to reconsider its Final Order. As Petitioners' raised in their response to the Reconsideration Motion, it is not in the public interest, nor is it appropriate, for the Board to consider this "new" evidence on a one-sided motion for reconsideration. *See* IDAPA 58.01.23.730.03 (providing the Board with the authority to "remand the matter for further evidentiary hearings if further factual development of the record is necessary . . .") (emphasis added).

//

//

//

The Board should therefore deny DEQ and Perpetua's Joint Motion to Strike,

Dated: June 7, 2024

Respectfully submitted,

BEFORE THE BOARD OF ENVIRONMENTAL QUALITY

STATE OF IDAHO

IN THE MATTER OF AIR QUALITY PERMIT TO CONSTRUCT P-2019.0047	Case Docket No. 0101-22-01 OAH Case No. 23-245-01
NEZ PERCE TRIBE, IDAHO CONSERVATION LEAGUE, and SAVE THE SOURTH FORK SALMON, Petitioners, v. IDAHO DEPARTMENT OF ENVIRONMENTAL QUALITY, Respondents, and PERPETUA RESOURCES IDAHO, INC., Intervenor-Respondent.	ORDER ON PETITIONS FOR RECONSIDERATION AND/OR CLARIFICATION OF FINAL ORDER

I. INTRODUCTION

On July 22, 2022, the Nez Perce Tribe, the Idaho Conservation League, and Save the South Fork Salmon (collectively "Petitioners"), filed a *Petition to Initiate Contested Case: Air Quality Permit to Construct P-2019.0047 (Jun. 17, 2022)*, seeking review of the Idaho Department of Environmental Quality's ("DEQ") issuance on June 17, 2022 of Air Quality Permit to Construct P-2019.0047 ("PTC"), to mining company Perpetua Resources Idaho, Inc.

("Perpetua") for its proposed Stibnite Gold Project ("SGP"). REC 0001–0028. Perpetua filed a Petition to Intervene in the matter on August 12, 2022. REC 0040–0043. A Hearing Officer was appointed and the parties participated in discovery and ultimately filed cross-motions for summary judgement. REC 319–322, REC 1204–1206, REC 1276–1278. On October 31, 2023, the Hearing Officer issued a *Preliminary Order*. REC 3280–3328. On November 14, 2023, the Petitioners filed a *Petition for Review* of the *Preliminary Order.* REC 3342–3356. On December 5, 2023, the Hearing Officer issued an *Amended Preliminary Order*. REC 3372–3425. In response, the Petitioners filed an *Amended Petition for Review* that requested review by the Board of Environmental Quality of both the October 31, 2023 *Preliminary Order* and the December 5, 2023 *Amended Preliminary Order*. REC 3426–3441. On May 9, 2024 the Board issued a *Final Order* in this matter. REC 3695–3720. On May 23, 2024, Petitioners filed their *Petitioners' Motion for Clarification and/or Reconsideration.* REC 3721–3727. On May 23, 2024, DEQ and Perpetua filed a *Joint Motion for Reconsideration and/or Clarification of Final Order* and *Memorandum in Support of Joint Motion for Reconsideration and/or Clarification of Final Order*. REC 3728–3751. On June 3, 2024, Petitioners filed *Petitioners Response Opposing DEQ/Perpetua's Motion for Reconsideration.* On June 4, 2024, DEQ and Perpetua filed a *Joint Motion to Strike Petitioner's Response*.

RELIEF REQUESTED

1. Petitioner's Requests

Petitioners request the Board of Environmental Quality clarify or reconsider its *Final Order* to set aside or vacate the PTC while on remand or to order an amended Application for Permit to Construct be filed with DEQ.

2. DEQ and Perpetua's Requests

DEQ and Perpetua request the Board of Environmental Quality:

1. Reconsider its issuance of a final order in this matter.

2. Reconsider its decision regarding DEQ's analysis of arsenic ambient concentrations and issue a final order that finds DEQ acted reasonably and in accordance with law.

3. Reconsider its decision regarding DEQ's analysis of arsenic ambient concentrations and reopen the proceedings before the Board and hold additional hearings on the analysis before issuing a final order.

4. Reconsider and/or clarify its instructions on remand so that the Hearing Officer and the parties directly address the sufficiency of evidence the Board seeks to affirm the PTC.

ANALYSIS

1. Petitioner's Motion for Reconsideration is Denied

Petitioners assert that the Board of Environmental Quality is required to set aside the PTC under I.C. § 67-5279(3). That provision, however, applies to judicial review by a court of an agency action and is not applicable in this matter.

Petitioners further cite *In the Matter of Sunnyside Park Utilities' Application for Sewage Disposal Permit*, Final Order on Petition for Review of Preliminary Order, at p. 10 (BEQ Dkt. 0103-07-02, April 7, 2009) for the proposition that the PTC must be set aside. In *Sunnyside*, DEQ denied an application for permit but failed to provide sufficient reasoning for the denial. *Id.* at 11. The Board of Environmental Quality found:

> Simply put, we are unable to tell exactly what criteria DEQ chose to apply in determining whether Idaho Falls' central wastewater system was reasonably accessible to the subdivision. Since we cannot determine that DEQ's reasoning and conclusion were rational, the permit denial must be set aside. Setting aside the permit denial will apply DEQ to process the application again, or to process an amended application should Sunnyside decide to submit one, and in so doing identify the facts and circumstances that should be considered, apply its expertise to the facts and issues, and provide an adequate explanation for its decision.

Id. at 11–12. Unlike in *Sunnyside*, DEQ provided, in this matter, extensive reasoning for its issuance of the PTC. The Board of Environmental Quality found that DEQ's decision in four of the five issues brought for review were supported by sufficient evidence and that DEQ acted reasonably in making those decisions. The fifth issue brought for review has been remanded to the Hearing Officer for additional fact finding. But the remand has no effect on the Board of Environmental Quality's decision on the first four issues for which there was sufficient evidence. Because DEQ has been upheld on most of its decisions in the PTC it does not make sense to set aside or vacate the entire PTC or to require the applicant to file a new application for permit. Therefore, the *Petitioners' Motion for Clarification and/or Reconsideration* is denied.

2. DEQ and Perpetua's Motion for Reconsideration and/or Clarification is Denied in Part and Granted in Part.

As outlined below, the Board of Environmental Quality grants DEQ and Perpetua's request to clarify the effective date of the *Final Order*, denies the request to reconsider its decision on the ambient arsenic concentration issue, denies the request to reopen the proceedings before the Board or hold additional hearings before the Board on the arsenic issue, and denies the request to provide additional clarification on the issues for remand.

A. The Board of Environmental Quality Clarifies its Decision as to the Effective Date of the Final Order.

When reviewing a petition for review of a preliminary order, the Board of Environmental Quality must: "(a) Issue a final order in writing, within fifty-six (56) days of the receipt of the final briefs or oral argument, whichever is later, unless the period is waived or extended with the written consent of all parties, or for good cause shown; (b) Remand the matter for additional hearings; or (c) Hold additional hearings." I.C. § 67-5245(6)(a)–(c). DEQ and Perpetua argue that the disjunctive "or" in this section means that the Board may *either* issue a final order or

remand the matter for additional hearings, but not do both. However, I.C. § 67-5246(1) seems to contemplate that the only type of order an agency head may issue is a final order: "If the presiding officer is the agency head, the presiding officer shall issue a final order."

In this matter, the Board of Environmental Quality found that sufficient evidence existed to support DEQ's findings in four of the five issues brought for review and that DEQ acted reasonably in making those decisions. The Board of Environmental Quality's decision on those matters is final. However, the Board also found, with regard to the ambient arsenic air concentration analysis, that there was not sufficient evidence to support DEQ's analysis and that further factual development was needed on that issue. Consequently, the Board remanded that issue to the Hearing Officer. So that issue is not yet final.

This split decision creates some ambiguity as to the nature of the order that the Board of Environmental Quality must issue in this matter. The Board recognizes that if it issues a final order that issuance will trigger certain time frames under I.C. §§ 67-5270 and 67-5273 under which the parties must seek judicial review of that final order. Those time frames would likely overlap with any proceedings being held by the Hearing Officer on remand, creating a situation in which the parties must simultaneously seek judicial review under I.C. § 67-5270, while at the same time engaging in a remand proceeding before the Hearing Officer on the arsenic issue. The Board of Environmental Quality recognizes that this may create confusion in the record and likely does not result in judicial economy.

Idaho Code Section 67-5246(5) provides: "*Unless a different date is stated in a final order*, the order is effective fourteen (14) days after its service date if a party has not filed a petition for reconsideration. . . ." (emphasis added); *see also* IDAPA 58.01.23.730.03. This provision provides the Board of Environmental Quality some discretion to determine a different timeframe

for when its order becomes "effective" for purposes of triggering judicial review deadlines under I.C. §§ 67-5270 and 67-5273. While the Board's decision is final as to the first four issues, it is not final as to the arsenic issue. Therefore, the Board will stay issuance of a final order on all five issues until the remand before the Hearing Officer is complete and all statutory deadlines for review of the Hearing Officer's Orders have run. The order will still be a "Final Order," but it will not be considered "effective" for purposes of I.C. §§ 67-5246(5), 67-5270, and 67-5273 until the Hearing Officer has issued an order on the arsenic issue and all statutorily-allowed administrative review of that issue has been completed. At that point, all five issues will be considered "final" and appealable under I.C. §§ 67-5270 and 67-5273. This will allow a full factual record to be developed for the arsenic issue and will prevent the parties from having to simultaneously file for judicial review and engage in additional fact finding before the Hearing Officer. Therefore, the Board of Environmental Quality grants DEQ and Perpetua's motion for clarification of the effective date of the *Final Order*.

B. The Board of Environmental Quality Denies the Request to Reconsider its Decision on the Ambient Arsenic Concentration Issue.

DEQ and Perpetua argue that the Board of Environmental Quality misunderstood or was mistaken in its decision on the ambient arsenic air concentration analysis. In support of their positions, DEQ and Perpetua present additional evidence that is not a part of the record in this case. DEQ and Perpetua also make new arguments that were not briefed or argued by the parties. When reviewing a preliminary order, the Board of Environmental Quality's findings of fact "must be based exclusively on the evidence in the record of the contested case and on matters officially noticed in that proceeding." I.C. § 67-5248(2). The agency record of a contested case consists of all items enumerated in I.C. § 67-5249(1)(a)–(g) (pleadings, evidence received, matter officially noticed, record prepared by the hearing officer and transcript of the

proceeding, staff memos or data, and orders). Unless an exception exists, "the agency record constitutes the exclusive basis for agency action in contested cases under this chapter or for judicial review thereof." I.C. § 67-5249(3), *see also* IDAPA 04.11.01.650.01, *Masterson v. Idaho Dep't of Transp.*, 150 Idaho 126, 130, 244 P.3d 625, 629 (Ct. App. 2010) (holding a hearing officer in a contested case erred by relying on materials that were not made part of the record.).

The Board of Environmental Quality will not accept new evidence or arguments regarding the ambient arsenic air concentration analysis and will not reconsider its decision on that issue. The parties will have an opportunity to supplement and develop a full factual record on the arsenic issue before the Hearing Officer on remand. Therefore, DEQ and Perpetua's request for the Board to reconsider its decision on the arsenic issue is denied.

C. The Board of Environmental Quality Denies the Request to Reopen the Proceedings or Hold Additional Hearing before the Board.

DEQ and Perpetua request the Board of Environmental Quality reopen the proceedings before the Board or hold additional hearings. The Board will not reopen the proceedings before it or hold additional hearing in this matter. The parties will have an opportunity to develop a full factual record on the arsenic issue before the Hearing Officer on remand. Therefore, DEQ and Perpetua's request to reopen or hold additional proceedings before the Board of Environmental Quality is denied.

D. The Board of Environmental Quality Denies the Request for Additional Clarification or Instructions to the Hearing Officer.

DEQ and Perpetua request the Board of Environmental Quality provide clarification and instructions to the Hearing Officer regarding the proceedings on remand, including determining what evidence may be submitted and how the issue must be framed. The Board will not limit the scope of the proceedings on remand or the types of evidence that may be presented, other than to

restate that they must focus only on the development of additional factual evidence on the ambient arsenic air concentration analysis performed by DEQ for the PTC. As stated above, the other four issues brought before the Board have been finally decided and cannot be reopened on remand. The parties will have a full opportunity before the Hearing Officer on remand to define the scope of those proceedings and evidence that may be presented. Therefore, DEQ and Perpetua's request for additional clarification and instruction for the Hearing Officer on remand is denied.

CONCLUSION

Based on the foregoing, it is hereby ordered:

1. Petitioner's Motion for Clarification and/or Reconsideration is Denied
2. The Joint Motion for Reconsideration and/or Clarification of Final Order is Granted in Part and Denied in Part.
    a. The Board of Environmental Quality Clarifies its Decision as to the Effective Date of the Final Order.
    b. The Board of Environmental Quality Denies the Request to Reconsider its Decision on the Ambient Arsenic Concentration Issue.
    c. The Board of Environmental Quality Denies the Request to Reopen the Proceedings or Hold Additional Hearing before the Board.
    d. The Board of Environmental Quality Denies the Request for Additional Clarification or Instructions to the Hearing Officer.

BEFORE THE OFFICE OF ADMINISTRATIVE HEARINGS
STATE OF IDAHO

IN THE MATTER OF AIR QUALITY PERMIT TO CONSTRUCT P-2019.0047	)	BEQ Case No. 0101-22-01
NEZ PERCE TRIBE, IDAHO CONSERVATION LEAGUE, and SAVE THE SOUTH FORK SALMON, Petitioners, v. DEPARTMENT OF ENVIRONMENTAL QUALITY, Respondent, and PERPETUA RESOURCES IDAHO, INC., Intervenor.	)	OAH Case No. 23-245-01 NOTICE OF STATUS AND SCHEDULING CONFERENCE; UPDATED DISCLOSURE

On June 12, 2024, the Board of Environmental Quality issued its Order on Petitions for Reconsideration and/or Clarification of Final Order, returning jurisdiction of this matter to the Office of Administrative Hearings and the hearing officer. On June 17, 2024, counsel for DEQ sent an email to the parties and hearing officer attaching a proposed Scheduling Order and requesting the setting of a scheduling conference. Based on subsequent email exchanges, the parties will meet and confer regarding scheduling matters on June 25, 2024. The parties had also set aside July 2 and 3, 2024 to discuss scheduling issues, though there is disagreement among the parties as to whether the July dates were intended to be counsel-only or with the hearing officer. Regardless of that issue, the

subsequent email exchange also informed the hearing officer that counsel for Save the South Fork Salmon would be unavailable for the majority of July and a few days in early August.

The hearing officer is sympathetic to—and personally identifies with—the challenges of managing summer travel while working at a small law firm. However, the hearing officer is not comfortable deferring the first post-remand conference among the parties and hearing officer until mid-August. Because counsel for the parties had already been setting aside July 2 and/or 3 to discuss scheduling issues, the hearing officer hereby notifies the parties that he will convene a status and scheduling conference via Zoom on 2:30 p.m. on Tuesday, July 2, 2024, and will circulate the associated Zoom credentials separately. To the extent counsel for any of the parties is unavailable at that date and time, he or she should coordinate an alternative, mutually convenient date and time with the other parties and inform the hearing officer so that an amended notice can be issued. The hearing officer can rearrange his calendar to accommodate a conference at any reasonable time on July 2 or July 3.

In light of the proposed hearing dates in DEQ's draft Scheduling Order, the hearing officer hereby notifies the parties, in advance of their June 25 meet-and-confer, that he currently has a contested case hearing scheduled for late September 2024. Therefore, a hearing on the merits in this matter should take place no earlier than October 2024. In addition, the hearing officer invites and encourages the parties to file a short status report regarding their June 25 meet-and-confer on or prior to Friday, June 28, 2024, noting the areas of agreement and disagreement regarding the nature, scope, and conduct of the proceedings on remand.

Finally, in connection with the resumption of these proeedings, the hearing officer hereby attaches an updated disclosure of his other professional matters involving the State of Idaho as a party, and notifies the parties that OAH has approved the associated waiver request.

Dated this 24th day of June, 2024.

Dylan B. Lawrence
Hearing Officer

Current Formal Judicial/Administrative Proceedings Involving State Agencies as Adverse Parties

In the Matter of Application for Permit No. 63-34753 in the Name of Idaho Water Resource Board: This involves the water right application filed by IWRB that is associated with the proposed raise of Anderson Ranch Dam. I represent Elmore County, who has filed a protest in opposition to the application.

In the Matter of Application for Permit No. 2-10556 in the Name of the State of Idaho: This involves the water right application filed by IWRB for a winter water supply for the Snake River pump station and treatment plant project at the Mountain Home Air Force Base. I represent Elmore County, who has filed a protest requesting certain conditions to be placed on any approval.

Hirschi v. Idaho Dept. of Lands, Case No. CV04-24-0096, Sixth District, Bear Lake County: I represent the petitioner in a petition for judicial review of an IDL decision involving encroachment permit applications under the Lake Protection Act.

Hirschi, et al. v. State of Idaho, et al., Case No. CV04-24-0112, Sixth District, Bear Lake County: I represent the plaintiff in a declaratory judgment action against DEQ, IDL, the Dept. of Insurance, and the Bear Lake Fire District regarding regulation of fueling practices.

Other Ongoing, Less Formal Contacts with State Agencies

I have clients who have been pursuing funding from DEQ for water projects. I have been involved in some discussions with DEQ staff related to that effort.

My practice focuses on water rights, so I am nearly always involved in multiple matters and communications with IDWR and IWRB. For example, I typically have multiple clients with water right applications or protests pending with IDWR, and am in regular communication with IWRB and IDWR staff on a variety of topics and matters.

Past Matters

DEQ/BEQ: I have been directly adverse to DEQ in two air quality permit matters and in a handful of matters involving releases and management of hazardous waste.

Others: I have been directly adverse to IDWR, IWRB, IDFG, IDL, and ABC in dozens of past matters (mostly IDWR and IWRB).

BEFORE THE BOARD OF ENVIRONMENTAL QUALITY
STATE OF IDAHO

IN THE MATTER OF AIR QUALITY PERMIT TO CONSTRUCT P-2019.0047 NEZ PERCE TRIBE, IDAHO CONSERVATION LEAGUE, and SAVE THE SOUTH FORK SALMON, Petitioners, v. IDAHO DEPARTMENT OF ENVIRONMENTAL QUALITY, Respondent, and PERPETUA RESOURCES IDAHO, INC., Intervenor-Respondent.	Case Docket No. 0101-22-01 OAH Case No. 23-245-01 **IDAHO DEPARTMENT OF ENVIRONMENTAL QUALITY'S INITIAL STATUS REPORT**

On May 9, 2024 the Idaho Board of Environmental Quality ("Board") issued the *Final Order* remanding this matter to the Hearing Officer "for the development of further evidence regarding the ambient air concentrations of arsenic that will be produced by the [Stibnite Gold Project ("SGP")] and whether those levels comply with the Air Rules." Final Order at 23.

On June 12, 2024, the Board issued its *Order on Petitions for Reconsideration and/or Clarification of Final Order* ("Reconsideration Order"). The Board explained that "[t]he parties will have a full opportunity before the Hearing Officer on remand to define the scope of those proceedings and evidence that may be presented." *Id.*

The Idaho Department of Environmental Quality ("DEQ") submitted a proposed scheduling order on June 17, 2024. After email discussions among the Hearing Officer and the parties, the Hearing Officer issued his *Notice of Status and Scheduling Conference; Updated*

Disclosure on June 24, 2024 requesting status reports from the parties. On June 25, 2024, the parties met and conferred to discuss the scope of the issues on remand and a scheduling order. While the parties have come to an agreement on the scope of the issues, no agreement was met on the nature and schedule for the proceedings.

A. Issues on Remand

The parties agree that the appropriate scope of issues on remand are:

1) Whether DEQ acted reasonably in its use of the five-year rolling average in the ambient arsenic air concentration analysis. Final Order at 18-19.
2) Whether "non-West End Pit" production was limited, and what effect non-West End Pit production has on arsenic emissions. Final Order at 19-20.
3) Whether the "16/70 analysis performed by DEQ was equally or more protective of human and animal life and vegetation as what is provided for by the Air Rules" and whether the level of arsenic emissions from the SGP comply with the Air Rules. Final Order at 21-23.

Accordingly, these will be the only issues considered by the Hearing Officer on remand.

B. Schedule

DEQ proposes the following scheduling order for these remand proceedings:

July 2, 2024-	Scheduling Conference
August 9, 2024-	DEQ submission addressing remand issues (including declarations and/or exhibits)
August 23, 2024-	Perpetua response to DEQ (including declarations and/or exhibits)
September 6, 2024-	Petitioners response to DEQ and Perpetua (including declarations and/or exhibits)

October 1, 2024- Hearing officer makes determination on the need of a hearing, including identification of the specific issues or sub-issues he wants the parties to present or argue.

October 15, 2024- Hearing officer decision (if no hearing is requested)

October 22, 2024- Hearing (if requested)

November 15, 2024- Post-hearings briefs (simultaneous)

December 15, 2024- Hearing officer decision

C. Proposed Procedures for Brief and at a Potential Hearing

One source of disagreement among the parties, specifically the opinion of Petitioners, concerns the nature and scope of presenting new factual evidence, as requested by the Board. Specifically, Petitioners believe that DEQ's submission must be limited to explaining the record as it currently exists. Despite the clear language of the Board's Reconsideration Order, Petitioners argue that it is inappropriate for DEQ to use later or new evidence to justify the permit.[1]

In the Reconsideration Order, the Board explained that "[t]he Board will not limit the scope of the proceedings on remand or the types of evidence that may be presented, other than to restate that they **must focus only on the development of additional factual evidence** on the ambient arsenic air concentration analysis performed by DEQ for the PTC." Reconsideration Order at 7-8 (emphasis added); *see also* Final Order ("the Board of Environmental Quality remands this matter back for the development of further evidence regarding the ambient air concentrations of arsenic that will be produced by the SGP and whether those levels comply with the Air Rules) (emphasis added). "The parties will have an opportunity to supplement and develop a full factual record on

[1] Petitioners have indicated that if new evidence is presented they will ask for briefing on the acceptability of that evidence, as well as a hearing and decision, all before setting any further scheduling. This unnecessary effort would delay scheduling and briefing on the substantive issues for many months. The Board unequivocally remanded the arsenic issue for the development of new, additional factual evidence. Extensive time dedicated to the non-issue of whether DEQ and Perpetua can develop new evidence undermines the express purpose of the remand, is a delay tactic, and should be disregarded.

the arsenic issue before the Hearing Officer on remand." Reconsideration Order at 7 (emphasis added).

To be clear, it is DEQ's intent to more fully expound on and clarify its rationale for its decision on the arsenic issue. The Board has explicitly requested that DEQ do so through the "development of further evidence," and DEQ will use this opportunity on remand to provide a more full and complete explanation of its decision regarding the arsenic issue. DEQ maintains that its arsenic decision is correct and that additional explanation of evidence in the record, as well as new testimony and evidence explaining and reinforcing DEQ's rationale, will serve to clarify any confusion or uncertainty the Board has. This effort will likely necessitate the presentation of some new evidence and the reframing of existing evidence. But, DEQ is not presenting any new theory for its decision, nor is DEQ submitting data or evidence that was not relied upon by DEQ for its original agency decision. DEQ's submission and supporting declarations will not be voluminous nor will they contain arguments and data that is novel or a surprise to Petitioners. Any new evidence presented will serve the simple purpose of providing additional detail, explanation, and clarification of the evidence, arguments, and rationale already in the record.

The issues on remand are not new to the parties. DEQ stands ready to present its submission in short order, as does Perpetua. Throughout this lengthy contested case, Petitioners, same as DEQ and Perpetua, were afforded considerable time to consult experts and understand the issues. Any suggestion that DEQ's use of new facts or its clarification on the arsenic issue would necessitate significant time for Petitioners to respond is insincere, and such attempts to transform this narrowly tailored remand into a full-blown litigious proceedings should be avoided.

If the Hearing Officer determines that a hearing is necessary, DEQ requests that he identify specifically the issues or sub-issues to be presented. DEQ also requests that the Hearing Officer

indicate which, if any, witness he personally wants to testify and question. At the hearing, each party will have the opportunity to call witnesses. The other parties and the hearing officer will then have the opportunity to examine each witness. The party calling the witness will have the opportunity for redirect examination of their witness. DEQ defers to the Hearing Officer's discretion as to the number of days necessary to hold a potential hearing.

DEQ's suggested scope and course of the proceedings is reasonable, provides a manageable and effective, but efficient, resolution of the remand, and more importantly, it will serve the explicit purposes of the remand—to develop further factual evidence on the arsenic issue.

Attorneys for Perpetua Resources Idaho, Inc.

BEFORE THE BOARD OF ENVIRONMENTAL QUALITY
STATE OF IDAHO

IN THE MATTER OF AIR QUALITY PERMIT TO CONSTRUCT P-2019.0047 _____ NEZ PERCE TRIBE, IDAHO CONSERVATION LEAGUE, and SAVE THE SOUTH FORK SALMON, Petitioner, v. IDAHO DEPARTMENT OF ENVIRONMENTAL QUALITY, Respondent, and PERPETUA RESOURCES IDAHO, INC. Intervenor-Respondent.	Case Docket No. 0101-22-01 **INTERVENOR-RESPONDENT'S STATUS REPORT**

The Hearing Officer asked the parties to submit a short status report regarding their June 25 meet-and-confer, "noting the areas of agreement and disagreement regarding the nature, scope, and conduct of the proceedings on remand." Intervenor-Respondent Perpetua Resources Idaho, Inc. ("Perpetua") submits the following status report.

The parties met on June 25, 2024, discussed the remand proceedings, and later (by email) exchanged proposed schedules.

Areas of Agreement. The parties are aligned on the scope of issues remanded by the Board of Environmental Quality (the "Board"). The issues are:

(1) Whether the Idaho Department of Environmental Quality ("DEQ") acted reasonably in its use of the five-year rolling average in the ambient arsenic air concentration analysis. Final Order at 18-19 (May 9, 2024).

(2) Whether "non-West End Pit" production was limited, and what effect non-West End Pit production has on arsenic emissions. *Id*. at 19-20.

(3) Whether the "16/70 analysis performed by DEQ was equally or more protective of human and animal life and vegetation as what is provided for by the Air Rules" and whether the level of arsenic emissions from the SGP comply with the Air Rules. *Id*. at 21-23.

Areas of Partial Agreement/Partial Disagreement. With respect to the nature and conduct of the proceedings on remand, the parties are not completely aligned. Perpetua proposes the following schedule (with additional explanation below):

1. August 9 – DEQ submission addressing remand issues (including declarations and/or exhibits)
2. August 23 – Perpetua response to DEQ (including declarations and/or exhibits)
3. September 6 - Petitioners response to DEQ and Perpetua (including declarations and/or exhibits)
4. September 20 – hearing officer identifies specific issues for evidentiary hearing
5. October 4 – (simultaneous filing) pre-hearing briefs
6. October 17 (and October 18 if needed) – evidentiary hearing
7. November 1 – (simultaneous filing) post hearing briefs
8. November 30 – tentative hearing officer decision

First we address Nos. 1 – 3 above. At the June 25 meet and confer, Petitioners suggested that DEQ first address the remand issues, followed by responses by Perpetua and Petitioners. DEQ proposed August 9, 2024, for its deadline to address the remand issues (including declarations and/or exhibits). Perpetua agrees with that approach and deadline. DEQ also

proposed that Perpetua respond to DEQ by August 23, 2024, and that Petitioners respond by September 6, 2024. Perpetua also agrees with this approach and the deadlines. While Petitioners seek September 13, 2024, for their response, four weeks is more than enough time.

Petitioners also propose an entirely different procedure, which is inconsistent with the Board's remand order. Petitioners contend the remand proceedings must be limited to explaining the record before DEQ at the time it approved the PTC and ask for the opportunity to object to "new evidence" or rationale by September 13, followed by additional briefing and oral argument if they do object. Such a process is unnecessary and contrary to the Board's order requiring remand: "the Board of Environmental Quality remands this matter back *for the development of further evidence* regarding the ambient air concentrations of arsenic that will be produced by the SGP and whether those levels comply with the Air Rules."[1] *Id*. at 23 (emphasis added). In particular, the Board observed that DEQ "did not provide sufficient evidence in the form of an expert opinion from a toxicologist or other qualified expert regarding the cancer risk associated with the 16/70 adjustment." *Id*. at 22.

The Board's order on reconsideration reiterates that the case is remanded "for additional fact finding" and the development of a "full factual record." Order on Petitions for Reconsideration and/or Clarification at 4, 6 (June 12, 2024). The Board also stated that it "will not limit the scope of the proceedings on remand or the types of evidence that may be presented, other than to restate that they must focus only on *the development of additional factual evidence* on the ambient arsenic air concentration analysis performed by DEQ for the PTC. … The parties

[1] The Board clearly has the discretion to remand for additional hearings. Idaho Code § 67-5245(6). The Board also has the authority to regulate the course of the proceedings and afford the opportunity to present and respond to evidence. Idaho Code § 67-5242(3). The Board's Contested Case Rules also allow for the development of evidence. *See* IDAPA 58.01.23.003.13 (incorporating IDAPA 04.11.01.600-609). The Board has done that here.

will have a full opportunity before the Hearing Officer on remand to define the scope of those proceedings and evidence that may be presented." *Id*. at 8 (emphasis added).

Perpetua agrees that Petitioners should have the opportunity to consider and respond to DEQ and Perpetua's respective submissions, including additional evidence. The proposed response date of September 6, 2024, provides sufficient time. While Petitioners can object to any additional evidence, there is no need to delay these proceedings by weeks and months as Petitioners propose. Petitioners can make their objections as part of their September 6th submittal. Allowing Petitioners to object to any additional evidence with more briefing and oral argument and then, if they lose, to present competing evidence is unnecessary, and it unreasonably delays the remand hearing and decision by the Hearing Officer. Petitioners' objections and submissions of additional evidence can be considered by the Hearing Officer in deciding the scope of the hearing.

That leads to Nos. 4 – 8 above, and Perpetua's proposal regarding the hearing and briefing. Our understanding is that the parties reached some agreement, but not complete agreement regarding the hearing and briefing. The parties generally agree that the Hearing Officer can preside over a hearing on remand and can determine the scope of the hearing within the confines set in the Board's remand (namely, the three issues referenced above). Perpetua requests that any evidentiary hearing fall within the Board's remand instructions. Perpetua does not oppose a narrow hearing on specific issues identified by the Hearing Officer within the general scope set by the Board to allow testimony and examination of declarants on the evidence presented on remand. Perpetua proposes October 17 (and 18 if necessary) for the hearing date.

As for briefing, unlike DEQ, Perpetua sees value in simultaneous pre-hearing briefs for all concerned, including the Hearing Officer, but we would be amenable to reasonably tight page

limits to ensure the pre-hearing briefs are focused. Perpetua agrees with DEQ's proposal for simultaneous post-hearing briefs.

Perpetua understands the proposed dates for Nos. 4-8 depend on multiple schedules and may need modest revision. During the six weeks between September 6 and hearing on October 17-18, Perpetua proposes that the Hearing Officer prescribe the scope of the evidentiary hearing on or about September 20 and that the parties present pre-hearing briefs by October 4. The hearing would commence two weeks later. Post-hearing briefs would be due October 31, two weeks after the hearing.

After four years in process and following two years of administrative review since issuance of a Final PTC, Perpetua seeks efficiency, economy of resources, and continuity to resolve the pending proceeding as required by the contested case rules. *See* IDAPA 04.11.01.052. We appreciate your attention and commitment to this matter.

Attorney for Save the South Fork Salmon

BEFORE THE OFFICE OF ADMINISTRATIVE HEARINGS
STATE OF IDAHO

IN THE MATTER OF AIR QUALITY PERMIT TO CONSTRUCT P-2019.0047	BEQ Case No. 0101-22-01
NEZ PERCE TRIBE, IDAHO CONSERVATION LEAGUE, and SAVE THE SOUTH FORK SALMON Petitioners, v. DEPARTMENT OF ENVIRONMENTAL QUALITY, Respondent, and PERPETUA RESOURCES IDAHO, INC., Intervenor.	OAH Case No. 23-245-01 **PETITIONERS' STATUS REPORT**

Pursuant to the Hearing Officer's June 24, 2024 Notice of Status and Scheduling Conference; Updated Disclosure ("Notice"), and subsequent emails between the Hearing Officer and counsel for the Nez Perce Tribe, Idaho Conservation League, and Save the South Fork Salmon ("Petitioners"), the Department of Environmental Quality ("DEQ"), and Perpetua Resources Idaho, Inc. ("Perpetua"), Petitioners hereby submit this status report regarding the Petitioners' position on the nature, scope, and conduct of the proceedings on remand.

The Hearing Officer scheduled a status conference in this case for July 2, 2024. Prior to the conference, on June 25, 2024, the parties' counsel met and conferred to discuss the issues on remand, how the remand proceedings may be conducted, and scheduling proceedings on remand. Further discussion was exchanged between the parties by email in the subsequent days. The parties, however, were unable to come to an agreement on many of the items discussed, and therefore determined to file separate status reports.

I. Scope of Issues on Remand

This case was remanded to the Hearing Officer from the May 9, 2024 Board of Environmental Quality's ("Board") Final Order that "DEQ did not act reasonably and in accordance with the law when it analyzed the ambient arsenic air concentrations for the [Stibnite Gold Project]." Final Order at 23. Petitioners generally agree with DEQ's proposed identification of the issues on remand, but add to the issues (in underline) as follows:

1. Whether DEQ acted reasonably in its use of the five-year rolling average in the ambient arsenic air concentrations analysis and whether use of the five-year rolling average complies with the Air Rules. Final Order at 18-19;
2. Whether "non-West End Pit" production was limited, and what effect non-West End Pit production has on arsenic emissions. Final Order at 19-20; and

3. Whether the "16/70 analysis performed by DEQ was equally or more protective of human and animal life and vegetation as what is provided for by the Air Rules" and whether the level of arsenic emissions from the Stibnite Gold Project comply with the Air Rules. Final Order at 21-23.

II. Nature of Proceedings on Remand

The Board's remand to the Hearing Officer to address these three issues does not change the nature of this administrative appeal, which evaluates whether the Stibnite Gold Project permit to construct was properly issued by DEQ in accordance with the Clean Air Act, idaho air rules, the Idaho Administrative Procedure Act, and other legal requirements, as the parties have addressed through their previous cross-motions for summary judgment

The Board's remand for the Hearing Officer to address the above three issues thus does not expand the scope of review, which remains constrained to determine whether or not DEQ erred in issuing the permit in any of these three ways. In other words, the remand is not an opportunity for DEQ to somehow rewrite the permit or use later or new evidence to justify the permit that it approved.

Through discussions among counsel, DEQ has indicated it needs until August 9, 2024, to submit its materials on the issues for remand. Petitioners agree that date is reasonable and should be adopted by the Hearing Officer as the initial deadline on remand.

However, Petitioners reiterate that DEQ's remand submissions should properly be limited to explaining the record before DEQ at the time it approved the air permit, which might include declarations from permit staff, as DEQ provided with its prior summary judgment briefing papers submitted during prior proceedings before this Hearing Officer. But Petitioners intend to object and move to strike if DEQ seeks to submit new evidence (including, e.g., later scientific

reports or expert testimony) which goes beyond the record before the agency when it approved the permit. Indeed, if the permit cannot be supported by the record in place when DEQ approved it, the correct process is for DEQ to reopen the permit and allow further public comment on any new evidence that DEQ wants to consider.

Moreover, Petitioners do not believe that Perpetua should be able to submit any new evidence or rationale on remand. It is DEQ's responsibility to justify the permit on the record existing at the time it was approved to ensure that it is in accordance with the Clean Air Act and Idaho's air rules, not Perpetua's.

To the extent that DEQ or Perpetua submit new evidence or rationales outside of the current record to support an existing permit, again, Petitioners plan to object and move to strike such new evidence. But until DEQ (and Perpetua) provide their submissions on remand, Petitioners cannot determine whether such an objection is needed. Thus, any schedule for this remand needs to have adequate opportunity for Petitioners to evaluate DEQ's and Perpetua's submissions so that Petitioners can determine whether to object, and if so, prepare appropriate motion(s) to strike or other appropriate responses.

Finally, if the Hearing Officer does allow DEQ and Perpetua to submit new evidence, expert testimony, or rationales, then Petitioners will need additional time to determine whether Petitioners need to submit their own evidence and/or expert testimony. But Petitioners submit that such scheduling is unnecessary and premature until the parties and Hearing Officer have resolved the scope of the remand submissions that DEQ and/or Perpetua may properly submit.

//

//

//

III. Initial Schedule for Proceedings on Remand

Petitioners thus propose that the Hearing Officer set August 9, 2024, as the deadline for DEQ to submit its proposed remand submissions, and (assuming Perpetua insists on submissions as well), August 23, 2024, as the deadline for Perpetua's submissions.

Petitioners further propose that the Hearing Officer set September 13, 2024, as the deadline for Petitioners to file any objections and related motions to strike DEQ and/or Perpetua's submissions. If Petitioners do object to submissions filed by DEQ and/or Perpetua, the Hearing Officer should set a reasonable briefing schedule on petitioners' anticipated motion(s) to strike during the remainder of September and early October 2024, and set an oral argument date in mid-October. A further scheduling conference can then be conducted once the Hearing Officer issues a decision on any motion(s).

Dated: July 1, 2024

Respectfully submitted,

/s/ *Laird J. Lucas*

BEFORE THE OFFICE OF ADMINISTRATIVE HEARINGS
STATE OF IDAHO

IN THE MATTER OF AIR QUALITY PERMIT TO CONSTRUCT P-2019.0047	)	BEQ Case No. 0101-22-01
NEZ PERCE TRIBE, IDAHO CONSERVATION LEAGUE, and SAVE THE SOUTH FORK SALMON,	)	OAH Case No. 23-245-01
Petitioners,	)	SCHEDULING ORDER
v.	)	
DEPARTMENT OF ENVIRONMENTAL QUALITY,	)	
Respondent,	)	
and	)	
PERPETUA RESOURCES IDAHO, INC.,	)	
Intervenor.	)	

On May 9, 2024, the Board of Environmental Quality (BEQ) issued a document styled as a Final Order. The Final Order affirmed the hearing officer's dismissal of four claims of error, but concluded that "DEQ did not act reasonably and in accordance with law when it analyzed the ambient arsenic air concentrations for the SGP." (Final Order of 5/9/24, at p. 23.) More specifically, BEQ concluded that (1) "DEQ did not act reasonably in using a five-year rolling average for T-RACT that was not properly supported by permit conditions;" (2) "there was insufficient evidence to support the T-RACT analysis limiting the non-West End Pit production limit;" and (3) "DEQ did not act reasonably and in accordance with law when it applied the 16/70

calculation to the ambient arsenic air concentration analysis" (collectively, the "Remaining Issues").) (*Id*. at pp. 18, 19, 21.)

After some post-Final Order motion practice, on June 12, 2024, BEQ issued its Order on Petitions for Reconsideration and/or Clarification of Final Order. That Order remanded the matter to OAH with instructions to provide the parties with "an opportunity to supplement and develop a full factual record on the arsenic issue…." (Order of 6/12/24, at p. 7.) Otherwise, BEQ declined to provide additional instructions, clarifications, or limitations regarding the conduct of the remaining administrative proceedings.

On July 2, 2024, the parties and hearing officer convened via Zoom for a status and scheduling conference to discuss the nature, scope, and timing of the proceedings on remand. At the conference, the parties and hearing officer generally agreed to the following:

1. The Remaining Issues are highly technical in nature, such that expert testimony is required to assist the hearing officer as the trier of fact.
2. The parties prefer to utilize expert witness declarations to develop their testimony prior to a hearing on the merits instead of written discovery, expert witness disclosures, and depositions pursuant to Idaho Rules of Civil Procedure 26, 30, 33, and 34.
3. Sequentially, DEQ should file the first expert witness declarations. All of the parties' status reports of July 1, 2024 suggested August 9, 2024 as the deadline for DEQ's filings, though at the status conference, DEQ indicated an additional week may be helpful. (In a subsequent email, counsel for DEQ indicated he will be unavailable August 14 to 23, 2024.)
4. Perpetua should have an opportunity to file the second round of declarations, in case

it wishes to supplement or clarify anything in DEQ's declarations. All three status reports suggested August 23, 2024 as the deadline for Perpetua's filings.

5. The Petitioners should then file its own expert witness declarations, responding to the DEQ and Perpetua filings. In their status reports, DEQ and Perpetua suggested September 6, 2024 as Petitioners' deadline. Petitioners' status report suggested September 13, 2024 for their deadline, though the specific context at the time was for objections and motions to strike, as the status report was filed before the discussion of the need for expert witness testimony at the conference.
6. Even though DEQ's expert witness declarations will inform and affect the subsequent filings by Perpetua and the Petitioners to a certain extent, BEQ's orders are sufficiently detailed regarding the nature of the Remaining Issues for those parties to consult with and retain expert witnesses prior to DEQ's filings.
7. The parties and hearing officer set aside October 17, and 18, 2024 as the dates for a hearing on the merits, with the understanding that they will revisit those dates after DEQ has filed its declarations.
8. The parties declined to establish the related dates and deadlines leading up to a hearing on the merits at the conference. Instead, they expressed a preference for the hearing officer to do his best to establish those dates and deadlines in the forthcoming scheduling order.
9. Due to the highly technical nature of the Remaining Issues, it seems unlikely that further dispositive motion practice is warranted.

Based upon the above understandings and related email exchanges, the hearing officer hereby establishes the following dates and deadlines to govern the remainder of these administrative

proceedings:

Tuesday, August 13, 2024: Deadline for DEQ to file expert witness declarations explaining the basis for DEQ's decision-making regarding the Remaining Issues.

Friday, August 30, 2024: Deadline for Perpetua to file expert witness declarations, to the extent necessary to supplement or clarify any aspects of DEQ's expert witness declarations.

Wednesday, September 4, 2024, at 3:30 p.m.: Status and scheduling conference among parties and hearing officer to revisit the remaining deadlines and hearing dates in light of the declarations filed thus far, and whether they should establish deadlines to exchange witness lists and exhibits in advance of the hearing on the merits. (For now, the hearing officer assumes those issues will be relatively clear from the declarations filed.)

Friday, September 20, 2024: Deadline for the Petitioners to file responsive expert witness declarations and any motions in limine, motions to strike, or any other procedural motions related to the conduct of the hearing on the merits (collectively, "Procedural Motions").

Friday, September 27, 2024: Deadline for DEQ and Perpetua responses to Procedural Motions filed by the Petitioners.

Friday, October 4, 2024: Deadline for DEQ and Perpetua to file any Procedural Motions.

Friday, October 11, 2024: Deadline for (1) pre-hearing statements, summarizing the testimony each party will adduce at the hearing on the merits and how it relates to the Remaining Issues; and (2) Petitioners' response to Procedural Motions filed by DEQ or Perpetua.

Tuesday, October 15, 2024, 10:30 a.m.: Pre-hearing conference to discuss the upcoming hearing on the merits and any related procedural matters.

Thursday, October 17, 2024: Day 1 of hearing on the merits (location TBD).

Friday, October 18, 2024: If necessary, Day 2 of hearing on the merits (location TBD).

Friday, October 25, 2024: Deadline for post-hearing statements, identifying key testimony from the hearing on the merits and how it relates to the Remaining Issues.

Tuesday, November 26, 2024: Target date for written decision regarding the Remaining Issues.

In addition to the above dates, the hearing officer provides the following reminders and additional instructions:

There shall be no page limits on the expert witness declarations. Any other filings referenced above (Procedural Motions, responses thereto, pre-hearing statements, post-hearing statements) shall be limited to 10 pages of content, exclusive of the first page and the certificate of service. If a party wishes to exceed these page limits, that party shall email the hearing officer in advance of the filing (copying the other parties), with a request to that effect and a brief explanation.

Expert witness declarations should establish the witness's qualifications to opine on the Remaining Issues and should lay the proper foundation for any opinions offered as to the Remaining Issues.

While the deadlines for Procedural Motions and responses thereto are relatively tight, because the hearing officer (not a jury) is the finder of fact, he assumes any such filings will be relatively limited and targeted.

Parties who wish to reschedule any of the conferences or hearings established herein shall confer with the other parties regarding their availability and provide the hearing officer with three alternative mutually agreeable sets of dates and times from which to choose.

Dated this 8th day of July, 2024.

Dylan Lawrence
Hearing Officer

Case Docket No. 0101-22-01
OAH Case No. 23-245-01

EXPERT DECLARATION OF NORKA E. PADEN, Ph.D.

I, NORKA E. PADEN, Ph.D., hereby declare under penalty of perjury and pursuant to the law of the State of Idaho that the foregoing is true and correct:

Qualifications

1. My name is Norka E. Paden. I am an Environmental Toxicologist with 16 years of experience and have been with the Idaho Department of Environmental Quality's (DEQ's) Toxicologist/Risk Assessor since 2016. I am responsible for toxicological and risk assessment analyses for contaminated sites and toxic exposures statewide. I provide toxicological expertise for contamination issues related to air, water, and soil. I deliver written comments to policy makers and stakeholders during negotiated rulemaking that involves selenium, copper, and arsenic human health water quality criteria. I mentored a professor from Lewis-Clark State College on the risk assessment of air pollutants in the Lewiston Valley and was acknowledged in the paper, "Observations of volatile organic and sulfur compounds in ambient air and health risk assessment near a paper mill in rural Idaho, U.S.A," published in the 2020 *Atmospheric Pollution Journal*. In 2023, I delivered technical comments for the Idaho Department of Health and Welfare's "Letter Health Consultation for the Lewiston Clark Air Quality Study," and DEQ received commendation from the Nez Perce Tribe for the technical support.

2. I received my Master of Science in Human Ecology at the Free University of Brussels, Belgium, and Ph.D. in Environmental Toxicology from Texas Tech University. Prior to joining DEQ, I worked for the Idaho Department of Health and Welfare from 2011 through 2016 and authored six public health consultations and 12 letter health consultations, which are written responses to a specific request for information about health risks related to a hazardous material, chemical release, or specific site, under the Agency for Toxic Substances and Disease Registry (ATSDR) cooperative agreement. While working at GEI Inc., a Colorado environmental consulting firm from 2008 to 2011, I provided technical expertise in preparing risk investigations for Superfund sites, drafted technical reports on toxicity evaluations, and supported clients by writing technical reports and rebuttals during rulemaking meetings. I served as an adjunct faculty member for the Department of Community and Environmental Health at Boise State University from 2012 to 2015. I currently serve on various advisory committees in Idaho including the Cancer/Cluster Analysis Work Group, Fish Consumption Advisory Project, One Health Consortium, Groundwater Monitoring Technical Group, and Federal-State Toxicology Risk Analysis Committee. I am also a member of the Society of Environmental Toxicology and Chemistry (SETAC) and Editorial Board of the Journal of Integrated Environmental Assessment and Management.

Assignment

3. I have been asked by DEQ's Air Quality Division to review and evaluate the issue: "DEQ did not act reasonably and in accordance with law when it applied the 16/70 calculation to the ambient arsenic air concentration analysis" and provide this declaration to assist the Hearing Officer as the trier of fact. This declaration provides evidence in the form of an expert opinion

as a toxicologist, as the Board of Environmental Quality (DEQ Board) suggested in its *Final Order in the Matter of Air Quality Permit to Construct P-2019.0047* (Final Order).[1]

Summary of Opinions

4. Based on the information provided, cancer risk estimates using 16-years, and 70-years of exposure duration are both within the range of public health guidelines of 1 in 1,000,000 to 1 in 10,000 (i.e., one in a million to one in ten thousand) for protection of human health as suggested by the United States Environmental Protection Agency's (EPA's) target cancer risk range. Based on this assessment, the estimated lifetime cancer risk from exposure to arsenic through inhalation using the exposure duration of 16 years (lifetime of the mine) followed EPA's guidelines that are the framework for DEQ's Rules for the Control of Air Pollution in Idaho and falls within EPA's target cancer risk range of 1 in 1,000,000 to 1 in 10,000 (i.e., one in a million to one in ten thousand) and is not expected to increase cancer risk under current permit operating conditions.

Documents reviewed

5. I reviewed the May 1, 2024, DEQ Board meeting minutes transcript and background of the Perpetua-Stibnite Gold Mine Permit to Construct issued in June 2022 and subsequent documents on the case docket No. 0101-55-01 OAH No 23-245-01: May 23 Memorandum in Support of Joint Motion for Reconsideration and/or Clarification of Final Order, June 12 Order on Petitions for Reconsideration and/or Clarification of Final order, and July 8 Scheduling Order.

Background and Discussion

6. Based on my interpretation, the DEQ Board supported DEQ on four of the five matters. The fifth matter related to Section 586 of the "Rules for Control of Air Pollution in Idaho" (IDAPA 58.01.01) and DEQ's approach to arsenic and cancer risk. The DEQ Board found insufficient evidence to support DEQ's ambient arsenic air concentration analysis and determined that further factual development was needed on this issue. The DEQ Board remanded this issue to the Hearing Officer.

7. Dr. McMillan indicates that DEQ misinterpreted the acceptable ambient concentration (AACC) for carcinogens to comply with the air quality rules. He disagrees with the project-specific adjustment factor (16 years of mining operation), contends that DEQ failed to recognize the AACC functions to limit cancer initiation not only after 70 years but every day

[1] *See* REC 3716, *Final Order in the Matter of Air Quality Permit to Construct P-2019.0047*, *Nez Perce Tribe, Idaho Conservation League, and Save the South Fork Salmon v. Idaho Department of Environmental Quality*, Case Docket No. 0101-22-01, OAH Case No. 23-245-01 (Final Order at 22).

of a person's life starting at birth, and posits that DEQ's analysis underestimates the actual cancer risk (MacMillan 2024).[2]

8. Based on the analyses presented below, the cancer risk estimates were accurately calculated; the methodology for the calculations adheres to toxicological guidance and analytical practices to modify exposure duration and did not underestimate risk.

9. After reviewing the permit's cancer risk calculations and the toxic air pollutant rules, I researched cancer risk from arsenic exposures through inhalation. I calculated exposure concentrations and excess cancer risks for a residential inhalation exposure scenario (for a person living at a residence) using the maximum modeled annual concentration (potential worse-case scenario) of 0.00416 µg/m^3, calculated by analyses of the permit application, for the following exposure duration scenarios of 16 years (lifetime of the mine), and 70 years (EPA's lifetime exposure). The following paragraphs summarize my findings.

10. The permit application and DEQ review documentation states that cancer risk calculations used modeling scenarios, applied to develop AACCs outlined in the rules, and evaluated via the 70-year lifetime exposure. The maximum modeled concentrations for carcinogenic toxic air pollutants were modified to account for the life-of-mine production limits that affect the lifetime exposure using the following formula (DEQ 2022)[3]:

$$Lifetime\ exposure\ \left(\frac{\mu g}{m^3}\right) = \frac{Highest\ annual\ concentration\ \left(\frac{\mu g}{m^3}\right) \times 16\ (mine\ operation\ years)}{70\ (years, lifetime\ exposure)}$$

Cancer Risk Calculation in the Idaho Air Rules mirrors EPA's Guidelines

11. Section 586 in IDAPA 58.01.01, "Rules for the Control of Air Pollution in Idaho" (Idaho Air Rules), provides the following values for carcinogen toxic air pollutants: unit risk factors (URF) from EPA, screening emission levels (EL), and acceptable ambient levels for carcinogens (AACCs) (i.e., determined to cause cancer over lifetime exposure). The acceptable ambient levels for carcinogens are based on the cancer unit risk values from EPA and correspond to a one in one million cancer risk (DEQ 2019)[4]. In other words, the AACC for arsenic compounds presented in Idaho Air Rule Section 586 is calculated using EPA's Excess Cancer Risk Probability formula shown below:

---

[2] *See* Board of Environmental Quality Special Meeting (May 1, 2024) Transcript ("SM Tr.") 10:19-21 ("I believe DEQ has misinterpreted how the acceptable ambient concentration for carcinogens, the AACC, must be applied if it is to comply with our air quality rules"); *see also* SM Tr. 11:2-11.

[3] REC 710, Idaho Department of Environmental Quality. *TAPs Addendum Modeling Review Attachment* to the *PRI SGP Modeling Review Memorandum* (January 6, 2022) ("DEQ's TAPS Modeling Attachment") at 14. For convenience, a true and correct copy of DEQ's TAPS Modeling Attachment is attached hereto as Exhibit A.

[4] Idaho Department of Environmental Quality. *Idaho Administrative Bulletin*. Boise, ID, September 4, 2019–Vol 19-9, page 388 ("The acceptable ambient levels for carcinogens are based on the cancer unit risk values from the Environmental Protection Agency and correspond to a one in a million cancer risk") (citing EPA 2019). A true and correct copy of page 388 is attached hereto as Exhibit B.

Excess Cancer Risk Probability = IUR x EC

Where Excess Cancer risk = 10^{-6} (1 in 1,000,000 one in a million)

IUR for arsenic is = 4 x 10^{-3} (0.0043)

EC = exposure concentration or acceptable ambient concentration (AACC)

AACC= (10^{-6})/ 4.3 x 10^{-3}

AACC= 2.3 x 10^{-4} = 0.00023 µg/m^3

The arsenic lifetime concentration associated with an excess cancer risk of one in one million is 0.00023 µg/m^3.

12. Under EPA's methodology for human health risk assessments, cancer risk calculations are done using a lifetime exposure set at 70 years. The exposure duration is the amount of time an individual is exposed to the contaminant being evaluated and is typically given in years. The exposure duration can be modified based on the site-specific information using the following formula to calculate screening values (EPA 2009)[5].

EC = (CA x ET x EF x ED)/AT

Where: EC (µg/m^3) = exposure concentration;
CA (µg/m^3) = contaminant concentration in air;
ET (hours/day) = exposure time;
EF (days/year) = exposure frequency;
ED (years) = exposure duration; and
AT (lifetime in years 70 x 365 days/year x 24 hours/day) = averaging time

13. **Step 1: Exposure Concentration Calculations**: I calculated exposure concentrations using the maximum modeled arsenic concentration in air (0.00416 µg/m^3), exposure time (24 hours per day), exposure frequency (365 days per year), and averaging time for 70 years of lifetime (EPA's default value) exposed for 365 days and 24 hours per day for a resident scenario with exposure durations of 16-years (life time of the mine), 70- years (EPA's default lifetime exposure) using EPA's approach and the formulas presented above. Table 1 shows the results for the calculations:

Table 1. Values used for the exposure concentration calculation.

Contaminant Concentration in Air (µg/m^3)	Exposure Time (hours/day)	Exposure Frequency (days/year)	Exposure Duration (years)	Averaging Time	Exposure Concentration µg/m^3
0.00416	24	365	16 (lifetime of the mine)	70x365x24	0.00095
0.00416	24	365	70 (EPA's default lifetime exposure)	70x365x24	0.00416

[5] Environmental Protection Agency (EPA). 2009. Risk Assessment Guidance for Superfund Volume I: Human Health Evaluation Manual (Part F, Supplemental Guidance for Inhalation Risk Assessment). EPA-540-R-070-002. OSWER 9285.7-82. Available at: https://semspub.epa.gov/work/HQ/140530.pdf. Accessed on July 18, 2024.

14. **Step 2: Cancer Risk Calculations:** To calculate cancer risk, I used the Inhalation Unit Risk (IUR) for arsenic from EPA's Integrated Risk Information System (IRIS) and the exposure concentrations calculated in Table 1 using the following formula (EPA 2009).[6] As previously mentioned, this is the same formula used for the AACC calculation in the Idaho Air Rules. Results of these calculations are presented in Table 2. *See* IDAPA 58.01.01.586.

Excess Cancer Risk Probability = IUR x EC

Where: IUR $(\mu g/m^3)^{-1}$ = Inhalation Unit Risk (for arsenic is 0.0043); and
EC $(\mu g/m^3)$ = exposure concentration

EPA defines excess cancer risk as an additional risk of cancer from exposure to a contaminant beyond an individual's risk of cancer from everyday life. Excess cancer risk is the probability that an exposed individual will develop cancer from exposure over a lifetime (70 years)[7]. The methodology EPA uses for the calculation of the excess cancer risk includes the inhalation unit risk (IUR) value, based on toxicological studies, the value selected for the inhalation unit risk represents a continuous exposure (24 hours/day and 7 days/week) and is supported by years of research from scientists at EPA's Integrated Risk Information System (IRIS) and the Superfund Health Risk Technical Support Center[8].

Table 2. Excess cancer risk calculations and interpretation.

Exposure duration (in years)	Inhalation Unit Risk $(\mu g/m^3)^{-1}$	Exposure Concentration $(\mu g/m^3)$	Excess Cancer Risk Probability	Interpretation	Within EPA's Recommended range > 1 in 1 million to < 1 in 10,000
16 (lifetime of the mine)	0.0043	0.00095	4.09E-06	4 in 1 million	Yes
70 (EPA's default lifetime exposure)	0.0043	0.00416	1.79E-05	2 in 100,000	Yes

15. DEQ used EPA's methodology for adjusting exposure duration given the known exposure duration (lifetime of the mine). The modification of the exposure duration is also consistent with DEQ's screening level risk assessment methodology for any contaminated site in Idaho (i.e., EPA's Regional Screening Levels)[9]. Inputs and outputs of the EPA's Regional Screening Levels online calculator using the parameters outlined in Table 1 (i.e., exposure duration, exposure time, lifetime in years) yield the same cancer risk estimates shown in Table 2 and are

[6] *Id.*

presented in Exhibit C.[10] Two parameters that were modified in the EPA's Regional Screening Level Calculator were: exposure frequency from 350 days (EPA assumption is that the receptor takes 2 weeks of vacation every year away from the contamination) to 365 days/year, which is more conservative. The other parameter that was modified was the target hazard quotient (THQ) from 0.1 usually used when screening multiple contaminants to THQ=1.0, commonly used when screening only one contaminant, in this case arsenic.

Cancer Risk Estimates and T-RACT within EPA's acceptable range

16. Toxic Air Pollutant Reasonably Available Control Technology (T-RACT) for carcinogens outlined in the Idaho Air Rules: cancer risk probability of less than one in one hundred thousand (1 in 100,000) (IDAPA 58.01.01.210.12.b) falls within the EPA's recommended range of > 1 in 1 million to < 1 in 10,000 presented in Table 2.

17. The cancer risk estimates from exposure to 0.00416 µg/m^3 arsenic (maximum arsenic concentration calculated from modeling using potential worse-case scenario) through inhalation 24 hours a day, 365 days, and for 16 years (lifetime of the mine) is four additional cancers in a population of one million people exposed. The probability for a resident to develop cancer after exposure to 0.00416 µg/m^3 arsenic through inhalation 24 hours a day, 365 days, and for 70 years (EPA's default lifetime exposure) is two additional cancers in 100,000. These excess cancer risk estimates are within the range EPA considers acceptable (<1 in 10,000 to > 1 in 1,000,000) [7]. EPA considers excess cancer risk < 10^{-6} (1 in 1,000,000) to be negligible, 10^{-4} (>1 in 10,000) and 10^{-6} to 10^{-4} (1 in 1,000,000 to 1 in 10,000) to be acceptable (EPA 1989)[11]. This analysis shows at the maximum arsenic levels modeled (0.00416 µg/m^3) for exposures of 16, or 70 years are within the public health guidelines, and DEQ followed EPA's guidelines when using the 16-year exposure scenario (lifetime of the mine).

Cancer Risk Considerations

18. Other factors may play a role in analyzing cancer risk, such as existing cancers in the population, arsenic background concentrations at the site, sensitive populations living near the site, and uncertainty of maximum arsenic concentration derivation. According to the American Cancer Society, cancer affects 1 in 3 people in the United States, meaning that over a lifetime, an American's probability of getting any cancer is 0.333333 (ACS 2024)[12]. Adding the probability of 2 in 100,000 (excess cancer risk calculated for someone exposed for a lifetime of 70) to 0.333333, the probability of an individual getting cancer increases to 0.333353; this difference is very small.

---

[10] A true and correct copy of EPA's *Regional Screening Levels Calculator Inputs and Outputs for Exposure Durations 16, and 70 years* is attached hereto as Exhibit C.

19. From the toxicological point of view, enough evidence exists on the carcinogenic effects (urinary bladder, lung, and skin) of inorganic arsenic (IARC 2012)[13]. People who accidentally eat arsenic for a long time can develop some diseases. Sources of arsenic for ingestion include food (seafood, fish, algae, cereals), air (coal-fired power and smelting), and water (EFSA 2009)[14]. Evidence indicates that long-term exposure to arsenic mainly through drinking water is of great concern to human health due to daily consumption and occurrence in several regions of the world over the past decades (Martinez et al. 2011)[15]. Some occupational studies have documented lung cancer due to inhalation exposures to arsenic, and EPA has used these studies to derive the Inhalation Unit Risk (IUR) (EPA 2024)[16].

20. Cancer risk depends on a wide variety of factors such as alcohol and tobacco use, sun light and radiation exposures, age, diet, hormones, obesity, infectious agents, cancer-causing agents, family history, immunosuppression, and chronic inflammation (NIH 2015)[17]. The literature indicates that inorganic arsenic causes harmful effects mainly through the initiation of oxidative stress (when there are many molecules called free radicals in the body and not enough antioxidants to eliminate them), alterations to DNA (DNA and RNA are both macromolecules essential for life), protein modification, and RNA expression as Dr. McMillan alluded; however, these effects are mainly documented from exposures to elevated levels of arsenic in drinking water (EPA 2024)[18]. The literature also reveals that further cancer studies are needed to understand the mechanisms of arsenic carcinogenesis (Zhou & Xi 2018; Speer et al. 2022)[19,20].

Cancer Risk Calculations were not underestimated

21. Additional information to support DEQ's calculation did not underestimate cancer risk, including the no significant concentration level of 0.067 μg/m^3 (i.e., air concentration at 1 in 100,000 excess lung cancer mortality) from the Texas Commission on Environmental Quality (Erraguntla et al.2012)[21]. The value is used to evaluate ambient air monitoring data to protect the public against adverse health effects from chronic exposure to arsenic. The maximum modeled air concentration 0.00416 μg/m^3 is below this threshold. The maximum modeled air concentration of 0.00416 μg/m^3 is within World Health Organization's recommendations for concentrations of arsenic range from 1–10 ng/m^3 (0.001–0.01 μg/m^3) in rural areas, 3–30 ng/m^3 (0.003–0.03 μg/m^3) in noncontaminated urban areas (WHO 2000)[22].

Conclusion

22. I conclude that DEQ's analysis followed EPA's guidelines and that results from a shorter duration exposure (i.e., 16 years) is within EPA's target risk range of 1 in 1,000,000 to 1 in 10,000 (i.e., one in one million to one in ten thousand) and is not likely to increase cancer risk by the arsenic air emissions calculated by the analyses of the air permit application (maximum arsenic-modeled concentrations).

EXHIBIT A

TAPs Addendum Modeling Review Attachment

1.0 Introduction and Summary

Perpetua Resources Idaho, Inc. (PRI) submitted the *Stibnite Gold Project (SGP) Permit to Construct Application TAP Addendum* (*TAP Addendum*), prepared by Air Sciences Inc. (Air Sciences) and submitted to DEQ on October 5, 2021. The TAP Addendum reassessed source applicability to Toxic Air Pollutant (TAP) permitting requirements, refined TAPs regulatory methods to demonstrate compliance with applicable TAP increments, revised and/or refined operations and operational parameters affecting TAP emissions, and refined TAP air impact analyses. The revisions and refinements made for the TAP Addendum also reduced PM_{10} and $PM_{2.5}$ emissions, and this effect is presented in this *TAPs Addendum Modeling Review Attachment* (*Modeling Review Attachment*).

2.0 Scope of TAPs Addendum

DEQ reevaluated TAPs compliance regulatory interpretations and impact assessment methods following the second public comment period of February 18, 2021, through March 19, 2021. Areas of revision in response to issues identified after the public comment period included:

- Revising source-specific TAP impact assessment applicability, primarily identifying what sources can be excluded because they are "covered" or "addressed" by a National Emissions Standard for Hazardous Air Pollutants (NESHAP) or New Source Performance Standard (NSPS).
- Refining regulatory methods used to demonstrate compliance with TAP increments.
- Refining TAP emission calculation methods and dispersion-affecting parameters.
- Reassessing TAP impacts resulting from revised and/or refined methods and data.
- Providing a best-estimate of actual TAP emissions that will occur from operation of the mine, and then comparing this to maximum permit-allowable emissions.

PRI and Air Sciences, PRI's permitting consultant, submitted the *TAP Addendum* on October 5, 2021.

3.0 Revised NESHAP/NSPS TAP Exclusion

DEQ and PRI reevaluated TAP source applicability after the second public comment period in response to expressed concerns regarding sources excluded as per *Idaho Air Rules* Section 210.20 (excluding sources that are "covered" or "addressed" by a NESHAP). TAP applicability is explained in greater detail in the main body of the DEQ Statement of Basis. As a result of the reevaluation, some additional sources were included in the TAP impact modeling analyses that were not previously. TAP sources from gold mining that were modeled in the final TAP analyses included: drilling, blasting, excavating, hauling, prill silos, rock dumps and storage piles, and tailings.

Air Sciences consulted with DEQ to refine TAP compliance demonstration methods from what was originally submitted in the application. The refinement was primarily needed to show compliance with the

REC 3884
REC 0697
PET 331

arsenic Acceptable Ambient Concentration of a Carcinogen (AACC). The revised methods are described in the submitted *TAP Addendum* and this DEQ *Modeling Review Attachment*.

4.0 TAPs Refined Compliance Demonstration Approach

PRI, in consultation with DEQ, used a highly refined TAPs analysis approach to demonstrate compliance with applicable TAP increments. This approach involved the following:

- AACC Adjustment for Toxic Air Pollutant Reasonably Available Control Technology (T-RACT) Utilization.
- TAP Emission Averaging Period.
- AACC Adjustment for the Operational Life of the Mine.

4.1 AACC Adjustment for T-RACT Utilization

Idaho Air Rules Section 210.12 allows TAP impacts of 10 times the AACC if the application demonstrates that T-RACT is used for the TAP emission sources. This represents a life-time cancer risk of 1-in-100,000. An adjustment cannot be made for non-carcinogenic TAPs listed in *Idaho Air Rules* Section 585.

Review of the T-RACT demonstration is performed by the DEQ permit writer and is described in the main body of the DEQ Statement of Basis.

4.2 TAP Emission Averaging Period

Annual average emissions of carcinogenic TAPs are typically used in the dispersion model to estimate maximum annual impacts. PRI refined the analyses by using source-specific emission rates that are representative of a 5-year averaging period. This approach is appropriate because carcinogenic impacts are of concern from a long-term exposure basis.

4.3 AACC Adjustment for the Operational Life of the Mine

AACCs were established based on a 1-in-1,000,000 cancer risk over a 70-year lifetime, as stated in *Idaho Air Rules* Section 006.125:

> ***Toxic Air Pollutant Carcinogenic Increments****. Those ambient air quality increments based on the probability of developing excess cancers over a seventy (70) year lifetime exposure to one (1) microgram per cubic meter (1 ug/m3) of a given carcinogen and expressed in terms of a screening emission level or an acceptable ambient concentration for a carcinogenic toxic air pollutant. They are listed in Section 586.*

PRI indicated the maximum life-of-mine will be 16 years. Life-time exposures to carcinogenic TAPs were refined by multiplying the maximum modeled annual impact by a ratio of 16/70. Section 5.7 of this *Modeling Review Attachment* provides more details on this adjustment for the project.

5.0 Refined TAP Emission Estimates and Modeling Methods/Parameters

This section describes changes made to TAP emission estimates and to methods/parameters used in the impact modeling analyses.

5.1 Operational Adjustments

PRI and Air Sciences proposed and committed to several operational adjustments to reduce actual and estimated TAP emissions:

- Installing and operating dust collection systems on drilling rigs (determined to be T-RACT).
- Capping the haul roads that are outside of the pits and development rock storage facilities (DRSFs) with clean (lower levels of arsenic) development rock (determined to be T-RACT).
- Eliminating the West End Development Rock Storage Facility, which eliminated the highest-emitting operational scenario W5.
- Limiting long-term mining production to an average of 135,000 tons/day for a 5-year rolling average.
- Constructing the Burntlog access road with offsite materials containing "background" levels of arsenic.
- Updating the bulldozing emission factor using the SGP site-specific silt content.

5.2 General Modeling Methods and Parameters

Modeling methods and parameters used in TAP impact analyses presented in the *TAP Addendum* are largely identical to those used in the previously submitted application. These include the air dispersion model used, meteorological data, terrain, building downwash, ambient air boundary, and receptors. TAP modeling was conducted for the 14 operational modeling scenarios, consistent with the NAAQS analyses. Modeling Scenario W5 was eliminated from the arsenic modeling, as discussed in Section 5.8 of this *Modeling Review Attachment*.

The meteorological dataset processed using McCall, Idaho, cloud cover data was used for analyses in the *TAP Addendum*. Impacts were not assessed using the dataset processed using the Bulk Richardson (BULKRN) method for boundary layer parameter calculations. EPA considers both methods to be acceptable. Although modeled impacts tend to be somewhat larger when using meteorological data processed by the BULKRN method, DEQ contends that the impact analyses are still largely conservative compared to actual impacts anticipated. Conservative aspects include: continual operation of the worst-case operational scenario; operation at maximum allowable rates for the averaging period; no reduction in winter-time emissions from fugitive sources, accounting for emission suppression effects of increased moisture.

5.3 TAP Modeling Applicability

Table 1 provides a comparison between applicable facility-wide maximum potential TAP emissions for the highest-emitting scenario (W3) and TAP screening emission levels (ELs) from *Idaho Air Rules* Sections 585 (for non-carcinogens) and 586 (for carcinogens). Note that TAPs also classified as HAPs

REC 3886
REC 0699
PET 333

emitted from sources "addressed" or "covered" by NSPS or NESHAP were not required to be evaluated for compliance with TAP increments in accordance with *Idaho Air Rules* Section 210.20. Furthermore, PRI has determined that the West End Development Rock Storage Facility will not be constructed. This change eliminated Modeling Scenario W5 (the highest-emitting scenario described in the main body of the DEQ *Modeling Review Memorandum*) as a potential operating scenario. After eliminating Modeling Scenario W5, it was determined that Modeling Scenario W3 is the highest-emitting scenario for all TAPs.

Table 1. TAP MODELING APPLICABILITY DETERMINATION (HIGHEST-EMITTING MODELING SCENARIO: W3).

HAP/TAP	Emissions (lb/hr)			EL (lb/hr)		Determination
	(a)	(b)	Total	(c)	(d)

a. Total HAP/TAP emissions for EL evaluation from mining (i.e., pits, blasting, haul roads, stockpiles and DRSF, tailings storage facility, access road, and underground exploration) and leaching. Emissions from sources covered/addressed by NSPS/NESHAP are not included in the evaluation for modeling applicability.

b. Total HAP/TAP emissions for EL evaluation from processing and production (i.e., ore processing [crushers and transfer, prill silos], ore concentration and refining [autoclave, electrowinning cells and pregnant solution tank, retort, furnace, carbon kiln], process heating [POX boiler, carbon regeneration kiln, propane vaporizer, solution heater], lime production [limestone crushers, screens, mill, transfers, lime kiln, kiln feed, lime mill, pebble lime silo, lime silos, lime mill crushing], aggregate production [portable crushers, screens, transfers], concrete production [central mixer, cement silos, aggregate bin], HVAC [heaters], emergency power [emergency generators, fire pump], fuel storage [gasoline fuel and tanks]). Emissions from sources covered/addressed by NSPS/NESHAP are not included in the evaluation for modeling applicability.

c. Non-carcinogenic EL from *Idaho Air Rules* Section 585.

d. Carcinogenic EL from *Idaho Air Rules* Section 586.

Table 1 shows that the SGP facility-wide potential TAP emissions exceed the respective EL for arsenic, beryllium, cadmium, cyanide, formaldehyde, manganese, nickel, phosphorus, aluminum, barium, calcium carbonate, calcium oxide, iron, sulfuric acid, thallium, and vanadium. Therefore, modeling was required for these 16 TAPs (11 non-carcinogenic and five carcinogenic TAPs) to demonstrate compliance with Acceptable Ambient Concentrations of Non-Carcinogens (AACs) and AACCs.

5.4 TAP Modeled Emission Rates

Table 2 lists the source-specific modeled emission rates for all 11 non-carcinogenic TAPs that required modeling (worst-case modeling scenario for all non-carcinogenic TAPs: W5). Table 3 lists the source-specific modeled emission rates for all five carcinogenic TAPs that required modeling (worst-case impacts for arsenic are associated with modeling scenario W2; worst-case impacts for all other carcinogenic TAPs are associated with modeling scenario W1). Note that all source-specific emission rates listed in Tables 2 and 3 were extracted by DEQ's modeling staff from the submitted modeling input files.

The total modeled emission rates for all non-carcinogenic TAPs are equal to the total facility-wide HAP/TAP emissions as stated in the permitting emissions inventory (excluding sources addressed by NSPS/NESHAP), evaluated at 180,000 T/day (see last two rows of Table 2). However, for carcinogenic TAPs, modeling was performed using an emission inventory that included T-RACT controls, long-term mining production limits, and other emission inventory refinements, as described in Section 4.0 of this *Modeling Review Attachment* (see last three rows of Table 3).

Table 2. MODELED EMISSION RATES FOR NON-CARCINOGENIC TAPS (WORST-CASE MODELING SCENARIOS).

a. Aluminum (worst-case modeling scenario: W5).
b. Pounds per hour.
c. Barium (worst-case modeling scenario: W5).
d. Calcium carbonate (worst-case modeling scenario: W5).
e. Calcium oxide (worst-case modeling scenario: W5).
f. Cyanide (worst-case modeling scenario: W5).
g. Iron (worst-case modeling scenario: W5).
h. Manganese (worst-case modeling scenario: W5).
i. Phosphorus (worst-case modeling scenario: W5).
j. Sulfuric acid (worst-case modeling scenario: W5).
k. Thallium (worst-case modeling scenario: W5).
l. Vanadium (worst-case modeling scenario: W5).
m. The Haul Road was represented in the model as a series of volume sources. The emission rates listed in this table represent each individual volume source.
n. Total emission rates at 180,000 tons per day were derived from Worksheet "TblA" in the emission inventory dated October 5, 2021. The total emission rates in this row represent all facility-wide HAP/TAP emission sources from mining, leaching, and processing and production (excluding emissions from sources "addressed" or "covered" by NSPS/NESHAP).

a. Arsenic (worst-case modeling scenario: W2).
b. Pounds per hour.
c. Beryllium (worst-case modeling scenario: W1).
d. Cadmium (worst-case modeling scenario: W1).
e. Formaldehyde (worst-case modeling scenario: W1).
f. Nickel (worst-case modeling scenario: W1).
g. The Haul Road was represented in the model as a series of volume sources. The emission rates listed in this table represent each individual volume source.
h. Total T-RACT emission rates – calculated based on T-RACT controls, long-term mining production limits, and other emission inventory refinements, as described in Section 4.0 of this *Modeling Review Attachment* – are derived from Tables B-W2 (for Arsenic) and B-W1 (for Beryllium, Cadmium, Formaldehyde, and Nickel) in Appendix B of the *TAP Addendum*.
i. Total emission rates at 180,000 tons per day were derived from Worksheet "TblA" in the emission inventory dated October 5, 2021. The total emission rates in this row represent all facility-wide HAP/TAP emission sources from mining, leaching, and processing and production (excluding emissions from sources "addressed" or "covered" by NSPS/NESHAP).

5.5 Cyanide Modeling Emission Source Parameters

Modeling analyses for cyanide introduced two new emission sources that were not previously evaluated by DEQ: tailings storage facility (model ID: TSF) and mill tanks (model ID: MILLTANKS).

1. The tailings storage facility was modeled by Air Sciences as a surface-based (zero release height above ground-level and zero initial vertical dimension) AREA source. The easterly and northerly lengths were calculated as square-root of the TSF area (easterly length = northerly length = $\sqrt{1{,}338{,}158\ square\ meters}$ = 1,157 meters).

2. The mill tanks were grouped and modeled by Air Sciences as a single VOLUME source. The tanks sit on the ground, so the release height was set to the average tank height of 12.2 meters (40 feet). The initial lateral dispersion (σ_y) was calculated as the equivalent diameter of the combined (18) tank area divided by the single VOLUME source coefficient of 4.3:

REC 3894
REC 0707
PET 341

$$\sigma_{y(MILLTANKS)} = \frac{Equivalent\ diameter}{4.3} = \frac{\sqrt{\Sigma(d)^2}}{4.3} = 42.8\ feet$$

The individual tank diameters (d) are: two tanks at 40 feet, four tanks at 52 feet, six tanks at 54 feet, and six tanks at 20 feet.

DEQ typically requires that tailings storage facilities be modeled as an AREAPOLY source with an outline that follows the contour of the emission source, and that mill tanks be represented in the model as individual volume sources; but, given that the maximum modeled concentration for cyanide is safely below the AAC (0.08%), DEQ's modeling team accepted the modeling analysis submitted by Air Sciences and concluded that it confidently demonstrates that the cyanide AAC will not be exceeded.

5.6 Deposition Modeling

Air Sciences applied particle deposition algorithms in the impact modeling for particulate TAPs. The particulate deposition parameters used in the NAAQS compliance analysis were derived for PM_{10} and $PM_{2.5}$ (see Tables 22 and 23 in the main body of the DEQ *Modeling Review Memorandum*). Dust-related metal TAP emissions include total particulates (all size fractions of particulate matter [PM] up to PM_{30}). Therefore, the deposition parameters for PM were calculated using the same methodology and EPA references used for PM_{10} and $PM_{2.5}$ in the NAAQS compliance demonstration analyses. The PM deposition parameters are provided below in Table 4. The same density values were used as in the previous TAPs modeling analysis. However, an additional deposition characterization bin was added to better handle deposition of 10 µm to 30 µm particulates; mass fractions were adjusted accordingly.

[a.] See Table 23 in the main body of the DEQ *Modeling Review Memorandum*.

5.7 Carcinogenic TAP Modeling Lifetime Exposure Adjustment

Maximum modeled concentrations for carcinogenic TAPs were adjusted to account for the life-of-mine production limits, which affects the lifetime exposure.

PRI evaluated the highest modeled annual carcinogenic TAP concentration from each of the 14 modeling scenarios for lifetime exposure as follows:

$$Lifetime\ exposure\ \left(\frac{\mu g}{m^3}\right) = \frac{Highest\ annual\ concentration\ \left(\frac{\mu g}{m^3}\right) \times 16\ (mine\ operation\ years)}{70\ (years, lifetime\ exposure)}$$

This equation assumes that the highest annual concentration from the 14 modeling scenarios is repeated for 16 years of mining operation. This was then averaged over 70 years to calculate the 70-year lifetime exposure.

PRI and Air Sciences contend that calculating lifetime exposure based on 16 years of mining operation is conservative. The annual emissions for carcinogenic TAP modeling are based on 135,000 tons/day (see Section 5.1 of this *Modeling Review Attachment*) and 365 days per year. Over 16 years, this equates to a potential mining production of 788.4 million tons:

$$\frac{135{,}000\ \left(\frac{tons}{day}\right) \times 365\ \left(\frac{days}{year}\right) \times 16\ years}{1{,}000{,}000\ \left(\frac{tons}{million\ ton}\right)} = 788.4\ million\ tons$$

The actual life-of-mine total production as described in the SGP *Refined Proposed Action* (*ModPRO2*) mine plan is only 402.86 million tons (Perpetua 2021), which is 51.1% of the potential life-of-mine production represented in the above equation and related emission evaluations.

5.8 Arsenic Compliance Demonstration for Modeling Scenarios W1-W4

To demonstrate compliance with the AACC for arsenic, PRI applied two additional operating limitations:

- The removal of Modeling Scenario W5 as a potential operating scenario
- Limiting the West End Pit's life-of-mine potential mining production to 50% of the total life-of-mine potential mining production of 788.4 million tons: 50% * 788.4 million tons = 394.2 million tons

PRI has determined that the West End Development Rock Storage Facility (DRSF) will not be constructed. This change eliminated Modeling Scenario W5 from the arsenic modeling evaluation. The remaining four West End Pit modeling scenarios (W1–W4) are evaluated using the 70-year lifetime exposure equation from Section 5.7 and adjusting for the proposed West End Pit life-of-mine production limit of 50% of the total production as follows:

$$LifeExpose_{Wi,j,n} = \left[\left(WEPExpose_{Wi,n}\right)(50\%) + \left(nonWEPExpose_{Sj,n}\right)(50\%)\right]\left[\frac{16\ year\ LOM}{70\ year\ exposure}\right]$$

where:

W*i*	=	West End Pit scenario, where *i* = 1 to 4.
S*j*	=	non West End Pit scenario, where *j* = B1, B2, H1, H2, H3, H4, Y1, Y2, and Y3.
n	=	specific receptor.
$LifeExpose_{Wi,j,n}$	=	lifetime exposure in µg/m^3 for West End Pit scenario *i*, non West End Pit scenario *j*, at receptor *n*.
$WEPExpose_{Wi,n}$	=	annual maximum impact in µg/m^3 for West End Pit scenario *i* at receptor *n*.
$nonWEPExpose_{Sj,n}$	=	annual maximum impact in µg/m^3 for non West End Pit scenario *j* at receptor *n*.
16 year LOM	=	maximum life-of-mine.
70 year exposure	=	Lifetime exposure used for development of AACCs in *Idaho Air Rules*.

The above equation was used to calculate the lifetime arsenic exposure from the West End Pit scenarios (W1–W4) on a receptor-by-receptor basis. Combining the concentrations from Modeling Scenarios W1–W4 with the highest concentration from the remaining non-West End Pit scenarios (B1, B2, H1, H2, H3, H4, Y1, Y2, or Y3) conservatively ensures that the maximum potential impacts from applicable sources are evaluated and remain below AACCs.

PRI contends that calculating lifetime arsenic exposure based on the proposed West End Pit life-of-mine production limit of 50% of the total production is conservative. The actual life-of-mine total production from the West End Pit as described in the ModPRO2 mine plan is only 198.26 million tons (Perpetua 2021), which is 50.3% of the proposed West End Pit life-of-mine production limit of 394.2 million tons.

6.0 Impact Results

TAP impact analysis results, as submitted in the *TAP Addendum* and as further assessed by DEQ, are discussed in this section. The effect of various operational refinements also reduced PM_{10} and $PM_{2.5}$ impacts, and this is discussed in Section 6.2.

6.1 TAP Impact Analyses Results

This section describes the revised TAP impact analyses and demonstrates that applicable TAP emissions resulting from operation of the SGP will not result in increased impacts that exceed AACs or AACCs.

6.1.1 Modeling Non-Carcinogenic TAPs

The non-carcinogenic TAPs subject to impact modeling requirements to demonstrate compliance with AACs of *Idaho Air Rules* Section 585 were modeled at the emission levels shown in Table 1 above. The maximum 24-hour modeled concentration for each of the 14 modeling scenarios demonstrates compliance with the applicable AAC, as summarized below in Table 5. PRI elected to include Scenario W5 in the modeling analysis for non-carcinogenic TAPs. Figure 1 illustrates the locations of the maximum impacts for each non-carcinogenic TAP.

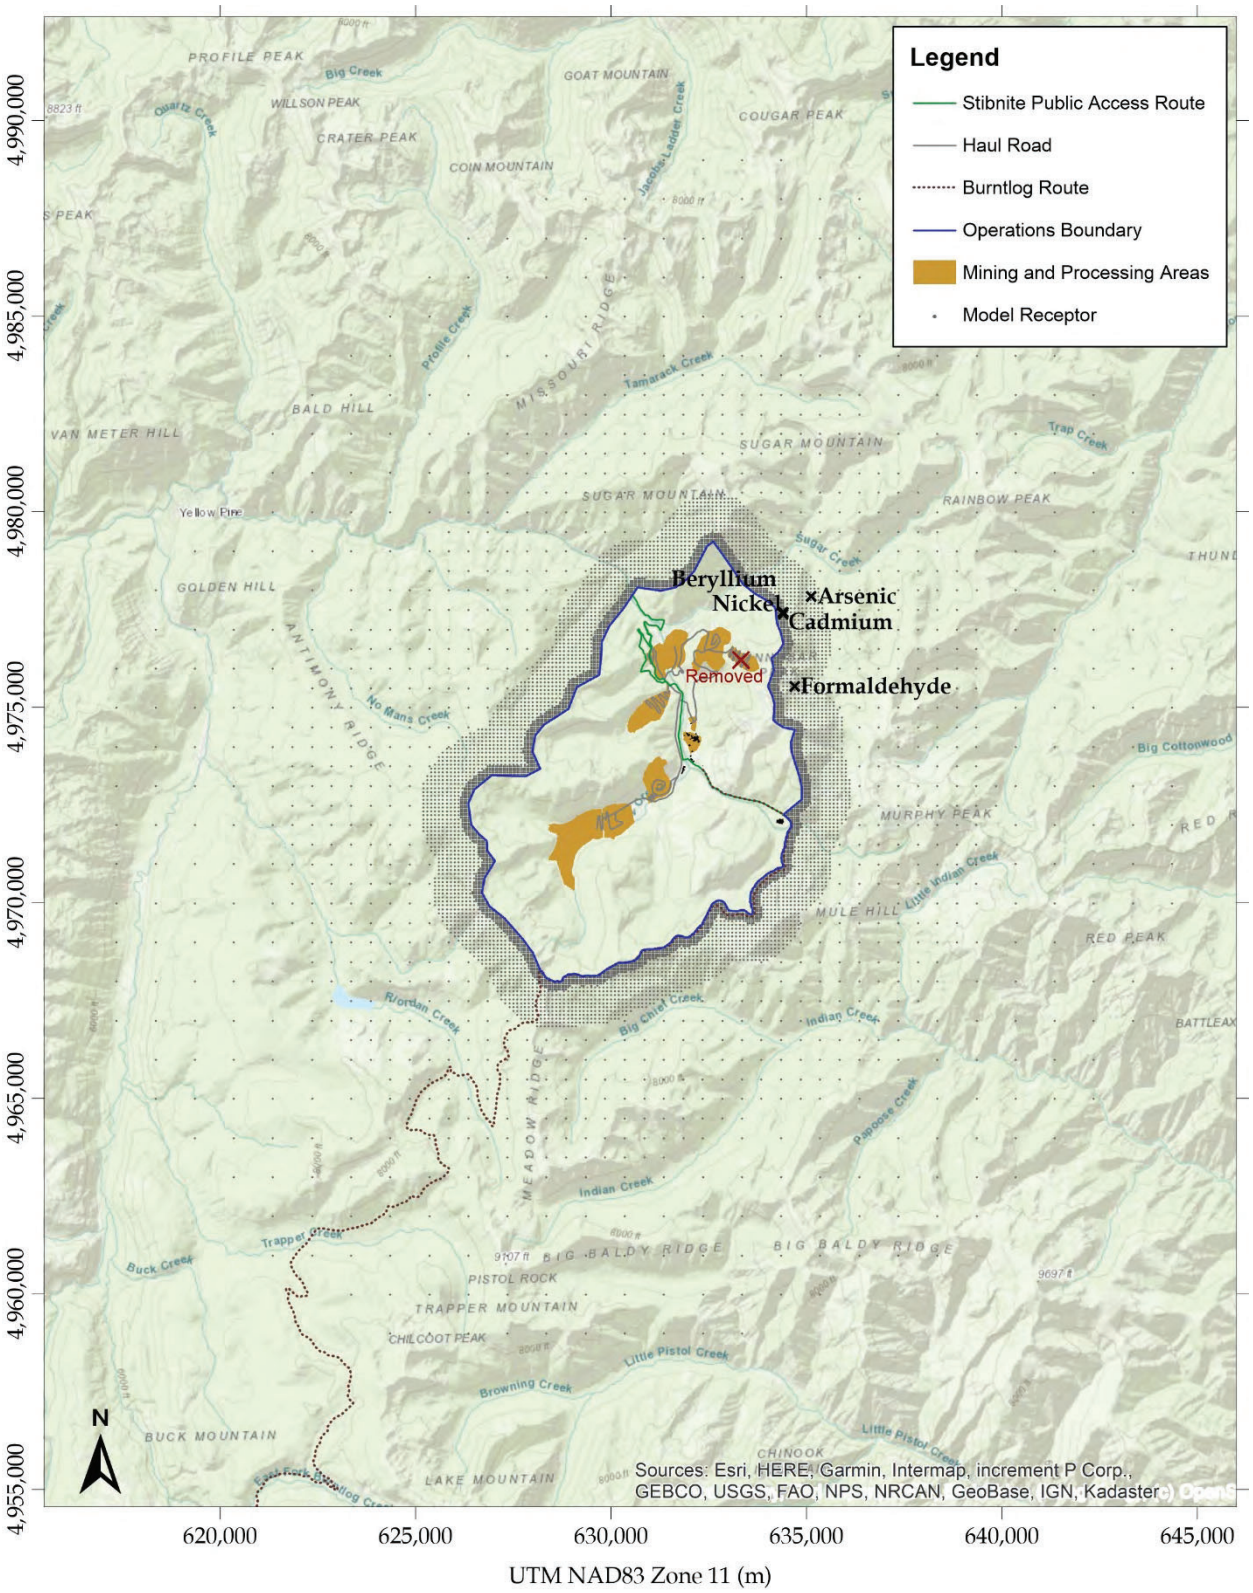
6.1.2 Modeling Carcinogenic TAPs

The carcinogenic TAPs subject to impact modeling requirements to demonstrate compliance with AACCs of *Idaho Air Rules* Section 586 were modeled using an emission inventory that includes the T-RACT controls, long-term mining production limits, and other emission inventory refinements, as described in Section 4.0 and 5.0 of this *Modeling Review Attachment*.



The maximum modeled impact for each of the 14 modeling scenarios demonstrated compliance with the T-RACT AACC, as summarized below in Table 6. The SGP maximum concentrations were adjusted to account for the life-of-mine production limits, which affect the lifetime exposure, and to account for the elimination of Modeling Scenario W5. See Sections 5.7 and 5.8 of this *Modeling Review Attachment* for more detail. The locations of the maximum impacts for each carcinogenic TAP are presented in Figure 2. Arsenic concentrations are considerably lower in areas away from the location of maximum impact as shown in Figure 3.

Table 6. RESULTS FOR TAPS IMPACT ANALYSES FOR CARCINOGENIC TAPS.

Toxic Air Pollutant	Averaging Time	Maximum Modeled Lifetime Exposure Concentration ($\mu g/m^3$)[a,b]	Model Scenario	AACC[c] ($\mu g/m^3$)	T-RACT[d] AACC	Percent of T-RACT AACC
Arsenic	Annual	0.00095	W2	0.00023	0.0023	41.30%
Beryllium	Annual	0.00001	W1	0.0042	0.042	0.02%
Cadmium	Annual	0.000002	W1	0.00056	0.0056	0.04%
Formaldehyde	Annual	0.00007	W1	0.077	0.77	0.01%
Nickel	Annual	0.00001	W1	0.042	0.42	<0.01%

a. Micrograms per cubic meter.
b. The lifetime exposure concentrations are based on the proposed restrictions discussed in Sections 5.7 and 5.8 of this *Modeling Review Attachment*.
c. Acceptable Ambient Concentration of a Carcinogenic TAP.
d. Toxic Air Pollutant Reasonably Available Control Technology allows the AACCs to be increased by a factor of ten per *Idaho Air Rules* Section 210.12(b).

6.2 Effect of Changes to Modeled PM_{10} Results

PRI has determined that the West End Development Rock Storage Facility will not be constructed. This change eliminated Modeling Scenario W5 as a potential operating scenario. In Section 4.1.4 in the main body of the DEQ *Modeling Review Memorandum*, DEQ identified PM_{10} NAAQS exceedances at four hotspot receptors when using the BULKRN meteorological dataset for Modeling Scenario W5 (the highest PM_{10} impact modeling scenario). When Modeling Scenario W5 is removed, the highest modeled impacts are predicted to occur for Modeling Scenario W3, which represents the transport of development rock from the West End Pit to the Hangar Flats Development Rock Storage Facility.

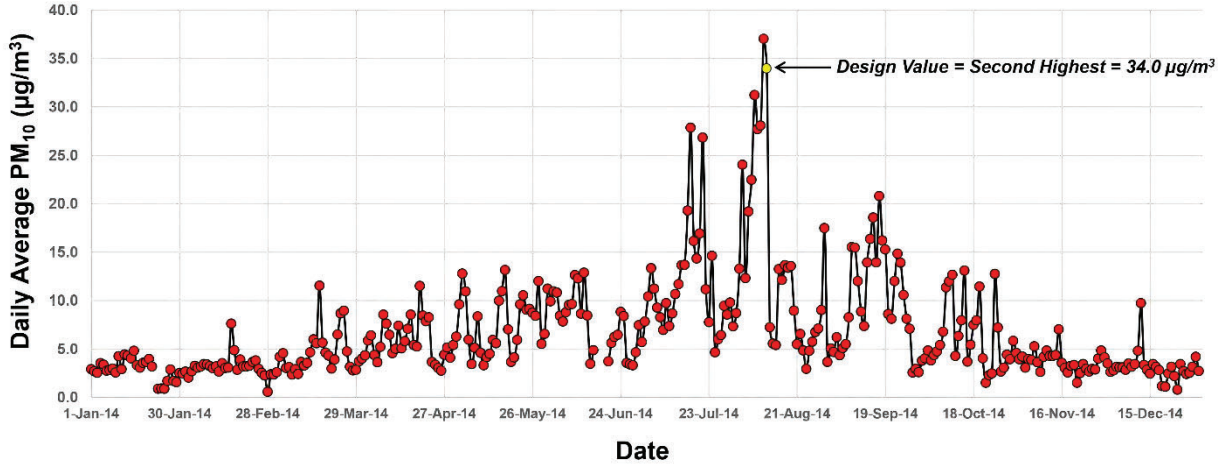
Table 7 presents results for the cumulative NAAQS impact analyses for Scenario W3. Results still exceed the 24-hour PM_{10} NAAQS even when Modeling Scenario W5 is eliminated. However, there is only one hotspot receptor exceeding NAAQS. The modeled violation is also predicted to occur during winter. This is a critical consideration because during winter, not only are fugitive emissions minimized because of the higher moisture content of material handled or driven over, but background concentrations in such remote areas are also generally much lower because of the absence of wildfires and dust-generating sources.

Table 7 also lists the results when using temporally varying backgrounds, instead of a single-value background, in the cumulative NAAQS impact analysis (using the "SEASON" and "MONTH" options in AERMOD). The highest daily average PM_{10} concentrations measured at Stibnite for every season and month in 2014 were used as inputs in the model. Table 7 shows that the SGP facility *safely* demonstrates compliance with the 24-hour PM_{10} NAAQS when temporally varying backgrounds (both seasonal and monthly) are used instead of the single-value background. Summing modeled design values with a single-value background that is on the upper end of the distribution results in a very conservative estimate of total impacts. DEQ strongly believes that using temporally varying backgrounds that respect seasonality is appropriate for the SGP facility, and that using the highest value in the period interval is very conservative.

TABLE 7. RESULTS FOR 24-HOUR PM_{10} CUMULATIVE NAAQS IMPACT ANALYSES FOR MODELING SCENARIO W3.

Backgrounds Scenario	Max. Conc.[a] (µg/m³)[b]	Model Scenario	Back. Conc.[c] (µg/m³)	Total Conc.[d] (µg/m³)	NAAQS (µg/m³)	Percent of NAAQS
Single-Value Background	116.9	W3	34.0	150.9[e]	150	100.6%
Seasonally Varying Backgrounds	123.5[f]	W3	*Seasonal*	123.5[f]		82.3%
Monthly Varying Backgrounds	123.5[f]	W3	*Monthly*	123.5[f]		82.3%

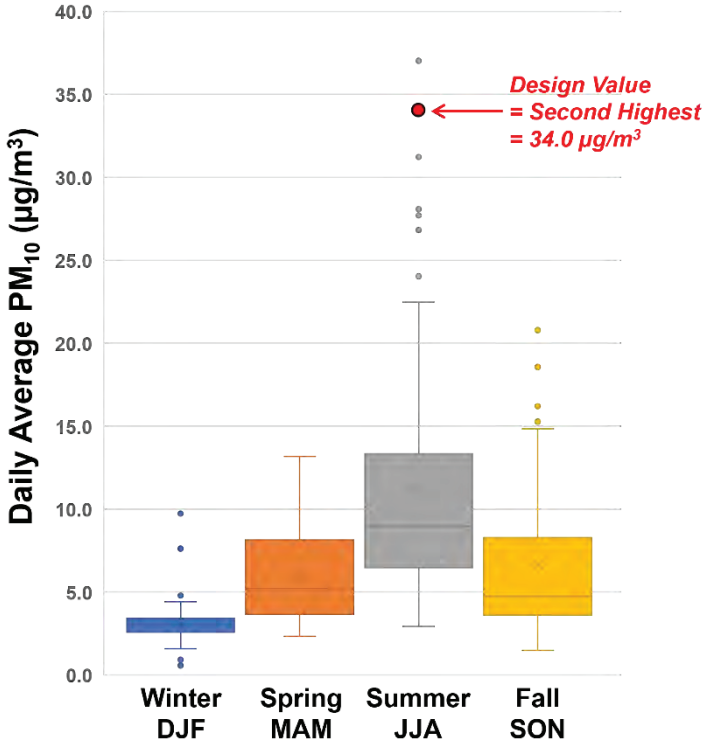
a. Max. Conc. = maximum modeled design concentration.
b. Micrograms per cubic meter.
c. Back. Conc. = background concentration.
d. Total Conc. = total (modeled + background) concentration.
e. One hotspot receptor exceeds NAAQS.
f. The maximum modeled design concentration already incorporates the seasonal and monthly background values.



The time series plot in Figure 4 and the box-and-whiskers plot in Figure 5 illustrate the variability in daily average PM_{10} concentrations collected at the Stibnite Site in 2014. Figures 4 and 5 confirm that the highest concentrations from the modeled and monitored datasets do *not* occur simultaneously. Highest modeled impacts are predicted to occur during winter while the highest background concentrations were measured at Stibnite during summer. Therefore, the summation method, where total impacts are

REC 3904
REC 0717
PET 351

calculated by summing modeled design values with a background concentration that is also consistent in form with the regulatory design value, results in a very conservative estimate of the total impact for comparison to NAAQS. DEQ concludes that use of temporally varying (i.e., seasonal and monthly) backgrounds for SGP is justified. DEQ is highly confident that operation of the SGP will not cause or contribute to a violation of NAAQS.



PM_{10} and $PM_{2.5}$ NAAQS compliance was previously demonstrated prior to refinements and adjustments proposed in the submitted *TAP Addendum*. The main body of the DEQ *Modeling Review Memorandum* discussed and considered results from both modeling with meteorological data processed using the BULKRN method and modeling with data processed using cloud cover data, and DEQ concluded that NAAQS compliance was demonstrated with a high degree of confidence. The adjustments and refinements described in the *TAP Addendum* further increase DEQ's confidence in NAAQS compliance.

REC 0718
PET 352

Figure 5. BOX-AND-WHISKERS PLOT FOR SEASONAL PM_{10} BACKGROUND CONCENTRATIONS MEASURED AT STIBNITE IN 2014.

In Figure 5 the middle line of each box represents the median. The "x" in the box represents the mean. The bottom and the top lines of the box represent the 1st quartile (25th percentile) and the 3rd quartile (75th percentile), respectively. The whiskers extend to the minimum and maximum values not considered outliers. Outliers are plotted individually.

7.0 Conclusions

This section provides conclusions of the *TAP Addendum* and DEQ's review of the *TAP Addendum*.

7.1 Conclusions of Revised TAP Analyses

The revised and refined TAP analyses:

- Revised TAP-applicable sources at the SGP facility.
- Proposed additional emission control measure and adjusted operations to reduce TAP emissions.
- Refined the approach used to demonstrate compliance with TAP regulations.

The submitted application, with the adjustments and refinements to analyses as described in the *TAP Addendum*, demonstrated to DEQ's satisfaction that the emissions of applicable TAPs will not result in impacts to ambient air that exceed TAP increments of *Idaho Air Rules* Section 585 and 586.

7.2 Effects of Adjustments/Revisions on NAAQS Compliance Demonstrations

The submitted application, prior to the *TAP Addendum*, demonstrated compliance with NAAQS to DEQ's satisfaction; and the operational measures proposed in the *TAP Addendum* will only further reduce estimated emissions. Eliminating Modeling Scenario W5 impacts, with the elimination of the West End Development Rock Storage Facility, affects the 24-hour PM_{10} impact modeling analysis for SGP. Modeling Scenario W3 is now the scenario producing the highest modeled impacts, and NAAQS compliance is easily demonstrated when using temporally varying background PM_{10} values, which were obtained from onsite monitoring data.

7.3 Conservatism of Permitting Analyses

Emissions and locations from which emissions occur are highly dynamic at mining facilities. This presents unique challenges for permit development because permits must include limits and operational requirements that ensure air quality standards are not violated. Permitting rules require that air impacts be assessed using maximum potential emissions as limited by either the capacity of the unit/operation or as limited by enforceable permit provisions. A permit where actual emissions are nearly representative of maximum allowable emissions, through imposing permit limits, would be exceedingly complex and require overly burdensome monitoring and record-keeping requirements. To avoid this, applicants typically calculate allowable emissions and perform impact analyses based on simplistic operational scenarios that largely overstate emissions estimated to occur from the facility.

PRI and Air Sciences have asserted that the submitted emission estimates, operational scenarios, and air impact analyses associated with the permit application greatly overstate best-estimated values. This point is evident when comparing the permit application materials and analyses with those presented in ModPRO2, PRI's revised mine plan and associated impacts. ModPRO2 is used in support of the Environmental Impact Statement (EIS).

EXHIBIT B

order to effectively implement 161, the department developed a policy that set emission limits for certain toxic air pollutants. Idaho industry requested that the policy be implemented in rule (instead of a policy) to provide greater certainty and transparency for industry. Through many discussions with industry and the public, a rule was developed that was responsibly protective of environmental quality while being reasonably permissive of industrial activity. As noted in Section 203.03, by complying with the TAPs rules developed in sections 210, 585 and 586, a facility adequately demonstrated compliance with 161.

Because TAPs are generally known to be hazardous to human health (EPA 1991), the federal government also implemented rules to control emissions of TAPs through National Emission Standards for Hazardous Air Pollutants (NESHAPs). EPA first tried to implement risk based standards according to the Clean Air Act (CAA) amendments of 1970. Between 1970 and 1990, EPA was only able to implement standards for 8 pollutants (asbestos, benzene, beryllium, coke oven emissions, inorganic arsenic, mercury, radionuclides, and vinyl chloride). Because of EPA's inability to address air toxics in a timely and efficient manner, Congress revised the CAA in 1990 to develop a program to control a list of hazardous air pollutants (HAPs) through technology standards for specific industries. Congress itself developed the list of 188 HAPs. They also prescribed maximum achievable control (MACT) standards for large (major) sources of HAPs and generally achievable control technology (GACT) standards for smaller (area) sources. The area source NESHAPs also only focused on a subset of 30 HAPs that were identified as being the most problematic in urban areas. Congress's intent was to address the major risks associated with TAPs by focusing on the most toxic pollutants and most significant source categories. The original list of 188 HAPs was based on the list of pollutants subject to the Emergency Planning and Community Right-to-Know Act (EPCRA). After the HAPs list was created in the early 1990's, the list of pollutants subject to EPCRA has doubled, while the list of HAPs has remained essentially unchanged.

The Idaho TAPs rules were developed to complement the federal NESHAPs, thus the rules are not more stringent than federal law. IDAPA 58.01.01.210.20 specifically states that if a facility is subject to a federal NESHAP, they have met the requirements of our state air toxics rules. These rules do regulate an activity not regulated by the federal government. They are a uniquely Idaho solution of addressing air toxics emissions. An argument could be made that the rules are broader in scope than federal law, as they do regulate an activity not regulated by federal law.

(2) To the degree that a department action is based on science, in proposing any rule or portions of any rule subject to this section, the department shall utilize:

(a) The best available peer reviewed science and supporting studies conducted in accordance with sound and objective scientific practices; and

The Idaho TAPs rules were developed to protect public health by developing risk based standards that would apply to new or modified industrial sources only. There are two lists of pollutants that facilities need to consider, but only if the facility is not subject to a federal air toxics standard.

The first list of pollutants are non-carcinogens (do not cause cancer) in IDAPA 58.01.01.585. They may cause adverse health effects based on short term (24-hour) exposures. Examples include methyl isocyanate, chlorine, cyanide and xylene. The acceptable ambient levels for non-carcinogens are based on occupational exposure levels from the American Conference of Government Industrial Hygienists (ACGIH) threshold limit values (TLV). (ACGIH 2019). The TLV is typically an 8 hour time weighted average concentration and it is the concentration to which workers may be repeatedly exposed during a 40 hour work week without adverse effect. Two safety factors were applied to the TLV value: 1) to extrapolate the 8 hour exposure level to a 24 hour public exposure, and 2) to extrapolate from the relatively healthy mostly male working population to a general population that included women, children and the elderly. Thus the TAP increment values are 1/20th the TLV values.

Because ambient monitoring values can sometimes be difficult to determine, the department also developed stack emission screening levels (ELs) for easier analysis (in pounds/hour). These were based on a conservative stack modeling analysis.

The second list of pollutants are carcinogens (i.e., have been determined to cause cancer over a lifetime of exposure) in IDAPA 58.01.01.586. Examples include formaldehyde, benzene, and polycyclic aromatic hydrocarbons. The acceptable ambient levels for carcinogens are based on the cancer unit risk values from the Environmental Protection Agency and correspond to a one in a million cancer risk. (EPA 2019). An EL was also determined for

Case Docket No. 0101-22-01
OAH Case No. 23-245-01

EXPERT DECLARATION OF KEVIN SCHILLING

I, KEVIN SCHILLING, hereby declare under penalty of perjury and pursuant to the law of the State of Idaho that the foregoing is true and correct:

I. Introduction

1. My name is Kevin Schilling. I am the Stationary Source Air Modeling Supervisor for the Stationary Source Bureau at the State Air Quality Division of the Idaho Department of Environmental Quality (DEQ) in Boise. I have held this position since September of 2004; however, the title of the position and location within the organizational structure of the Air Quality Division has changed over time.

2. Presently, two staff positions, both Air Quality Dispersion Modeling Analysts, report directly to me. Darrin Mehr fills one of those positions and the other is filled by Christina Boulay. Ms. Boulay filled the position vacated by Dr. Pao Baylon, who left DEQ in 2023 for employment with a private environmental consulting company. Dr. Baylon was the lead Air Quality Dispersion Modeling Analyst for review of the Perpetua Resources Idaho, Inc. (PRI) Stibnite Gold Project (SGP) air impact analyses that were submitted with the Permit to Construct (PTC) application.

3. My role in the permitting of the SGP has been both supervisory and technical/policy review and evaluation. As mentioned above, Dr. Baylon was the lead in review and verification of impact analyses submitted with the application, and he also performed supplemental analyses to support DEQ's conclusion that the SGP would not cause or contribute to violation of air quality standards or increments. Where air impact modeling methods used by PRI and presented in the PTC application were atypical or of questionable appropriateness, Dr. Baylon discussed the approach, data, and analyses with me. Prior to permit issuance, Dr. Baylon, DEQ Permit Writer Kelli Wetzel, Permitting Supervisor Darrin Pampaian, Stationary Source Bureau Chief Mike Simon, and I discussed various aspects of the SGP, including proposed operations, emission calculations, permit provisions needed to assure compliance, and monitoring and recordkeeping requirements. This was done to provide a comprehensive assessment of DEQ's confidence of NAAQS and TAP compliance in a weight-of-evidence type approach. At the conclusion, DEQ was highly confident that operation of the SGP, as described in the application and as required by the DEQ PTC, will not cause or contribute to a violation of a National Ambient Air Quality Standard (NAAQS) or exceed an applicable Toxic Air Pollutant (TAP) increment.

A. Assignment

4. The *Final Order in the Matter of Air Quality Permit to Construct P-2019.0045*[1] ("Final Order") indicated there was "insufficient evidence to support DEQ's analysis of the ambient arsenic air concentrations." Three remaining issues were identified by the Board of Environmental Quality (DEQ Board) for resolution. These are:

[1] REC 3706, *Final Order in the Matter of Air Quality Permit to Construct P-2019.0047*, *Nez Perce Tribe, Idaho Conservation League, and Save the South Fork Salmon v. Idaho Department of Environmental Quality*, Case Docket No. 0101-22-01, OAH Case No. 23-245-01 (Final Order at 12).

a. DEQ did not act reasonably in using a five-year rolling average for T-RACT that was not properly supported by permit conditions.

b. There was insufficient evidence to support the T-RACT analysis limiting the non-West End pit production limit.

c. DEQ did not act reasonably and in accordance with law when it applied the 16/70 calculation to the ambient arsenic air concentration analysis.

5. The identified issues pertain to specific requirements for how analyses and developed permit conditions and restrictions must provide for satisfactory assurance that the facility will operate as described in the application and as needed to comply with applicable air quality standards and/or increments. The accuracy, representativeness, and/or conservatism of methods and data used to estimate impacts were described in detail in the PTC application materials submitted by PRI and in DEQ's *Modeling Review Memorandum* and the *TAPs Addendum Modeling Review Attachment* attached thereto.[2] The aspects of methods and data used in the analyses are not in question by any of the three remaining issues, and this report will not revisit or expand on DEQ's confidence in the results of impact analyses. This report will address the above-listed issues by showing how DEQ's regulatory interpretation is appropriate and that the permit conditions adequately assure compliance with the arsenic T-RACT TAP increment.

B. Summary of Opinions

6. This Expert Declaration will show that:

a. Use of a 5-year rolling average production limit for assessing compliance with the T-RACT AACC is appropriate because long-term exposure to a given concentration over the life of the project is the critical parameter for the risk-based AACCs. Short-term fluctuations in impacts do not affect compliance and do not impact long-term exposure concentrations.

b. A specific limit on non-West End Pit production is not necessary to assure compliance with T-RACT AACCs. Since West End Pit production is the risk driver in analyses, the combination of a limit on total production and a limit on the fraction of total production that may occur from West End Pit sources is adequate to assure compliance with the T-RACT AACC.

[2] *See* REC 699, 701-711, 719-720, Idaho Department of Environmental Quality, *TAPs Addendum Modeling Review Attachment* to the PRI SGP *Modeling Review Memorandum* (January 6, 2022) (REC 697-713, Demonstrating Compliance with IDAPA 58.01.01.203.02 (NAAQS) and 203.03 (TAPs) as it relates to air quality impact analyses) ("DEQ's TAPS Modeling Attachment"). For convenience, a true and correct copy of DEQ's TAPS Modeling Attachment is attached hereto as Exhibit A.

c. DEQ acted reasonably and in accordance with law when it applied a 16/70 factor to adjust concentrations for comparison to the T-RACT AACC. The Expert Declaration of DEQ Environmental Toxicologist Dr. Norka Paden [3] shows that the factor is appropriate because cancer risk estimates, as evaluated by the EPA risk model, are conservative and are a function of a combination of concentration, exposure time, exposure frequency, and exposure duration. Dr. Paden's Declaration provides the primary justification for using the 16/70 factor to account for the limited duration SGP, and this Declaration provides a brief description of how that meets the requirements of carcinogenic TAP permitting rules.

C. Qualifications and Experience

7. I received a Bachelor of Science (BS) degree in Environmental Science, with a minor in chemistry, from Washington State University in 1986. After graduation I was employed by Washington State University as a Research Assistant at the Laboratory for Atmospheric Research while attending graduate school. I received a Masters of Science (MS) degree in Environmental Engineering (specializing in atmospheric chemistry, air pollution meteorology, air pollution monitoring, and atmospheric pollutant dispersion) from Washington State University in 1988.

8. I initially began employment with DEQ (at that time the Division of Environmental Quality) in 1989 and then left the agency in 1990 for employment with Morrison Knudsen Company, a large Idaho-based construction company. I worked in Morrison Knudsen's Environmental Group, performing a wide range of air quality related projects where a key focus was air pollutant impact assessment. These projects included permitting, pollutant emissions estimation, atmospheric dispersion modeling, air pollution monitoring, and industrial hygiene functions.

9. In the mid-1990s, I actively participated in the initial development of Idaho's TAP permitting regulations while working at Morrison Knudsen. I provided technical and regulatory assistance to the Idaho Association of Commerce and Industry (IACI). IACI negotiated with DEQ on the development and promulgation of the TAP rules. I held the position of Chair of the Air Toxics Subcommittee during part of the multi-year negotiations. I stepped down from Chair of the subcommittee before final promulgation of the TAP rules because of other project obligations at Morrison Knudsen that required extensive work outside of Idaho. The work on the IACI Air Toxic Subcommittee involved:

a. Evaluation of the basis from which carcinogenic and non-carcinogenic air impact limits would be established.

b. Ensuring that the interests and concerns of the regulated community were considered in the development of regulations.

[3] *Expert Declaration of Dr. Norka Paden* (August 13, 2024) ("Paden Decl."), ¶¶ 11-18.

c. Structuring regulations in a format that is easily used in the context of air permitting for industrial facilities and DEQ.

10. I returned to DEQ in December of 2001, working in the Technical Services Division where I primarily reviewed air impact modeling analyses submitted as part of air permit applications. I transferred to the Air Quality Program Office as the Stationary Source Air Modeling Coordinator in 2004. Later my title was changed from *coordinator* to *supervisor*.

11. My primary responsibilities as Stationary Source Air Modeling Supervisor are both management/administrative and senior level technical and regulatory oversight. A critical component of my position in the Stationary Source Modeling Group is performing, reviewing, and overseeing technical and regulatory aspects of air impact analyses that satisfy regulatory requirements for permit issuance. Where project-specific conditions present unique circumstances, and there is uncertainty in the acceptability of proposed technical and regulatory approaches to address those unique circumstances, DEQ collectively employs its expertise and experience to develop and evaluate the approach.

II. Background Discussion

A. Permitting Requirements for TAPs

12. TAPs were regulated only by *Idaho Air Rules* Section 161[4] prior to the mid-1990s. DEQ developed a permitting TAPs Policy to provide consistency in how TAPs would be addressed in air permitting. The foundation of that policy was to ensure that a proposed project would not cause impacts to ambient air exceeding: 1) non-carcinogenic pollutant concentration levels that are based on occupational exposure limits; and 2) carcinogenic pollutant concentration levels that are based on EPA inhalation Unit Risk Factors (URFs) (as described in more detail in the Expert Declaration of Dr. Norka Paden[5]) and a selected acceptable lifetime cancer risk. The unit risk is lifetime[6] excess cancer risk estimated to result from continuous exposure to a toxic air contaminant at a concentration of 1 microgram/cubic meter of air ($\mu g/m^3$).

13. The regulated community (those applying for and regulated by an air quality permit from DEQ) expressed concerns in the early 1990s regarding DEQ regulation of TAPs by policy. The regulated community, under the representation of IACI, then engaged in regulatory negotiation with DEQ to establish TAP rules for air permitting. The goals of the negotiations were to develop rules that: 1) are reasonably protective of public health, but still afford flexibility to regulated

[4] *Idaho Administrative Procedures Act 58.01.01, Rules for the Control of Air Pollution in Idaho* ("Idaho Air Rules"), Section 161, Toxic Air Pollutants. This Section states: "Any contaminant that is by its nature toxic to human or animal life or vegetation must not be emitted in such quantities or concentrations as to alone, or in combination with other contaminants, injure or unreasonably affect human or animal life or vegetation."

[5] Paden Decl., ¶¶ 12-16.

[6] 70 years was selected as a lifetime.

facilities and projects; 2) are relatively easy to understand and implement; and 3) do not require excessive expenditure of time and resources by DEQ and the permittee during the permitting process.

14. During development of the TAP rules, DEQ's reliance on EPA URFs remained the regulatory approach cornerstone for developing consistent acceptable methods to evaluate impacts to ambient air for carcinogenic TAPs. A DEQ internal memorandum[7] responding to a request for layman's explanation of URF & TLV/100 stated, "Within IAQB (Idaho Air Quality Bureau) New Source Review (NSR) policy, URFs are used to calculate acceptable ambient levels for a given carcinogen. IAQB generally establishes that an ambient concentration which causes no more excess cancers than one in a million (1×10^{-6}) is acceptable." In the early stages of TAP regulation development, DEQ sent IACI a letter that provided a "straw-man" of possible TAP regulatory language.[8] That regulatory straw-man proposal stated the following for procedures to demonstrate compliance for emissions of carcinogenic pollutants:

> "For sources that can demonstrate, using Department-approved methods, that emissions of carcinogens contribute an ambient air cancer risk probability of less than 1:1,000,000 and that emissions of non-carcinogens contribute to an ambient air concentration less than one percent of the Threshold Limit Value, no additional procedures are needed."

15. During development of the TAP rules, DEQ continually asserted that carcinogenic TAPs resulting from a permitting project should be regulated to prevent an unacceptable excess cancer risk based on a 70-year lifetime. Excess inhalation cancer risk probability over a 70-year lifetime is calculated from the EPA Inhalation Unit Risk and the Exposure Concentration, as described in the Expert Declaration of Dr. Norka Paden.[9] The formula is as follows:

Excess Cancer Risk Probability = (IUR)(EC)

Where: IUR = Inhalation Unit Risk per $\mu g/m^3$ of exposure
EC = Exposure Concentration in $\mu g/m^3$

An acceptable arsenic concentration can be calculated by rearranging the formula and solving for EC using an allowable risk of 10^{-6} (1-in-1,000,000) and a IUR of $0.0043/(\mu g/m^3)$ for arsenic. The resulting EC is 2.3 E-4 $\mu g/m^3$, which is the AACC listed in *Idaho Air Rules* Section 586. This clearly shows how the EPA cancer risk model was used to generate AACCs to protect against lifetime cancer risk from long-term exposures.

---

[7] State of Idaho Department of Health and Welfare, Division of Environmental Quality. *Request for layman's explanation of URF& TLV/100*. From Robert Wilkosz and Tim Teater. To Orvil [sic] Green. March 7, 1991. A true and correct copy of this memorandum is attached hereto as Exhibit B.

[8] State of Idaho Department of Health and Welfare, Division of Environmental Quality. Letter from Robert Wilkosz, Bureau Chief, Technical Services Bureau, to Dick Rush, Vice President, IACI. July 29, 1992. A true and correct copy of this letter is attached hereto as Exhibit C.

[9] Paden Decl., ¶ 15.

16. Dr. Paden further explains that the Exposure Concentration can be calculated using the contaminant concentration, exposure time, exposure frequency, exposure duration, and applicable averaging time by the following:

$$EC = (CA \times ET \times EF \times ED)/AT$$

Where: EC = Exposure Concentration ($\mu g/m^3$)
CA = Contaminant Concentration ($\mu g/m^3$)
ET = Exposure Time (hours/day)
EF = Exposure Frequency (day/year)
ED = Exposure Duration (years)
AT = Averaging Time (70 years x 365 days/year x 24 hours/day)

17. The above formula is used to calculate an Exposure Concentration for a specified project duration over a 70-year average lifetime. This Exposure Concentration can then be compared to a concentration limit that is protective for lifetime cancer risk, such as the AACC or the T-RACT AACC. Although the AACC is expressed as an annual average, it represents the concentration averaged over a 70-year lifetime, as defined by how it was generated from URFs and how it is intended to limit long-term exposure concentration and limit the associated excess cancer risk to 1-in-1,000,000. When the Exposure Duration is equal to the 70-year Averaging Time, and the Exposure Frequency and Time are conservatively set to 365 day/year and 24 hours/day, then the Exposure Concentration is simply equal to the Contaminant Concentration, which is the annual impact obtained from the model. Since the vast majority of DEQ permitting projects are of permanent operations (70 years), no adjustment of the Contaminant Concentration is required to obtain the Exposure Concentration.

18. The SGP will have an Exposure Duration of 16 years, the applicable Contaminant Concentration (an annual value obtained from modeling results) is 0.00416 $\mu g/m^3$, the Exposure Frequency is 365 days/year, and the Exposure Time is 24 hours/day. The calculated Exposure Concentration is then:

$$EC = \frac{(0.00416\ \mu g/m^3)(24\ \text{hours/day})(365\ \text{days/year})(16\ \text{years})}{(24\ \text{hours/day})(365\ \text{days/year})(70\ \text{years})} = 0.00095\ \mu g/m^3$$

As observed in the equation, with conservative assumptions for exposure time and frequency, the equation reduces to the 16/70 factor that was used in DEQ's analysis to account for the limited life of the mine. This demonstrates how a 16/70 adjustment factor to annual estimated impacts is appropriate.

19. DEQ air permits are issued to facilities primarily for permanent and consistent operations where resulting emissions vary little through time. Rather than develop a carcinogenic TAP rule that provided for a project-specific lifetime in the calculation of allowable carcinogenic TAP concentrations in ambient air, DEQ provided simpler regulatory language that provides a concentration limit based on a 70-year continual exposure and expressed that exposure as an annual

average exposure concentration. TAP permitting regulations in *Idaho Air Rules* Section 210.15 provide a short-term project adjustment factor of 10 to apply to the allowable AAC when a project will have a duration of less than 5 years. This shows: 1) an adjustment in the exposure concentration is appropriate (in this case, the rules adjust the AACC rather than the exposure concentration); 2) an adjustment greater than 10 cannot be used for projects of duration less than 5 years. In general, DEQ determined it would not be appropriate to subject individuals to a life-time allowable cancer risk within a duration of less than 5 years. Therefore, the adjustment was capped at 10, rather than using a higher value or values calculated from exposure durations of 5 years of less (e.g., 70 years/5 years = 14 or 70 years/2 years = 35). These short-term projects were most commonly remediation and pilot-scale projects having a duration of up to several years.

B. Form of the Arsenic AACC

20. *Idaho Air Rules* Section 586 state that the AACCs "in this section are annual averages." The rules also state that the Toxic Air Pollutant Carcinogenic Increments "are based on . . . a seventy (70) year lifetime exposure." The former is the averaging period of the modeling results (CA), and the latter is the average period of the lifetime exposure concentration (EC) used for determining excess cancer risk. Air impact analyses only demonstrate compliance with standards when the analyses use the same averaging period as the applicable standard. An annual average impact concentration does not demonstrate compliance with a 24-hour standard. In the case of carcinogenic TAPs, the applicable standard is a pollutant-specific inhalation cancer risk posed in ambient air that results from allowable emissions from the proposed project for the life of the project. That acceptable cancer risk is either 10^{-6} (1-in-1,000,000) as expressed in the AACC or 10^{-5} (1-in-100,000) when controls meeting T-RACT are used. The listed annual AACCs are an expression of that standard when applied to a permanent project/facility that has no permit restrictions on operating duration. These AACCs were developed using the EPA inhalation Unit Risk Factors (URFs) that existed at the time *Idaho Air Rules* Section 586 was promulgated. The *Idaho Air Rules* do not preclude use of an exposure concentration adjustment for impacts, and the EPA risk model that was used in the development of the AACCs provides for this adjustment to calculate the exposure concentration.

C. Arsenic Compliance Approach for SGP

21. The arsenic TAP compliance demonstration approach used by PRI for the SGP permitting analyses was thoroughly described in DEQ's *TAPs Addendum Modeling Review Attachment* of the DEQ *Modeling Review Memorandum*[10] for the SGP. This Expert Declaration will summarize the regulatory approach used to demonstrate compliance and provide additional justification for that approach. It will not reiterate the conservatism of the data and methods of the modeling approach used to estimate arsenic impacts to ambient air, as that is not an identified issue.

22. During development of final SGP permitting analyses, PRI expressed concern that compliance with AACCs could not be demonstrated with the conservative assumptions used in

[10] REC 698, 710-711; DEQ's TAPS Modeling Attachment at 2, 14-15.

previous analyses, including the assumption that the SGP was a permanent source rather than one of 16-year duration. Rather than revise the analytical approach to provide a less conservative assessment of impacts, I proposed that compliance with carcinogenic TAP increments could be based on cumulative cancer risk of the limited-duration project rather than the worst-case annual impact for a project of limited duration. Since the AACC annual average is an expression of a 1-in-1,000,000 cancer risk limit for permitting projects, modeled impacts (annual contaminant concentration) must be adjusted to an exposure concentration that is appropriately comparable to the annual average AACC. Therefore, annual impacts for a project with a 16-year duration could be multiplied by a 16/70 factor to more appropriately compare to the AACC, which is based on a 70-year exposure duration. Similarly, year-to-year variability in emissions could be distributed over an alternative averaging period, provided there is still an adequate periodic evaluation that long-term risk limits are not exceeded.

23. My justification for the acceptability of using a 16/70 factor to adjust modeled impacts was based on technical/scientific considerations, my personal working-level knowledge of DEQ's TAP rules, and my limited knowledge of carcinogenic risk assessment and its relation to the TAP rules. Because of the unique 16-year project duration of the SGP and because *Idaho Air Rules* only identify AACC values for 70 years and less than 5 years, I discussed the approach with the DEQ permitting team prior to proposing use of the method. The DEQ permitting team concluded that the exposure duration consideration was an appropriate adjustment to the calculation of an exposure concentration (EC) for comparison to the T-RACT AACC, and it was concluded by the team that this approach was consistent with implementation of the URFs and identified acceptable excess cancer risks (1-in-1,000,000 or 1-in-100,000 when T-RACT is used) adopted by DEQ as AACCs into *Idaho Air Rules* Section 586.

III. Response to Remaining Issues Identified by the Board of Environmental Quality

A. DEQ Acted Reasonably in Using a 5-Year Rolling Average for T-RACT and it was Supported by Permit Conditions

24. *Idaho Air Rules* Section 586 state that AACCs are annual averages. The implication of the stated issue is that when a standard or increment is specified for a certain averaging-period, then any limits imposed on operations should be for the same averaging period or a shorter averaging period. For example, an operational limit designed to limit emissions that is based on a 5-year averaging period would not be adequate for assuring compliance with an annual average standard. This is because variability in operational rates within the 5-year period could result in a violation of the annual standard while still complying with the 5-year operational limit in the permit. For short-term 1-hour standards, DEQ uses 1-hour averaged operational limits and 1-hour averaged monitoring requirements. Permit requirements to assure compliance with a 1-hour limit would not be based on longer averaging periods such as daily rates because the 1-hour limit could be exceeded while still complying with the daily rate.

25. As I have established earlier in this declaration, carcinogenic TAP AACCs were established to ensure that impacts of any carcinogenic TAPs from a project or facility would not cause a lifetime cancer risk over 1-in-1,000,000 or 1-in-100,000 when using T-RACT. Cancer risks used to establish AACCs were based on EPA's cancer risk model (using established EPA URFs), where risk is dependent on an exposure for a certain project duration, and the risk varies linearly with exposure duration. Because limiting total project-caused cancer risk is the underlying criteria for carcinogenic TAP regulation, any permit limits must only assure that concentrations in ambient air over the total duration of the project do not cause a potential exposure concentration associated with a 1-in-1,000,000 or 1-in-100,000 cancer risk. Therefore, compliance with the carcinogenic AACCs would still be demonstrated if processing rates were only limited to the 788.4 million tons over the life of the mine (combined with the restriction on West End Pit production as described in the next section). Use of a 5-year averaging period for limiting processing rates easily accomplishes this requirement for a project with a 16-year duration, and it provides for reasonable periodic assurance of compliance with the long-term limit.

26. The *Final Order* from the DEQ Board[11] asserted that, "A five-year rolling average allows considerable daily and annual increases in exposures which are contrary to limits set forth in the Air Rules." Because pollutant-specific total project cancer risk is the blanketing objective of regulating carcinogenic TAPs, and since risks as assessed by the EPA risk model are a function of exposure concentration (accounting for exposure duration over a lifetime), any daily and annual variability is inconsequential to the exposure concentration and resulting risk. For example, assume a processing rate of 200,000 tons/year results in an annual arsenic impact of 3.0 E-4 $\mu g/m^3$, 153,000 tons/year results in 2.3 E-4 $\mu g/m^3$ (equal to the standard), and processing 100,000 tons/year results in an annual impact of 1.5 E-4 $\mu g/m^3$. Then assume a facility processes 200,000 tons during years one and two, 100,000 tons during years three and five, and 153,000 tons during year four. The total material processed over five years is 753,000 tons, and the mean annual processing rate is 150,600 tons/year. The same mean processing rate would result from processing 150,600 tons for each of the five years, and this would result in the same average annual air impact and the same carcinogenic exposure concentration. Since the exposure concentration (a resulting project caused concentration averaged over a lifetime) is a measure of compliance with AACC, the five-year rolling average is consistent with limits in *Idaho Air Rules* for carcinogenic TAPs.

B. DEQ had sufficient Evidence Supporting Limits on non-West End Pit Production

27. Final maximum potential arsenic exposures resulting from the SGP, as limited by permit conditions, were calculated from maximum modeled annual impacts and post-processing of those impacts by the following equation[12,13]:

[11] REC 3713 (Final Order at 19).

[12] REC 710-711, DEQ's TAPS Modeling Attachment at 14-15.

[13] *See* REC 1947-48, *Stibnite Gold Project Permit to Construct Application TAP Addendum.* Prepared for Perpetua Resources Idaho, Inc., Prepared by Air Sciences Inc., October 5, 2021 (full document at REC 1921-2146).

$$LifeExposure_{Wi,j,n} = \left[\left(WEPExposure_{Wi,n}\right)(50\%) + \left(nonWEPExposure_{Sj,n}\right)(50\%)\right]\left[\frac{16\ year\ LOM}{70\ year\ exposure}\right]$$

Where:

W_i	=	West End Pit scenario, where i = 1 to 4
S_j	=	Non-West End Pit scenario, where j = B1, B2, H1, H2, H3, H4, Y1, Y2, and Y3.
n	=	specific receptor.
$LifeExposure_{Wi,j,n}$	=	lifetime exposure in µg/m^3 for West End Pit scenario i, non-West End Pit scenario j, at receptor n.
$WEPExposure_{Wi,n}$	=	annual maximum modeled impact in µg/m^3 for West End Pit scenario i at receptor n
$nonWEPExposure_{Sj,n}$	=	annual maximum modeled impact in µg/m^3 for non-West End Pit scenario j at receptor n
16 *year LOM*	=	maximum life-of-mine
70 *year exposure*	=	lifetime exposure used for development of AACCs in *Idaho Air Rules*

The issued permit provided a total mine production limit and a production limit for West End Pit operations. The *Final Order* from the DEQ Board[14] stated, "However, the equation listed above shows that the non-West End Pit production was also limited by 50%. The Board of Environmental Quality was unable to determine from the record where this 50% reduction came from or whether it was actually applied when doing the calculation."

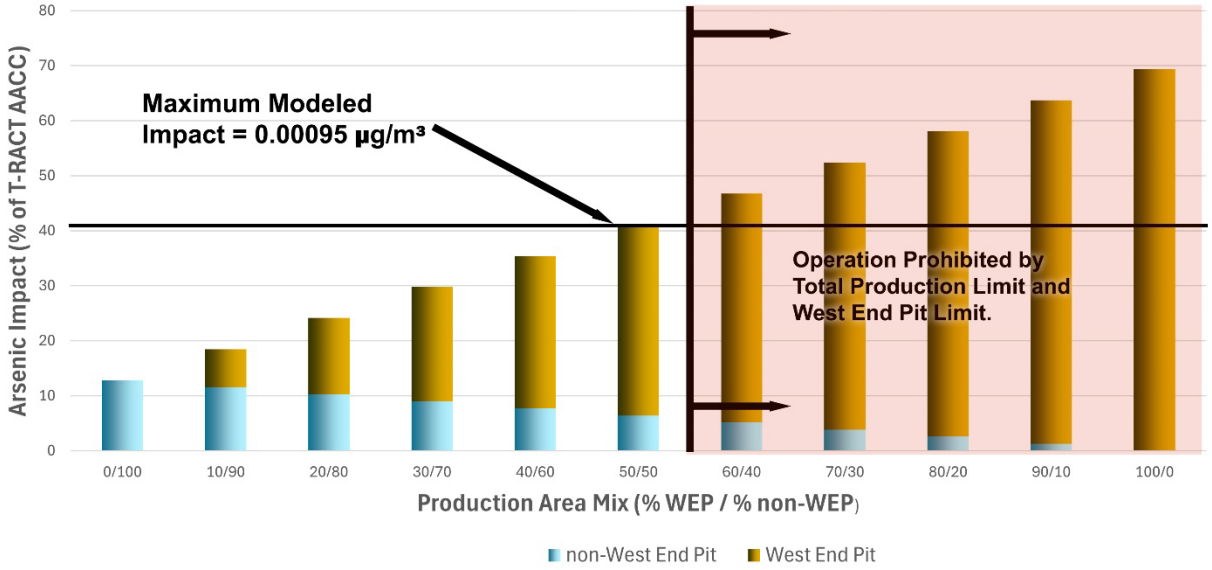
28. The DEQ Board, in the *Final Order*, fails to understand how the issued PTC appropriately and effectively limits both West End Pit and non-West End Pit production. The listed equation provides worst-case impacts for the various scenarios, but by itself it does not fully explain how certain sources must be limited by the permit to assure that the SGP operates as described in the application and in compliance with applicable standards and increments. The PTC limits total hauling and excavation from the mine to 788.4 million tons (West End Pit production combined with non-West End Pit production) and limits hauling and excavation from the West End Pit to 394.2 million tons, which is equal to 50% of total allowable production. Impacts to critical receptors (those having impacts that may approach the T-RACT AACC) are far greater for West End Pit sources than for non-West End Pit Sources. Analyses performed by DEQ during review of the application [15] showed that maximum arsenic impacts when 100% of the allowable production is from non-West End Pit sources (0.0023 µg/m^3 before adjusting for the life of the mine and 0.00053 µg/m^3 after adjusting for the life of the mine) are well below the maximum impact when 100% of allowable production is from West End Pit; therefore, with both a limit on total production and West End Pit production, an additional limit on non-West End Pit production is not necessary to assure that the SGP operates as represented in the application and as needed to

[14] REC 3714 (Final Order at 20).

[15] *PERPETUA RESOURCES IDAHO, INC. – P-2019.0047 PROJ 62288 - Lifetime Arsenic Exposure for Scenarios W1-W4 (DEQ's Post Processing Analysis).xlxs*. Excel Workbook. DEQ, 2021. A true and correct copy of this Excel workbook is provided concomitantly with this declaration and identified as Exhibit D.

assure that applicable emissions do not exceed the arsenic T-RACT AACC. Non-West End Pit production is limited to the facility-wide 788.4-million-ton limit for total hauling and excavation at the mine if there were no West End Pit production.

29. Production is effectively limited from non-West End Pit sources because of the following relationship:



$$Production_{Non\text{-}WEP} = Production_{total} - Production_{WEP}$$

Where:

$Production_{Non\text{-}WEP}$ = production from non-West End Pit Sources
$Production_{total}$ = Total allowable production.
$Production_{WEP}$ = production from West End Pit Sources (not to exceed 50% of $Production_{total}$)

30. The effect of a limit on total production and West End Pit production can be observed by showing how maximum arsenic impacts change with changes in the fraction of total allowable production that occurs from the West End Pit. This was done for the single receptor that had the highest overall exposure concentration. Figure 1 shows how the total adjusted impact is affected by changes in the West End Pit production. The Figure shows how total impacts increase as West End Pit production increases and non-West End Pit production decreases. Figure 1 also shows how impacts would increase above the adjusted combined impact of 0.00095 µg/m^3 for West End Pit allowable production above 50% of the total allowable production from combined West End Pit and non-West End Pit sources.

Figure 1: Maximum Arsenic Impacts as a Function of the Percentage of Total Allowable Production that may Occur from West End Pit Sources

C. DEQ Acted Reasonably and in Accordance with Law when it Applied the 16/70 Calculation to the Ambient Arsenic Air Concentration Analysis

31. The DEQ Board, in the Final Order, misses the point that project-caused pollutant specific cancer risk is the overriding criteria of acceptability and that AACCs, expressed as an annual average, are provided to simplistically apply to permanent sources with emissions of low variability. The Final Order states that "nowhere in the Air Rules does it provide that a project that will operate more than 5 years but less than 70 years may be adjusted in proportion to the amount of time it will operate." Idaho Air Rules do not preclude the use of such a factor within the context of the regulatory intent. *Idaho Air Rules* do not alter EPA's science nor preclude its use, which includes use of a 70-year lifetime exposure duration in calculating AACCs. For projects with an enforceable operational life of less than 70 years, an adjustment for reduced exposure duration is appropriate. Total project-caused carcinogenic risk has been identified as the criteria from which the AACCs were established, as has been described earlier in this Declaration. When specific parameters associated with a project subject to the AACCs are not consistent with the assumptions/conditions that went into development of the AACCs, DEQ staff are compelled to adjust for those in an appropriate and/or conservative manner. DEQ then used its authority to write reasonable permit conditions per IDAPA 58.01.01.211 to limit total production including specific limitations on the West End pit.

32. Additionally, DEQ did not adjust the AACC. DEQ adjusted the applicable modeled impact concentration, which has a duration of 16 years, to an exposure concentration representative of a 70-year lifetime. With this adjustment, the exposure concentration can be compared to the AACC or the T-RACT AACC. The adjustment involved assuming maximum modeled impacts persist for the 16 years of mine life, and then those impacts are evenly distributed over a 70-year period to be consistent with the assumptions of carcinogenic TAP regulations.

33. Apart from the DEQ Board's identified issue with lack of specific allowance in the *Idaho Air Rules* to use an adjustment factor to account for project duration, the *Final Order* also stated that "DEQ did not provide sufficient evidence in the form of an expert opinion from a toxicologist or other qualified expert regarding the cancer risk associated with the 16/70 adjustment." As previously mentioned, outside of DEQ's adjustment factor of 10 specified for short-term sources of less than five years, cancer risk associated with exposures between 5 and 70 years are based on the EPA risk assessment model, using established URFs and exposure concentrations. DEQ's toxicologist, Dr. Norka Paden, demonstrated in her declaration[16] that use of the 16/70 adjustment factor is appropriate to calculate exposure concentration impacts of a 16-year project to be compared to the T-RACT AACC, which is based on a 70-year lifetime.

IV. Conclusions

34. Regarding the three remaining issues identified by the DEQ Board on the arsenic analysis supporting issuance of the DEQ PTC, DEQ concludes:

[16] Paden Decl., ¶ 18.

A. A 5-year rolling average production limit and associated monitoring of production was appropriate and reasonable because the criterion of acceptance is project-caused excess inhalation cancer risk. Short-term variability is inconsequential to the total risk.

B. Limits on total production along with a limit on West End Pit production effectively limits non-West End Pit production. A separate limit on non-West End Pit production is not necessary because compliance with the T-RACT AACC is still demonstrated when 100% of total allowable production is from non-West End Pit sources.

C. DEQ acted reasonably and in accordance with law when applying the 16/70 factor to generate an Exposure Concentration to compare against the T-RACT AACC. As demonstrated, AACCs are an annual representation of the acceptable Exposure Concentration for a permanent project and a 1-in-1,000,000 excess cancer risk. Standard EPA risk assessment methods (the same methods used to develop the AACCs) were used with the modeled annual concentration to calculate an Exposure Concentration representative of the 16-year project duration while conservatively assuming a 24 hour/day Exposure Time and a 365 day/year Exposure Frequency. This reduces to the 16/70 factor applied to the modeled concentration.

EXHIBIT A

TAPs Addendum Modeling Review Attachment

1.0 Introduction and Summary

Perpetua Resources Idaho, Inc. (PRI) submitted the *Stibnite Gold Project (SGP) Permit to Construct Application TAP Addendum* (*TAP Addendum*), prepared by Air Sciences Inc. (Air Sciences) and submitted to DEQ on October 5, 2021. The TAP Addendum reassessed source applicability to Toxic Air Pollutant (TAP) permitting requirements, refined TAPs regulatory methods to demonstrate compliance with applicable TAP increments, revised and/or refined operations and operational parameters affecting TAP emissions, and refined TAP air impact analyses. The revisions and refinements made for the TAP Addendum also reduced PM_{10} and $PM_{2.5}$ emissions, and this effect is presented in this *TAPs Addendum Modeling Review Attachment* (*Modeling Review Attachment*).

2.0 Scope of TAPs Addendum

DEQ reevaluated TAPs compliance regulatory interpretations and impact assessment methods following the second public comment period of February 18, 2021, through March 19, 2021. Areas of revision in response to issues identified after the public comment period included:

- Revising source-specific TAP impact assessment applicability, primarily identifying what sources can be excluded because they are "covered" or "addressed" by a National Emissions Standard for Hazardous Air Pollutants (NESHAP) or New Source Performance Standard (NSPS).
- Refining regulatory methods used to demonstrate compliance with TAP increments.
- Refining TAP emission calculation methods and dispersion-affecting parameters.
- Reassessing TAP impacts resulting from revised and/or refined methods and data.
- Providing a best-estimate of actual TAP emissions that will occur from operation of the mine, and then comparing this to maximum permit-allowable emissions.

PRI and Air Sciences, PRI's permitting consultant, submitted the *TAP Addendum* on October 5, 2021.

3.0 Revised NESHAP/NSPS TAP Exclusion

DEQ and PRI reevaluated TAP source applicability after the second public comment period in response to expressed concerns regarding sources excluded as per *Idaho Air Rules* Section 210.20 (excluding sources that are "covered" or "addressed" by a NESHAP). TAP applicability is explained in greater detail in the main body of the DEQ Statement of Basis. As a result of the reevaluation, some additional sources were included in the TAP impact modeling analyses that were not previously. TAP sources from gold mining that were modeled in the final TAP analyses included: drilling, blasting, excavating, hauling, prill silos, rock dumps and storage piles, and tailings.

Air Sciences consulted with DEQ to refine TAP compliance demonstration methods from what was originally submitted in the application. The refinement was primarily needed to show compliance with the

REC 3933
REC 0697
PET 331

arsenic Acceptable Ambient Concentration of a Carcinogen (AACC). The revised methods are described in the submitted *TAP Addendum* and this DEQ *Modeling Review Attachment*.

4.0 TAPs Refined Compliance Demonstration Approach

PRI, in consultation with DEQ, used a highly refined TAPs analysis approach to demonstrate compliance with applicable TAP increments. This approach involved the following:

- AACC Adjustment for Toxic Air Pollutant Reasonably Available Control Technology (T-RACT) Utilization.
- TAP Emission Averaging Period.
- AACC Adjustment for the Operational Life of the Mine.

4.1 AACC Adjustment for T-RACT Utilization

Idaho Air Rules Section 210.12 allows TAP impacts of 10 times the AACC if the application demonstrates that T-RACT is used for the TAP emission sources. This represents a life-time cancer risk of 1-in-100,000. An adjustment cannot be made for non-carcinogenic TAPs listed in *Idaho Air Rules* Section 585.

Review of the T-RACT demonstration is performed by the DEQ permit writer and is described in the main body of the DEQ Statement of Basis.

4.2 TAP Emission Averaging Period

Annual average emissions of carcinogenic TAPs are typically used in the dispersion model to estimate maximum annual impacts. PRI refined the analyses by using source-specific emission rates that are representative of a 5-year averaging period. This approach is appropriate because carcinogenic impacts are of concern from a long-term exposure basis.

4.3 AACC Adjustment for the Operational Life of the Mine

AACCs were established based on a 1-in-1,000,000 cancer risk over a 70-year lifetime, as stated in *Idaho Air Rules* Section 006.125:

> ***Toxic Air Pollutant Carcinogenic Increments****. Those ambient air quality increments based on the probability of developing excess cancers over a seventy (70) year lifetime exposure to one (1) microgram per cubic meter (1 ug/m3) of a given carcinogen and expressed in terms of a screening emission level or an acceptable ambient concentration for a carcinogenic toxic air pollutant. They are listed in Section 586.*

PRI indicated the maximum life-of-mine will be 16 years. Life-time exposures to carcinogenic TAPs were refined by multiplying the maximum modeled annual impact by a ratio of 16/70. Section 5.7 of this *Modeling Review Attachment* provides more details on this adjustment for the project.

5.0 Refined TAP Emission Estimates and Modeling Methods/Parameters

This section describes changes made to TAP emission estimates and to methods/parameters used in the impact modeling analyses.

5.1 Operational Adjustments

PRI and Air Sciences proposed and committed to several operational adjustments to reduce actual and estimated TAP emissions:

- Installing and operating dust collection systems on drilling rigs (determined to be T-RACT).
- Capping the haul roads that are outside of the pits and development rock storage facilities (DRSFs) with clean (lower levels of arsenic) development rock (determined to be T-RACT).
- Eliminating the West End Development Rock Storage Facility, which eliminated the highest-emitting operational scenario W5.
- Limiting long-term mining production to an average of 135,000 tons/day for a 5-year rolling average.
- Constructing the Burntlog access road with offsite materials containing "background" levels of arsenic.
- Updating the bulldozing emission factor using the SGP site-specific silt content.

5.2 General Modeling Methods and Parameters

Modeling methods and parameters used in TAP impact analyses presented in the *TAP Addendum* are largely identical to those used in the previously submitted application. These include the air dispersion model used, meteorological data, terrain, building downwash, ambient air boundary, and receptors. TAP modeling was conducted for the 14 operational modeling scenarios, consistent with the NAAQS analyses. Modeling Scenario W5 was eliminated from the arsenic modeling, as discussed in Section 5.8 of this *Modeling Review Attachment*.

The meteorological dataset processed using McCall, Idaho, cloud cover data was used for analyses in the *TAP Addendum*. Impacts were not assessed using the dataset processed using the Bulk Richardson (BULKRN) method for boundary layer parameter calculations. EPA considers both methods to be acceptable. Although modeled impacts tend to be somewhat larger when using meteorological data processed by the BULKRN method, DEQ contends that the impact analyses are still largely conservative compared to actual impacts anticipated. Conservative aspects include: continual operation of the worst-case operational scenario; operation at maximum allowable rates for the averaging period; no reduction in winter-time emissions from fugitive sources, accounting for emission suppression effects of increased moisture.

5.3 TAP Modeling Applicability

Table 1 provides a comparison between applicable facility-wide maximum potential TAP emissions for the highest-emitting scenario (W3) and TAP screening emission levels (ELs) from *Idaho Air Rules* Sections 585 (for non-carcinogens) and 586 (for carcinogens). Note that TAPs also classified as HAPs

REC 3935
REC 0699
PET 333

emitted from sources "addressed" or "covered" by NSPS or NESHAP were not required to be evaluated for compliance with TAP increments in accordance with *Idaho Air Rules* Section 210.20. Furthermore, PRI has determined that the West End Development Rock Storage Facility will not be constructed. This change eliminated Modeling Scenario W5 (the highest-emitting scenario described in the main body of the DEQ *Modeling Review Memorandum*) as a potential operating scenario. After eliminating Modeling Scenario W5, it was determined that Modeling Scenario W3 is the highest-emitting scenario for all TAPs.

Table 1. TAP MODELING APPLICABILITY DETERMINATION (HIGHEST-EMITTING MODELING SCENARIO: W3).

HAP/TAP	Emissions (lb/hr)			EL (lb/hr)		Determination
	(a)	(b)	Total	(c)	(d)	
1,3-Butadiene	--	--	--	--	2.4E-5	EL not exceeded
3-Methylchloranthrene	--	4.5E-8	4.5E-8	--	2.5E-6	EL not exceeded
Acetaldehyde	--	--	--	--	3.0E-3	EL not exceeded
Acrolein	--	--	--	1.7E-2	--	EL not exceeded
Antimony	1.9E-2	1.6E-6	1.9E-2	3.3E-2	--	EL not exceeded

Table 1. TAP MODELING APPLICABILITY DETERMINATION (HIGHEST-EMITTING MODELING SCENARIO: W3).						
HAP/TAP	Emissions (lb/hr)			EL (lb/hr)		Determination
	(a)	(b)	Total	(c)	(d)	
Thallium	8.1E-3	5.2E-4	8.7E-3	7.0E-3	--	Non-carcinogenic EL exceeded
Uranium	8.1E-3	5.2E-4	8.7E-3	1.3E-2	--	EL not exceeded
Vanadium	2.3E-2	8.4E-4	2.4E-2	3.0E-3	--	Non-carcinogenic EL exceeded
Trimethyl Benzene	--	1.1E-2	1.1E-2	8.2E+0	--	EL not exceeded
Tungsten	8.1E-3	5.2E-4	8.7E-3	3.3E-1	--	EL not exceeded
Zinc	2.9E-2	2.2E-3	3.1E-2	6.7E-1	--	EL not exceeded

a. Total HAP/TAP emissions for EL evaluation from mining (i.e., pits, blasting, haul roads, stockpiles and DRSF, tailings storage facility, access road, and underground exploration) and leaching. Emissions from sources covered/addressed by NSPS/NESHAP are not included in the evaluation for modeling applicability.

b. Total HAP/TAP emissions for EL evaluation from processing and production (i.e., ore processing [crushers and transfer, prill silos], ore concentration and refining [autoclave, electrowinning cells and pregnant solution tank, retort, furnace, carbon kiln], process heating [POX boiler, carbon regeneration kiln, propane vaporizer, solution heater], lime production [limestone crushers, screens, mill, transfers, lime kiln, kiln feed, lime mill, pebble lime silo, lime silos, lime mill crushing], aggregate production [portable crushers, screens, transfers], concrete production [central mixer, cement silos, aggregate bin], HVAC [heaters], emergency power [emergency generators, fire pump], fuel storage [gasoline fuel and tanks]). Emissions from sources covered/addressed by NSPS/NESHAP are not included in the evaluation for modeling applicability.

c. Non-carcinogenic EL from *Idaho Air Rules* Section 585.

d. Carcinogenic EL from *Idaho Air Rules* Section 586.

Table 1 shows that the SGP facility-wide potential TAP emissions exceed the respective EL for arsenic, beryllium, cadmium, cyanide, formaldehyde, manganese, nickel, phosphorus, aluminum, barium, calcium carbonate, calcium oxide, iron, sulfuric acid, thallium, and vanadium. Therefore, modeling was required for these 16 TAPs (11 non-carcinogenic and five carcinogenic TAPs) to demonstrate compliance with Acceptable Ambient Concentrations of Non-Carcinogens (AACs) and AACCs.

5.4 TAP Modeled Emission Rates

Table 2 lists the source-specific modeled emission rates for all 11 non-carcinogenic TAPs that required modeling (worst-case modeling scenario for all non-carcinogenic TAPs: W5). Table 3 lists the source-specific modeled emission rates for all five carcinogenic TAPs that required modeling (worst-case impacts for arsenic are associated with modeling scenario W2; worst-case impacts for all other carcinogenic TAPs are associated with modeling scenario W1). Note that all source-specific emission rates listed in Tables 2 and 3 were extracted by DEQ's modeling staff from the submitted modeling input files.

The total modeled emission rates for all non-carcinogenic TAPs are equal to the total facility-wide HAP/TAP emissions as stated in the permitting emissions inventory (excluding sources addressed by NSPS/NESHAP), evaluated at 180,000 T/day (see last two rows of Table 2). However, for carcinogenic TAPs, modeling was performed using an emission inventory that included T-RACT controls, long-term mining production limits, and other emission inventory refinements, as described in Section 4.0 of this *Modeling Review Attachment* (see last three rows of Table 3).

Table 2. MODELED EMISSION RATES FOR NON-CARCINOGENIC TAPS (WORST-CASE MODELING SCENARIOS).

a. Arsenic (worst-case modeling scenario: W2).
b. Pounds per hour.
c. Beryllium (worst-case modeling scenario: W1).
d. Cadmium (worst-case modeling scenario: W1).
e. Formaldehyde (worst-case modeling scenario: W1).
f. Nickel (worst-case modeling scenario: W1).
g. The Haul Road was represented in the model as a series of volume sources. The emission rates listed in this table represent each individual volume source.
h. Total T-RACT emission rates – calculated based on T-RACT controls, long-term mining production limits, and other emission inventory refinements, as described in Section 4.0 of this *Modeling Review Attachment* – are derived from Tables B-W2 (for Arsenic) and B-W1 (for Beryllium, Cadmium, Formaldehyde, and Nickel) in Appendix B of the *TAP Addendum*.
i. Total emission rates at 180,000 tons per day were derived from Worksheet "TblA" in the emission inventory dated October 5, 2021. The total emission rates in this row represent all facility-wide HAP/TAP emission sources from mining, leaching, and processing and production (excluding emissions from sources "addressed" or "covered" by NSPS/NESHAP).

5.5 Cyanide Modeling Emission Source Parameters

Modeling analyses for cyanide introduced two new emission sources that were not previously evaluated by DEQ: tailings storage facility (model ID: TSF) and mill tanks (model ID: MILLTANKS).

1. The tailings storage facility was modeled by Air Sciences as a surface-based (zero release height above ground-level and zero initial vertical dimension) AREA source. The easterly and northerly lengths were calculated as square-root of the TSF area (easterly length = northerly length = $\sqrt{1{,}338{,}158\ square\ meters}$ = 1,157 meters).

2. The mill tanks were grouped and modeled by Air Sciences as a single VOLUME source. The tanks sit on the ground, so the release height was set to the average tank height of 12.2 meters (40 feet). The initial lateral dispersion (σ_y) was calculated as the equivalent diameter of the combined (18) tank area divided by the single VOLUME source coefficient of 4.3:

REC 3943
REC 0707
PET 341

$$\sigma_{y(MILLTANKS)} = \frac{Equivalent\ diameter}{4.3} = \frac{\sqrt{\Sigma(d)^2}}{4.3} = 42.8\ feet$$

The individual tank diameters (d) are: two tanks at 40 feet, four tanks at 52 feet, six tanks at 54 feet, and six tanks at 20 feet.

DEQ typically requires that tailings storage facilities be modeled as an AREAPOLY source with an outline that follows the contour of the emission source, and that mill tanks be represented in the model as individual volume sources; but, given that the maximum modeled concentration for cyanide is safely below the AAC (0.08%), DEQ's modeling team accepted the modeling analysis submitted by Air Sciences and concluded that it confidently demonstrates that the cyanide AAC will not be exceeded.

5.6 Deposition Modeling

Air Sciences applied particle deposition algorithms in the impact modeling for particulate TAPs. The particulate deposition parameters used in the NAAQS compliance analysis were derived for PM_{10} and $PM_{2.5}$ (see Tables 22 and 23 in the main body of the DEQ *Modeling Review Memorandum*). Dust-related metal TAP emissions include total particulates (all size fractions of particulate matter [PM] up to PM_{30}). Therefore, the deposition parameters for PM were calculated using the same methodology and EPA references used for PM_{10} and $PM_{2.5}$ in the NAAQS compliance demonstration analyses. The PM deposition parameters are provided below in Table 4. The same density values were used as in the previous TAPs modeling analysis. However, an additional deposition characterization bin was added to better handle deposition of 10 µm to 30 µm particulates; mass fractions were adjusted accordingly.

5.7 Carcinogenic TAP Modeling Lifetime Exposure Adjustment

Maximum modeled concentrations for carcinogenic TAPs were adjusted to account for the life-of-mine production limits, which affects the lifetime exposure.

PRI evaluated the highest modeled annual carcinogenic TAP concentration from each of the 14 modeling scenarios for lifetime exposure as follows:

$$Lifetime\ exposure\ \left(\frac{\mu g}{m^3}\right) = \frac{Highest\ annual\ concentration\ \left(\frac{\mu g}{m^3}\right) \times 16\ (mine\ operation\ years)}{70\ (years, lifetime\ exposure)}$$

This equation assumes that the highest annual concentration from the 14 modeling scenarios is repeated for 16 years of mining operation. This was then averaged over 70 years to calculate the 70-year lifetime exposure.

PRI and Air Sciences contend that calculating lifetime exposure based on 16 years of mining operation is conservative. The annual emissions for carcinogenic TAP modeling are based on 135,000 tons/day (see Section 5.1 of this *Modeling Review Attachment*) and 365 days per year. Over 16 years, this equates to a potential mining production of 788.4 million tons:

$$\frac{135{,}000\ \left(\frac{tons}{day}\right) \times 365\ \left(\frac{days}{year}\right) \times 16\ years}{1{,}000{,}000\ \left(\frac{tons}{million\ ton}\right)} = 788.4\ million\ tons$$

The actual life-of-mine total production as described in the SGP *Refined Proposed Action* (*ModPRO2*) mine plan is only 402.86 million tons (Perpetua 2021), which is 51.1% of the potential life-of-mine production represented in the above equation and related emission evaluations.

5.8 Arsenic Compliance Demonstration for Modeling Scenarios W1-W4

To demonstrate compliance with the AACC for arsenic, PRI applied two additional operating limitations:

- The removal of Modeling Scenario W5 as a potential operating scenario
- Limiting the West End Pit's life-of-mine potential mining production to 50% of the total life-of-mine potential mining production of 788.4 million tons: 50% * 788.4 million tons = 394.2 million tons

PRI has determined that the West End Development Rock Storage Facility (DRSF) will not be constructed. This change eliminated Modeling Scenario W5 from the arsenic modeling evaluation. The remaining four West End Pit modeling scenarios (W1–W4) are evaluated using the 70-year lifetime exposure equation from Section 5.7 and adjusting for the proposed West End Pit life-of-mine production limit of 50% of the total production as follows:

$$LifeExpose_{Wi,j,n} = \left[\left(WEPExpose_{Wi,n}\right)(50\%) + \left(nonWEPExpose_{Sj,n}\right)(50\%)\right]\left[\frac{16\ year\ LOM}{70\ year\ exposure}\right]$$

where:

W*i*	=	West End Pit scenario, where *i* = 1 to 4.
S*j*	=	non West End Pit scenario, where *j* = B1, B2, H1, H2, H3, H4, Y1, Y2, and Y3.
n	=	specific receptor.
$LifeExpose_{Wi,j,n}$	=	lifetime exposure in µg/m^3 for West End Pit scenario *i*, non West End Pit scenario *j*, at receptor *n*.
$WEPExpose_{Wi,n}$	=	annual maximum impact in µg/m^3 for West End Pit scenario *i* at receptor *n*.
$nonWEPExpose_{Sj,n}$	=	annual maximum impact in µg/m^3 for non West End Pit scenario *j* at receptor *n*.
16 year LOM	=	maximum life-of-mine.
70 year exposure	=	Lifetime exposure used for development of AACCs in *Idaho Air Rules*.

The above equation was used to calculate the lifetime arsenic exposure from the West End Pit scenarios (W1–W4) on a receptor-by-receptor basis. Combining the concentrations from Modeling Scenarios W1–W4 with the highest concentration from the remaining non-West End Pit scenarios (B1, B2, H1, H2, H3, H4, Y1, Y2, or Y3) conservatively ensures that the maximum potential impacts from applicable sources are evaluated and remain below AACCs.

PRI contends that calculating lifetime arsenic exposure based on the proposed West End Pit life-of-mine production limit of 50% of the total production is conservative. The actual life-of-mine total production from the West End Pit as described in the ModPRO2 mine plan is only 198.26 million tons (Perpetua 2021), which is 50.3% of the proposed West End Pit life-of-mine production limit of 394.2 million tons.

6.0 Impact Results

TAP impact analysis results, as submitted in the *TAP Addendum* and as further assessed by DEQ, are discussed in this section. The effect of various operational refinements also reduced PM_{10} and $PM_{2.5}$ impacts, and this is discussed in Section 6.2.

6.1 TAP Impact Analyses Results

This section describes the revised TAP impact analyses and demonstrates that applicable TAP emissions resulting from operation of the SGP will not result in increased impacts that exceed AACs or AACCs.

6.1.1 Modeling Non-Carcinogenic TAPs

The non-carcinogenic TAPs subject to impact modeling requirements to demonstrate compliance with AACs of *Idaho Air Rules* Section 585 were modeled at the emission levels shown in Table 1 above. The maximum 24-hour modeled concentration for each of the 14 modeling scenarios demonstrates compliance with the applicable AAC, as summarized below in Table 5. PRI elected to include Scenario W5 in the modeling analysis for non-carcinogenic TAPs. Figure 1 illustrates the locations of the maximum impacts for each non-carcinogenic TAP.

6.1.2 Modeling Carcinogenic TAPs

The carcinogenic TAPs subject to impact modeling requirements to demonstrate compliance with AACCs of *Idaho Air Rules* Section 586 were modeled using an emission inventory that includes the T-RACT controls, long-term mining production limits, and other emission inventory refinements, as described in Section 4.0 and 5.0 of this *Modeling Review Attachment*.

The maximum modeled impact for each of the 14 modeling scenarios demonstrated compliance with the T-RACT AACC, as summarized below in Table 6. The SGP maximum concentrations were adjusted to account for the life-of-mine production limits, which affect the lifetime exposure, and to account for the elimination of Modeling Scenario W5. See Sections 5.7 and 5.8 of this *Modeling Review Attachment* for more detail. The locations of the maximum impacts for each carcinogenic TAP are presented in Figure 2. Arsenic concentrations are considerably lower in areas away from the location of maximum impact as shown in Figure 3.

Table 6. RESULTS FOR TAPS IMPACT ANALYSES FOR CARCINOGENIC TAPS.

Toxic Air Pollutant	Averaging Time	Maximum Modeled Lifetime Exposure Concentration ($\mu g/m^3$)[a,b]	Model Scenario	AACC[c] ($\mu g/m^3$)	T-RACT[d] AACC	Percent of T-RACT AACC
Arsenic	Annual	0.00095	W2	0.00023	0.0023	41.30%

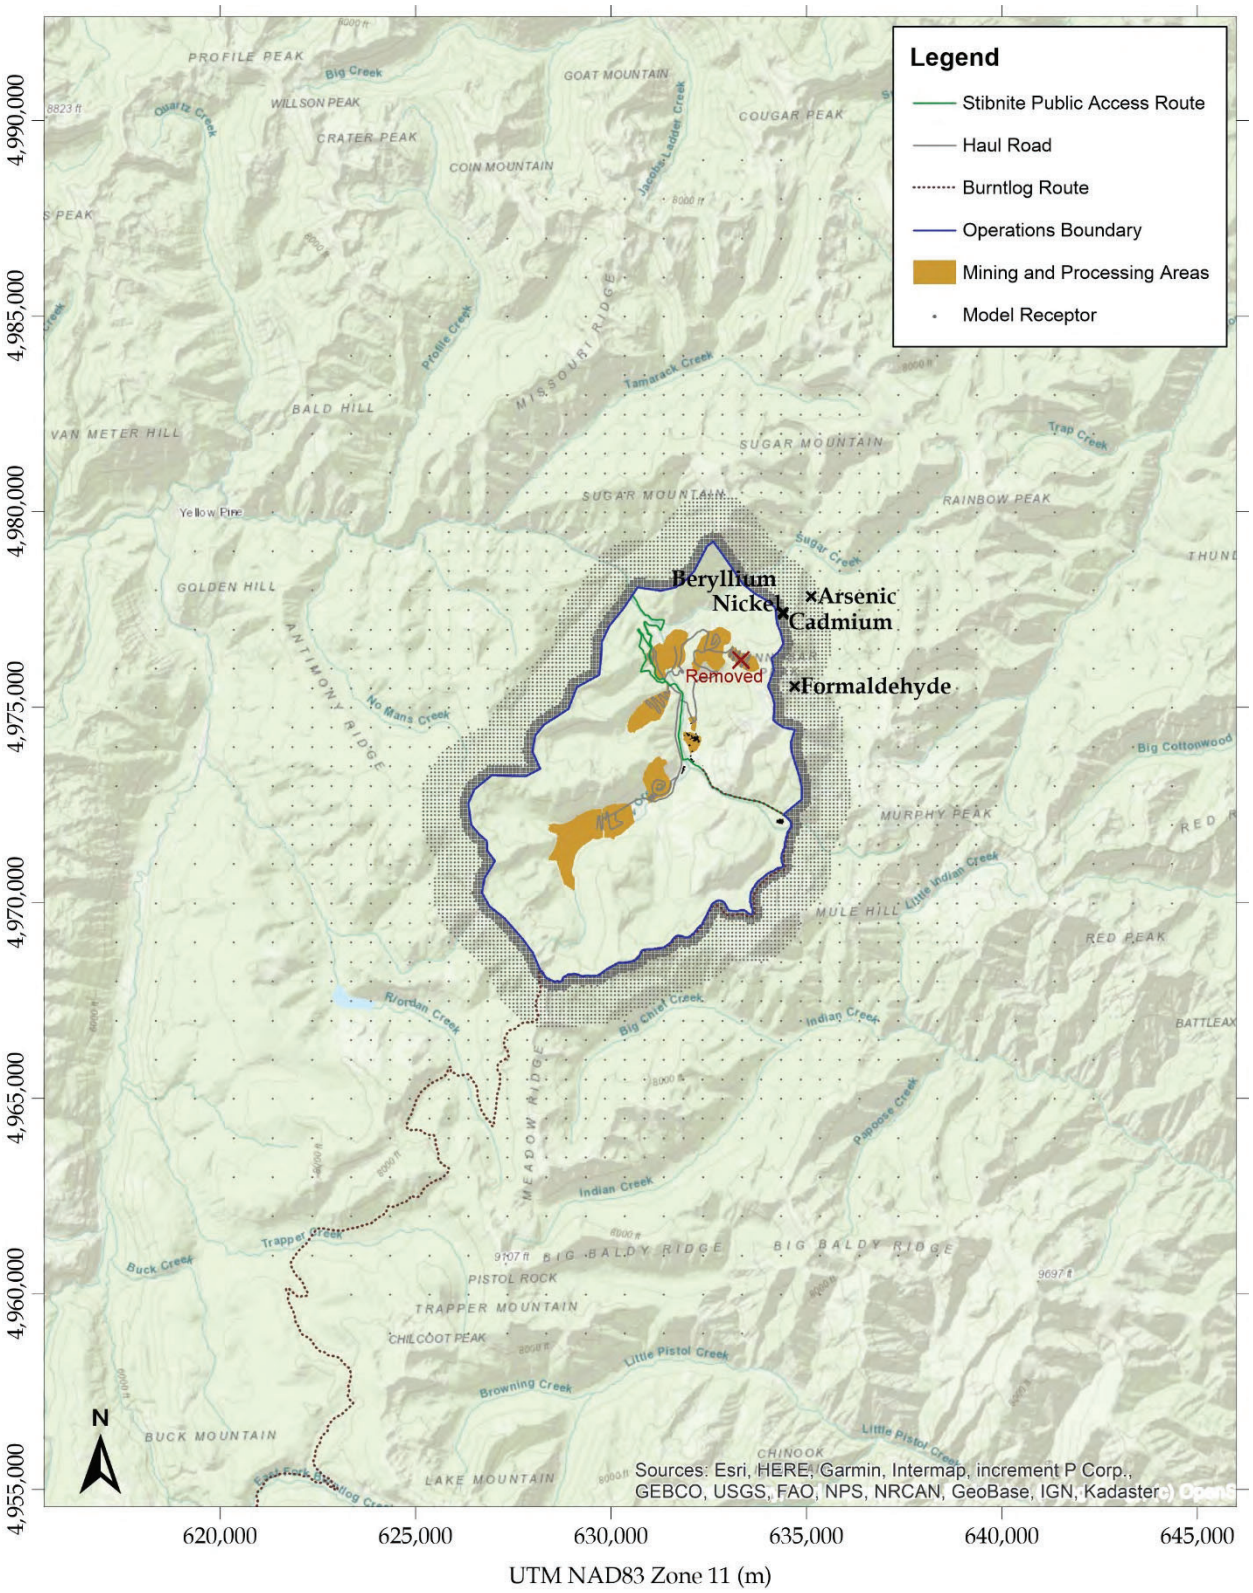
Figure 2. SGP CARCINOGENIC MAXIMUM TAP IMPACT LOCATIONS.



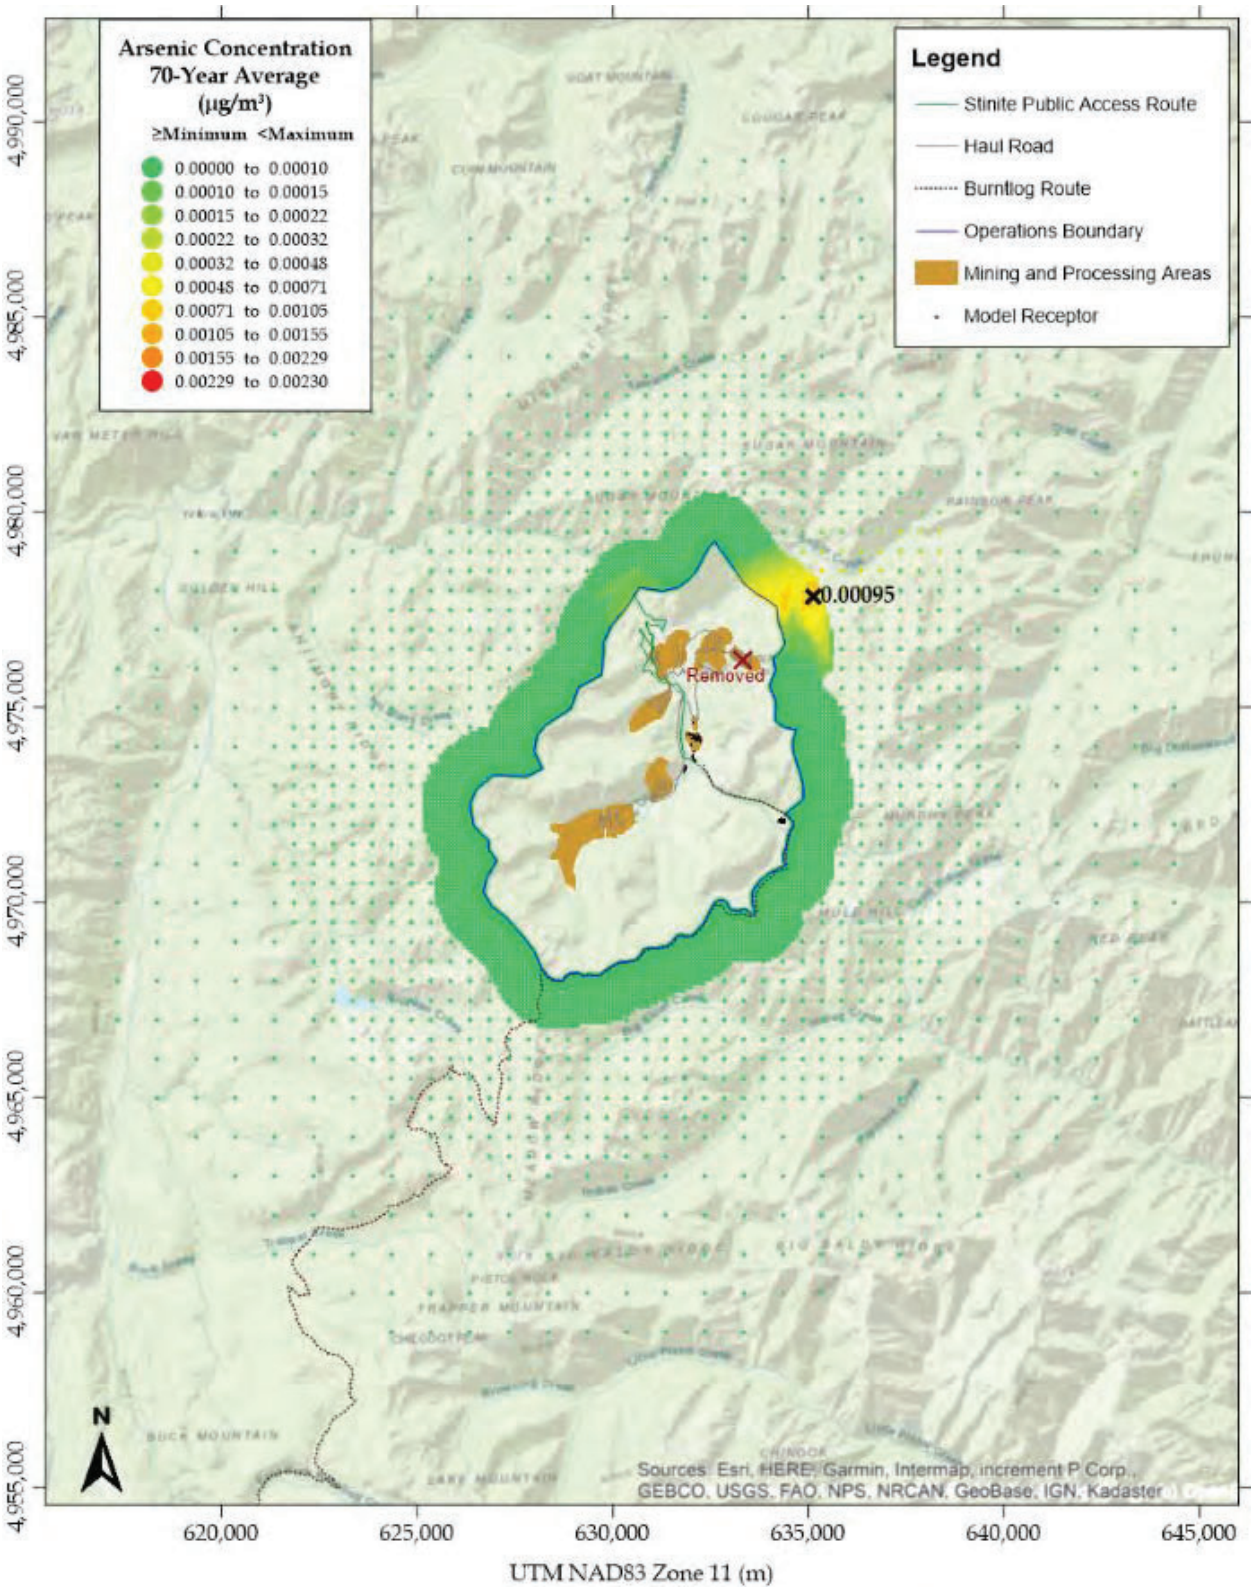


Figure 3. SGP CONTOURS OF LIFETIME ARSENIC IMPACTS.

6.2 Effect of Changes to Modeled PM_{10} Results

PRI has determined that the West End Development Rock Storage Facility will not be constructed. This change eliminated Modeling Scenario W5 as a potential operating scenario. In Section 4.1.4 in the main body of the DEQ *Modeling Review Memorandum*, DEQ identified PM_{10} NAAQS exceedances at four hotspot receptors when using the BULKRN meteorological dataset for Modeling Scenario W5 (the highest PM_{10} impact modeling scenario). When Modeling Scenario W5 is removed, the highest modeled impacts are predicted to occur for Modeling Scenario W3, which represents the transport of development rock from the West End Pit to the Hangar Flats Development Rock Storage Facility.

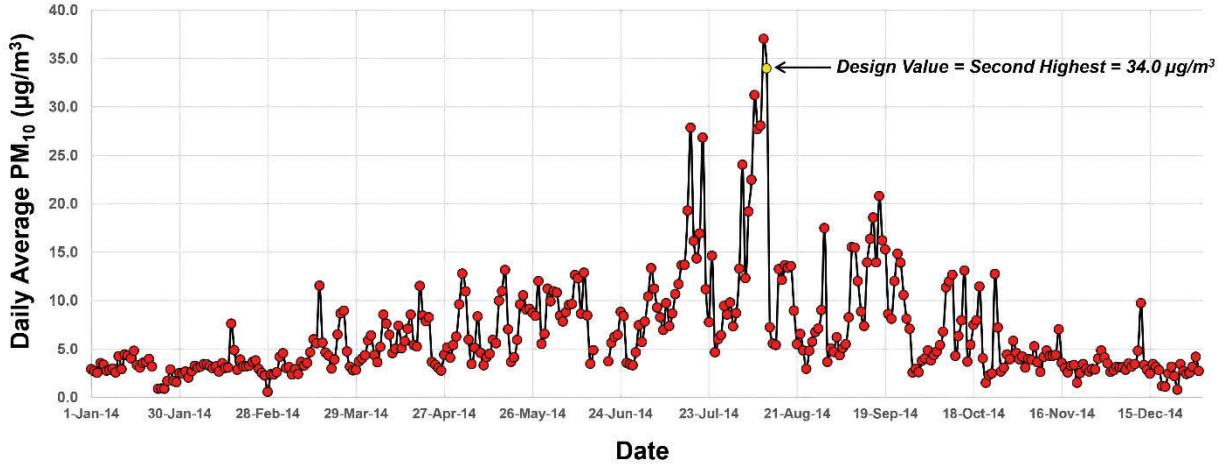
Table 7 presents results for the cumulative NAAQS impact analyses for Scenario W3. Results still exceed the 24-hour PM_{10} NAAQS even when Modeling Scenario W5 is eliminated. However, there is only one hotspot receptor exceeding NAAQS. The modeled violation is also predicted to occur during winter. This is a critical consideration because during winter, not only are fugitive emissions minimized because of the higher moisture content of material handled or driven over, but background concentrations in such remote areas are also generally much lower because of the absence of wildfires and dust-generating sources.

Table 7 also lists the results when using temporally varying backgrounds, instead of a single-value background, in the cumulative NAAQS impact analysis (using the "SEASON" and "MONTH" options in AERMOD). The highest daily average PM_{10} concentrations measured at Stibnite for every season and month in 2014 were used as inputs in the model. Table 7 shows that the SGP facility ***safely*** demonstrates compliance with the 24-hour PM_{10} NAAQS when temporally varying backgrounds (both seasonal and monthly) are used instead of the single-value background. Summing modeled design values with a single-value background that is on the upper end of the distribution results in a very conservative estimate of total impacts. DEQ strongly believes that using temporally varying backgrounds that respect seasonality is appropriate for the SGP facility, and that using the highest value in the period interval is very conservative.

TABLE 7. RESULTS FOR 24-HOUR PM_{10} CUMULATIVE NAAQS IMPACT ANALYSES FOR MODELING SCENARIO W3.

Backgrounds Scenario	Max. Conc.[a] (µg/m³)[b]	Model Scenario	Back. Conc.[c] (µg/m³)	Total Conc.[d] (µg/m³)	NAAQS (µg/m³)	Percent of NAAQS
Single-Value Background	116.9	W3	34.0	150.9[e]	150	100.6%
Seasonally Varying Backgrounds	123.5[f]	W3	*Seasonal*	123.5[f]		82.3%
Monthly Varying Backgrounds	123.5[f]	W3	*Monthly*	123.5[f]		82.3%

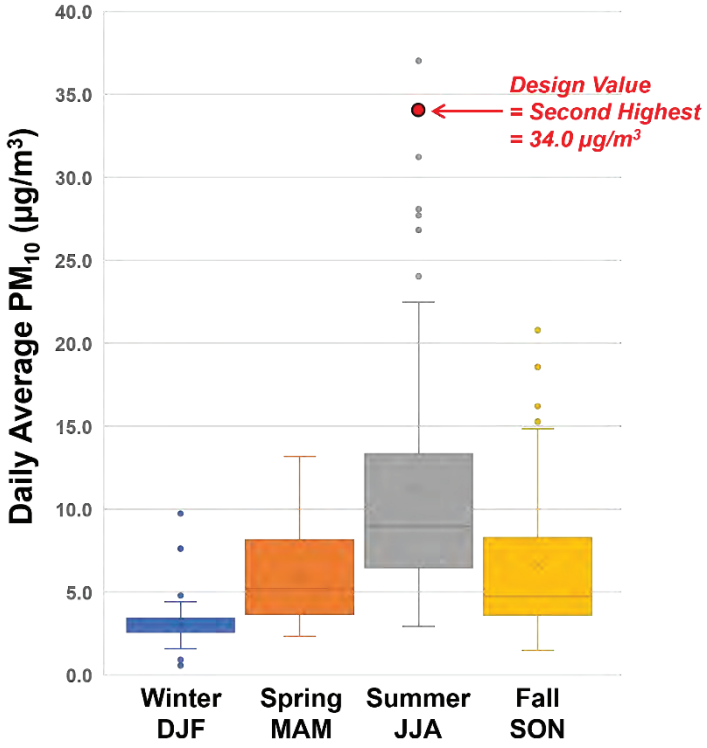
a. Max. Conc. = maximum modeled design concentration.
b. Micrograms per cubic meter.
c. Back. Conc. = background concentration.
d. Total Conc. = total (modeled + background) concentration.
e. One hotspot receptor exceeds NAAQS.
f. The maximum modeled design concentration already incorporates the seasonal and monthly background values.



The time series plot in Figure 4 and the box-and-whiskers plot in Figure 5 illustrate the variability in daily average PM_{10} concentrations collected at the Stibnite Site in 2014. Figures 4 and 5 confirm that the highest concentrations from the modeled and monitored datasets do ***not*** occur simultaneously. Highest modeled impacts are predicted to occur during winter while the highest background concentrations were measured at Stibnite during summer. Therefore, the summation method, where total impacts are

REC 3953
REC 0717
PET 351

calculated by summing modeled design values with a background concentration that is also consistent in form with the regulatory design value, results in a very conservative estimate of the total impact for comparison to NAAQS. DEQ concludes that use of temporally varying (i.e., seasonal and monthly) backgrounds for SGP is justified. DEQ is highly confident that operation of the SGP will not cause or contribute to a violation of NAAQS.



PM_{10} and $PM_{2.5}$ NAAQS compliance was previously demonstrated prior to refinements and adjustments proposed in the submitted *TAP Addendum*. The main body of the DEQ *Modeling Review Memorandum* discussed and considered results from both modeling with meteorological data processed using the BULKRN method and modeling with data processed using cloud cover data, and DEQ concluded that NAAQS compliance was demonstrated with a high degree of confidence. The adjustments and refinements described in the *TAP Addendum* further increase DEQ's confidence in NAAQS compliance.

The bottom and the top lines of the box represent the 1st quartile (25th percentile) and the 3rd quartile (75th percentile), respectively. The whiskers extend to the minimum and maximum values not considered outliers. Outliers are plotted individually.

7.0 Conclusions

This section provides conclusions of the *TAP Addendum* and DEQ's review of the *TAP Addendum*.

7.1 Conclusions of Revised TAP Analyses

The revised and refined TAP analyses:

- Revised TAP-applicable sources at the SGP facility.
- Proposed additional emission control measure and adjusted operations to reduce TAP emissions.
- Refined the approach used to demonstrate compliance with TAP regulations.

The submitted application, with the adjustments and refinements to analyses as described in the *TAP Addendum*, demonstrated to DEQ's satisfaction that the emissions of applicable TAPs will not result in impacts to ambient air that exceed TAP increments of *Idaho Air Rules* Section 585 and 586.

7.2 Effects of Adjustments/Revisions on NAAQS Compliance Demonstrations

The submitted application, prior to the *TAP Addendum*, demonstrated compliance with NAAQS to DEQ's satisfaction; and the operational measures proposed in the *TAP Addendum* will only further reduce estimated emissions. Eliminating Modeling Scenario W5 impacts, with the elimination of the West End Development Rock Storage Facility, affects the 24-hour PM_{10} impact modeling analysis for SGP. Modeling Scenario W3 is now the scenario producing the highest modeled impacts, and NAAQS compliance is easily demonstrated when using temporally varying background PM_{10} values, which were obtained from onsite monitoring data.

7.3 Conservatism of Permitting Analyses

Emissions and locations from which emissions occur are highly dynamic at mining facilities. This presents unique challenges for permit development because permits must include limits and operational requirements that ensure air quality standards are not violated. Permitting rules require that air impacts be assessed using maximum potential emissions as limited by either the capacity of the unit/operation or as limited by enforceable permit provisions. A permit where actual emissions are nearly representative of maximum allowable emissions, through imposing permit limits, would be exceedingly complex and require overly burdensome monitoring and record-keeping requirements. To avoid this, applicants typically calculate allowable emissions and perform impact analyses based on simplistic operational scenarios that largely overstate emissions estimated to occur from the facility.

PRI and Air Sciences have asserted that the submitted emission estimates, operational scenarios, and air impact analyses associated with the permit application greatly overstate best-estimated values. This point is evident when comparing the permit application materials and analyses with those presented in ModPRO2, PRI's revised mine plan and associated impacts. ModPRO2 is used in support of the Environmental Impact Statement (EIS).

Subject: Request for layman's explanation of URF & TLV

Attached, per your request is a draft explanation of URF and TLV/100 concepts as utilized in TAP NSR. This, of course, represents our tox. based views of what will do the job. We defer this draft to you for final decision as to what a layman might understand.

In developing emissions limits for new permitted facilities, the Idaho Air Quality Bureau (IAQB) uses the terms Unit Risk Factors and Threshold Limit Values. The following is an explanation of these terms and how they are used.

UNIT RISK FACTOR

A unit risk factor (URF) is used to describe the possibility of developing excess cancers over a average 70 year lifetime. This is based on being exposed to concentration of one microgram of a carcinogenic (cancer causing) substance in one cubic meter (1 $ug/m^{3)}$ of air over the 70 years. The term excess cancers means cases of cancers in excess of what would be normal for a given population. For example, if there was normally 5 cases of a given type of cancer in Anytown USA before a given exposure to some substance and 7 after the exposure, there would be 2 excess cancers.

Inhalation URFs are developed by the U.S. Environmental Protection Agency for carcinogenic substances. Each URF represents months of research and often years of policy process. Teams of toxicologists gathered all the toxicological information for each known or suspected carcinogen that could be found around the world. The available data were then rated or point factored per the quality of the research involved. A URF then is a probability statement derived from this process. Each URF was proposed by EPA

Celebrate IDAHO
1890 · CENTENNIAL · 1990™
REC 3958
Printed on Recycled Paper

and extensively reviewed and debated in public by scientists, health officials and industry representatives. Every URF represents a consensus of the best science and health opinion of the potency of a given carcinogen.

URFs are usually expressed as a number times 10 to some negative power. For example, benzine, an organic hydrocarbon found in various petroleum products and cigarette smoke has a unit risk factor of 8.3×10^{-6}. This means that there are 8.3 chances in one million of getting cancer if a person is exposed to 1 ug/m^3 24 hours a day for 70 years.

Another example would be asbestos. Asbestos has a URF of 2.3×10^{-1}. That means that if exposed to 1 ug/m^3 concentration for 70 years, the chances of getting cancer would be 2.3 in 10.

Within IAQB New Source Review (NSR) policy, URFs are used to calculate acceptable ambient levels for a given carcinogen. IAQB generally establishes that an ambient concentration which causes no more excess cancers than one in a million (1×10^{-6}) is acceptable. Once an acceptable ambient level is established, IAQB can then back calculate via engineering equations to an acceptable emission rate (in pounds per hour) for a given stack.

THRESHOLD LIMIT VALUE

Threshold Limit Value (TLV) is a time weighted exposure limit developed by the Occupational and Safety Administration and or the American Council of Government Industrial Hygienists. This value is used to limit the exposure of informed workers to a given toxic substance in the work place. The value is based on exposure of adult males working an eight hour shift. The IAQB uses TLV information to screen proposed new source emissions levels. The IAQB divides the TLV first by a value of 10 due to the fact that an ambient air exposure of a carcinogen means people are usually living under that exposure longer than eight hours out of 24. This value is then again divided by 10 to compensate for the fact that not everyone who is potentially exposed is an adult male. Other people may be more sensitive. The TLV thus is divided by a total of 100 for use in setting an acceptable ambient level.

For example, the TLV for cyanide is 5 milligrams per cubic meter (mg/m^3). An acceptable ambient level under IAQB policy would be 5 divided by 100 or 0.05 mg/m^3. For another example, the TLV for Lindane (an insecticide) would be 0.5 mg/m^3 concentration. The acceptable ambient level would be 0.5 divided by 100 or 0.005 mg/m^3.

As with carcinogens, the TLV derived acceptable ambient levels are used by the IAQB engineers to back calculate an acceptable stack emission rate for any proposed new source. A more pointed treatment these concepts can be found in The Toxic Air Pollutant NSR Policy Summary or the more thorough Draft Guidance Manual for Obtaining a Permit to Construct, Modify or Operate an Air Pollution Source.

Dear Mr. Rush:

Attached is the DEQ list of ideas for rules to control new sources of toxic air pollutants in Idaho. This submittal should be considered a "straw-man" in that our deputy attorney general has not had adequate time to review this material. Nor has anyone from the State Bureau of Health had opportunity to comment. I will continue to try to get that input prior to our next meeting. But for now, we must consider this specific submittal for discussion purposes only.

The package is formatted so that comparisons can be made to the existing Air Quality Rules. If you have any questions, please call me.

Sincerely,

Robert Wilkosz
Bureau Chief

TOXIC AIR POLLUTION
-- RULES CHANGE IDEAS FROM DEQ

IDAPA 16.01.01003 -- DEFINITIONS.

Approved Fuels. Natural gas, propane gas, liquified petroleum gas, distillate fuel oils, residual fuel oils, and diesel fuel; except that waste oil, gasoline, or refined gasoline are not approved fuels.

Environmental Remediation Source. An emission source that functions to remediate or recover any release, spill, leak, discharge or disposal of any petroleum product or substance or any hazardous waste as defined by IDAPA 16.01.01003,44, from any soil or ground or surface waters. Any Environmental Remediation Source shall have an operational life of no greater than five (5) years from the inception of actual operations to the cessation of actual operations.

Pilot or Experimental Plant. An emission source that functions to test processing, mechanical, or pollution control equipment to determine full-scale feasibility.

Occupational Exposure Limit. Refers to airborne concentrations of substances and represents conditions under which it is believed that nearly all workers may be repeatedly exposed day after day without adverse effects. Occupational exposure Limits can be found in Threshold Limit Values for Chemical Substances and Physical Agents and Biological Exposure Indices with Intended Changes for 1991-92 or the current edition, adopted by the American Conference of Governmental Industrial Hygienists, or the National Institute for Occupational Safety and Health (NIOSH) current Relative Exposure Limit (REL), or the Occupational Health and Safety Administration (OSHA) Air Contaminate Standards, current Permissible Exposure Limit (PEL) or current Worker Protection Standards for Agricultural Pesticides promulgated by the Environmental Protection Agency under the Federal Insecticide, Fungicide and Rodenticide Act (FIFRA). In the case of conflicting values, the most stringent value shall take precedence.

Unit Risk Factor. These factors describe the probability of developing excess cancers over a 70 year lifetime exposure to 1 ug/m^3 of a given carcinogen. Unit Risk Factors Can Be Found in the Federal Register Vol. 56 No. 35 / Thursday February 21, 1991 / Rules and Regulations Appendix V. or listed on the Integrated Risk Information System (IRIS) of the U.S. Environmental Protection Agency or listed in the Health Effects Summary Tables promulgated

by the U.S. Environmental Protection Agency Office of Health Effects Assessment and the Office of Air Quality Planning and Standards. In the absence of U.S. EPA accepted risk factors, risk factors under review by the EPA Carcinogen Risk Assessment Verification Endeavor (CRAVE) shall be used on an interim basis.

IDAPA 16.01.01012, PROCEDURES AND REQUIREMENTS FOR PERMITS TO CONSTRUCT AND OPERATING PERMITS.

IDAPA 16.01.01012,02. *Permit to Construct. No owner or operator may commence construction ..., except that no permit to construct is required for ~~the following classes of equipment which have actual and allowable emissions of less than one hundred (100) tons per year of any air contaminant or and would not significantly increase the emissions of a major facility~~ sources which:*

a. have actual and allowable emissions of less than one hundred (100) tons per year of any air contaminant

and

b. would not significantly increase the emissions of a major facility

and

c. will not have an ambient air concentration of any air contaminant that would, as demonstrated using Department-approved methods:

i. cause or significantly contribute to a violation of an ambient air quality standard,

or

ii. cause an ambient concentration in excess of one percent of the Threshold Limit Value,

or

iii. cause a cancer-risk probability in excess of one in one million:

and

list: including but not limited to.

d. which belong to one of the following classes of equipment:

i. Air conditioning or ventilating equipment not designed to remove air contaminants generated by or released from equipment;

ii. Air contaminant detectors or recorders, combustion controllers, or combustion shutoffs;

iii. Fuel burning equipment for indirect heating and for heating and reheating furnaces using gas exclusively with a capacity of less than fifty (50) million BTU's per hour input;

iv. Other fuel burning equipment for indirect heating with a capacity of less than one million (1,000,000) BTU's per hour input;

v. Mobile internal combustion engines, marine installations and locomotives;

vi. Stationary internal combustion engines in accordance with the following:

100 horsepower or less -- unlimited hours of operation
101 to 200 horsepower -- 450 hours per month
201 to 400 horsepower -- 225 hours per month
401 to 600 horsepower -- 150 hours per month

vii. Stationary internal combustion engines used exclusively for emergency power generation which burn an approved fuel and which operate less than 200 hours per year;

viii. Laboratory equipment used exclusively for chemical and physical analyses, including ventilating and exhaust systems for laboratory hoods;

ix. *Environmental characterization activities including emplacement and operation of field instruments, drilling of sampling and monitoring wells, and any other activities specifically exempted by the Director;*

x. *Pilot or experimental plants located at least 1/4 mile from any recreational area or residence or other structure not occupied or used solely by the owner of the facility or the owner of the property upon which the facility is located; which operate less than one year; and that also meet one of the following conditions:*

1. *use a slip stream from an existing process stream not to exceed ten percent of that existing process stream, or*

2. *have actual uncontrolled emissions which are not significant;*

xi. *Any emission source or sources provided that the actual uncontrolled facility-wide emissions are not significant, and the uncontrolled emissions would not significantly contribute to ambient air quality concentrations;*

xii. *Any other class or size of equipment specifically exempted by the Director. A list of those sources unconditionally exempted by the Director will be maintained by the Department, and made available upon request.*

IDAPA 16.01.01012,13. *Procedure for Issuing Permits*

a. General procedures ...

b. Additional procedures ... attainment or unclassifiable area ...

c. Additional procedures ... federal Class I area ...

d. Procedures for operating permits ...

e. The Department ... fluid model ...

f. Modification of permits ...

g. Additional procedures for demonstrating compliance with the toxic substances provision 01.01011,01.

i. For sources that can demonstrate, using Department-approved methods, that emissions of carcinogens contribute an ambient air cancer risk probability of less than 1:1,000,000 and that emissions of non-carcinogens contribute to an ambient air concentration less than one percent of the Threshold Limit Value, no additional procedures are needed.

ii. For sources not recognized by the Department as environmental remediation sources that cannot demonstrate, using Department-approved methods, that emissions of carcinogens contribute an ambient air cancer risk probability of less than 1:100,000 and that emissions of non-carcinogens contribute to an ambient air concentration of less than one percent of the Threshold Limit Value, a permit cannot be issued unless the source has achieved the greatest degree of emission reduction that has been adequately

demonstrated and declared acceptable by the Department's Division of Health.

iii. For remediation sources that cannot demonstrate, using Department-approved methods, that emissions of carcinogens contribute an ambient air cancer risk probability of less than 1:10,000 and that emissions of non-carcinogens contribute to an ambient air concentration of less than ten percent of the Threshold Limit Value, a permit cannot be issued unless the source has achieved the greatest degree of emission reduction that has been adequately demonstrated and declared acceptable by the Department's Division of Health.

iv. Department-approved methods will consist of the following:

(a) Comparison of maximum potential emissions to the screening emission limits for carcinogens and non-carcinogens as documented in Appendix A1 or A2 of the Toxic Air Pollutant list as promulgated but the Division of Environmental Quality. Maximum potential emissions can be determined by actual emissions testing using U.S. Environmental Protection Agency approved methods subject to review and approval by the Division of Environmental Quality or estimates of the maximum potential emissions using standard scientific and engineering principals and practices subject to review and approval by the Division of Environmental Quality

The State is reviewing and approving EPA policy... this is redundant

We need to open up in that we want to be able to approve more than EPA approved...

(b) *Atmospheric dispersion modeling, using only U.S. Environmental Protection Agency (EPA) currently approved models, applied according to EPA's Guidelines on Air Quality Models, and as approved for the application by the Division of Environmental Quality.*

average in what respect
- emission levels
- met conditions

1. *For carcinogens, multiply the average hourly concentration by a persistence factor of 0.15 to convert the hourly average to an annual average The resulting product is then multiplied by the unit risk factor to obtain a an ambient air cancer risk probability.*

or other long term model procedures allow better factor than 0.15 that

2. *For non-carcinogens, multiply the average hourly concentration by persistence factor of 0.15 to convert the hourly average to an annual average The resulting product is then compared to one one hundredth (1/100 of the appropriate occupational exposure limit.*

(c) *Any other method approved by the Director.*

TOXDEMN2.RUL

This language probably assumes use of T-SCREEN or something. We need to go more general?

We need to get model examples out to rest of group.

BEFORE THE BOARD OF ENVIRONMENTAL QUALITY
STATE OF IDAHO

IN THE MATTER OF AIR QUALITY PERMIT TO CONSTRUCT P-2019.0047 NEZ PERCE TRIBE, IDAHO CONSERVATION LEAGUE, and SAVE THE SOUTH FORK SALMON, Petitioner, v. IDAHO DEPARTMENT OF ENVIRONMENTAL QUALITY, Respondent, and PERPETUA RESOURCES IDAHO, INC. Intervenor-Respondent.	Case Docket No. 0101-22-01 OAH Case No. 23-245-01 **EXPERT DECLARATION OF KEVIN LEWIS**

I, Kevin Lewis, hereby declare and affirm as follows:

1. I am currently a Principal Air Quality Engineer at Air Sciences Inc. (Air Sciences). I have prepared this declaration in support of the Permit to Construct (PTC) issued for the Stibnite Gold Project (SGP) on June 17, 2022. Perpetua Resources Idaho, Inc. (Perpetua) received the PTC that was challenged in this proceeding, Case Docket No. 0101-22-01; OAH Case No. 23-245-01.

A. Qualifications and Experience

2. I earned a Bachelor of Science (BS) degree in Chemical Engineering from the University of Wisconsin, Madison, in 1990.

3. From 1990 to 1992, I worked at the Wisconsin Department of Natural Resources, where I wrote air quality permits for toxic pollutants and conducted compliance inspections.

4. In 1993, I joined Air Sciences, became an owner in 1996, and served as President from 2011 to 2021. Air Sciences is a consulting firm specializing in ambient air quality analyses, permitting, and compliance.

5. With over 33 years of experience in air quality, I have conducted air quality analyses for permits across more than 25 states and internationally. At Air Sciences, I focus primarily on air permitting for the gold mining industry. In collaboration with the Nevada Mining Association and the U.S. Environmental Protection Agency (EPA), I compiled, analyzed, and summarized technical data to help develop the National Emissions Standard for Hazardous Air Pollutants (NESHAP): Gold Mine Ore Processing and Production Area Source Category rules under 40 CFR Part 63, Subpart EEEEEEE, which applies to the SGP.

6. During my time at Air Sciences, I developed air quality analyses for hundreds of air permits, renewals, and modifications. I also provided technical support to state agencies throughout the technical review, permit drafting, and public comment phases.

7. I led the modeling and permit development for Perpetua, ensuring compliance with ambient air quality standards while achieving project objectives. This included using reliable emissions data and appropriate modeling techniques to reflect permit conditions.

8. I began working with Perpetua as an air quality consultant in 2017, and I continue to provide consultancy services to this day.

B. Scope of Review

9. I reviewed the in the *Final Order* issued by the Board of Environmental Quality (Board) on May 9, 2024 in the Matter of Air Quality Permit to Construct P-2019.0047 (Final Order), which remanded "this matter back for the development of further evidence regarding ambient air concentrations of arsenic that will be produced by the SGP and whether those levels comply with the Air Rules." Final Order at 23. Based on my review of the Final Order the Board found the following issues to be addressed on remand:

a. DEQ did not act reasonably in using a five-year rolling average for T-RACT that was not properly supported by permit conditions.

b. There was insufficient evidence to support the T-RACT analysis limiting the non-West End pit production limit.

c. DEQ did not act reasonably and in accordance with law when it applied the 16/70 calculation to the ambient arsenic air concentration analysis.

10. I will address items (a), (b) and (c) in this declaration.

C. Documents Reviewed

11. I have reviewed the permitting record in this case, the expert declarations of Theresa Lopez, Norka Paden, and Kevin Schilling, and documents referenced below and attached as an exhibit to this declaration.

D. Summary of Opinions

12. Based on my expertise and multi-state permitting experiences:

a. DEQ properly established a five-year rolling average compliance demonstration in the PTC for ambient arsenic concentrations from the SGP.

b. DEQ sufficiently supported the permitting for the non-West End Pit activities.

c. DEQ correctly applied the provisions of IDAPA[1] 586 to perform an "apples to apples" toxic air pollutant (TAP) risk evaluation using an adjusted arsenic concentration and exposure duration to compare to the T-RACT Acceptable Ambient Concentration for Carcinogens (AACC).

Following rigorous analyses of Perpetua's application, as well as addressing repeated comments from stakeholders, DEQ prepared a thorough and conservative record in support of the PTC.

E. General Permitting and Modeling Context

13. With over thirty years of experience as an air permit consultant, including the development and review of hundreds of permits, I have identified two key objectives in the permitting process:

a. The permittee must submit a thorough and complete permit application.

[1] The Rules for the Control of Air Pollution in Idaho (Air Rules), IDAPA 58.01.01, provide for the control of air pollution in Idaho and govern issuance of air quality permits, including permits to construct. For brevity, citations to the Air Rules are abbreviated "IDAPA," followed by the specific section of IDAPA 58.01.01.

b. The permitting agency must issue a permit that includes operating restrictions and monitoring requirements to ensure compliance with air quality regulations.

14. Integral to these objectives is the creation of accurate emissions data and modeling to support compliance with ambient air quality standards.

15. To obtain a permit in Idaho, an applicant must satisfy for DEQ that the proposal will comply with all applicable state or federal emission standards, will not cause or contribute to a violation of the National Ambient Air Quality Standards, and using the methods provided in IDAPA 210, the emissions of toxic air pollutants will not injure or unreasonably affect human or animal life or vegetation as required by IDAPA 161. IDAPA 202.01, 202.02, 202.03.

16. Compliance with all applicable toxic air pollutant carcinogenic increments demonstrates preconstruction compliance with IDAPA 161 with regards to the pollutants listed in IDAPA 586: the Ambient Air Concentrations for Carcinogenic increments. IDAPA 202.03.

17. Modeling is necessary to meet the requirements of IDAPA 202.02 and 202.03. Specifically, the project proponent must determine the ambient concentrations of relevant toxic air pollutants from the project and compare these concentrations to the AACC.

18. Perpetua and DEQ took a conservative approach throughout the process of demonstrating compliance with IDAPA 202. Specifically, the analyses included arsenic emissions from fugitive dust related to mining activities. This is significant because fugitive dust is the primary source of arsenic emissions from the project. Furthermore, fugitive dust emissions of arsenic are "addressed" by NESHAP Subpart EEEEEEE and therefore would normally be

excluded from the analysis per IDAPA 210.20. *See* Statement of Basis, Permit to Construct No. P-2019.0047 at 28 (Feb. 18, 2021) (Proposed for Public Comment).[2]

19. Modeling of arsenic emissions from the SGP to comply with the Air Rules included fugitive dust from mining activities and involved the following steps: (1) quantifying annual arsenic emissions from all sources while accounting for process scenarios and emission control measures, (2) inputting the emissions data, emission locations, and initial dispersion parameters into the model, and (3) running the model with one year of onsite meteorological data to determine the annual average concentration at specific receptors located at and beyond the ambient air boundary.

20. The results of the modeling performed by Air Sciences and DEQ contain multiple layers of conservatism.

21. First, the model itself is conservative. EPA's evaluation studies for the type of modeling conducted for the SGP showed that the model, specifically AERMOD, over predicts pollutant concentrations by 1.41 to 3.21 times. REC 1834

22. Second, the quantification of arsenic emissions from the SGP was conservative. For haul road dust, the largest source of arsenic emissions, we used the higher of the two published emission factors in the emissions calculations. The emission factor used is five times greater than the lower factor. REC 1834

23. Third, the control and reduction in arsenic emissions from haul road dust was calculated conservatively. We used a control efficiency of 90% for chemical suppressants; the actual range is 90-99%. We also used a control efficiency of 33% for watering dust; the actual range is 75-95%. REC 1834

[2] The 2021 Statement of Basis, along with selected appendices, is attached hereto as Attachment 1.

24. Finally, we conducted fourteen modeling scenarios, each using conservative process and operating assumptions. Each scenario assumed mining activity in a single deposit and hauling to a single location year-round at the maximum permitted production level to maximize predicted arsenic impacts. Actual operation will be more varied in location and rates resulting in significantly lower arsenic impacts.

25. These analyses led to predicted arsenic impacts that are one to two orders of magnitude higher than the actual impacts will be.

26. In my experience, applying multiple layers of conservatism in the permitting review process is standard practice across all air quality permitting agencies, and DEQ's process is no exception. The goal is always to ensure compliance with air quality regulations under all circumstances.

27. DEQ also provided extra opportunities for public involvement. DEQ provided the most robust opportunity for public participation in the SGP permitting process that I've encountered in my 33 years of permitting experience. DEQ afforded commenters unprecedented accommodations that responded to public input. All comments, suggestions, and challenges were thoroughly reviewed. DEQ addressed each comment and, in some instances, conducted additional, more conservative analyses in response to the comments submitted.

F. Opinions

The IDAPA 586 AACC Annual Averaging Period is Not the Compliance Period.

28. As an expert on the relationship between air quality regulations and air quality modeling, I have a comprehensive understanding of the meaning and purpose of IDAPA 586 that reads "The AACC in this section are annual averages."

29. This text led the Board to infer that "the rule specifies compliance on an annual basis." Final Order at 19. This inference incorrectly conflates the AACC *averaging period* specified in IDAPA 586 with the *compliance period* described in IDAPA 006.125.[3]

30. Regulations often differentiate between the averaging period and the compliance period for health-based air contaminant concentration standards, especially when assessing long-term health risks.[4]

31. Treatment of the AACC as requiring compliance on an annual basis introduces an improper compliance period into IDAPA 586 and overlooks the adopted rules defining the methods and EPA scientific principles for determining cancer risk probability.

32. Within the full context of IDAPA 586, "The AACC in this section are annual averages" describes the annual average concentration that will result in a 1-in-1,000,000 excess cancer risk probability assuming constant lifetime exposure (70 years) to that concentration of ambient air emissions.

33. The AACC values listed in IDAPA 586 encompass three components:

a. The ***annual average*** concentration (0.00023 µg/m³ for arsenic) that correlates to

b. The ***1-in-1,000,000*** cancer risk probability as defined by the URF in IDAPA 586 over

c. A ***70-year*** exposure duration or compliance period per IDAPA 006.125.

[3] Definition from Air Rules in effect during the PTC application review: "**Toxic Air Pollutant Carcinogenic Increments**. Those ambient air quality increments based on the probability of developing excess cancers over a seventy (70) year lifetime exposure to one (1) microgram per cubic meter (1 ug/m3) of a given carcinogen and expressed in terms of a screening emission level or an acceptable ambient concentration for a carcinogenic toxic air pollutant. They are listed in Section 586."

[4] For example, the new $PM_{2.5}$ National Ambient Air Quality Standard of 9.0 µg/m³ specifies an averaging period as the "annual arithmetic mean" (or annual average) per 40 CFR 50.20(a), while the compliance period is defined as a three-year average according to 40 CFR Part 50, Appendix N. *See* 89 Fed. Reg. 16202, 16203 (Mar. 6, 2024).

34. Neglecting any of these components when assessing the cancer risk probability, such as the 70-year exposure duration, not only conflicts with the rule, but fundamentally alters the rule itself and ignores the EPA scientific principles underlying the rule.

35. When comparing modeling results to the AACC values listed in IDAPA 586, all three components must align for a correct comparison:

a. The model output must be expressed as an ***annual average*** in $\mu g/m^3$;

b. The target cancer risk probability must be ***1-in-1,000,000;*** and

c. The exposure duration must occur or be permitted to occur over a ***70-year*** period.

36. The Final Order's statement that "the rule specifies compliance on an annual basis," Final Order at 19, rewrites one of the three essential components of the AACC, namely the exposure duration. Under the Board's interpretation, a project with a 5-year operational permit limit would pose the same risk as a project without a limit. Limiting the exposure duration reduces the cancer risk, as demonstrated by the EPA's risk calculation methods. Declaration of Norka Paden (Paden Decl.) ¶¶ 4, 13.

37. If the project proposal includes a different actual exposure duration that is less than the 70-year lifetime default or the project proposal includes a different target risk (like the 1-in-100,000 T-RACT), then either the model output concentration, the AACC itself, or both must be adjusted according to EPA's methods to ensure all components align.

38. Adjustment for actual project facts is necessary for a correct assessment of cancer risk. Failing to adjust components of the AACC is inconsistent with the rule and contrary to the EPA scientific principles upon which the rule is based.

DEQ Properly Established a Five-Year Rolling Average Compliance Demonstration Period.

39. The IDAPA 586 "annual average" does not represent the compliance period for project emissions; it represents the annual average concentration of emissions that presents a 1-in-1,000,000 (or 1-in-100,000 T-RACT) cancer risk probability assuming constant exposure over a 70-year lifetime.

40. The Final Order stated that "there was no evidence in the record explaining how the five-year rolling average comports with the annual AACC limits." This conclusion conflated the averaging period specified in IDAPA 586 with the notion of a compliance period.

41. The AACC value is defined as a lifetime of exposure, specifically 70 years. This means that cumulative exposure over this 70-year period must not exceed levels that would result in a cancer risk probability of 1-in-1,000,000, or 1-in-100,000 for T-RACT sources.

42. DEQ imposed a daily production limit of 135,000 tons per day (T/day) because production generates arsenic emissions (primarily from fugitive dust emissions). Limiting production proportionally reduces arsenic emissions, concentrations and exposure.

43. DEQ correctly established a compliance demonstration period of 5 years for the 135,000-T/day limit using a 5-year rolling average. The 5-year rolling average represents a more conservative (shorter) timeframe than the exposure duration of 70 years inherent in the AACC. The 5-year rolling average is also a more conservative (shorter) timeframe than the T-RACT AACC exposure duration for the SGP of 16 years.

44. A five-year rolling average production limit in Permit Condition 3.5 is appropriate because "any permit limits must only assure that concentrations in ambient air over the total duration of the project do not cause a potential exposure concentration associated with a 1-in

1,000,000 [AACC] or a 1-in-100,000 [T-RACT] cancer risk." Declaration of Kevin Schilling (Schilling Decl.) ¶ 25.

45. The Board asserted that a "five-year rolling average allows considerable daily and annual increases in exposures which are contrary to limits set forth in the Air Rules." As explained by Theresa Lopez in her Declaration, the T-RACT AACC represents the lifetime probability of cancer risk from a ***cumulative*** dose of arsenic over a specific period of exposure. During the 16-year SGP project life, the ***cumulative*** dose is unaffected by variability in exposures (daily or annual) that may occur over the 5-year averaging period. In addition, Kevin Schilling states, "any daily and annual variability is inconsequential to the exposure concentration and resulting risk." Schilling Decl. ¶ 26.

46. The notion that the Air Rules prohibit daily variability in exposure, and therefore, a daily production limit with a daily compliance demonstration is needed to protect public health, is inaccurate. Limiting daily production activity does not eliminate exposure variability. The modeled output emissions concentration is inherently variable due to a multitude of factors unrelated to production and emissions. For example, for a given day when the wind blows from northeast to southwest, the predicted concentration (and exposure) at the northeast side of the ambient air boundary will be zero, regardless of the production and emissions.

DEQ Sufficiently Justified the Permitting for the Non-West End Pit Activities.

47. The permit imposes a total mining production limit of 788.4 million tons for the life of the project (Permit Condition 3.6). This limit applies to the aggregate amount of mining from all deposits, whether from a single deposit or a combination of deposits, ensuring that the total does not exceed 788.4 million tons over the life of the mine.

48. During permit development, Air Sciences performed 14 different model runs reflecting 14 different operating scenarios to assess arsenic concentrations based on production activity from each of the deposits individually

49. The modeling analysis for arsenic emissions from the Non-West End Pit (non-WEP) deposit scenarios demonstrated that mining activities at the non-WEP deposits result in ambient arsenic concentrations at or below the T-RACT adjusted AACC, even when the full 788.4 million tons of production comes from any one of those deposits. Schilling Decl. ¶¶ 28, 30.

50. The modeling analyses for arsenic emissions from the West End Pit (WEP) deposit scenarios resulted in proportionally higher impacts. This is attributed to the WEP's proximity to the northeastern ambient air boundary and prevailing wind patterns, as illustrated in Figure 1, attached as Exhibit A.

51. To address these elevated arsenic impacts associated with mining at the WEP, DEQ imposed an additional specific production limit for WEP activity. The limit is set at 394.2 million tons over the life of the project (Permit Condition 3.6), which represents 50% of the total mining production limit of 788.4 million tons.

52. Two life-of-mine production limits effectively constrain operations as follows:

a. Total mining from WEP and non-WEP locations cannot exceed 788.4 million tons.

b. Mining at the WEP cannot exceed 394.2 million tons.

c. Mining at non-WEP locations cannot exceed 788.4 million tons minus any mining at the WEP.

53. These restrictions work together as follows: A + B = C, where A represents WEP mining, B represents non-WEP mining, and C represents total mining. There is no need to

establish another limit for non-WEP mining because B can only be the difference between the total (788.4 million) and the volume from the WEP (limited to 394.2 million) as set forth in Permit Condition 3.6. Imposing an additional production limit for non-WEP activity would not offer any further protection of public health or the environment.

DEQ Correctly Applied the Permit Conditions Limiting the Project Life to 16 Years to the Analysis of Compliance with the T-RACT AACC

54. Based on my extensive multi-state permitting experience, DEQ's interpretation and analyses of the cancer risk associated with arsenic from the SGP followed sound permitting practices and scientific methods for TAPs evaluations.

55. In specific, DEQ correctly interpreted that "annual average" referred to in IDAPA 586 is simply the output of the air dispersion model that will result in a **1-in-1,000,000** excess cancer risk probability assuming the emissions impact will occur ***each year for 70 years***. Schilling Decl. ¶ 20.

56. The air dispersion model, specifically EPA's AERMOD, predicts ambient air concentrations as annual averages. For assessing long-term health impacts, such cancer risk probability (the AACC), the annual average output from the model serves as the default long-term averaging period. Defining the AACC as "annual averages" is consistent with the model's output and informs the compliance demonstration. It does not negate the other components of the AACC essential to properly assessing the cancer risk from the project's arsenic emissions.

57. Again, the AACC values in IDAPA 586 encompass three components: (1) the annual average concentration (0.00023 $\mu g/m^3$ for arsenic), (2) a cancer risk probability of 1-in-1,000,000, and (3) a 70-year exposure duration. For a proper comparison of modeling results all three components must align.

58. The annual average output concentration from the model can only be compared directly to AACC values in IDAPA 586 under the following conditions: 1) a target risk of ***1-in-1,000,000*** and 2) an emissions impact duration (or exposure duration) of ***70 years***. If one or both conditions are adjusted, then an adjustment to either the AACC and/or the annual average model output concentration must also be made for an "apple-to-apples" comparison.

59. For example, the annual average concentration for a 5-year project cannot be compared to the listed AACC because the exposure durations differ: five (5) years for the actual project and 70 years for the listed AACC. This example is found in IDAPA 210.15. To adjust for exposure duration, the example found in IDAPA 210.15 prompts the AACC to be multiplied by 10 to adjust for the shorter duration of the project. See Schilling Decl. ¶ 19.

60. DEQ properly applied these principles in the arsenic analysis for the SGP. The listed AACC was adjusted in accordance with IDAPA 210.12 to reflect the permit conditions establishing T-RACT. Per IDAPA 210.12 the AACC was multiplied by 10 to represent a risk of ***1-in-100,000*** for an emissions impact duration of ***70 years***; this is the T-RACT AACC. Then the annual average output concentration from the model was adjusted for the life-of-mine permit condition to reflect a 16-year exposure duration. This is shown mathematically by multiplying the modeled concentration by 16/70. This adjustment represents the equivalent modeled concentration over a 70-year period, known as the Exposure Concentration (EC). Detailed explanations are provided in the declarations of Norka Paden (¶¶ 4, 13) and Kevin Schilling (¶¶ 6.c, 18, 20).

61. With the AACC adjusted to the T-RACT AACC and the modeled annual average concentration adjusted to the EC, DEQ established a scientifically appropriate comparison to

determine acceptable risk. If the EC is less than the T-RACT AACC, as in the case of the SGP, then the risk of the project is less than ***1-in-100,000***.

62. As described in the declarations of Kevin Schilling and Norka Paden, DEQ applied these adjustments properly in their analyses of the SGP arsenic emissions impacts. Not applying these adjustments would be contrary to DEQ's toxic air pollutant rule and contrary to EPA's scientific approach and risk factors used for calculating excess risk probability adopted by the rule.

I declare under penalty of perjury under the laws of the United States that the foregoing is true and correct to the best of my knowledge, information, and belief.

DATED: August 30, 2024.

Kevin Lewis, Air Sciences Inc.

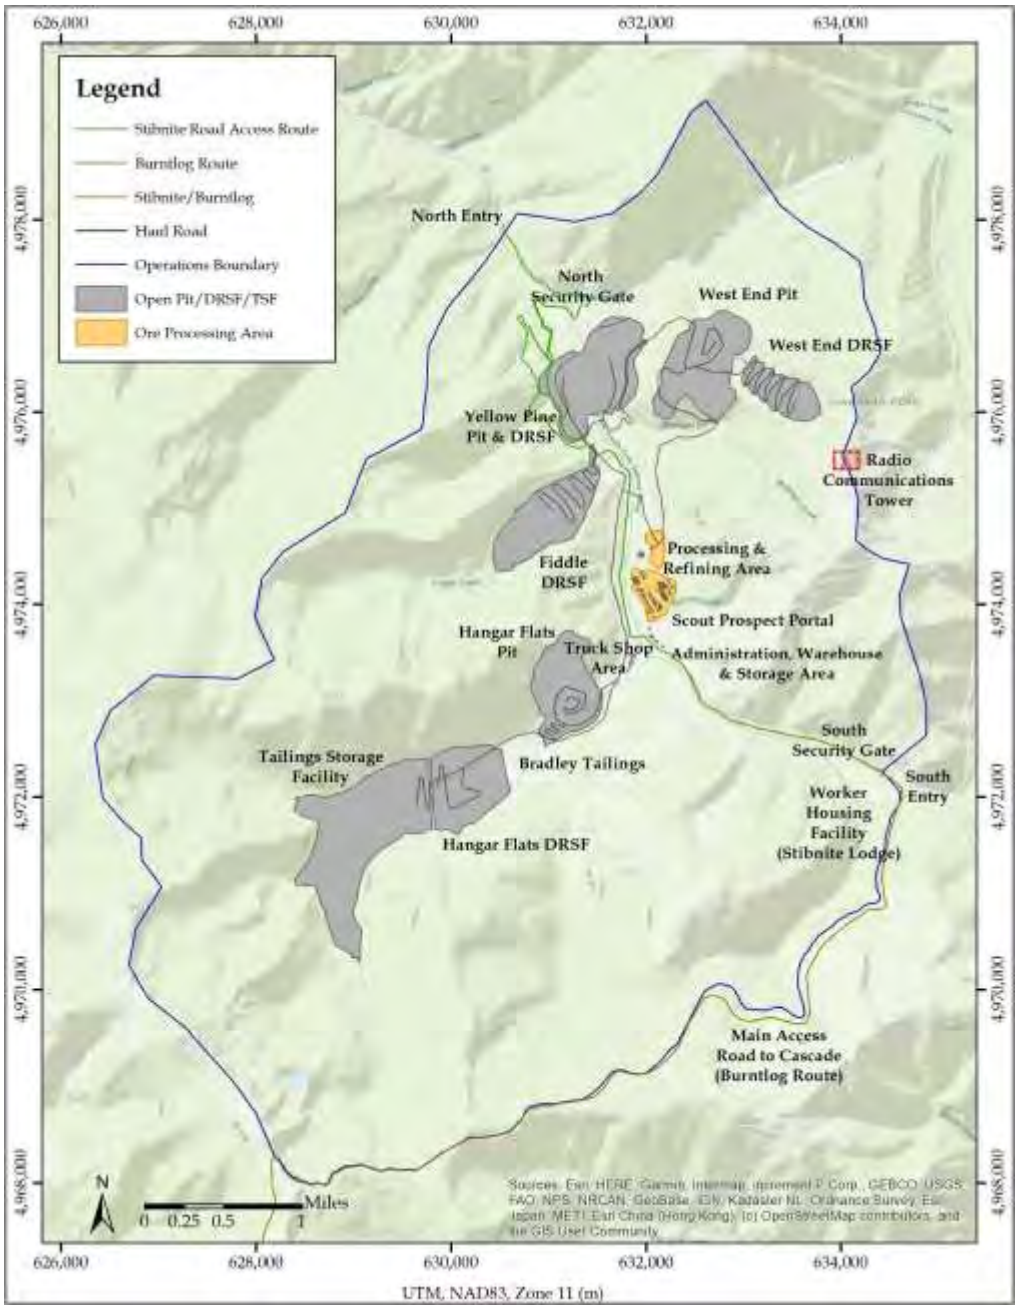
ACRONYMS, UNITS, AND CHEMICAL NOMENCLATURE

AAC	acceptable ambient concentrations
AACC	acceptable ambient concentrations for carcinogens
acfm	actual cubic feet per minute
ANFO	ammonium nitrate/fuel oil
As	arsenic
ASTM	American Society for Testing and Materials
bkW	brake kilowatt
BT	Bradley Tailings
Btu	British thermal units
CAA	Clean Air Act
CAM	Compliance Assurance Monitoring
CAS No.	Chemical Abstracts Service registry number
Cd	cadmium
CEMS	continuous emission monitoring systems
cfm	cubic feet per minute
CFR	Code of Federal Regulations
CI	compression ignition
CIP	Carbon-in-Pulp
CIL	Carbon-in-Leach
CMS	continuous monitoring systems
CO	carbon monoxide
CO_2	carbon dioxide
CO_2e	CO_2 equivalent emissions
COC	contaminants of concern
COMS	continuous opacity monitoring systems
DEQ	Department of Environmental Quality
DR	development rock
DRSF	development rock storage facilities
dscf	dry standard cubic feet
EF	emission factors
EIS	Environmental Impact Statement required by the National Environmental Policy Act
EL	screening emission levels
EPA	United States Environmental Protection Agency
FDCP	Fugitive Dust Control Plan
FDRSF	Fiddle Development Rock Storage Facility
Forest Service	United States Forest Service
GACT	Generally Available Control Technology
gpm	gallons per minute
gr	grains (1 lb = 7,000 grains)
H_2SO_4	Sulfuric Acid
HAP	hazardous air pollutants
HFDRSF	Hangar Flats Development Rock Storage Facility
HFP	Hangar Flats Pit
Hg	mercury
hp	horsepower
hr/yr	hours per consecutive 12-calendar-month period
HVAC	heating, ventilation, and air conditioning
ICE	internal combustion engines
IDAPA	a numbering designation for all administrative rules in Idaho promulgated in accordance with the Idaho Administrative Procedures Act
km	kilometers

lb/hr	pounds per hour
lb/qtr	pound per quarter
LMP	lime manufacturing plant
MACT	Maximum Achievable Control Technology
Midas Gold	Midas Gold Idaho, Inc.
MMBtu	million British thermal units
MMscf	million standard cubic feet
NAAQS	National Ambient Air Quality Standard
NESHAP	National Emission Standards for Hazardous Air Pollutants
Ni	nickel
NF	National Forest System road
NMMP	nonmetallic mineral processing
NO_2	nitrogen dioxide
NO_x	oxides of nitrogen
NSPS	New Source Performance Standards
NSR	New Source Review
O&M	operation and maintenance
O_2	oxygen
PAH	polycyclic aromatic hydrocarbons
Pb	lead
PM	particulate matter
$PM_{2.5}$	particulate matter with an aerodynamic diameter less than or equal to a nominal 2.5 micrometers
PM_{10}	particulate matter with an aerodynamic diameter less than or equal to a nominal 10 micrometers
POM	polycyclic organic matter
POX	pressure oxidation
ppm	parts per million
PSD	Prevention of Significant Deterioration
PTC	permit to construct
PTE	potential to emit
PW	process weight rate
RICE	reciprocating internal combustion engines
Rules	*Rules for the Control of Air Pollution in Idaho*
SAG	semi-autogenous grinding
Sb	antimony
scf	standard cubic feet
SCL	significant contribution limits
Se	selenium
SGP	Stibnite Gold Project
SIP	State Implementation Plan
SM	synthetic minor
SM80	synthetic minor facility with emissions greater than or equal to 80% of a major source threshold
SO_2	sulfur dioxide
STKP	crusher stockpile
Subsection 210.20	HAP TAP exemption for NSPS and NESHAP sources in IDAPA 58.01.01.210.20
T/day	tons per calendar day
T/hr	tons per hour
T/yr	tons per consecutive 12-calendar-month period
TAP	toxic air pollutants
ULSD	ultra-low sulfur diesel
U.S.C.	United States Code
VOC	volatile organic compounds

WEDRSF	West End Development Rock Storage Facility
WEP	West End pit
YPDRSF	Yellow Pine Development Rock Storage Facility
YPP	Yellow Pine Pit
$\mu g/m^3$	micrograms per cubic meter



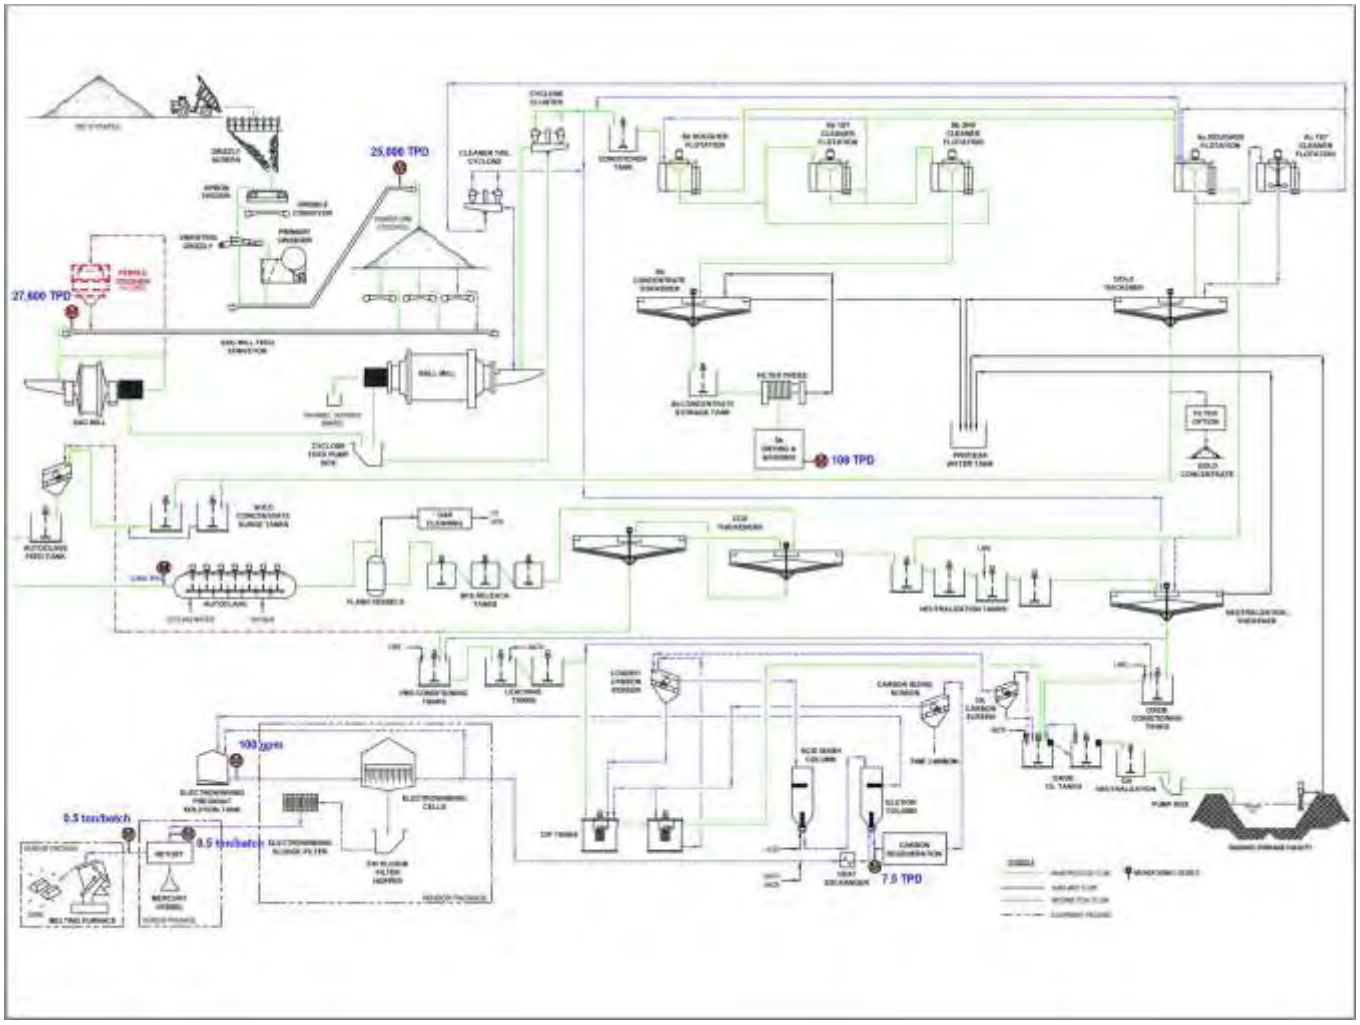
FACILITY INFORMATION

Description

Midas Gold Idaho, Inc. (Midas Gold) proposes to construct and operate the Stibnite Gold Project (SGP), consisting of conventional open-pit mining, ore preparation, and gold extraction operations.

SGP is to be located in Valley County at the intersection Forest Service roads NF-374 and NF-412 (Stibnite Road), approximately 10 miles east of Yellow Pine. The proposed Burntlog Route access road will provide year-round access to the site. The project comprises a combination of public national forest and private lands. The mining operations boundary within which public access will be excluded is defined in Figure 1. This operations boundary also defines the ambient air boundary used in all ambient air quality impact analyses.

Figure 1 PROJECT AREA OF OPERATIONS



SGP will require the construction of significant infrastructure, including a power transmission line, a primary mine site access road, onsite haul roads, an ore processing facility, onsite workspaces, employee housing and recreation, water storage and distribution facilities, and sewage disposal facilities.

Conventional open-pit mining methods including drilling, blasting, excavating, and hauling will be used to extract ore and waste rock, termed development rock (DR). Hydraulic shovels and front-end loaders will be used to load ore and DR into haul trucks. DR will be used for construction, restoration, and backfilling, or hauled to the dedicated development rock storage facilities (DRSF). Approximately 340 million tons of DR will be handled over the life of the mine.

The SGP will include three years of pre-mining development and construction activities, followed by an operating mine life of approximately 12 years. Mining will occur in three open pits: Yellow Pine Pit (YPP), Hangar Flats pit (HFP), and West End pit (WEP). Although there will be overlap in mine development construction and operations, the general sequence of mining will be the YPP deposit, followed by the HFP and WEP deposits. Legacy tailings from the Meadow Creek valley (Bradley Tailings [BT]) will also be reclaimed and reprocessed during the initial project schedule. Surface exploration drilling will occur within the pits and within the Scout Prospect decline (underground exploration) throughout the mine operation period. Restoration and reclamation of other legacy mining features will occur prior to mining, throughout the life of the mine, and as part of the mine closure.

Figure 2 DIAGRAM OF PROCESS FLOWS

Ore will be hauled to the primary crusher area, where it will be fed directly into the crusher dump pocket or stockpiled. The ore crushing plant will be designed to operate at a maximum rate of 25,000 tons per calendar day (T/day). Approximately 100 million tons of ore will be mined from the three pits over the life of the project. The metal-recovery process from ore will include conventional crushing and grinding, followed by froth-flotation circuits that will generate separate gold-silver and antimony-silver concentrates. The antimony-silver concentrate will be shipped offsite for refining, whereas additional onsite processing of the gold-silver concentrate will include pressure oxidation, carbon-in-leach circuits, and refining processes to recover gold and minor amounts of silver. The finely ground leftover ore material from the mineral-recovery process, termed tailings, will be neutralized, thickened, and transported via a pipeline to the tailings storage facility. A diagram of ore processing and ore concentration and refining process flows is provided in Figure 2.

Permitting History

This is the initial PTC for a new facility, thus there is no permitting history.

Application Scope

This permit is the initial PTC for this facility.

The applicant has proposed to conduct mining operations and to install and operate ore processing, ore concentration and refining, and ancillary equipment:

- Drilling, blasting, excavating, and hauling operations;
- Ore processing operations (OC1–OC13, PS);
- Ore concentration and refining operations (AC, EW, MR, MF, CKD);
- Process heating (ACB, CKB, PV, HS, LKC);
- Lime production operations (LS1–LS12, LSBM, LS-L/U, LK, LCR, LS1-L/U, MillS2-L/U, ACS1–ACS4);
- Aggregate production operations (PCSP1, PCSP2);
- Concrete production operations (CM; CS1–CS2-L/U, CA-L/U);
- Heating, Ventilation, and Air Conditioning heaters (H1M–H2M, HM, HAC, HR, HA, HMO, HTS, HW);
- Emergency generator engines (EDG1–EDG3, EDFP); and
- Fuel storage (TG1–TG2, TD3—TD10).

Application Chronology

August 20, 2019	DEQ received an application and an application fee.
August 29 – September 13, 2019	DEQ provided an opportunity to request a public comment period on the application and proposed permitting action.
September 19, 2019	DEQ determined that the application was incomplete.
October 4, 2019	DEQ received a preliminary response and supplemental information from the applicant, including a request to delegate authority of responsible official.
October 9, 2019	DEQ approved the request to delegate authority of responsible official.
October 15, 2019	DEQ met with the applicant to review and discuss the preliminary response.
October 22, 2019	DEQ determined that the application remained incomplete while the applicant prepared a response to the remaining items previously identified (9/19/19), and included a summary of recommendations provided at the meeting (10/15/19).
November 8, 2019	DEQ requested additional information from the applicant via email, relating to items previously identified (9/19/19).
November 21, 2019	DEQ received a request from the applicant for extension until November 27, 2019 to respond.
November 27, 2019	DEQ received supplemental information from the applicant, including a revised application with updated emissions inventories and modeling analyses.
December 24, 2019	DEQ determined that the application was incomplete.
January 8, 2020	DEQ received a request from the applicant for extension until February 7, 2020 to respond.
January 31, 2020	DEQ requested additional information from the applicant via email, relating to items previously identified (12/24/19).
February 5, 2020	DEQ received supplemental information from the applicant, including a revised application with updated emissions inventories and modeling analyses.
March 6, 2020	DEQ determined that the application was incomplete.
April 2, 2020	DEQ received a request from the applicant for extension until April 15, 2020 to respond.
April 15, 2020	DEQ received supplemental information from the applicant, including updated modeling analyses.
May 15, 2020	DEQ determined that the application was complete.
June 24, 2020	DEQ received the final application including all updates.
July 6, 2020	DEQ made available the draft permit and statement of basis for peer and regional office review.
July 14, 2020	DEQ made available the draft permit and statement of basis for applicant review.
July 31, 2020	DEQ made available an updated draft statement of basis Appendix B for applicant review.

August 3 and 13, 2020	DEQ received comments from the applicant on the draft permit and statement of basis.
August 20, 2020	DEQ received the permit processing fee.
September 10 – October 12, 2020	DEQ provided a public comment period on the proposed action.
October 12, 2020	DEQ received a request to extend the public comment period.
October 13 – November 11, 2020	DEQ extended the public comment period on the proposed action.
October 27, 2020	DEQ provided an information meeting during the extended public comment period.
November 20, 2020	DEQ requested additional information from the applicant to address substantive public comments received, including missing TAP and HAP emission estimates.
November 25 and December 11, 2020	DEQ extended the response to public comment period until February 22, 2021 to allow additional time for the applicant and DEQ to respond to substantive public comments.
December 17, 2020	DEQ received a response to the request for additional information from the applicant.[1]
December 18 and 21, 2020	DEQ received supplemental information from the applicant, including a response and HAP/TAP addendum to the application,[2] updated HAP and TAP emissions estimates,[3] updated TAP modeling analyses,[4] and supporting references.[5]
January 28, 2021	DEQ received updated modeling files with corrections for formaldehyde and sulfuric acid, and an updated figure showing TAP modeled impacts.
February XX – March XX, 2021	DEQ provided a public comment period on the proposed action as updated to address the HAP and TAP addendum and updates.
February XX, 2020	DEQ provided an information meeting during the public comment period.
DRAFT February 18, 2021	DEQ issued the final permit, statement of basis, and response to public comments.

TECHNICAL ANALYSIS

Emissions Units and Control Equipment

Table 1 lists all sources of regulated emissions for informational purposes.

Table 1 EMISSIONS UNIT AND CONTROL EQUIPMENT INFORMATION

Source ID No.	Source	Control Equipment	Maximum Process Rate
Mining			
	Drilling activities	Reasonable control and Fugitive Dust Control Plan (FDCP)	1,200 holes/day
	Blasting activities	Reasonable control & FDCP	2 blasts/day
	Excavating and hauling activities	Reasonable control & FDCP – Chemical suppression and water sprays Control efficiency: 93.3% for PM/PM_{10} (haul roads)	180,000 T/day
	Rock dumps and storage piles	Reasonable control & FDCP	n/a
PS1–2-L/U	(2) Prill Silos #1-2 Maximum capacity: 100 T (each)	Loading – None Unloading – None	200 T/day and 9,000 T/yr (combined)
Ore Processing			
OC1	Loader Transfer of Ore to Grizzly	Reasonable control & FDCP – Water sprays and moisture carryover	25,000 T/day
OC2	Grizzly to Apron Feeder		
OC3	Conveyor – Apron Feeder to Dribble		
OC4	Conveyor – Apron Feeder to Grizzly		
OC5	Conveyor – Dribble to Grizzly		
OC6	Grizzly to Primary Crusher or Coarse Ore Stockpile Feed		
OC7	Primary Crusher	Reasonable control & FDCP – Water sprays and moisture carryover	
OC8	Conveyor – Coarse Ore Stockpile Feed Transfer to Stockpile		
OC9	Stockpile Transfer to Reclaim Conveyors	Reasonable control & FDCP – Below-grade of storage piles Control efficiency: 80% for PM/PM_{10}	27,600 T/day
OC10	Conveyor – Reclaim Conveyors to SAG Mill Feed Conveyor		
OC11	Conveyor – SAG Mill Feed Transfer to SAG Mill	Reasonable control & FDCP – Enclosure Control efficiency: 80% for PM/PM_{10}	
OC12	Pebble Crusher	Reasonable control & FDCP – Water sprays and moisture carryover	
OC13	Pebble Discharge to SAG Mill Feed		
Ore Concentration and Refining			
CIP Leach 1–4	Carbon-in-Pulp Leach Tanks	Chemical treatment (lime, caustic soda, hydrogen peroxide, copper sulfate, etc.)	125 g/m^3 CN, 10.25 pH, and 1,700 T/yr PAX
CIL 1–6	Carbon-in-Leach Tanks	Chemical treatment	
CIP 1–6	Carbon-in-Pulp Tanks	Chemical treatment	
CN Detox 1–2	Cyanide Detox Tanks	Chemical treatment	25 g/m^3 CN, and 8.5 pH

Table 1 EMISSIONS UNIT AND CONTROL EQUIPMENT INFORMATION

Source ID No.	Source	Control Equipment	Maximum Process Rate
AC	Autoclave (AC)	Venturi Scrubber (VS1) Vent Gas Cleaning Tower (ST1) Vent Gas Steam Condensation Tower (CT1) Carbon Filter (CA5) Type: sulfur-impregnated activated carbon Form: granulated	6,960 T/day
EW	Electrowinning Cells and Pregnant Solution Tank	Shared Carbon Filter (CA2) Type: sulfur-impregnated activated carbon Form: granulated	100 gpm
MR	Mercury Retort	Condenser Carbon Filter (CA3) Type: sulfur-impregnated activated carbon Form: granulated	1,000 lb/batch and 21 T/yr
MF	Induction Melting Furnace	Baghouse (BH2) Carbon Filter (CA4) Type: sulfur-impregnated activated carbon Form: granulated	
CKD	Carbon Regeneration Kiln (Drum)	Wet Scrubber (WS2) Carbon Filter (CA1) Type: sulfur-impregnated activated carbon Form: granulated	7.2 T/day
	Tailings and Maintenance Pond activities	Chemical treatment, reasonable control & FDCP	1 g/m^3 CN
Process Heating			
ACB	POX Boiler (for AC) Maximum capacity: 17 MMBtu/hr Fuel: propane	None	operation is limited to AC startup only
HS	Strip Circuit Solution Heater Maximum capacity: 5 MMBtu/hr Fuel: propane	None	n/a
CKB	Carbon Regeneration Kiln Burners Maximum capacity: 2.255 MMBtu/hr Fuel: propane	None	(n/a)
PV	Propane Vaporizer Maximum capacity: 0.1 MMBtu/hr Fuel: propane	None	n/a
LKC	PFR Shaft Lime Kiln Combustion Maximum capacity: 22.0 MMBtu/hr Fuel: propane	None	n/a

Table 1 EMISSIONS UNIT AND CONTROL EQUIPMENT INFORMATION

Source ID No.	Source	Control Equipment	Maximum Process Rate
Lime Production			
LS1	Limestone transfer to Primary Crusher Hopper	None	1,130 T/day
LS2	Primary Crusher Maximum capacity: 1,130 T/day	None	
LS3	Primary Screen	None	
LS4	Secondary Crusher	None	
LS5	Secondary Screen	None	
LS6	Conveyor – Limestone to Ball Mill Feed Bin	None	
LS7	Conveyor – Limestone to Ball Mill Feed	None	
LS8	Conveyor – Ball Mill Feed to Ball Mill	None	
LSBM	Limestone Ball Mill	Baghouse (BH3)	
LS9	Conveyor – Limestone to Kiln Feed Bin	None	267 T/day
LS10	Conveyor – Limestone to Lime Kiln Feed	None	
LS11	Fines Screen	None	
LS12	Conveyor – Kiln Feed to PFR Shaft Lime Kiln	None	
LK	Parallel Flow Regenerative (PFR) Shaft Kiln	Baghouse (BH4)	169 T/day and 52,377 T/yr
LCR	Lime Mill Crusher	Baghouse (BH5)	
LS-L/U	Bucket Elevator – Pebble Lime Silo Loading	Loading – Bin Vent Filter	
	Pebble Lime Silo discharge to Lime Slaker	Unloading – Wet Scrubber (WS3)	
LS1-L/U	SAG Mill Lime Silo #1 Maximum capacity: 250 T/day	Loading – Bin Vent Filter Unloading – None	4,000 T/day and 70,000 T/yr (combined)
MillS2-L/U	SAG Mill Lime Silo #2 Maximum capacity: 250 T/day	Loading – Bin Vent Filter Unloading – None	
ACS1	AC Lime Silo #1 Maximum capacity: 1,000 T/day	Loading – Bin Vent Filter Unloading – None	
ACS2	AC Lime Silo #2 Maximum capacity: 1,000 T/day	Loading – Bin Vent Filter Unloading – None	
ACS3	AC Lime Silo #3 Maximum capacity: 1,000 T/day	Loading – Bin Vent Filter Unloading – None	
ACS4	AC Lime Silo #4 Maximum capacity: 500 T/day	Loading – Bin Vent Filter Unloading – None	
Aggregate Production			
PCSP1	Portable Crushing and Screening Plant 1 Crushers, screens, and conveyors	Reasonable control & FDCP – water sprays and moisture carryover	2,000 T/day (aggregate)
PCSP2	Portable Crushing and Screening Plant 2 Crushers, screens, and conveyors	Reasonable control & FDCP – water sprays and moisture carryover	2,000 T/day (aggregate)
Concrete Production			
CM	Central Mixer Loading Maximum capacity: 120 T/hr	Reasonable control & FDCP – Controls may include water sprays, enclosures, hoods, curtains, shrouds, movable and telescoping chutes, and central duct collection systems.	2,480 T/day and 560,000 T/yr (cement + aggregate)
CS1-L/U	Cement/Shotcrete Silo #1 Maximum capacity: 80 T	Loading – Bin Vent Filter Unloading – None	
CS2-L/U	Cement/Shotcrete Silo #2 Maximum capacity: 80 T	Loading – Bin Vent Filter Unloading – None	
CA-L/U	Aggregate Bin Maximum capacity: 2,400 T	Loading – None Unloading – None

Table 1 EMISSIONS UNIT AND CONTROL EQUIPMENT INFORMATION

Source ID No.	Source	Control Equipment	Maximum Process Rate
Emergency Power Generation and Fire Suppression			
EDG1	Camp Emergency Generator Date of construction: 2007 or later Maximum capacity: 1,000 bkW Maximum operation: 100 hr/yr (non-emergency) Fuel: ultra-low sulfur diesel (ULSD) Displacement: <10 L/cyl	EPA Tier 2 technologies	1 hr/day and 100 hr/yr
EDG2	Plant Emergency Generator #1 Date of construction: 2007 or later Maximum capacity: 1,000 bkW Maximum operation: 100 hr/yr (non-emergency) Fuel: ULSD Displacement: <10 L/cyl	EPA Tier 2 technologies	1 hr/day and 100 hr/yr
EDG3	Plant Emergency Generator #2 Date of construction: 2007 or later Maximum capacity: 1,000 bkW Maximum operation: 100 hr/yr (non-emergency) Fuel: ULSD Displacement: <10 L/cyl	EPA Tier 2 technologies	1 hr/day and 100 hr/yr
EDFP	Mill Fire Pump Date of construction: 2009 or later Maximum capacity: 200 bkW Maximum operation: 100 hr/yr (non-emergency) Fuel: ULSD Displacement: <10 L/cyl	None	1 hr/day and 100 hr/yr
Fuel Storage			
TG1–TG2	Mine Site Gasoline Tanks (#1 through #2) Maximum capacity: 5,000 gal each	Lids or other appropriate closure with gasketed seal and submerged filling	<100,000 gal/mo
TD3–TD10	Mine Site Diesel Tanks (#3 through #10)	Lids or other appropriate closure	n/a

Emissions Inventories

Potential to Emit

IDAPA 58.01.01 defines Potential to Emit (PTE) as the maximum capacity of a facility or stationary source to emit an air pollutant under its physical and operational design. Any physical or operational limitation on the capacity of the facility or source to emit an air pollutant, including air pollution control equipment and restrictions on hours of operation or on the type or amount of material combusted, stored or processed, shall be treated as part of its design if the limitation or the effect it would have on emissions is state or federally enforceable. Secondary emissions did not count in determining the PTE of a facility or stationary source.

Using this definition of PTE, an emissions inventory was developed for the SGP (see Appendix A). Emissions estimates of criteria pollutant and hazardous air pollutant (HAP) PTE were based on project-specific activity rates (e.g., continuous operation with the exception of the POX Boiler and emergency generator engines, design production rates, material haul rates, blasting agent usage rates, reagent usage rates, etc.), process design (e.g., open-pit mining, process concentration and pH, parallel flow regenerative lime production, central mix concrete production, haul fleet, etc.), emission abatement techniques (e.g., dust suppressant, chemical treatment, carbon filter, baghouse, bin vent filtration, wet scrubber, venturi scrubber, vent gas cleaning tower, and vent gas steam condensation tower control equipment), material characteristics (e.g., moisture content, road silt content, haul route distances, etc.), site conditions (onsite meteorological data, precipitation, etc.), and emission factors based on AP-42,[6] representative source test emissions data, and representative emission limits. Estimated emissions from the autoclave and the carbon regeneration kiln relied on emissions data from representative source test emissions data, scaled to the proposed equipment capacity. Estimated emissions from fuel storage tanks relied on TANKS[7] emission estimation software and projected annual gasoline and ULSD usage rates. Estimated emissions from the emergency generator engines relied on the use of certified engine emission factors.

Uncontrolled PTE

Using the definition of PTE, uncontrolled PTE is then defined as the maximum capacity of a facility or stationary source to emit an air pollutant under its physical and operational design. Any physical or operational limitation on the capacity of the facility or source to emit an air pollutant, including air pollution control equipment and restrictions on hours of operation or on the type or amount of material combusted, stored or processed, shall **not** be treated as part of its design **since** the limitation or the effect it would have on emissions **is not** state or federally enforceable.

The uncontrolled PTE is used to determine if a facility is a "synthetic minor" source of emissions. Synthetic minor sources are facilities that have an uncontrolled PTE for regulated air pollutants or HAP above an applicable major source threshold without permit limits.

For Midas Gold, uncontrolled PTE was based upon a worst-case for operation of the facility of continuous operation at proposed maximum material throughput and fuel input rates (Table 1), without consideration of control equipment. For batch operations, the number of operations necessary to achieve the proposed daily throughput rates was assumed in estimating emissions (MR, MF). Silo loading and unloading operations were assumed to occur at most once per day (LS1-L/U, MillS2-L/U, LS-L/U, PS-L/U, ACS1–ACS4-L/U, CS1–CS2-L/U, CA-L/U). Fuel storage was based on estimated facility-wide fuel usage rates (TG1, TG2 and TD3—TD10). For the purposes of maintenance and testing, emergency power generation operations were assumed to occur 1 hour per day and 100 hours per year (EDG1–EDG3, EDFP). With the exception of the POX Boiler in which operation is limited to AC startup only, continuous operation at maximum fuel input rates was assumed for all process heating and HVAC equipment.

Although not explicitly calculated, it was confirmed by Midas Gold in the response to a request for additional information[1] that the uncontrolled HAP PTE for SGP is estimated to exceed 25 tons per year (T/yr) without application of the specified control equipment (Table 1). Arsenic HAP PTE from haul roads at a controlled emission rate of 0.464 pounds per hour (lb/hr) and accounting for 93.3% control efficiency exceeds 20 T/yr, supporting that uncontrolled HAP PTE exceeds 10 T/yr of single HAP and 25 T/yr of total HAP.

Pre-Project PTE

Pre-project PTE is used to establish the change in emissions at a facility as a result of this project. Because this is a new facility, pre-project emissions are set to zero for all criteria pollutants.

Post-Project PTE

Post-project PTE is used in determining the change in emissions at a facility and in determining the facility's classification as a result of this project. Post-project PTE includes all permit limits resulting from this project.

In addition to assuming continuous operation of the facility at the proposed material throughput and fuel input rates, post-project emissions estimates account for the use of dust suppressant, chemical treatment, carbon filter, baghouse, bin vent filtration, wet scrubber, venturi scrubber, vent gas cleaning tower, and vent gas steam condensation tower control equipment.

A variety of factors impact emissions from unpaved roadways, and it was recognized that accurate determination of site-specific parameters characterizing road conditions and vehicle traffic was critical to estimating particulate matter emissions and ambient air impacts. Midas Gold provided site-specific information to support parameters such as silt content, mean vehicle weight, and dust suppressant control efficiencies, and provided an analysis evaluating the conservatism of the resulting emission factor (AP-42).[8] To ensure operation consistent with these parameters and to reasonably control fugitive emissions, compliance with requirements identified in the FDCP is

[8] Appendix A – Model Parameter / Assumption / Data Level of Conservatism IDEQ Forms to the Stibnite Gold Project Permit to Construct Application, Midas Gold, revised June 23, 2020 (2020AAG1078).

required by the permit. Further discussion of the sensitivity of predicted air quality impacts is provided in the Ambient Air Quality Impact Analyses section.

The following table presents the post-project PTE for criteria pollutants from all emissions units at the facility as determined by DEQ staff. Because this is a new facility, the post-project PTE is equivalent to the facility-wide PTE. Refer to Appendix A for a summary of the calculations and the assumptions used to determine emissions from each source, and the Facility Classification section for a review of facility classifications based on uncontrolled and controlled PTE.

a) Controlled average emission rate in tons per year is an annual average, based on the proposed annual operating scenarios and annual limits.

b) Estimated emissions from the "W3" scenario resulted in the most emissions across most activities, with the exception of material load/unload and wind erosion activities, which occurred in the Y1, H1, W1, and B1 scenarios. Totals reported are for the "W3" scenario.

c) In the response to a request for additional information, Midas Gold confirmed that antimony process dryer and bagging operation emission sources (Sb1 and Sb2) initially proposed would be replaced by a dewatering/packaging circuit. As a result, these emission sources have been removed from the permit and post-project PTE.

Fourteen operational scenarios were evaluated by the applicant and verified by DEQ in order to estimate maximum hourly, daily, and annual potential emissions from sources. These scenarios encompassed all feasible origin and destination location combinations for locating ore and development rock. A summary of these scenarios is provided in Table 4. Although drilling, blasting, excavating, and hauling activities are not expected to be confined to a single scenario in practice, emissions in each scenario were conservatively estimated at the maximum daily proposed processing rate (180,000 of ore and rock) to allow for maximum operational flexibility, and to evaluate potential air quality impacts. Scenarios having the greatest potential emissions (i.e., the top seven) were those with the longest origin-to-destination distances, which resulted in increased emissions evident in onsite hauling and material loading and unloading activities. Consequently, the W3 scenario having the maximum origin-to-destination distance (16,415 daily vehicle miles traveled) is representative of maximum potential emissions.

Table 4 OPERATING SCENARIOS

Scenario	Origin [a]	Destination [a]
Y1	YPP	STKP
Y2	YPP	FDRSF
Y3	YPP	HFDRSF
H1	HFP	STKP
H2	HFP	FDRSF

H4	HFP	YPDRSF
W1	WEP	STKP
W2	WEP	FDRSF
W3	WEP	HFDRSF
W4	WEP	YPDRSF
W5	WEP	WEDRSF
B1	BT	STKP
B2	BT	HFDRSF

a) Where ore and rock origin and destination locations as depicted in Figure 1 are abbreviated as follows:
YPP = Yellow Pine Pit, HFP = Hangar Flats pit, WEP = West End pit, BT = Bradley Tailings, STKP = Primary Crusher Stockpile, FDRSF = Fiddle DRSF, HFDRSF = Hangar Flats DRSF, YPDRSF = Yellow Pine DRSF, WEDRSF = West End DRSF, and DRSF = development rock storage facilities.

There are numerous sources of fugitive dust emissions at the facility, including drilling and blasting activities, crushing and ore handling equipment, ore and rock storage piles, and unpaved roadways. Calculated at maximum daily processing rates, emissions from these sources would tend to be conservatively estimated. But it is also recognized that uncertainties exist in some of the emission factors used, and that predicted modeled impacts may be sensitive to emissions from such sources. In particular, it may prove challenging to consistently and continuously achieve the targeted level of fugitive dust control for emissions from traffic on unpaved roadways, with over 55 miles of haul truck routes within the mining operations boundary, a fleet of 32 haul trucks weighing between 37 and 357 tons, and a targeted dust control efficiency of 93.3% accomplished by application of both dust suppressant and water controls. Based on this, and the scale of operations, a detailed Fugitive Dust Control Plan (FDCP) was required (Permit Conditions 2.6). It is noted that Midas Gold projected actual annual production at approximately 42.7 million T/yr, or 65% of the permitted annual production limit of 65.7 million T/yr (Permit Condition 3.5), and that as a result actual emissions are expected to be lower than presented.

Change in PTE

The change in facility-wide PTE is used to determine if a public comment period may be required and to determine the processing fee per IDAPA 58.01.01.225. The following table presents the facility-wide change in the potential to emit for criteria pollutants, which for a new source is equivalent to the facility-wide and post-project PTE.

a) HAP and TAP PTE emissions estimates are for the highest emissions year Scenario W3, referenced from Table B1-W3 of Appendix B to the HAP/TAP addendum and 'TblB1' worksheet in the supporting spreadsheet. Process and production activities include ore processing; ore concentration and refining; process heating; aggregate production; concrete production; heating, ventilation, and air conditioning (HVAC); emergency power generation and fire suppression; and fuel storage. Mining and leaching activities include drilling, blasting, excavating, hauling, prill silos, rock dumps and storage piles, and tailings.
b) Controlled average emissions rates in pounds per hour (lb/hr). Emissions rates for non-carcinogens are daily averages, based on the proposed daily operating scenarios and limits. Emissions rates for carcinogens are annual averages, based on the proposed annual operating scenarios and limits.
c) Controlled average emissions rates in tons per year (T/yr) are annual averages, based on the proposed annual operating scenarios and annual limits.
d) Adjusted TAP emissions and screening emission levels (EL) as specified in IDAPA 58.01.01.585-586 for purposes of TAP preconstruction compliance demonstrations. For TAP, adjusted emissions do not include sources addressed by NSPS and NESHAP in accordance with IDAPA 58.01.01.210.20Table 8.
e) Carcinogenic TAP as identified in IDAPA 58.01.01.586.
f) Polycyclic aromatic hydrocarbon (PAH). The group of seven PAH with a single EL are regulated as polycyclic organic matter (POM) equivalent in potency to benzo(a)pyrene as specified in IDAPA 58.01.01.586.
g) Adjusted mercury emissions (which are not TAP) are reported in pounds per year (lb/yr) and do not include fugitive sources and sources addressed by NESHAP 40 CFR 63 for comparison to the Mercury Emission Standard threshold of 25 lb/yr. Facility-wide mercury PTE emission rates were calculated as annual average based on federally-enforceable NESHAP Subpart EEEEEEE limits, and exceed values referenced from Table B1-W3 of Appendix B to the HAP/TAP addendum and 'TblB1' worksheet in the supporting spreadsheet (which account for the proposed mercury control devices for refinery process sources AC, EW, MR, MF, CKD).
h) Total hazardous air pollutant (HAP) emissions from all permitted sources and activities (combined). The maximum potential emissions of any single HAP is hydrogen chloride.
i) Toxic air pollutant that is not also a hazardous air pollutant (i.e., non-HAP TAP) and is not included in HAP totals.
j) Dichlorobenzene is regulated as both the ortho- and para- isomers (o-dichlorobenzene and 1,4-dichlorobenzene). For the purposes of TAP compliance, the lowest EL (and therefore most conservative) is listed.

HAP and TAP particulate metals are indirectly regulated via facility-wide fugitive dust requirements for particulate matter (PM) (Permit Conditions 2.1–2.8, 3.9, 5.9), material throughput and operational limits (Permit Conditions 3.3–3.8, 4.7–4.12, 5.4–5.8, 6.2), PM emission limits (Permit Conditions 4.3, 5.3), control device requirements (Permit Conditions 3.10, 4.13–4.17, 5.9–5.15), and associated testing, monitoring, recordkeeping, and reporting requirements. Because usage of process reagents were not correlated to material throughput rates and not otherwise inherently limited, HAP emissions limits and usage limits were established for potassium amyl xanthate (PAX) and sodium cyanide (Permit Conditions 4.4–4.6). Cyanide emissions were sensitive to leachant concentration and basicity, and monitoring of these parameters was established (Permit Condition 4.5) to ensure compliance with the emission limit. Monitoring of these limits and process parameters also ensure compliance with the major threshold for each individual HAP of 10 tons per year (T/yr).

Ambient Air Quality Impact Analyses

The applicant has demonstrated preconstruction compliance to DEQ's satisfaction that emissions from this facility will not cause nor significantly contribute to a violation of any ambient air quality standard. The applicant has also demonstrated preconstruction compliance to DEQ's satisfaction that the emissions increase due to this permitting action will not exceed any acceptable ambient concentration (AAC) or acceptable ambient concentration for carcinogens (AACC) for toxic air pollutants (TAP). A summary of the Ambient Air Impact Analysis for TAP is provided in Appendix B.

As presented in the modeling memorandum in Appendix B, the estimated emission rates of PM_{10}, $PM_{2.5}$, SO_2, CO, NO_x, and certain TAP from this project exceeded applicable screening emission levels (EL) and published DEQ modeling thresholds established in IDAPA 58.01.01.585-586 and in the State of Idaho Air Quality Modeling Guideline.[12] The facility-wide emission rate of lead (Pb) was determined to be below the "below regulatory concern" (BRC) threshold level of less than 10% of the "significant" emission rate defined in IDAPA 58.01.01.006 (i.e., less than 0.06 T/yr) and therefore modeling was not required.[12] Refer to the Emissions Inventories section for additional information concerning the emissions inventories.

New and updated TAP increment compliance demonstrations[4] were provided after evaluation of fugitive particulate TAP emissions from emission sources (Table 6) as identified in public comments and in a response and HAP/TAP addendum to the application provided by Midas Gold.[2] For non-HAP TAP, all sources were evaluated for TAP compliance by comparison of facility-wide emissions to applicable screening emission levels (EL). After exclusion of sources addressed by NSPS and NESHAP (Table 8), applicable concrete production and HVAC emission sources were evaluated for HAP TAP compliance by comparison of adjusted emissions to applicable EL. Refer to the Emissions Inventories section for estimates of HAP and TAP emissions (as summarized in Table 6) and to the Subsection 210.20 (IDAPA 58.01.01.210.20) section for relevant guidance and discussion of sources addressed by NSPS and NESHAP. With the exception of 12 TAP, estimated emission increases of non-carcinogenic and carcinogenic TAP demonstrated preconstruction compliance with TAP standards in accordance with IDAPA 58.01.01.210.07 using controlled average emission rates. Modeling analyses conducted in the development of TAP rules supports that if controlled average emission rates do not exceed applicable screening emission levels (EL) in IDAPA 58.01.01.585–586, controlled ambient concentrations are expected to be below the applicable acceptable ambient concentration (AAC/AACC).

Estimated emission increases of aluminum, arsenic, barium, cadmium, calcium carbonate, calcium oxide, formaldehyde, iron, nickel, sulfuric acid, thallium, and vanadium (12 TAP) demonstrated preconstruction compliance with TAP standards in accordance with IDAPA 58.01.01.210.08 for controlled ambient concentrations. Modeling analyses demonstrated preconstruction compliance with the acceptable ambient concentrations for these TAP (AAC/AACC) in IDAPA 58.01.01.585–586. Emission limits (Permit Condition 4.3), operational and material throughput limits (Permit Conditions 3.3–3.8, 4.5–4.12, and 5.4–5.8), fugitive dust control requirements (Permit Conditions 2.1–2.8), and control equipment requirements (Permit Conditions 2.6, 3.9–3.11, 4.13–4.17, and 5.9–5.15) limit these TAP emissions in accordance with IDAPA 58.01.01.210.08.c, limit Pb to BRC, and limit PM, PM_{10} ,and $PM_{2.5}$ to below the emission rates relied upon in the NAAQS evaluation of ambient air impacts in the modeling analyses.

Arsenic represented the single greatest HAP TAP emission; adjusted arsenic HAP TAP emissions at 5.7E-06 pounds per hour (lb/hr) did not exceed 2% of the applicable EL. Iron (Fe) represented the greatest single non-HAP TAP emission at over 15 lb/hr, which did not exceed 15% of the applicable EL. Any uncertainties in metal TAP emission estimates are not expected to affect compliance with TAP provisions.

It was recognized that accurately defining the mining operations boundary and controlling public access within that boundary was critical to estimating ambient air impacts. To ensure operation consistent with the defined mining operations boundary, site-specific access control measures will be employed. Midas Gold has committed

[12] Criteria pollutant thresholds in Table 2, State of Idaho Guideline for Performing Air Quality Impact Analyses, Doc ID AQ-011, September 2013, criteria pollutant BRC thresholds as provided in IDAPA 58.01.01.221.01, and DEQ guidance pertaining to BRC (2014ACF3).

to identifying and complying with these site-specific access control measures in an Access Management Plan (AMP, as required by Permit Condition 2.7).[13] Refer to Appendix E for a description and discussion of the mining operations boundary and control measures that may be included in this plan.

An ambient air quality impact analyses document has been crafted by DEQ based on a review of the modeling analysis submitted in the application. That document is part of the final permit package for this permitting action (refer to Appendix B). Refer to the Emissions Inventories section and Appendix A for additional information concerning development of the emissions inventories.

REGULATORY ANALYSIS

Attainment Designation (40 CFR 81.313)

The facility is located in Valley County, which is designated as attainment or unclassifiable for $PM_{2.5}$, PM_{10}, SO_2, NO_2, CO, and Ozone. Refer to 40 CFR 81.313 for additional information.

Facility Classification

The AIRS/AFS facility classification codes are as follows:

For HAP (hazardous air pollutants) only:

A = Use when any one HAP has permitted emissions > 10 T/yr or if the aggregate of all HAP (Total HAP) has permitted emissions > 25 T/yr.

SM80 = Use if a synthetic minor (uncontrolled HAP emissions are > 10 T/yr or if the aggregate of all uncontrolled HAP (Total HAP) emissions are > 25 T/yr and permitted emissions fall below applicable major source thresholds) and the permit sets limits > 8 T/yr of a single HAP or ≥ 20 T/yr of Total HAP.

SM = Use if a synthetic minor (uncontrolled HAP emissions are > 10 T/yr or if the aggregate of all uncontrolled HAP (Total HAP) emissions are > 25 T/yr and permitted emissions fall below applicable major source thresholds) and the permit sets limits < 8 T/yr of a single HAP and/or < 20 T/yr of Total HAP.

B = Use when the potential to emit (i.e. uncontrolled emissions and permitted emissions) are below the 10 and 25 T/yr HAP major source thresholds.

UNK = Class is unknown.

For All Other Pollutants:

A = Use when permitted emissions of a pollutant are > 100 T/yr.

SM80 = Use if a synthetic minor for the applicable pollutant (uncontrolled emissions are > 100 T/yr and permitted emissions fall below 100 T/yr) and permitted emissions of the pollutant are ≥ 80 T/yr.

SM = Use if a synthetic minor for the applicable pollutant (uncontrolled emissions are > 100 T/yr and permitted emissions fall below 100 T/yr) and permitted emissions of the pollutant are < 80 T/yr.

B = Use when the potential to emit (i.e. uncontrolled emissions and permitted emissions) are below the 100 T/yr major source threshold.

UNK = Class is unknown.

[13] Attachment 2 – Stibnite Road Access Management Plan to the Stibnite Gold Project Permit to Construct Application, Midas Gold, revised June 23, 2020 (2020AAG1078).

Table 7 REGULATED AIR POLLUTANT FACILITY CLASSIFICATION

Pollutant	Uncontrolled PTE (T/yr)	Permitted PTE (T/yr)	Major Source Thresholds (T/yr)	AIRS/AFS Classification
PM	560	86.6	**100**	SM80
PM_{10}	337	55.7	**100**	SM
$PM_{2.5}$	164	35.8	**100**	SM
SO_2	6.27	6.3	**100**	B
NO_x	36.16	36.2	**100**	B
CO	29.47	29.5	**100**	B
VOC	4.68	4.7	**100**	B
HAP (single)	>20	3.666	**10**	SM
Total HAP	>25	12.68	**25**	SM

Based on the uncontrolled PTE summarized in Table 2 and controlled PTE summarized above and in Table 3, Table 6, and Appendix A, the permittee will be a "synthetic minor" source of PM, PM_{10}, $PM_{2.5}$, and HAP emissions for new source review and Title V (Tier I) permitting purposes. The uncontrolled PTE for the remaining criteria pollutants (SO_2, NO_x, CO, VOC) confirm Midas Gold will be a natural minor source for these emissions.

Permit to Construct (IDAPA 58.01.01.201)

The permittee has requested that a PTC be issued to the facility for the proposed new emission sources. Therefore, a permit to construct is required in accordance with IDAPA 58.01.01.201. This permitting action was processed in accordance with the procedures of IDAPA 58.01.01.200-228.

Tier II Operating Permit (IDAPA 58.01.01.401)

IDAPA 58.01.01.401 ..... Tier II Operating Permit

The application was submitted for a permit to construct (refer to the Permit to Construct (IDAPA 58.01.01.201) section), and an optional Tier II operating permit has not been requested. Therefore, the procedures of IDAPA 58.01.01.400–410 were not applicable to this permitting action.

Subsection 210.20 (IDAPA 58.01.01.210.20)

IDAPA 58.01.01.210.20..... NSPS and NESHAP Sources

No demonstration of compliance with the TAP provisions is required to obtain a PTC or to demonstrate PTC exemption criteria for a new source or for modification of an existing source if the TAP is also a listed HAP from:

- *The equipment or activity covered by a NSPS or NESHAP; or*
- *The source category of equipment or activity addressed by a NSPS or NESHAP even if the equipment or activity is not subject to compliance requirements under the federal rule.*

Emission sources covered or addressed by NSPS or NESHAP are identified in the following table, and guidance on interpretation of "addressed" is provided in Appendix F. Each emission source and activity listed in the table is addressed by the corresponding NSPS and NESHAP. For the sources identified, emissions of TAP that are also HAP (HAP TAP) were excluded from TAP compliance demonstrations (i.e., excluded from comparison to TAP EL and from modeling to demonstrate compliance with TAP AAC/AACC, as discussed in the Ambient Air Quality Impact Analyses).

Table 8 NSPS and NESHAP Sources

NESHAP / NSPS	Source Category Subject & Addressed	Sources
NESHAP Subpart ZZZZ [a] NSPS Subpart IIII	Any industry using a stationary internal combustion engine	*Emergency Power Generation* EDG1, EDG2, EDG3, EDFP
NESHAP Subpart AAAAA [a] NSPS Subpart HH	Any lime manufacturing plant	*Lime Production* LK, LKC, LS1–LS12, LSBM, LS-L/U, LCR, LS1-L/U, MillS2-L/U, and ACS1-4-L/U
NESHAP Subpart DDDDD [a] NESHAP Subpart JJJJJJ [a] NSPS Subpart Dc etc.	Any facility using a boiler or process heater (indirect fire)	*Process Heating* ACB, CKB, PV, HS [b]
NESHAP Subpart CCCCCC [a]	Any gasoline dispensing facility Includes any operation that transfers and stores gasoline	*Gasoline Fuel Storage and Dispensing* TG1–TG2
NESHAP Subpart EEEEEEE [a]	Gold ore mining Includes an establishment engaged in developing the mine site, mining, and/or beneficiating ores valued chiefly for their gold content, or in transformation of gold into bullion or doré bar in combination with mining activities	*Mining* drilling, blasting, excavating, hauling, prill silos, rock dumps and storage piles, tailings *Ore Processing* OC1–OC13 [b] *Ore Concentration and Refining* CIP Leach 1–4, CIL 1–6, CIP 1–6, CN Detox 1–2, AC, EW, MR, MF, CKD *Process Heating* ACB, CKB, PV, HS [b]
NSPS Subpart LL	Any metallic mineral plant Includes any combination of equipment that extracts aluminum, copper, gold, iron, lead, molybdenum, silver, titanium, tungsten, uranium, zinc, and zirconium	*Ore Processing* OC1–OC13 [b]
NSPS Subpart OOO	Any nonmetallic mineral plant Includes plants processing crushed and broken stone, crushed and broken limestone, lime plants, sand and gravel, clay, etc.	*Aggregate Production* PCSP1, PCSP2 *Concrete Production* CA-L/U *Lime Production* LK, LKC, LS1–LS12, LSBM, LS-L/U, LCR, LS1-L/U, MillS2-L/U, and ACS1-4-L/U [b]
Source category that may not be subject to and may not be addressed by NSPS or NESHAP		*Concrete Production* CM, CS1-L/U, CS2-L/U *Heating, Ventilation, and Air Conditioning* H1M–H2M, HM, HAC, HR, HA, HMO, HTS, HW

a) NESHAP in 40 CFR 63.
b) Ore Processing emission sources are addressed by both the gold ore mining and metallic mineral plant source categories, Process Heating emission sources are addressed by both the gold ore mining and boiler/process heater source categories, and Lime Production emission sources are addressed by both the lime production and nonmetallic mineral processing plant source categories.

After exclusion of sources addressed by NSPS and/or NESHAP, concrete production (central mixer, cement/shotcrete silos, aggregate bin) and heating, ventilation, and air conditioning (HVAC) units comprise the remaining sources that are applicable to compliance with TAP provisions. Emissions of each TAP from these sources (non-NESHAP-addressed) were estimated and compared to the applicable screening emission level (as summarized in Table 6).

Mercury Emission Standard (IDAPA 58.01.01.215)

IDAPA 58.01.01.215..... Mercury Emission Standard for New or Modified Sources

No owner or operator may commence construction or modification of a stationary source or facility that results in an increase in annual potential emissions of mercury of 25 pounds or more unless the owner or operator has obtained a PTC under Sections 200–228 of the Rules. The PTC application shall include an MBACT analysis for the new or modified source or sources for review and approval by DEQ. A determination of applicability under Section 215 shall be based upon the best available information.

Fugitive emissions shall not be included in a determination of applicability under Section 215.

New or modified stationary sources within a source category subject to 40 CFR 63 are exempt from the requirements of Section 215.

IDAPA 58.01.01.215 sets requirements for mercury emissions. For this standard, fugitive emissions and sources in a source category subject to 40 CFR 63 are exempt. As identified in Table 8, emission sources within a source category subject to NESHAP 40 CFR 63, including Subpart ZZZZ, Subpart AAAAA, Subpart CCCCCC, and Subpart EEEEEEE were therefore exempt from this standard. Although non-applicable to area sources of HAP such as Midas Gold, as a source category lime manufacturing plants are subject to NESHAP 40 CFR 63, Subpart AAAAA and associated sources (identified in Table 8) therefore exempt from this standard. Fugitive emissions from drilling, blasting, excavating, roadways (hauling), dozing, grading, storage piles, tailings and other fugitive and mobile emission sources were also exempt from this standard. Refer to the MACT/GACT Applicability (40 CFR 63) section for regulatory applicability analysis. No mercury emissions are expected from fuel storage, emergency power generation, and fire suppression sources.

After exclusion of sources within a source category subject to an area source NESHAP (40 CFR 63), aggregate production (crushers, screens, and conveyors), concrete production (aggregate bin), and heating, ventilation, and air conditioning (HVAC) units comprise the remaining sources that are applicable to the Mercury Emission Standard. Mercury emissions from these sources (non-fugitive and non-NESHAP-addressed) were estimated at less than 0.041 pounds per year (lb/yr), below the level at which MBACT review is required. Mercury emissions from propane combustion in HVAC sources are uncontrolled. Mercury emissions from materials processed in aggregate production and concrete production are controlled via water sprays and moisture carryover. As such controls are required for the portable crushing and screening plant, central mixer, and cement/shotcrete silos (Permit Conditions 2.1–2.8, 5.9, 5.10, and 5.15).

For the autoclave, electrowinning cells and pregnant solution tank, mercury retort, and induction melting furnace refinery sources (AC, EW, MR, MF) with enforceable NESHAP Subpart EEEEEEE mercury emission limits, potential emissions estimates (PTE) calculated consistent with these limits were included in the facility-wide mercury emission totals in Table 6. These values were substituted in lieu of the controlled emission estimates referenced from Table B1-W3 of Appendix B to the HAP/TAP addendum and 'TblB1' worksheet in the supporting spreadsheet. Although the mercury emissions from these sources are ultimately not included in the adjusted mercury emission totals for the purposes of the Mercury Emission Standard, these were used for the purposes of estimating HAP PTE consistent with enforceable limits.

Particulate Matter – New Equipment Process Weight Limitations (IDAPA 58.01.01.701)

IDAPA 58.01.01.701 ..... Particulate Matter – New Equipment Process Weight Limitations

IDAPA 58.01.01.700 through 703 set PM emission limits for process equipment based on when the piece of equipment commenced operation and the piece of equipment's process weight (PW) in pounds per hour (lb/hr). IDAPA 58.01.01.701 establishes PM emission limits for equipment that commenced operation on or after October 1, 1979.

For equipment commencing operation on or after October 1, 1979, the PM allowable emission rate (E) is based on one of the following equations:

IDAPA 58.01.01.701.01.a: If PW is $< 9{,}250$ lb/hr; $E = 0.045\ (PW)^{0.60}$

IDAPA 58.01.01.701.01.b: If PW is $\geq 9{,}250$ lb/hr; $E = 1.10\ (PW)^{0.25}$

For the new ore processing, ore concentration and refining, lime production, aggregate production, and concrete production equipment sources (Table 1) emissions (E) were calculated at the proposed maximum throughput rates (Table 1), and estimated emissions from all sources demonstrated compliance with this requirement. Compliance with operational and material throughput limits (Permit Conditions 3.3–3.8, 4.5–4.12, and 5.4–5.8) and control equipment requirements (Permit Conditions 2.6, 3.9–3.11, 4.13–4.17, and 5.9–5.15) assure compliance with this standard, resulting in much lower emission rates.

Title V Classification (IDAPA 58.01.01.300, 40 CFR Part 70)

IDAPA 58.01.01.301 ..... Requirement to Obtain Tier I Operating Permit

Any source subject to 40 CFR 63, Subpart EEEEEEE is a Tier I source as defined in IDAPA 58.01.01.006.122.c. In accordance with IDAPA 58.01.01.313.01.b., the permittee must submit a complete application to DEQ for an initial Tier I operating permit within 12 months of becoming a Tier I source.

Midas Gold has committed to applying for a Tier I permit. Detailed federal regulatory applicability were provided in the PTC application, and specific federally-applicable requirements will be incorporated into the Tier I. Refer to the NSPS Applicability (40 CFR 60), NESHAP Applicability (40 CFR 61), and MACT/GACT Applicability (40 CFR 63) sections below for additional information regarding applicable requirements.

Post-project facility-wide emissions from this facility do not have a PTE greater than 100 tons per year for criteria pollutants or 10 tons per year for any one HAP or 25 tons per year for all HAP combined as demonstrated previously in the Emissions Inventories section of this analysis. Although not a major facility as defined in IDAPA 58.01.01.008.10, any source subject to 40 CFR 63, Subpart EEEEEEE is a Tier I source as defined in IDAPA 58.01.01.006.122.c. In accordance with IDAPA 58.01.01.313.01.b., the permittee must submit a complete application to DEQ for an initial Tier I operating permit within 12 months of becoming a Tier I source. Refer to the NESHAP Applicability (40 CFR 61) section for additional discussion of Subpart EEEEEEE applicability.

Permit Condition 2.24 incorporates the requirement to obtain a Tier I permit in accordance with IDAPA 58.01.01.313.01.b.

PSD Classification (40 CFR 52.21)

40 CFR 52.21 ..... Prevention of Significant Deterioration of Air Quality

The facility is not a major stationary source as defined in 40 CFR 52.21(b)(1), nor is it undergoing any physical change at a stationary source not otherwise qualifying under paragraph 40 CFR 52.21(b)(1) as a major stationary source which would constitute a major stationary source by itself as defined in 40 CFR 52. PSD requirements were therefore not applicable to this permitting action in accordance with 40 CFR 52.21(a)(2).

The facility includes a lime manufacturing plant (LMP) that uses a Parallel Flow Regenerative Shaft Kiln (LK, LKC) to produce lime product from limestone by calcination, which is a designated facility as defined in 40 CFR 52.21(b)(1)(i)(a). For each criteria pollutant, LMP emissions do not exceed 100 T/yr and facility-wide emissions do not exceed 250 T/yr.

NSPS Applicability (40 CFR 60)

The permittee has affected facilities subject to New Source Performance Standards (NSPS). The POX Boiler (ACB) meets the definition of process heater rather than steam generating unit, and the use of a rotary lime kiln has not been proposed in the production of lime; therefore Subpart Dc and Subpart HH are not applicable. Initial regulatory applicability analyses and determinations are provided below; detailed analyses and explicit incorporation of applicable requirements is left to the required Tier I permit action as discussed in the Title V Classification (IDAPA 58.01.01.300, 40 CFR Part 70) section.

- Standards of Performance for New Stationary Sources (NSPS) 40 CFR 60, Subpart A – General Provisions. DEQ is delegated this Subpart.

- NSPS 40 CFR 60, Subpart LL – Standards of Performance for Metallic Mineral Processing Plants. DEQ is delegated this Subpart. Each crusher, conveyor belt transfer point, and truck unloading station is an affected facility.
- NSPS 40 CFR 60, Subpart OOO – Standards of Performance for Nonmetallic Mineral Processing Plants. DEQ is delegated this Subpart. Each crusher, grinding mill, screening operation, belt conveyor, and storage bin is an affected facility.
- NSPS 40 CFR 60, Subpart IIII – Standards of Performance for Stationary Compression Ignition Internal Combustion Engines. DEQ is delegated this Subpart. Each emergency generator engine and fire pump is an affected facility.

Emission sources regulated by Subpart LL, Subpart OOO, and Subpart IIII are identified in the incorporation of federal requirements condition (Permit Condition 2.22)

40 CFR 60, Subpart A ..... General Provisions

§60.1 ..... Applicability

(a) Except as provided in subparts B and C, the provisions of this part apply to the owner or operator of any stationary source which contains an affected facility, the construction or modification of which is commenced after the date of publication in this part of any standard (or, if earlier, the date of publication of any proposed standard) applicable to that facility.

(b) Any new or revised standard of performance promulgated pursuant to section 111(b) of the Act shall apply to the owner or operator of any stationary source which contains an affected facility, the construction or modification of which is commenced after the date of publication in this part of such new or revised standard (or, if earlier, the date of publication of any proposed standard) applicable to that facility.

Because the permittee will own or operate NSPS affected facilities, which have been proposed to commence construction after the date of publication of the relevant applicable NSPS standards (as listed above), general provisions in Subpart A are applicable.

40 CFR 60, Subpart A is incorporated by reference into Permit Condition 2.22, and specific applicable requirements will be incorporated into the Tier I operating permit.

40 CFR 60, Subpart Dc ..... Standards of Performance for Small Industrial-Commercial-Institutional Steam Generating Units

§60.40c ..... Applicability and delegation of authority.

(a) Except as provided in paragraphs (d), (e), (f), and (g) of this section, the affected facility to which this subpart applies is each steam generating unit for which construction, modification, or reconstruction is commenced after June 9, 1989 and that has a maximum design heat input capacity of 29 megawatts (MW) (100 million British thermal units per hour (MMBtu/h)) or less, but greater than or equal to 2.9 MW (10 MMBtu/h).

§60.41c ..... Definitions.

As used in this subpart, all terms not defined herein shall have the meaning given them in the Clean Air Act and in subpart A of this part.

...

Heat input *means heat derived from combustion of fuel in a steam generating unit and does not include the heat derived from preheated combustion air, recirculated flue gases, or exhaust gases from other sources (such as stationary gas turbines, internal combustion engines, and kilns).*

Heat transfer medium *means any material that is used to transfer heat from one point to another point.*

...

Process heater *means a device that is primarily used to heat a material to initiate or promote a chemical reaction in which the material participates as a reactant or catalyst.*

…

Steam generating unit *means a device that combusts any fuel and produces steam or heats water or heats any heat transfer medium. This term includes any duct burner that combusts fuel and is part of a combined cycle system. This term does not include process heaters as defined in this subpart.*

Although the Pressure Oxidation Boiler (POX Boiler) is between 10 and 100 MMBtu/hr in design heat input capacity (17 MMBtu/hr) and is proposed for construction after June 9, 1989, it meets the definition of process heater rather than steam generating unit, and therefore is not applicable to this subpart. The POX Boiler (ACB) is a device used to directly heat ore material via steam injection into the autoclave, to promote chemical oxidation reactions in which the heated ore participates as a reactant. DEQ is delegated this Subpart.

40 CFR 60, Subpart HH ..... Standards of Performance for Lime Manufacturing Plants

§60.340 ..... Applicability and designation of affected facility.

(a) The provisions of this subpart are applicable to each rotary lime kiln used in the manufacture of lime.

(b) The provisions of this subpart are not applicable to facilities used in the manufacture of lime at kraft pulp mills.

(c) Any facility under paragraph (a) of this section that commences construction or modification after May 3, 1977, is subject to the requirements of this subpart.

§60.341 ..... Definitions.

As used in this subpart, all terms not defined herein shall have the same meaning given them in the Act and in the General Provisions.

(a) Lime manufacturing plant *means any plant which uses a rotary lime kiln to produce lime product from limestone by calcination.*

(b) Lime product *means the product of the calcination process including, but not limited to, calcitic lime, dolomitic lime, and dead-burned dolomite.*

(c) Positive-pressure fabric filter *means a fabric filter with the fans on the upstream side of the filter bags.*

(d) Rotary lime kiln *means a unit with an inclined rotating drum that is used to produce a lime product from limestone by calcination.*

(e) Stone feed *means limestone feedstock and mill scale or other iron oxide additives that become part of the product.*

The use of a rotary lime kiln has not been proposed in the production of lime, and therefore the requirements of Subpart HH are not applicable. DEQ is delegated this Subpart.

40 CFR 60, Subpart LL ..... Standards of Performance for Metallic Mineral Processing Plants

§60.380 ..... Applicability and designation of affected facility.

(a) The provisions of this subpart are applicable to the following affected facilities in metallic mineral processing plants: Each crusher and screen in open-pit mines; each crusher, screen, bucket elevator, conveyor belt transfer point, thermal dryer, product packaging station, storage bin, enclosed storage area, truck loading station, truck unloading station, railcar loading station, and railcar unloading station at the mill or concentrator with the following exceptions. All facilities located in underground mines are exempted from the provisions of this subpart. At uranium ore processing plants, all facilities subsequent to and including the beneficiation of uranium ore are exempted from the provisions of this subpart.

(b) An affected facility under paragraph (a) of this section that commences construction or modification after August 24, 1982, is subject to the requirements of this part.

Because the permittee will own or operate a metallic mineral processing plant with a crusher at an open-pit mine; with crushers, conveyor belt transfer points, and truck unloading stations at the mill or concentrator; and because these are proposed to commence construction after August 24, 1982, requirements in Subpart LL are applicable.

40 CFR 60, Subpart LL is incorporated by reference into Permit Condition 2.22, and specific applicable requirements will be incorporated into the Tier I operating permit.

40 CFR 60, Subpart OOO ..... Standards of Performance for Nonmetallic Mineral Processing Plants

§60.670 ..... Applicability and designation of affected facility.

(a)(1) Except as provided in paragraphs (a)(2), (b), (c), and (d) of this section, the provisions of this subpart are applicable to the following affected facilities in fixed or portable nonmetallic mineral processing plants: each crusher, grinding mill, screening operation, bucket elevator, belt conveyor, bagging operation, storage bin, enclosed truck or railcar loading station. Also, crushers and grinding mills at hot mix asphalt facilities that reduce the size of nonmetallic minerals embedded in recycled asphalt pavement and subsequent affected facilities up to, but not including, the first storage silo or bin are subject to the provisions of this subpart.

(2) The provisions of this subpart do not apply to the following operations: All facilities located in underground mines; plants without crushers or grinding mills above ground; and wet material processing operations (as defined in §60.671).

(b) An affected facility that is subject to the provisions of subparts F or I of this part or that follows in the plant process any facility subject to the provisions of subparts F or I of this part is not subject to the provisions of this subpart.

(c) Facilities at the following plants are not subject to the provisions of this subpart:

(1) Fixed sand and gravel plants and crushed stone plants with capacities, as defined in §60.671, of 23 megagrams per hour (25 tons per hour) or less;

(2) Portable sand and gravel plants and crushed stone plants with capacities, as defined in §60.671, of 136 megagrams per hour (150 tons per hour) or less; and

(3) Common clay plants and pumice plants with capacities, as defined in §60.671, of 9 megagrams per hour (10 tons per hour) or less.

(d)(1) When an existing facility is replaced by a piece of equipment of equal or smaller size, as defined in §60.671, having the same function as the existing facility, and there is no increase in the amount of emissions, the new facility is exempt from the provisions of §§60.672, 60.674, and 60.675 except as provided for in paragraph (d)(3) of this section.

(2) An owner or operator complying with paragraph (d)(1) of this section shall submit the information required in §60.676(a).

(3) An owner or operator replacing all existing facilities in a production line with new facilities does not qualify for the exemption described in paragraph (d)(1) of this section and must comply with the provisions of §§60.672, 60.674 and 60.675.

(e) An affected facility under paragraph (a) of this section that commences construction, modification, or reconstruction after August 31, 1983, is subject to the requirements of this part.

(f) Table 1 of this subpart specifies the provisions of subpart A of this part 60 that do not apply to owners and operators of affected facilities subject to this subpart or that apply with certain exceptions.

Because the project contains crushers, grinding mills, screening operations, belt conveyors, and storage bins in a fixed or portable nonmetallic mineral processing plant, which are proposed to commence construction after August 31, 1983, requirements in Subpart OOO are applicable. The portable crushing and screening plants (PCSP1, PCSP2) will be rated at below 150 tons per hour (T/hr), and are therefore not subject to the provisions of Subpart OOO.

40 CFR 60, Subpart OOO is incorporated by reference into Permit Condition 2.22, and specific applicable requirements will be incorporated into the Tier I operating permit.

40 CFR 60, Subpart IIII..... Standards of Performance for Stationary Compression Ignition Internal Combustion Engines

§60.4200..... Am I subject to this subpart?

(a) The provisions of this subpart are applicable to manufacturers, owners, and operators of stationary compression ignition (CI) internal combustion engines (ICE) and other persons as specified in paragraphs (a)(1) through (4) of this section. For the purposes of this subpart, the date that construction commences is the date the engine is ordered by the owner or operator.

(1) Manufacturers of stationary CI ICE with a displacement of less than 30 liters per cylinder where the model year is:

(i) 2007 or later, for engines that are not fire pump engines;

(ii) The model year listed in Table 3 to this subpart or later model year, for fire pump engines.

(2) Owners and operators of stationary CI ICE that commence construction after July 11, 2005, where the stationary CI ICE are:

(i) Manufactured after April 1, 2006, and are not fire pump engines, or

(ii) Manufactured as a certified National Fire Protection Association (NFPA) fire pump engine after July 1, 2006.

(3) Owners and operators of any stationary CI ICE that are modified or reconstructed after July 11, 2005 and any person that modifies or reconstructs any stationary CI ICE after July 11, 2005.

(4) The provisions of §60.4208 of this subpart are applicable to all owners and operators of stationary CI ICE that commence construction after July 11, 2005.

(b) The provisions of this subpart are not applicable to stationary CI ICE being tested at a stationary CI ICE test cell/stand.

(c) If you are an owner or operator of an area source subject to this subpart, you are exempt from the obligation to obtain a permit under 40 CFR part 70 or 40 CFR part 71, provided you are not required to obtain a permit under 40 CFR 70.3(a) or 40 CFR 71.3(a) for a reason other than your status as an area source under this subpart. Notwithstanding the previous sentence, you must continue to comply with the provisions of this subpart applicable to area sources.

(d) Stationary CI ICE may be eligible for exemption from the requirements of this subpart as described in 40 CFR part 1068, subpart C (or the exemptions described in 40 CFR part 89, subpart J and 40 CFR part 94, subpart J, for engines that would need to be certified to standards in those parts), except that owners and operators, as well as manufacturers, may be eligible to request an exemption for national security.

(e) Owners and operators of facilities with CI ICE that are acting as temporary replacement units and that are located at a stationary source for less than 1 year and that have been properly certified as meeting the standards that would be applicable to such engine under the appropriate nonroad engine provisions, are not required to meet any other provisions under this subpart with regard to such engines.

Because the permittee will own or operate compression ignition (CI) internal combustion engines (ICE) which are proposed to commence construction after July 11, 2005 and which will be ordered after April 1, 2006 for the emergency generator engines, and which will be ordered after July 1, 2006 for the fire pump engine, requirements in Subpart IIII are applicable. The permittee has not requested or qualified for exemption pursuant to §60.4200(b), (d), or (e).

40 CFR 60, Subpart IIII is incorporated by reference into Permit Condition 2.22, and specific applicable requirements will be incorporated into the Tier I operating permit.

NESHAP Applicability (40 CFR 61)

The facility is not subject to any NESHAP requirements in 40 CFR 61.

MACT/GACT Applicability (40 CFR 63)

The permittee has proposed to operate as a minor source of hazardous air pollutant (HAP) emissions, and has affected facilities subject to the following National Emission Standards for Hazardous Air Pollutants (NESHAP). The lime manufacturing plant is proposed at an area source of HAP, and therefore is not applicable to Subpart AAAAA. The process boiler is at an area source of Applicability determinations and regulatory analyses are provided below.

- National Emission Standards for Hazardous Air Pollutants for Source Categories (NESHAP) 40 CFR 63, Subpart A – General Provisions. DEQ is delegated this Subpart for Tier I sources.
- NESHAP 40 CFR 63, Subpart ZZZZ – National Emission Standards for Hazardous Air Pollutants for Stationary Reciprocating Internal Combustion Engines (RICE). DEQ is delegated this Subpart. The emergency generator and fire pump engines (EDG1, EDG2, EDG3, and EDFP) are affected sources.
- NESHAP 40 CFR 63, Subpart CCCCCC – National Emission Standards for Hazardous Air Pollutants for Source Category: Gasoline Dispensing Facilities. DEQ is delegated this Subpart for Tier I sources. The gasoline fuel storage tanks (TG1, TG2) are affected sources.
- NESHAP 40 CFR 63, Subpart EEEEEEE – National Emission Standards for Hazardous Air Pollutants: Gold Mine Ore Processing and Production Area Source Category. DEQ is delegated this Subpart for Tier I sources. The collection of ore pretreatment processes and the carbon process with mercury retort are affected sources. Ore pretreatment processes include the autoclave (AC). Carbon processes with mercury retort include the electrowinning cells and pregnant solution tank (EW), the mercury retort (MR), induction melting furnace (MF), and the carbon regeneration kiln (CKD).

Emission sources regulated by Subpart EEEEEEE, Subpart CCCCCC, and Subpart ZZZZ are identified in the incorporation of federal requirements condition (Permit Condition 2.22)

40 CFR 63, Subpart A ..... General Provisions

§63.1 ..... Applicability.

(a) General. *(1) Terms used throughout this part are defined in §63.2 or in the Clean Air Act (Act) as amended in 1990, except that individual subparts of this part may include specific definitions in addition to or that supersede definitions in §63.2.*

(2) This part contains national emission standards for hazardous air pollutants (NESHAP) established pursuant to section 112 of the Act as amended November 15, 1990. These standards regulate specific categories of stationary sources that emit (or have the potential to emit) one or more hazardous air pollutants listed in this part pursuant to section 112(b) of the Act. This section explains the applicability of such standards to sources affected by them. The standards in this part are independent of NESHAP contained in 40 CFR part 61. The NESHAP in part 61 promulgated by signature of the Administrator before November 15, 1990 (i.e., the date of enactment of the Clean Air Act Amendments of 1990) remain in effect until they are amended, if appropriate, and added to this part.

(3) No emission standard or other requirement established under this part shall be interpreted, construed, or applied to diminish or replace the requirements of a more stringent emission limitation or other applicable requirement established by the Administrator pursuant to other authority of the Act (section 111, part C or D or any other authority of this Act), or a standard issued under State authority. The Administrator may specify in a specific standard under this part that facilities subject to other provisions under the Act need only comply with the provisions of that standard.

(4)(i) Each relevant standard in this part 63 must identify explicitly whether each provision in this subpart A is or is not included in such relevant standard.

(ii) If a relevant part 63 standard incorporates the requirements of 40 CFR part 60, part 61 or other part 63 standards, the relevant part 63 standard must identify explicitly the applicability of each corresponding part 60, part 61, or other part 63 subpart A (General) provision.

(iii) The General Provisions in this subpart A do not apply to regulations developed pursuant to section 112(r) of the amended Act, unless otherwise specified in those regulations.

…

(b) Initial applicability determination for this part. *(1) The provisions of this part apply to the owner or operator of any stationary source that—*

(i) Emits or has the potential to emit any hazardous air pollutant listed in or pursuant to section 112(b) of the Act; and

(ii) Is subject to any standard, limitation, prohibition, or other federally enforceable requirement established pursuant to this part.

(2) [Reserved]

(3) An owner or operator of a stationary source who is in the relevant source category and who determines that the source is not subject to a relevant standard or other requirement established under this part must keep a record as specified in §63.10(b)(3).

Because the permittee will own or operate stationary sources that emit HAP which are subject to standards, limitations, prohibitions, or other federally-enforceable requirements established pursuant to NESHAP, provisions in Subpart A are applicable.

40 CFR 63, Subpart A is incorporated by reference into Permit Condition 2.22, and specific applicable requirements will be incorporated into the Tier I operating permit.

40 CFR 63, Subpart ZZZZ..... National Emissions Standards for Hazardous Air Pollutants for Stationary Reciprocating Internal Combustion Engines

§63.6580..... What is the purpose of subpart ZZZZ?

Subpart ZZZZ establishes national emission limitations and operating limitations for hazardous air pollutants (HAP) emitted from stationary reciprocating internal combustion engines (RICE) located at major and area sources of HAP emissions. This subpart also establishes requirements to demonstrate initial and continuous compliance with the emission limitations and operating limitations.

§63.6585..... Am I subject to this subpart?

You are subject to this subpart if you own or operate a stationary RICE at a major or area source of HAP emissions, except if the stationary RICE is being tested at a stationary RICE test cell/stand.

(a) A stationary RICE is any internal combustion engine which uses reciprocating motion to convert heat energy into mechanical work and which is not mobile. Stationary RICE differ from mobile RICE in that a stationary RICE is not a non-road engine as defined at 40 CFR 1068.30, and is not used to propel a motor vehicle or a vehicle used solely for competition.

(b) A major source of HAP emissions is a plant site that emits or has the potential to emit any single HAP at a rate of 10 tons (9.07 megagrams) or more per year or any combination of HAP at a rate of 25 tons (22.68 megagrams) or more per year, except that for oil and gas production facilities, a major source of HAP emissions is determined for each surface site.

(c) An area source of HAP emissions is a source that is not a major source.

(d) If you are an owner or operator of an area source subject to this subpart, your status as an entity subject to a standard or other requirements under this subpart does not subject you to the obligation to obtain a permit under 40 CFR part 70 or 71, provided you are not required to obtain a permit under 40 CFR 70.3(a) or 40 CFR 71.3(a) for a reason other than your status as an area source under this subpart. Notwithstanding the previous sentence, you must continue to comply with the provisions of this subpart as applicable.

(e) If you are an owner or operator of a stationary RICE used for national security purposes, you may be eligible to request an exemption from the requirements of this subpart as described in 40 CFR part 1068, subpart C.

(f) The emergency stationary RICE listed in paragraphs (f)(1) through (3) of this section are not subject to this subpart. The stationary RICE must meet the definition of an emergency stationary RICE in §63.6675, which includes operating according to the provisions specified in §63.6640(f).

(1) Existing residential emergency stationary RICE located at an area source of HAP emissions that do not operate or are not contractually obligated to be available for more than 15 hours per calendar year for the purposes specified in §63.6640(f)(2)(ii) and (iii) and that do not operate for the purpose specified in §63.6640(f)(4)(ii).

(2) Existing commercial emergency stationary RICE located at an area source of HAP emissions that do not operate or are not contractually obligated to be available for more than 15 hours per calendar year for the purposes specified in §63.6640(f)(2)(ii) and (iii) and that do not operate for the purpose specified in §63.6640(f)(4)(ii).

(3) Existing institutional emergency stationary RICE located at an area source of HAP emissions that do not operate or are not contractually obligated to be available for more than 15 hours per calendar year for the purposes specified in §63.6640(f)(2)(ii) and (iii) and that do not operate for the purpose specified in §63.6640(f)(4)(ii).

Because the permittee will own or operate stationary RICE at an area source of HAP which are subject to standards, limitations, prohibitions, or other federally-enforceable requirements established pursuant to NESHAP, requirements in Subpart ZZZZ are applicable.

40 CFR 63, Subpart ZZZZ is incorporated by reference into Permit Condition 2.22, and specific applicable requirements will be incorporated into the Tier I operating permit.

40 CFR 63, Subpart AAAAA..... National Emission Standards for Hazardous Air Pollutants for Lime Manufacturing Plants

§63.7080..... What is the purpose of this subpart?

This subpart establishes national emission standards for hazardous air pollutants (NESHAP) for lime manufacturing plants. This subpart also establishes requirements to demonstrate initial and continuous compliance with the emission limitations.

§63.7081..... Am I subject to this subpart?

(a) You are subject to this subpart if you own or operate a lime manufacturing plant (LMP) that is a major source, or that is located at, or is part of, a major source of hazardous air pollutant (HAP) emissions, unless the LMP is located at a kraft pulp mill, soda pulp mill, sulfite pulp mill, beet sugar manufacturing plant, or only processes sludge containing calcium carbonate from water softening processes.

(1) An LMP is an establishment engaged in the manufacture of lime product (calcium oxide, calcium oxide with magnesium oxide, or dead burned dolomite) by calcination of limestone, dolomite, shells or other calcareous substances.

(2) A major source of HAP is a plant site that emits or has the potential to emit any single HAP at a rate of 9.07 megagrams (10 tons) or more per year or any combination of HAP at a rate of 22.68 megagrams (25 tons) or more per year from all emission sources at the plant site.

(b) [Reserved]

§63.7143..... What definitions apply to this subpart?

Terms used in this subpart are defined in the Clean Air Act, in §63.2, and in this section as follows:

...

Lime manufacturing plant (LMP) *means any plant which uses a lime kiln to produce lime product from limestone or other calcareous material by calcination.*

Lime product *means the product of the lime kiln calcination process including, calcitic lime, dolomitic lime, and dead-burned dolomite.*

Limestone *means the material comprised primarily of calcium carbonate (referred to sometimes as calcitic or high calcium limestone), magnesium carbonate, and/or the double carbonate of both calcium and magnesium (referred to sometimes as dolomitic limestone or dolomite).*

...

The lime manufacturing plant is proposed at an area source of HAP, and therefore is not subject to this Subpart.

40 CFR 60, Subpart CCCCCC..... National Emission Standards for Hazardous Air Pollutants for Source Category: Gasoline Dispensing Facilities

§63.11110..... What is the purpose of this subpart?

This subpart establishes national emission limitations and management practices for hazardous air pollutants (HAP) emitted from the loading of gasoline storage tanks at gasoline dispensing facilities (GDF). This subpart also establishes requirements to demonstrate compliance with the emission limitations and management practices.

§63.11111..... Am I subject to the requirements in this subpart?

(a) The affected source to which this subpart applies is each GDF that is located at an area source. The affected source includes each gasoline cargo tank during the delivery of product to a GDF and also includes each storage tank.

(b) If your GDF has a monthly throughput of less than 10,000 gallons of gasoline, you must comply with the requirements in §63.11116.

(c) If your GDF has a monthly throughput of 10,000 gallons of gasoline or more, you must comply with the requirements in §63.11117.

(d) If your GDF has a monthly throughput of 100,000 gallons of gasoline or more, you must comply with the requirements in §63.11118.

(e) An affected source shall, upon request by the Administrator, demonstrate that their monthly throughput is less than the 10,000-gallon or the 100,000-gallon threshold level, as applicable. For new or reconstructed affected sources, as specified in §63.11112(b) and (c), recordkeeping to document monthly throughput must begin upon startup of the affected source. For existing sources, as specified in §63.11112(d), recordkeeping to document monthly throughput must begin on January 10, 2008. For existing sources that are subject to this subpart only because they load gasoline into fuel tanks other than those in motor vehicles, as defined in §63.11132, recordkeeping to document monthly throughput must begin on January 24, 2011. Records required under this paragraph shall be kept for a period of 5 years.

(f) If you are an owner or operator of affected sources, as defined in paragraph (a) of this section, you are not required to obtain a permit under 40 CFR part 70 or 40 CFR part 71 as a result of being subject to this subpart. However, you must still apply for and obtain a permit under 40 CFR part 70 or 40 CFR part 71 if you meet one or more of the applicability criteria found in 40 CFR 70.3(a) and (b) or 40 CFR 71.3(a) and (b).

(g) The loading of aviation gasoline into storage tanks at airports, and the subsequent transfer of aviation gasoline within the airport, is not subject to this subpart.

(h) Monthly throughput is the total volume of gasoline loaded into, or dispensed from, all the gasoline storage tanks located at a single affected GDF. If an area source has two or more GDF at separate locations within the area source, each GDF is treated as a separate affected source.

(i) If your affected source's throughput ever exceeds an applicable throughput threshold, the affected source will remain subject to the requirements for sources above the threshold, even if the affected source throughput later falls below the applicable throughput threshold.

(j) The dispensing of gasoline from a fixed gasoline storage tank at a GDF into a portable gasoline tank for the on-site delivery and subsequent dispensing of the gasoline into the fuel tank of a motor vehicle or other gasoline-fueled engine or equipment used within the area source is only subject to §63.11116 of this subpart.

(k) For any affected source subject to the provisions of this subpart and another Federal rule, you may elect to comply only with the more stringent provisions of the applicable subparts. You must consider all provisions of the rules, including monitoring, recordkeeping, and reporting. You must identify the affected source and provisions with which you will comply in your Notification of Compliance Status required under §63.11124. You also must demonstrate in your Notification of Compliance Status that each provision with which you will comply is at least as stringent as the otherwise applicable requirements in this subpart. You are responsible for making accurate determinations concerning the more stringent provisions, and noncompliance with this rule is not excused if it is later determined that your determination was in error, and, as a result, you are violating this subpart. Compliance with this rule is your responsibility and the Notification of Compliance Status does not alter or affect that responsibility.

§63.11132..... What definitions apply to this subpart?

As used in this subpart, all terms not defined herein shall have the meaning given them in the Clean Air Act (CAA), or in subparts A and BBBBBB of this part. For purposes of this subpart, definitions in this section supersede definitions in other parts or subparts.

Dual-point vapor balance system *means a type of vapor balance system in which the storage tank is equipped with an entry port for a gasoline fill pipe and a separate exit port for a vapor connection.*

Gasoline *means any petroleum distillate or petroleum distillate/alcohol blend having a Reid vapor pressure of 27.6 kilopascals or greater, which is used as a fuel for internal combustion engines.*

Gasoline cargo tank *means a delivery tank truck or railcar which is loading or unloading gasoline, or which has loaded or unloaded gasoline on the immediately previous load.*

Gasoline dispensing facility (GDF) *means any stationary facility which dispenses gasoline into the fuel tank of a motor vehicle, motor vehicle engine, nonroad vehicle, or nonroad engine, including a nonroad vehicle or nonroad engine used solely for competition. These facilities include, but are not limited to, facilities that dispense gasoline into on- and off-road, street, or highway motor vehicles, lawn equipment, boats, test engines, landscaping equipment, generators, pumps, and other gasoline-fueled engines and equipment.*

Monthly throughput *means the total volume of gasoline that is loaded into, or dispensed from, all gasoline storage tanks at each GDF during a month. Monthly throughput is calculated by summing the volume of gasoline loaded into, or dispensed from, all gasoline storage tanks at each GDF during the current day, plus the total volume of gasoline loaded into, or dispensed from, all gasoline storage tanks at each GDF during the previous 364 days, and then dividing that sum by 12.*

Motor vehicle *means any self-propelled vehicle designed for transporting persons or property on a street or highway.*

Nonroad engine *means an internal combustion engine (including the fuel system) that is not used in a motor vehicle or a vehicle used solely for competition, or that is not subject to standards promulgated under section 7411 of this title or section 7521 of this title.*

Nonroad vehicle *means a vehicle that is powered by a nonroad engine, and that is not a motor vehicle or a vehicle used solely for competition.*

Submerged filling *means, for the purposes of this subpart, the filling of a gasoline storage tank through a submerged fill pipe whose discharge is no more than the applicable distance specified in §63.11117(b) from the bottom of the tank. Bottom filling of gasoline storage tanks is included in this definition.*

Vapor balance system *means a combination of pipes and hoses that create a closed system between the vapor spaces of an unloading gasoline cargo tank and a receiving storage tank such that vapors displaced from the storage tank are transferred to the gasoline cargo tank being unloaded.*

Vapor-tight *means equipment that allows no loss of vapors. Compliance with vapor-tight requirements can be determined by checking to ensure that the concentration at a potential leak source is not equal to or greater than 100 percent of the Lower Explosive Limit when measured with a combustible gas detector, calibrated with propane, at a distance of 1 inch from the source.*

Vapor-tight gasoline cargo tank *means a gasoline cargo tank which has demonstrated within the 12 preceding months that it meets the annual certification test requirements in §63.11092(f) of this part.*

Because the permittee will own or operate a gasoline dispensing facility (GDF) at an area source of HAP, requirements in Subpart CCCCCC are applicable. Because the permittee has committed to loading and dispensing of less than 100,000 gallons of gasoline per month (gal/mo), the requirements of 40 CFR 63.11117 will become applicable in accordance with 40 CFR 63.11111(b) and (c). Gasoline loading and dispensing is limited by Permit Condition 2.18 to avoid requirements applicable to GDF exceeding 100,000 gal/mo, and requires recordkeeping in accordance with 40 CFR 63.11111(e).

40 CFR 63, Subpart CCCCCC is incorporated by reference into Permit Condition 2.22, and specific applicable requirements will be incorporated into the Tier I operating permit.

40 CFR 63, Subpart EEEEEEE..... National Emission Standards for Hazardous Air Pollutants: Gold Mine Ore Processing and Production Area Source Category

§40 CFR 63.11640..... Am I subject to this subpart?

(a) You are subject to this subpart if you own or operate a gold mine ore processing and production facility as defined in §63.11651, that is an area source.

(b) This subpart applies to each new or existing affected source. The affected sources are each collection of "ore pretreatment processes" at a gold mine ore processing and production facility, each collection of "carbon processes with mercury retorts" at a gold mine ore processing and production facility, each collection of "carbon processes without mercury retorts" at a gold mine ore processing and production facility, and each collection of "non-carbon concentrate processes" at a gold mine ore processing and production facility, as defined in §63.11651.

(1) An affected source is existing if you commenced construction or reconstruction of the affected source on or before April 28, 2010.

(2) An affected source is new if you commenced construction or reconstruction of the affected source after April 28, 2010.

(c) This subpart does not apply to research and development facilities, as defined in section 112(c)(7) of the Clean Air Act (CAA).

(d) If you own or operate a source subject to this subpart, you must have or you must obtain a permit under 40 CFR part 70 or 40 CFR part 71.

§40 CFR 63.11651..... What definitions apply to this subpart?

Terms used in this subpart are defined in the Clean Air Act, in §63.2, and in this section as follows:

Autoclave *means a pressure oxidation vessel that is used to treat gold ores (primarily sulfide refractory ore) and involves pumping a slurry of milled ore into the vessel which is highly pressurized with oxygen and heated to temperatures of approximately 350° to 430 °F.*

Calomel-based mercury control system *means a mercury emissions control system that uses scrubbers to remove mercury from the gas stream of a roaster or combination of roasters by complexing the mercury from the gas stream with mercuric chloride to form mercurous chloride (calomel). These scrubbers are also referred to as "mercury scrubbers."*

Carbon adsorber *means a control device consisting of a single fixed carbon bed, multiple carbon beds or columns, carbon filter packs or modules, and other variations that uses activated carbon to remove pollutants from a gas stream.*

Carbon kiln *means a kiln or furnace where carbon is regenerated by heating, usually in the presence of steam, after the gold has been stripped from the carbon.*

Carbon processes with mercury retorts *means the affected source that includes carbon kilns, preg tanks, electrowinning cells, mercury retorts, and melt furnaces at gold mine ore processing and production facilities that use activated carbon, or resins that can be used as a substitute for activated carbon, to recover (adsorb) gold from the pregnant cyanide solution.*

Carbon processes without mercury retorts *means the affected source that includes carbon kilns, preg tanks, electrowinning cells, and melt furnaces, but has no retorts, at gold mine ore processing and production facilities that use activated carbon, or resins that can be used as a substitute for activated carbon, to recover (adsorb) gold from the pregnant cyanide solution.*

Concentrate *means the sludge-like material that is loaded with gold along with various other metals (such as silver, copper, and mercury) and various other substances, that is produced by electrowinning, the Merrill-Crowe process, flotation and gravity separation processes. Concentrate is measured as the input to mercury retorts, or for facilities without mercury retorts, as the input to melt furnaces before any drying takes place. For facilities without mercury retorts or melt furnaces, concentrate is measured as the quantity shipped.*

Deviation *means any instance where an affected source subject to this subpart, or an owner or operator of such a source:*

(1) Fails to meet any requirement or obligation established by this subpart, including but not limited to any emissions limitation or work practice standard;

(2) Fails to meet any term or condition that is adopted to implement an applicable requirement in this subpart and that is included in the operating permit for any affected source required to obtain such a permit; or

(3) Exceeds any operating limit established under this subpart.

Electrowinning *means a process that uses induced voltage on anode and cathode plates to remove metals from the continuous flow of solution, where the gold in solution is plated onto the cathode. Steel wool is typically used as the plating surface.*

Electrowinning Cells *means a tank in which the electrowinning takes place.*

Gold mine ore processing and production facility *means any industrial facility engaged in the processing of gold mine ore that uses any of the following processes: Roasting operations, autoclaves, carbon kilns, preg tanks, electrowinning, mercury retorts, or melt furnaces. Laboratories (see CAA section 112(c)(7)), individual prospectors, and very small pilot scale mining operations that processes or produces less than 100 pounds of concentrate per year are not a gold mine ore processing and production facility. A facility that produces primarily metals other than gold, such as copper, lead, zinc, or nickel (where these metals other than gold comprise 95 percent or more of the total metal production) that may also recover some gold as a byproduct is not a gold mine ore processing and production facility. Those facilities whereby 95 percent or more of total mass of metals produced are metals other than gold, whether final metal production is onsite or offsite, are not part of the gold mine ore processing and production source category.*

Melt furnace *means a furnace (typically a crucible furnace) that is used for smelting the gold-bearing material recovered from mercury retorting, or the gold-bearing material from electrowinning, the Merrill-Crowe process, or other processes for facilities without mercury retorts.*

Mercury retort *means a vessel that is operated under a partial vacuum at approximately 1,100° to 1,300 °F to remove mercury and moisture from the gold bearing sludge material that is recovered from electrowinning, the Merrill-Crowe process, or other processes. Mercury retorts are usually equipped with condensers that recover liquid mercury during the processing.*

Merrill-Crowe process *means a precipitation technique using zinc oxide for removing gold from a cyanide solution. Zinc dust is added to the solution, and gold is precipitated to produce a concentrate.*

Non-carbon concentrate processes *means the affected source that includes mercury retorts and melt furnaces at gold mine ore processing and production facilities that use the Merrill-Crowe process or other processes and do not use carbon (or resins that substitute for carbon) to recover (adsorb) gold from the pregnant cyanide solution.*

Ore dry grinding *means a process in which the gold ore is ground and heated (dried) prior to additional preheating or prior to entering the roaster.*

Ore preheating *means a process in which ground gold ore is preheated prior to entering the roaster.*

Ore pretreatment processes *means the affected source that includes roasting operations and autoclaves that are used to pre-treat gold mine ore at gold mine ore processing and production facilities prior to the cyanide leaching process.*

Pregnant solution tank (or preg tank) *means a storage tank for pregnant solution, which is the cyanide solution that contains gold-cyanide complexes that is generated from leaching gold ore with cyanide solution.*

Pregnant cyanide solution *means the cyanide solution that contains gold-cyanide complexes that are generated from leaching gold ore with a dilute cyanide solution.*

Quenching *means a process in which the hot calcined ore is cooled and quenched with water after it leaves the roaster.*

Roasting operation *means a process that uses an industrial furnace in which milled ore is combusted across a fluidized bed to oxidize and remove organic carbon and sulfide mineral grains in refractory gold ore. The emissions points of the roasting operation subject to this subpart include ore dry grinding, ore preheating, the roaster stack, and quenching.*

Because the permittee will own or operate a gold mine ore processing and production facility at an area source of HAP, requirements in Subpart EEEEEEE are applicable. The collection of ore pretreatment processes and the carbon process with mercury retort are affected sources. Ore pretreatment processes include the autoclave (AC). Carbon processes with mercury retort include the electrowinning cells and pregnant solution tank (EW), the mercury retort (MR), induction melting furnace (MF), and the carbon regeneration kiln (CKD).

Any source subject to 40 CFR 63, Subpart EEEEEEE is a Tier I source as defined in IDAPA 58.01.01.006.122.c. In accordance with IDAPA 58.01.01.313.01.b., the permittee must submit a complete application to DEQ for an initial Tier I operating permit within 12 months of becoming a Tier I source.

This subpart includes mercury emissions limits for the collection of new ore pretreatment processes and for the new carbon processes with mercury retort. This subpart also requires weight measurement devices for measuring ore throughput for the autoclave (AC) and mineral-bearing solution throughput for the electrowinning cells and pregnant solution tank (EW). Requires monitoring of mercury emissions, and monitoring of either inlet gas temperature for each process unit with a carbon filter (EW, MR, MF, CKD) or both water flow and pressure drop for each process unit with a wet scrubber not followed by a carbon filter (AC).

40 CFR 63, Subpart EEEEEEE is incorporated by reference into Permit Condition 2.22, and specific applicable requirements will be incorporated into the Tier I operating permit.

Permit Conditions Review

This section describes the permit conditions for this initial permit.

Permit Conditions 1.1–1.2 describe the purpose of this permitting action and the emission sources and the control equipment regulated by this permit. This reflects information presented in the application and relied upon in the development of emissions inventories, and in the evaluation of ambient air impacts in the modeling analyses. Refer to the Emissions Inventories and the Ambient Air Quality Impact Analyses sections for additional information concerning these analyses.

Because specific vendor and manufacturer information was unavailable at the time of permitting, documentation and testing requirements were included (Permit Condition 2.20) to verify consistency with the information specified in the application. Production values and limits were based on process flow diagrams and engineering design information provided.

Permit Conditions 2.1–2.8 incorporate fugitive dust emission limits and control requirements as required by IDAPA 58.01.01.650-651. Compliance is ensured by implementing reasonable control precautions and corrective actions when appropriate, excluding public access to operations, and complying with inspection, monitoring, recordkeeping, and notification requirements. Specific precautions are identified and required in the fugitive dust control plan (FDCP), and specific measures to control public access within the operations boundary are identified in and required by the Access Management Plan (AMP; Permit Conditions 2.6 and 2.7, respectively). A trigger level for haul roads was also established requiring employment of control measures (Permit Condition 2.5).

Reduction of PM emissions from each of the identified conveyors by 80% was supported by assuming location of these material transfers at below grade (OC9, OC10) or enclosure on all sides (OC11). Reduction of PM emissions from haul roads by a combined 93.3% was supported by assuming appropriate application of water and magnesium chloride dust suppression; DEQ is cognizant that to consistently achieve this level of control requires conscientious efforts, vigilant inspection and monitoring, and a comprehensive FDCP. Because continuous operation was proposed, suppression measures will need to account for and accommodate all weather conditions including diurnal and seasonal variability, and all traffic loads including mining and public traffic along publicly accessible roads. Conditions outside of what may normally be anticipated may require additional measures such as a reduction in vehicle speeds or selection of a more effective chemical dust suppressant. Although the FDCP specifies a minimum of efforts required, additional operational limits and monitoring are to be considered moving forward and evaluated for incorporation into the FDCP. Certification of employees for visible emissions inspection, training and orientation of relevant employees, and periodic evaluation of FDCP requirements are also required.

Access control measures are described in the Ambient Air Boundary section of the application (Section 5.6), and address primary access points, secondary access points, and surveillance.

Permit Conditions 2.9–2.12 incorporate visible emission limits and control requirements (Permit Condition 2.9) in accordance with IDAPA 58.01.01.625. Compliance is ensured by implementing corrective actions when appropriate and complying with inspection, monitoring, and recordkeeping requirements. Certification of employees for visible emissions inspection is also required.

Permit Condition 2.13 incorporates PM emission limits for process equipment as defined in IDAPA 58.01.01.006, in accordance with IDAPA 58.01.01.700-703, which includes all ore processing, ore concentration and refining, lime production, aggregate production, and concrete production equipment (Table 1). Compliance with operational and material throughput limits (Permit Conditions 3.3–3.8, 4.5–4.12, and 5.4–5.8) and control equipment requirements (Permit Conditions 2.6, 3.9–3.11, 4.13–4.17, and 5.9–5.15) and associated monitoring were considered adequate to ensure compliance with process weight-based PM emission limitations.

Permit Conditions 2.14–2.15 incorporate odorous emission limits in accordance with IDAPA 58.01.01.776.01. Compliance is ensured by complying with monitoring and recordkeeping requirements, including corrective action when appropriate.

Permit Conditions 2.16–2.17 incorporate sulfur content limits for distillate fuel oil, in accordance with IDAPA 58.01.01.725. Compliance is ensured by complying with monitoring and recordkeeping requirements.

Permit Conditions 2.18–2.19 limit facility-wide gasoline fuel throughput. Limiting gasoline throughput limits PTE, ensures avoidance of Subpart CCCCCC requirements applicable to GDF exceeding 100,000 gal/mo, and requires recordkeeping in accordance with 40 CFR 63.11111(e). Compliance is ensured by complying with monitoring and recordkeeping requirements.

Permit Conditions 2.20–2.21 require developing and complying with the requirements of an O&M manual to ensure compliance with control equipment maintenance and operation general provisions (Permit Condition 7.2). Documentation of as-built process equipment specifications and control equipment performance guarantees and establishing control equipment operating parameters and procedures were required, since these were relied upon in the development of emissions inventories, and in the evaluation of ambient air impacts in the modeling analyses. Compliance is ensured by complying with monitoring and recordkeeping requirements.

Permit Condition 2.22 incorporates applicable general compliance, notification, recordkeeping, reporting, general provisions, and other federal requirements by reference in accordance with IDAPA 58.01.01.107.03 and 590-591. Compliance is ensured by complying with applicable federal testing, monitoring, recordkeeping, and reporting requirements. In the event there is a conflict between the subparts and/or emission sources listed (Permit Condition 2.22), the federal requirements shall apply.

With regard to permit conditions referenced in accordance with federal requirements (i.e., NSPS and NESHAP requirements), should there be a conflict between the language of the permit condition and the language of the requirement, the language of the requirement shall govern. Refer to NSPS Applicability (40 CFR 60) and MACT/GACT Applicability (40 CFR 63) sections for additional information concerning applicable requirements.

Permit Conditions 2.23–2.24 require notification upon becoming a Tier I source and require the permittee to obtain a Tier I operation permit within 12 months of commencement of operation of any ore concentration and refining equipment (i.e., NESHAP Subpart EEEEEEE-affected sources) in accordance with IDAPA 58.01.01.313.01.b.

Permit Condition 2.25 specifies recommended test methods to be used when performance testing is required, unless otherwise specified in the permit, in accordance with IDAPA 58.01.01.157. The permittee is required to comply with notification and reporting requirements and is encouraged to submit performance test protocol to DEQ for approval prior to any performance testing in accordance with the performance testing general provisions (Permit Condition 7.7–7.9).

Permit Condition 2.26 provides DEQ agency contact information.

Permit Conditions 3.1–3.2 describe mining and ore processing equipment and controls. This reflects information presented in the application and relied upon in the development of emissions inventories, and in the evaluation of ambient air impacts in the modeling analyses.

Permit Conditions 3.3–3.8 and 3.11–3.16 establish limits on material throughput and production. These limits were relied upon in the development of emissions inventories and in the evaluation of ambient air impacts in the modeling analyses. Overall mine throughput is limited by hauling and excavating limits (Permit Condition 3.5). Compliance is ensured by complying with monitoring and recordkeeping requirements (Permit Conditions 3.11–3.16).

Permit Conditions 3.9–3.10 require measures to include in the FDCP to control fugitive emissions. Use of reasonable controls were relied upon in the development of emissions inventories and in the evaluation of ambient air impacts in the modeling analyses. Compliance is ensured by complying with fugitive dust monitoring and recordkeeping requirements (Permit Conditions 2.1–2.8).

Permit Conditions 4.1–4.2 describe ore concentration and refining equipment and controls. This reflects information presented in the application and relied upon in the development of emissions inventories, and in the evaluation of ambient air impacts in the modeling analyses.

Permit Condition 4.3, and 4.33–4.34 establish emissions limits for ore concentration and refining equipment, consistent with estimates relied upon in the development of emissions inventories and in the evaluation of ambient air impacts in the modeling analyses for these sources. A sulfuric acid emission limit consistent with the modeled TAP emission rate from the autoclave was established in accordance with IDAPA 58.01.01.210.08. Compliance is ensured by complying with equipment operating and testing requirements (Permit Conditions 4.5–4.17, and 4.33–4.34).

Permit Conditions 4.4, 4.5–4.6, 4.7–4.12 and 4.18–4.25 limit operations of ore concentration and refining process equipment, consistent with the hours of operation, reagent usage, and material throughput assumptions relied upon in the development of emissions inventories and in the evaluation of ambient air impacts in the modeling analyses for these sources. Compliance is ensured by complying with monitoring and recordkeeping requirements (Permit Conditions 4.18–4.25). Cyanide is consumed, recycled, and destroyed in the process, and cyanide HAP emissions (and emission factors) dependent upon leachant concentration and basicity. Monitoring of these parameters was established to ensure that emissions do not exceed 10 T/yr of cyanide HAP to avoid classification as a HAP major source. Re-classification as a major source would affect NSPS and NESHAP applicability determinations, such as Subpart AAAAA as discussed in the NESHAP Applicability (40 CFR 61) section.

Permit Conditions 4.13–4.17 and 4.26–4.32 require control equipment for ore concentration and refining processes, consistent with controls relied upon in the development of emissions inventories and in the evaluation of ambient air impacts in the modeling analyses. Compliance is ensured by complying with monitoring and recordkeeping requirements (Permit Conditions 4.26–4.32).

Permit Condition 4.33 and 4.34 require testing of ore concentration and refining emission sources to demonstrate compliance with emissions limits (Permit Condition 4.3).

Permit Conditions 5.1–5.2 describe lime, aggregate, and concrete production equipment and controls. This reflects information presented in the application and relied upon in the development of emissions inventories, and in the evaluation of ambient air impacts in the modeling analyses.

Permit Condition 5.3 establishes emissions limits for lime, aggregate, and concrete production equipment, consistent with estimates relied upon in the development of emissions inventories and in the evaluation of ambient air impacts in the modeling analyses for these sources. Compliance is ensured by complying with equipment operating requirements (Permit Conditions 5.4–5.15).

Permit Conditions 5.4–5.8 and 5.16–5.20 limit operations of each lime, aggregate, and concrete production process equipment, consistent with material throughput assumptions relied upon in the development of emissions inventories and in the evaluation of ambient air impacts in the modeling analyses for these sources. Compliance is ensured by complying with monitoring and recordkeeping requirements (Permit Conditions 5.15–5.20).

Permit Conditions 5.9–5.10 require measures to include in the FDCP to control fugitive emissions. Use of water sprays, building enclosures, and reasonable controls were relied upon in the development of emissions inventories and in the evaluation of ambient air impacts in the modeling analyses. Compliance is ensured by complying with fugitive dust monitoring and recordkeeping requirements (Permit Conditions 2.1–2.8).

Permit Conditions 5.11–5.15 and 5.21–5.24 require control equipment for lime, aggregate, and concrete production processes, consistent with controls relied upon in the development of emissions inventories and in the evaluation of ambient air impacts in the modeling analyses. Compliance is ensured by complying with monitoring and recordkeeping requirements (Permit Conditions 5.21–5.24).

Permit Condition 6.1 describes the emergency power generation equipment. This reflects information presented in the application and relied upon in the development of emissions inventories, and in the evaluation of ambient air impacts in the modeling analyses.

Permit Conditions 6.2 and 6.3–6.4 limit operations of each emergency power generation engine, consistent with the purpose and hours of operation assumptions relied upon in the development of emissions inventories, in the determination of federal regulatory applicability, and in the evaluation of ambient air impacts in the modeling analyses for these sources. Compliance is ensured by complying with monitoring, recordkeeping, and notification requirements (Permit Conditions 6.3–6.4).

Permit Condition 7.1, the duty to comply general compliance provision, requires that the permittee comply with all of the permit terms and conditions pursuant to Idaho Code §39-101.

Permit Condition 7.2, the maintenance and operation general compliance provision, requires that the permittee maintain and operate all treatment and control facilities at the facility in accordance with IDAPA 58.01.01.211.

Permit Condition 7.3, the obligation to comply general compliance provision, specifies that no permit condition is intended to relieve or exempt the permittee from compliance with applicable state and federal requirements, in accordance with IDAPA 58.01.01.212.01.

Permit Condition 7.4, the inspection and entry provision, requires that the permittee allow DEQ inspection and entry pursuant to Idaho Code §39-108.

Permit Condition 7.5, the permit expiration construction and operation provision, specifies that the permit expires if construction has not begun within two years of permit issuance or if construction has been suspended for a year in accordance with IDAPA 58.01.01.211.02.

Permit Condition 7.6, the notification of construction and operation provision, requires that the permittee notify DEQ of the dates of construction and operation, in accordance with IDAPA 58.01.01.211.01 and 211.03.

Permit Condition 7.7, the performance testing notification of intent provision, requires that the permittee notify DEQ at least 15 days prior to any performance test to provide DEQ the option to have an observer present, in accordance with IDAPA 58.01.01.157.03.

Permit Condition 7.8, the performance test protocol provision, requires that any performance testing be conducted in accordance with the procedures of IDAPA 58.01.01.157 and encourages the permittee to submit a protocol to DEQ for approval prior to testing.

Permit Condition 7.9, the performance test report provision, requires that the permittee report any performance test results to DEQ within 60 days of completion, in accordance with IDAPA 58.01.01.157.04-05.

Permit Condition 7.10, the monitoring and recordkeeping provision, requires that the permittee maintain sufficient records to ensure compliance with permit conditions, in accordance with IDAPA 58.01.01.211.

Permit Condition 7.11, the excess emissions provision, requires that the permittee follow the procedures required for excess emissions events, in accordance with IDAPA 58.01.01.130-136.

Permit Condition 7.12, the certification provision, requires that a responsible official certify all documents submitted to DEQ, in accordance with IDAPA 58.01.01.123.

Permit Condition 7.13, the false statement provision, requires that no person make false statements, representations, or certifications, in accordance with IDAPA 58.01.01.125.

Permit Condition 7.14, the tampering provision, requires that no person render inaccurate any required monitoring device or method, in accordance with IDAPA 58.01.01.126.

Permit Condition 7.15, the transferability provision, specifies that this permit to construct is transferable, in accordance with the procedures of IDAPA 58.01.01.209.06.

Permit Condition 7.16, the severability provision, specifies that permit conditions are severable, in accordance with IDAPA 58.01.01.211.

PUBLIC REVIEW

Public Comment Opportunity

An opportunity for public comment period on the application was provided in accordance with IDAPA 58.01.01.209.01.c. During this time, there was a request for a public comment period on DEQ's proposed action. Refer to the Application Chronology for public comment opportunity dates.

Public Comment Period

Comment periods were made available to the public in accordance with IDAPA 58.01.01.209.01.c. An initial comment period and extension were provided to address the initial application and proposed action (i.e., permit and technical statement of basis), and a final comment period was provided to address updates to the proposed action resulting from a HAP/TAP application addendum[2] submitted by Midas Gold that included new HAP and TAP emission estimates, additional information and discussion supporting HAP and TAP emission estimates, new and updated TAP increment compliance demonstrations which included particulate TAP emissions from fugitive sources, and a source-by-source inventory of HAP and TAP emissions. During this time, comments were submitted in response to DEQ's proposed action. Refer to the Application Chronology for the dates of each public comment period.

A response to public comments document has been crafted by DEQ based on comments submitted during each public comment period. That document is part of the final permit package for this permitting action.

APPENDIX B – AMBIENT AIR QUALITY IMPACT ANALYSES REVIEW MEMORANDUM

M E M O R A N D U M

DATE: February 8, 2021

TO: Morrie Lewis, Permit Writer, Air Program

FROM: Pao Baylon, Modeling Review Analyst, Air Program
Through Kevin Schilling, Modeling Supervisor, Air Program

PROJECT: P-2019.0047 PROJ 62288, Permit for an Open-pit Gold Mine and On-site Ore Preparation and Gold Extraction Operation located in Valley County, Idaho.

SUBJECT: Demonstration of Compliance with IDAPA 58.01.01.203.02 (NAAQS) and 203.03 (TAPs) as it relates to air quality impact analyses.

1.0 Summary

Midas Gold Idaho, Inc. (Midas Gold) submitted a Permit to Construct (PTC) application to construct and operate the Stibnite Gold Project (SGP) in Valley County, Idaho. The SGP will consist of conventional open-pit mining operations and onsite ore preparation and gold extraction processes. The potential air emissions from the SGP are less than the applicable major source thresholds for both criteria and hazardous air pollutants (HAP), and therefore, the facility is designated as a minor source for Title V and New Source Review (NSR) requirements, and an area source for National Emission Standards for Hazardous Air Pollutants (NESHAP) applicability. Project-specific air quality analyses involving atmospheric dispersion modeling of estimated emissions associated with the facility were submitted to DEQ to demonstrate that applicable emissions do not result in violation of a National Ambient Air Quality Standard (NAAQS) or Toxic Air Pollutant (TAP) increment as required by the Idaho Administrative Procedures Act 58.01.01.203.02 and 203.03 (Idaho Air Rules Section 203.02 and 203.03). This memorandum provides a summary of the applicability assessment for analyses and air impact analyses used to demonstrate compliance with applicable NAAQS and TAP increments, as required by Idaho Air Rules Section 203.02 and 203.03.

Air Sciences, Inc. (Air Sciences), on behalf of Midas Gold, prepared the PTC application and performed ambient air impact analyses for this project. DEQ review of submitted data and DEQ analyses summarized by this memorandum addressed only the rules, policies, methods, and data pertaining to the air impact analyses used to demonstrate that estimated emissions associated with operation of the facility will not cause or significantly contribute to a violation of any applicable air quality standard. This review did not address/evaluate compliance with other rules or analyses not pertaining to the air impact analyses. Evaluation of emission estimates was the responsibility of the DEQ permit writer and is addressed in the main body of the DEQ Statement of Basis, and emission calculation methods were not evaluated in this modeling review memorandum.

Table 1 presents key assumptions and results to be considered in the development of the permit. Idaho Air Rules require air impact analyses be conducted in accordance with methods outlined in 40 Code of Federal Regulations (CFR) 51, Appendix W *Guideline on Air Quality Models* (Appendix W). Appendix W requires that air quality impacts be assessed using atmospheric dispersion models with emissions and operations representative of design capacity or as limited by a federally enforceable permit condition.

The submitted information and analyses: 1) utilized appropriate methods and models; 2) was conducted using reasonably accurate or conservative model parameters and input data (review of emission estimates was addressed by the DEQ permit writer); 3) adhered to established DEQ guidelines for new source review dispersion modeling; 4) showed either a) that estimated potential/allowable emissions are at a level defined as below regulatory concern (BRC) and do not require a NAAQS compliance demonstration; b) that predicted pollutant concentrations from emissions associated with the project as modeled were below Significant Impact Levels (SILs) or other applicable regulatory thresholds; or c) that predicted pollutant concentrations from emissions associated with the project, when appropriately combined with co-contributing sources and background concentrations, were below applicable NAAQS at ambient air locations where and when the project has a significant impact; 5) showed that TAP emission increases associated with the project will not result in increased ambient air impacts exceeding allowable TAP increments. This conclusion assumes that conditions in Table 1 are representative of facility design capacity or operations as limited by a federally enforceable permit condition. The DEQ permit writer should use Table 1 and other information presented in this memorandum to generate appropriate permit provisions/restrictions to assure emissions do not exceed applicable regulatory thresholds requiring further analyses and to assure the requirements of Appendix W are met regarding emissions representative of design capacity or permit allowable rates.

Table 1. KEY ASSUMPTIONS USED IN MODELING ANALYSES.	
Criteria/Assumption/Result	**Explanation/Consideration**
General Emission Rates. Emission rates used in the air impact analyses must represent maximum potential emissions as given by design capacity, inherently limited by the nature of the process or configuration of the facility, or as limited by the issued permit for the specific pollutant and averaging period.	Compliance has not been demonstrated for emission rates greater than those used in the air impact analyses.
Air Impact Analyses for Criteria Pollutant Emissions. Stibnite Gold Project (SGP) facility-wide maximum potential to emit are greater than the respective Level I thresholds for all criteria pollutants and averaging periods except for Lead. Therefore, modeling is triggered for applicable averaging periods for $PM_{2.5}$[a], PM_{10}[b], CO[c], NOx[d], and SO_2[e]. Modeling was not required for Lead.	Project-specific air impact analyses demonstrating compliance with NAAQS, as required by Idaho Air Rules Section 203.02, are required for pollutant increases above Below Regulatory Concern (BRC) thresholds, or for pollutants having an emissions increase that is greater than Level I modeling applicability thresholds (where the BRC exclusion cannot be used).
Air Impact Analyses for TAP Emissions. SGP facility-wide potential Toxic Air Pollutant (TAP) emissions exceed the respective screening emission levels (ELs) for arsenic, cadmium, formaldehyde, nickel, aluminum, barium, calcium carbonate, calcium oxide, iron, sulfuric acid, thallium, and vanadium. Therefore, air dispersion modeling was required for these 12 TAPs. TAPs also classified as Hazardous Air Pollutants (HAPs) emitted from sources addressed by New Source Performance Standards (NSPS) or National Emission Standards for Hazardous Air Pollutants (NESHAP) were not required to be evaluated for compliance with TAP increments in accordance with IDAPA 58.01.01.210.20.	A TAP increment compliance demonstration would be required for any TAPs with emissions above ELs. IDAPA 58.01.01.210.20 states that if TAP emissions from a specific source are addressed by NSPS or NESHAP, then a TAP impact analysis is not required for that TAP from that specific source.
Significant Impact Level Analysis Not Conducted. A Significant Impact Level (SIL) analysis was not conducted for the SGP facility.	Based on the magnitude of the facility-wide emissions and preliminary modeling analyses, it was determined that the impacts from the SGP emissions exceeded the SIL for most criteria pollutants. Therefore, SIL analyses were considered redundant and not performed for the project.
Multiple Modeling Scenarios. To evaluate the worst-case air impacts from the SGP facility, a total of 14 scenarios were modeled. These scenarios represent the hauling of material, which can be either ore or development rock (DR), from four possible origins (three pits and a tailings facility) to five possible destinations (ore will be hauled to the crushing area while DR will be hauled to one of four development rock storage facilities [DRSF]). Modeled design values listed in this modeling memo represent the worst-case modeling scenario for every modeled pollutant and averaging period.	Conventional open-pit methods will be used to extract ore and DR from four possible origins (Yellow Pine Pit [YPP], Hangar Flats Pit [HFP], West End Pit [WEP], and Bradley Tailings [BT]). Ore and DR will be hauled to five possible destinations (Stockpile [STKP], Yellow Pine DRSF [YPDRSF], Hangar Flats DRSF [HFDRSF], West End DRSF [WEDRSF], and Fiddle DRSF [FDRSF]). Only 14 of the 20 possible scenarios were modeled. Six scenarios were not feasible because the timing of the activity within the sequence of mine operations makes the scenarios logistically impossible. Modeled results listed in this memo represent worst-case modeling scenarios.
Modeling of Material Origin and Destination. Each material origin location (YPP, HFP, WEP, and BT) was modeled as an AREA source. Ore destination (STKP) was modeled as a VOLUME source. Each DR destination (YPDRSF, HFDRSF, WEDRSF, and FDRSF) was modeled as a VOLUME source.	Each material origin location comprised appropriate emissions from drilling, material loading, dozing, and surface exploration. Ore destination comprised ore unloading emissions. Each DR destination comprised appropriate emissions from DR unloading, dozing, and wind erosion. For the four AREA and five VOLUME sources, the dimensions were developed by reasonably fitting an equal-area rectangle within the actual footprint of each fugitive source. For the pit and DRSF fugitive activity locations, the release height was based on the haul truck height. The applicable initial lateral dispersion for each VOLUME source was calculated from the respective shorter dimension and EPA-specified methods. The applicable initial vertical dispersion for each AREA and VOLUME source was

Table 1. KEY ASSUMPTIONS USED IN MODELING ANALYSES.	
Criteria/Assumption/Result	**Explanation/Consideration**
	calculated from the respective vertical dimension and EPA-specified methods.
Modeling of Haul Roads. A representative haul road network for hauling material from inside the pit to various destinations was developed for each of the 14 modeling scenarios.	The haul road network was divided into 22 sections. Each section was further divided into multiple segments with a length equal to twice the adjusted haul road width. Each of the segments was characterized as an individual VOLUME source in the model. Material hauling emissions associated with each origin-destination route were assigned to each segment along the route based on estimated total emissions along the route and traffic distribution along each section.
Modeling of Blasting Emissions. Blasting emissions were represented by a VOLUME source inside a pit (YPPBL, HFPBL, and WEPBL). Blasting is not expected to occur in BT but was modeled (BTBL) in order to streamline the permitting process.	The blasting physical parameters were developed from dimensions based on blast area used in the emission calculation. The blasting release height was the midpoint of the blasting height. The initial lateral and vertical dispersion dimensions for blasting were calculated per methods specified in the AERMOD User's Guide.
Modeling of Burntlog Route Access Road. The access road portion within the operations boundary was characterized by a series of LINE sources laid along the actual route.	Emissions associated with the portion of the Burntlog Route mine access road that is within project boundary (from the south gate to the process area) are included in the SGP analyses. These include dust emissions generated from travel of maintenance equipment, light-duty pickup trucks and buses used for employee, visitor, and contractor transportation, and heavy-duty trucks used for cargo (including fuel, consumables, machine parts, ore processing supplies, ore concentrate, etc.) and services (including food supplies, trash, recyclables, etc.) transportation. Release parameters for the LINE sources were based on an estimated average vehicle height. The access road emissions were evenly distributed along the road by dividing the total access road emissions by its total area.
Control of Fugitive Dust from Roadways. Fugitive particulate emissions from roadways were assumed to be controlled above 93%, which is an aggressive level of control.	The high level of emission control was needed to demonstrate compliance with NAAQS. Compliance is not demonstrated for emissions greater than those associated with above 93% control.
NOx Chemistry and NO_2/NOx In-Stack Ratios. Ozone Limiting Method (OLM), a Tier 3 NO_2 screening method, was used to estimate the 1-hour and annual NO_2 impacts. The following NO_2/NOx In-Stack Ratios (ISR) were used in the modeling analyses: Blasting: 0.036 Diesel engines: 0.11 Propane heaters: 0.10	The OLM method requires an input of NO_2/NOx ISRs for each modeled source. The NO_2/NOx ratio for blasting was based on blasting plume measurements provided in published literature. The NO_2/NOx ratio for stationary diesel combustion sources was based on heavy-duty diesel trucks in the California Air Pollution Control Officers Association (CAPCOA) Guidance Document. This NO_2/NOx ratio (11 percent) is conservatively higher than the diesel combustion NO_2/NOx ratio provided in the EPA ISR database: 6 percent average, 9.8 percent maximum. The CAPCOA document and the EPA ISR database do not provide an NO_2/NOx ratio for propane boilers. The CAPCOA-recommended NO_2/NOx ratio for natural gas boilers was selected for the propane boilers. The natural gas boilers NO_2/NOx ratio is considered appropriate for the propane boilers because both are gaseous fuels with relatively similar combustion characteristics and are expected to have similar NO_2/NOx ratios. DEQ performed a sensitivity analysis using Tier 2 (Ambient Ratio Method 2), a more conservative NO_2 screening method, and found that the facility is safely below the 1-hour and annual NO_2 NAAQS.

Table 1. KEY ASSUMPTIONS USED IN MODELING ANALYSES.	
Criteria/Assumption/Result	**Explanation/Consideration**
Alternate Meteorological Data Processed Using Cloud Cover. An alternative meteorological dataset was processed without using the Bulk Richardson (BULKRN) method. This alternate processing (NON-BULKRN) used upper air data from Boise airport, supplemented with the cloud-cover data collected at the National Weather Service station in McCall, Idaho.	Meteorological data processing with and without BULKRN are considered acceptable regulatory options by EPA. The NON-BULKRN meteorological data yielded lower modeled design values than the meteorological data processed using the BULKRN method.
Ambient Air Boundary. Midas Gold will legally control the SGP, an active industrial site where mining activities will occur, such as heavy equipment operation. Most areas of the mine will require strict safety protocols and controlled access. Midas Gold has established an operations boundary to identify the area where public access will be excluded. Public access inside the operations boundary will be restricted for the life of the mine by physical barriers at points of potential access, including the current Stibnite Road point of entry and proposed site access via the Burntlog Route, as well as natural features of the landscape that prevent access.	Ambient air is defined in Section 006 of the Idaho Air Rules as "that portion of the atmosphere, external to buildings, to which the general public has access." Receptors must be placed at any portion of the atmosphere that is considered ambient air.
Onsite Background $PM_{2.5}$ and PM_{10} Concentrations. The following background $PM_{2.5}$ and PM_{10} concentrations were measured at SGP in 2014 and used in the cumulative NAAQS impact analysis: Annual $PM_{2.5}$: 3.5 $\mu g/m^3$ (weighted average of quarterly means) 24-hour $PM_{2.5}$: 15.0 $\mu g/m^3$ (98^{th} percentile/8^{th} high) 24-hour PM_{10}: 37.0 $\mu g/m^3$ (highest 1^{st} high)	Midas Gold developed an onsite monitoring program to collect site-specific meteorological parameters and determine ambient particulate matter ($PM_{2.5}$ and PM_{10}) concentrations at its Stibnite monitoring station. $PM_{2.5}$ and PM_{10} background concentrations were based on calendar year 2014 instead of the complete dataset (November 2013 through June 2015). For 24-hour PM_{10}, the design value is the *second-highest* 24-hour average concentration in a given year. However, the background value that was used in the modeling analyses represents the *first-highest* 24-hour average concentration measured in 2014. Therefore, using a larger background concentration adds a layer of conservatism to the calculated total impact for 24-hour PM_{10}.
NW AIRQUEST Background CO, NO_2, and SO_2 Concentrations. The following background concentrations for CO, NO_2, and SO_2 were used in the cumulative NAAQS impact analysis: 1-hour CO: 1,740 $\mu g/m^3$ 8-hour CO: 1,110 $\mu g/m^3$ 1-hour NO_2: 4.3 $\mu g/m^3$ Annual NO_2: 0.9 $\mu g/m^3$ 1-hour SO_2: 12.3 $\mu g/m^3$ 3-hour SO_2: 16.8 $\mu g/m^3$	Gaseous pollutant background concentrations were determined using the Northwest International Air Quality Environmental Science and Technology Consortium (NW AIRQUEST) online tool. The NW AIRQUEST tool uses regional scale modeling of pollutants in Washington, Oregon, and Idaho, with model results adjusted according to available monitoring data.
Medium-Traffic Background Concentrations. To provide additional information regarding the relative contribution of traffic emissions, background concentrations were obtained from NW AIRQUEST for the road section between mile markers 143 and 144 on Highway 55 passing through the town of McCall.	The McCall location is approximately 38 miles west of the SGP. The annual average daily traffic count for this road section is over 10,000 vehicles per day. Although the background concentrations at McCall are not representative of the rural SGP area, they provide additional information regarding the relative contribution of traffic emissions.
Weight-of-Evidence Analyses for 24-hour PM_{10}. PM_{10} modeling with meteorological dataset processed using the site-specific BULKRN method shows up to five hotspot receptors for Scenario W5 (the highest PM_{10} modeling scenario) that exceed NAAQS. All modeled violations occur during winter when the average snow depth and average precipitation at the project site are 21-68 inches and 6.0 inches, respectively. Therefore, fugitive road dust emissions during high-modeled impact hours could be overestimated. PM_{10} modeling simulation was based on a mining production rate of 180,000 ton/day of development rock (65,700,000 ton/year, which is more conservative than the	Meteorological data processing with and without BULKRN are considered acceptable by EPA, with the BULKRN method utilizing more of the onsite collected meteorological parameters. However, the BULKRN-processed meteorological data yielded higher modeled design value impacts for the SGP facility than the meteorological data processed without the BULKRN method. DEQ's supplemental analyses suggest that when emissions are more-closely representative of typical daily mining production rates for a high-production period (everything else held constant), the SGP facility is able to demonstrate

Table 1. KEY ASSUMPTIONS USED IN MODELING ANALYSES.	
Criteria/Assumption/Result	**Explanation/Consideration**
expected peak production rate of 42,692,000 ton/year). To investigate the effect of a lower modeled mining production rate on design value concentrations, DEQ performed a modeling simulation where mining production rate was assumed to be 120,000 ton/day instead of 180,000 ton/day, but everything else was held constant. Maximum modeled concentration, when summed with the background concentration, is lower than the 24-hour PM_{10} NAAQS thereby demonstrating NAAQS compliance. DEQ's weight-of-evidence analyses conclude that, considering all the collective conservative layers of the modeling analyses, including the use of meteorological data processed by two different methods, there is a satisfactory level of confidence that operation of the project as described in the application will not cause or contribute to a violation of NAAQS.	compliance with 24-hour PM_{10} NAAQS at those few receptors showing a potential violation when using meteorological data processed with the BULKRN method.

Summary of Submittals and Actions

May 30, 2019	Modeling protocol was submitted to DEQ by Brown and Caldwell on behalf of the applicant.
June 27, 2019	Conditional modeling protocol approval was provided to Brown and Caldwell by DEQ.
August 21, 2019	Regulatory start date. PTC application and modeling report were prepared by Air Sciences on behalf of the applicant.
September 19, 2019	Application deemed incomplete by DEQ.
October 4, 2019	DEQ received a preliminary response and supplemental information from the applicant.
October 15, 2019	DEQ met with the applicant to review and discuss the preliminary response.
October 22, 2019	DEQ determined that the application remained incomplete while the applicant prepared a response to remaining items previously identified, and included a summary of recommendations provided at the meeting.
November 8, 2019	DEQ requested additional information from the applicant via e-mail, relating to items previously identified.
November 21, 2019	Applicant requested extension until November 27, 2019 to respond to incompleteness.
November 27, 2019	DEQ received supplemental information from the applicant, including a revised application with updated emission inventories and modeling analyses.

December 24, 2019	DEQ determined that the application was incomplete.
January 8, 2020	Applicant requested extension until February 7, 2020 to respond to incompleteness.
February 5, 2020	DEQ received supplemental information from the applicant, including a revised application with updated emission inventories and modeling analyses.
March 6, 2020	DEQ determined that the application was incomplete.
April 2, 2020	Applicant requested extension until April 15, 2020 to respond to incompleteness.
April 15, 2020	DEQ received supplemental information from the applicant, including updated modeling analyses.
May 15, 2020	DEQ determined that the application was complete.
June 24, 2020	DEQ received the final updated application.
July 14, 2020	DEQ made available the draft permit and statement of basis for applicant review.
July 31, 2020	DEQ made available an updated draft statement of basis for applicant review.
August 3 and 13, 2020	DEQ received comments from the applicant on the draft permit and statement of basis.
September 10 – October 12, 2020	DEQ provided a public comment period on the proposed action.
October 12, 2020	DEQ received a request to extend the public comment period.
October 13 – November 11, 2020	DEQ extended the public comment period.
November 20, 2020	DEQ requested additional information from the applicant to address substantive public comments received, including missing HAP and TAP emission estimates.
December 18, 2020	DEQ received supplemental information from the applicant, including a HAP/TAP addendum, updated HAP and TAP emission estimates, and updated TAP modeling analyses.
January 28, 2021	DEQ received updated modeling files with corrections for formaldehyde and sulfuric acid, and an updated figure showing TAP modeled impacts.

2.0 Background Information

This section provides background information applicable to the project and the site proposed for the facility. It also provides a brief description of the applicable air impact analyses requirements for the project.

2.1 Project Description

The SGP will require the construction of significant infrastructure, including a power transmission line, a primary mine site access road, onsite haul roads, an ore processing facility, onsite workspaces, employee housing and recreation, water storage and distribution facilities, and sewage disposal facilities.

The SGP will include three years of pre-mining development and construction activities, followed by an operating mine life of approximately 12 years. Mining will occur in three open pits: Yellow Pine Pit (YPP), Hangar Flats Pit (HFP), and West End Pit (WEP). The general sequence of mining will be the YPP deposit, followed by the HFP and WEP deposits. Legacy tailings from the Meadow Creek valley (Bradley Tailings [BT]) also will be reclaimed and reprocessed during the initial project schedule. Surface exploration drilling will continue within the pits and the Scout Prospect decline (underground exploration) throughout the mine operation period. Restoration and reclamation of other legacy mining features will occur prior to mining, throughout the life of the mine, and as part of the mine closure.

Conventional open-pit methods including drilling, blasting, excavating, and hauling will be used to extract ore and waste rock, termed development rock (DR). Hydraulic shovels and front-end loaders will be used to load ore and DR into haul trucks. DR will be used for construction, restoration, and backfilling, or hauled to the dedicated development rock storage facilities (DRSF). Approximately 340 million tons of DR will be handled over the life of the mine. Ore will be hauled to the primary crusher area, where it will be fed directly into the crusher dump pocket or stockpiled. The ore crushing plant will be designed to operate at a maximum rate of 25,000 tons per day (ton/day). Approximately 100 million tons of ore will be mined from the three pits over the life of the project.

The metal-recovery process from ore will include conventional crushing and grinding, followed by froth-flotation circuits that will generate separate gold-silver and antimony-silver concentrates. The antimony-silver concentrate will be shipped offsite for refining, whereas additional onsite processing of the gold-silver concentrate will include pressure oxidation, carbon-in-leach circuits, and refining processes to recover gold and minor amounts of silver. The finely ground leftover ore material from the mineral-recovery process, termed tailings, will be neutralized, thickened, and transported via a pipeline to the tailings storage facility (TSF).

Lime used in the ore processing will either be purchased or manufactured onsite from limestone available at the site. In addition, certain construction and maintenance activities during operations may require sized aggregate. To allow for the operational flexibility to produce construction aggregate onsite, the application included two portable crushing and screening plants.

The following air pollutants are expected from operations at the SGP facility:

- Criteria air pollutants: carbon monoxide (CO), oxides of nitrogen (NOx), particulate matter less than 2.5 microns (μm) and 10 μm ($PM_{2.5}$ and PM_{10}), sulfur dioxide (SO_2), lead (Pb), and ozone (O_3) precursor volatile organic compounds (VOC)
- Hazardous air pollutants (HAP), including mercury (Hg)
- Other non-HAP toxic air pollutants (TAP)
- Greenhouse gases

Based on the uncontrolled potential to emit (PTE) and controlled PTE, the SGP facility will be a "synthetic minor" source of PM, PM_{10}, $PM_{2.5}$, and HAP emissions for new source review (NSR) and Title V (Tier I) permitting purposes. The uncontrolled PTE for the remaining criteria pollutants (SO_2, NOx,

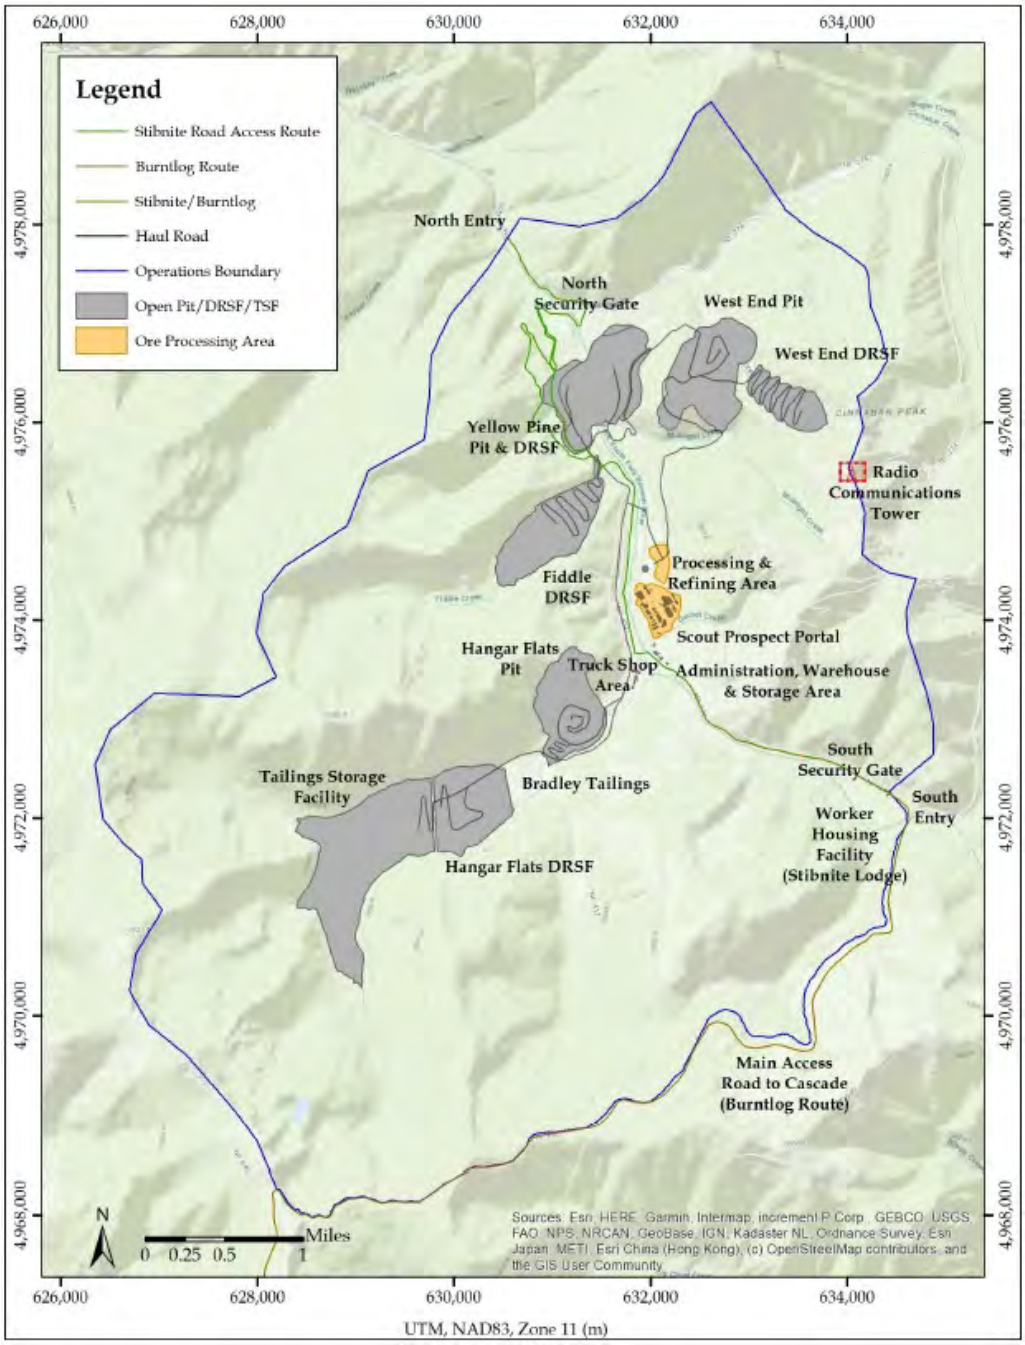
CO, VOC) confirm that the SGP facility will be a natural minor source for these emissions. Facility classification is reviewed by the permit writer. Detailed calculations and explanations are provided in the DEQ Statement of Basis.

The PTC addresses all air pollutant-emitting activities associated with the facility.

2.2 Facility Location and Area Classification

The SGP is located in the Stibnite-Yellow Pine Mining District in Valley County, central Idaho (Northing: 4,973,751 meters [m]; Easting: 632,038 m; UTM Zone 11), approximately 100 miles northeast of Boise, 38 miles east of McCall, and approximately 10 miles east of Yellow Pine. A facility location map for the SGP is presented in Figure 1. This figure also shows the proposed Burntlog Route (access road) that will provide a year-round safe access to the site. The SGP site layout is presented in Figure 2.

The Stibnite-Yellow Pine Mining District is characterized by historic mining activities and unpatented (federal land) and patented (private land) mining claims that include deposits of gold, silver, tungsten, and antimony. The district lies in both Boise National Forest (BNF) and Payette National Forest (PNF), but is administered by the PNF's Krassel Ranger District (Midas Gold 2017a). The project area terrain is characterized by narrow valleys 6,000 to 6,600 feet above mean sea level (amsl), surrounded by steep mountains ranging over 8,500 feet amsl. The main drainage basin in the project area is the East Fork of the South Fork of the Salmon River (EFSFSR).



The EFSFSR joins Johnson Creek 16 miles downstream, near the village of Yellow Pine. The project area is encompassed by the watersheds of EFSFSR tributaries, including Sugar Creek, Meadow Creek, Johnson Creek, Riordan Creek, Burntlog Creek, Midnight Creek, and Trout Creek. Primary commercial activity in the area comprises mineral exploration, mining, logging, and dispersed recreation.

This area is designated as an attainment or unclassifiable area for SO_2, NO_2, CO, Lead, O_3, PM_{10}, and $PM_{2.5}$. The area is not classified as non-attainment for any criteria pollutants.

Figure 1. SGP FACILITY LOCATION MAP.

Figure 2. SGP SITE LAYOUT AND STIBNITE ROAD ACCESS ROUTE.

2.3 Air Impact Analyses Required for All Permits to Construct

Idaho Air Rules Sections 203.02 and 203.03:

> *No permit to construct shall be granted for a new or modified stationary source unless the applicant shows to the satisfaction of the Department all of the following:*

***02. NAAQS**. The stationary source or modification would not cause or significantly contribute to a violation of any ambient air quality standard.*

***03. Toxic Air Pollutants.** Using the methods provided in Section 210, the emissions of toxic air pollutants from the stationary source or modification would not injure or unreasonably affect human or animal life or vegetation as required by Section 161. Compliance with all applicable toxic air pollutant carcinogenic increments and toxic air pollutant non-carcinogenic increments will also demonstrate preconstruction compliance with Section 161 with regards to the pollutants listed in Sections 585 and 586.*

Atmospheric dispersion modeling, using computerized simulations, is used to demonstrate compliance with both NAAQS and TAPs. Idaho Air Rules Section 202.02 states:

***02. Estimates of Ambient Concentrations**. All estimates of ambient concentrations shall be based on the applicable air quality models, data bases, and other requirements specified in 40 CFR 51 Appendix W (Guideline on Air Quality Models).*

2.4 Significant Impact Level and Cumulative NAAQS Impact Analyses

If specific criteria pollutant emission increases associated with the proposed permitting project cannot qualify for a BRC exemption as per Idaho Air Rules Section 221, then the permit cannot be issued unless the application demonstrates that applicable emission increases will not cause or significantly contribute to a violation of NAAQS, as required by Idaho Air Rules Section 203.02.

The first phase of a NAAQS compliance demonstration is to evaluate whether the proposed facility/project could have a significant impact to ambient air. Section 3.1.1 of this memorandum describes the applicability evaluation of Idaho Air Rules Section 203.02. The Significant Impact Level (SIL) analysis for a new facility or proposed modification to a facility involves modeling estimated criteria air pollutant emissions from the facility or modification to determine the potential impacts to ambient air. Air impact analyses are required by Idaho Air Rules to be conducted in accordance with methods outlined in Appendix W. Appendix W requires that facilities be modeled using emissions and operations representative of design capacity or as limited by a federally enforceable permit condition.

A facility or modification is considered to have a significant impact on air quality if maximum modeled impacts to ambient air exceed the established SIL listed in Idaho Air Rules Section 006 (referred to as a "significant contribution" in Idaho Air Rules) or as incorporated by reference as per Idaho Air Rules Section 107.03.b. Table 2 lists the applicable SILs.

Table 2. APPLICABLE REGULATORY LIMITS.

Pollutant	Averaging Period	Significant Impact Levels[a] (µg/m^3)[b]	Regulatory Limit [c] (µg/m^3)	Modeled Design Value Used[d]
PM_{10}[e]	24-hour	5.0	150[f]	Maximum 6th highest[g]
$PM_{2.5}$[h]	24-hour	1.2	35[i]	Mean of maximum 8th highest[j]
	Annual	0.2	12[k]	Mean of maximum 1st highest[l]
Carbon monoxide (CO)	1-hour	2,000	40,000[m]	Maximum 2nd highest[n]
	8-hour	500	10,000[m]	Maximum 2nd highest[n]
Sulfur Dioxide (SO_2)	1-hour	3 ppb[o] (7.8 µg/m^3)	75 ppb[p] (196 µg/m^3)	Mean of maximum 4th highest[q]
	3-hour	25	1,300[m]	Maximum 2nd highest[n]
Nitrogen Dioxide (NO_2)	1-hour	4 ppb (7.5 µg/m^3)	100 ppb[s] (188 µg/m^3)	Mean of maximum 8th highest[t]
	Annual	1.0	100[r]	Maximum 1st highest[n]
Lead (Pb)	3-month[u]	NA	0.15[r]	Maximum 1st highest[n]

	Quarterly	NA	1.5[r]	Maximum 1st highest[n]
Ozone (O_3)	8-hour	40 TPY VOC[v]	70 ppb[w]	Not typically modeled

a. Idaho Air Rules Section 006 (definition for significant contribution) or as incorporated by reference as per Idaho Air Rules Section 107.03.b.
b. Micrograms per cubic meter.
c. Incorporated into Idaho Air Rules by reference, as per Idaho Air Rules Section 107.
d. The maximum 1st highest modeled value is always used for the significant impact analysis unless indicated otherwise. Modeled design values are calculated for each ambient air receptor.
e. Particulate matter with an aerodynamic diameter less than or equal to a nominal 10 micrometers.
f. Not to be exceeded more than once per year on average over 3 years.
g. Concentration at any modeled receptor when using five years of meteorological data.
h. Particulate matter with an aerodynamic diameter less than or equal to a nominal 2.5 micrometers.
i. 3-year mean of the upper 98th percentile of the annual distribution of 24-hour concentrations.
j. 5-year mean of the 8th highest modeled 24-hour concentrations at the modeled receptor for each year of meteorological data modeled. For the SIL analysis, the 5-year mean of the 1st highest modeled 24-hour impacts at the modeled receptor for each year.
k. 3-year mean of annual concentration.
l. 5-year mean of annual averages at the modeled receptor.
m. Not to be exceeded more than once per year.
n. Concentration at any modeled receptor.
o. Interim SIL established by EPA policy memorandum.
p. 3-year mean of the upper 99th percentile of the annual distribution of maximum daily 1-hour concentrations.
q. 5-year mean of the 4th highest daily 1-hour maximum modeled concentrations for each year of meteorological data modeled. For the significant impact analysis, the 5-year mean of 1st highest modeled 1-hour impacts for each year is used.
r. Not to be exceeded in any calendar year.
s. 3-year mean of the upper 98th percentile of the annual distribution of maximum daily 1-hour concentrations.
t. 5-year mean of the 8th highest daily 1-hour maximum modeled concentrations for each year of meteorological data modeled. For the significant impact analysis, the 5-year mean of maximum modeled 1-hour impacts for each year is used.
u. 3-month rolling average.
v. An annual emissions rate of 40 ton/year of VOCs is considered significant for O_3.
w. Annual 4th highest daily maximum 8-hour concentration averaged over three years.

If modeled maximum pollutant impacts to ambient air from the emission sources associated with a new facility or modification exceed the SILs, then a cumulative NAAQS impact analysis is necessary to demonstrate compliance with NAAQS and Idaho Air Rules Section 203.02.

A cumulative NAAQS impact analysis for attainment area pollutants involves assessing ambient impacts (typically the design values consistent with the form of the standard) from potential/allowable emissions resulting from the project and emissions from any nearby co-contributing sources (including existing emissions from the facility that are unrelated to the project), and then adding a DEQ-approved background concentration value to the modeled result that is appropriate for the criteria pollutant/averaging-period at the facility location and the area of significant impact. The resulting pollutant concentrations in ambient air are then compared to the NAAQS listed in Table 2. Table 2 also specifies the modeled design value that must be used for comparison to the NAAQS. NAAQS compliance is evaluated on a receptor-by-receptor basis for the modeling domain.

If the cumulative NAAQS impact analysis indicates an exceedance of NAAQS, a culpability analysis can determine if this exceedance is due to emissions from the proposed project. The permit may not be issued if the proposed project has a significant contribution (exceeding the SIL) to the modeled violation. If project-specific impacts are below the SIL, then the project does not have a significant contribution to the specific violations.

Compliance with Idaho Air Rules Section 203.02 is generally demonstrated if: a) applicable specific criteria pollutant emission increases are at a level defined as BRC, using the criteria established by DEQ regulatory interpretation (DEQ 2014); or b) all modeled impacts of the SIL analysis are below the

applicable SIL or other level determined to be inconsequential to NAAQS compliance; or c) modeled design values of the cumulative NAAQS impact analysis (modeling all emissions from the facility and co-contributing sources, and adding a background concentration) are less than applicable NAAQS at receptors where impacts from the proposed facility/modification exceeded the SIL or other identified level of consequence; or d) if the cumulative NAAQS analysis showed NAAQS violations, the impact of proposed facility/modification to any modeled violation was inconsequential (typically assumed to be less than the established SIL) for that specific receptor and for the specific modeled time when the violation occurred.

2.5 Toxic Air Pollutant Analyses

Emissions of toxic substances are generally addressed by Idaho Air Rules Section 161:

> *Any contaminant which is by its nature toxic to human or animal life or vegetation shall not be emitted in such quantities or concentrations as to alone, or in combination with other contaminants, injure or unreasonably affect human or animal life or vegetation.*

Permitting requirements for toxic air pollutants (TAPs) from new or modified sources are specifically addressed by Idaho Air Rules Section 203.03 and require the applicant to demonstrate to the satisfaction of DEQ the following:

> *Using the methods provided in Section 210, the emissions of toxic air pollutants from the stationary source or modification would not injure or unreasonably affect human or animal life or vegetation as required by Section 161. Compliance with all applicable toxic air pollutant carcinogenic increments and toxic air pollutant non-carcinogenic increments will also demonstrate preconstruction compliance with Section 161 with regards to the pollutants listed in Sections 585 and 586.*

Per Section 210, if the total project-wide emission increase of any TAP associated with a new source or modification exceeds screening emission levels (ELs) of Idaho Air Rules Section 585 or 586, then the ambient impact of the emission increase must be estimated. If ambient impacts are less than applicable Acceptable Ambient Concentrations (AACs) for non-carcinogens of Idaho Air Rules Section 585 and Acceptable Ambient Concentrations for Carcinogens (AACCs) of Idaho Air Rules Section 586, then compliance with TAP requirements has been demonstrated.

TAPs also classified as HAPs emitted from sources addressed by New Source Performance Standards (NSPS) or National Emission Standards for Hazardous Air Pollutants (NESHAP) were not required to be evaluated for compliance with TAP increments in accordance with IDAPA 58.01.01.210.20 (Subsection 210.20). The DEQ permit writer evaluates the applicability of specific TAPs to the Subsection 210.20 exclusion. Guidance and clarification of Subsection 210.20 source exemptions are included in the DEQ Statement of Basis.

IDAPA 58.01.01.215 sets requirements for mercury emissions. For this standard, fugitive emissions and sources in a source category subject to 40 CFR 63 are exempt. The DEQ permit writer evaluates the applicability of mercury emissions to the exemption criteria. Details are provided in the DEQ Statement of Basis. Adjusted mercury emissions from non-fugitive and non-NESHAP-addressed sources were below the level (25 pounds per year) at which Mercury Best Available Control Technology (MBACT) review is required.

3.0 Analytical Methods and Data

This section describes the methods and data used in the analyses to demonstrate compliance with applicable air quality impact requirements. The DEQ Statement of Basis provides a discussion of the methods and data used to estimate criteria and TAP emission rates.

3.1 Emission Source Data

Emissions of criteria pollutants and TAPs resulting from operation of the SGP facility were estimated by Air Sciences for various applicable averaging periods. The calculation of potential emissions is the responsibility of the DEQ permit writer, and the representativeness and accuracy of emission estimates is not addressed in this modeling memorandum. DEQ air impact analysts are responsible for assuring that potential emission rates provided in the emission inventory are properly used in the model. The rates listed must represent the maximum allowable rate as averaged over the specified period.

Emission rates used in the impact modeling applicability analyses and any modeling analyses, as listed in this memorandum, should be reviewed by the DEQ permit writer and compared with those in the final emission inventory. All modeled criteria air pollutant and TAP emission rates must be equal to or greater than the facility's potential emissions calculated in the PTC emission inventory or proposed permit allowable emission rates.

Emissions from unpaved roads were calculated based on a control efficiency of 90% from chemical application and 33% from watering (combined control efficiency above 93%). Emission controls and emission calculations are not reviewed in this modeling memorandum. However, it is critical for NAAQS compliance that this high level of control be achieved.

Activity-specific (e.g., drilling, blasting, material crushing and conveying, refining, and other ancillary sources) emissions were estimated based on maximum activity rates, coupled with applicable emission estimation techniques. Maximum emissions were calculated on a short-term (hourly and daily) and long-term (annual) basis for ore processing and mining operations, as discussed below.

The ore-processing rate will range from 20,000 ton/day to 25,000 ton/day at full production. Therefore, maximum potential daily ore processing emissions were based on the maximum design rate of 25,000 ton/day. Maximum potential annual emissions were based on potential daily emissions multiplied by 365 days per year.

Emissions from mining operations (drilling, blasting, material extraction and movement, mobile mine machinery use, and other ancillary sources) vary for each year of the life of the mine (LOM). However, for the modeling analyses, the mining operation potential emissions were estimated using conservatively high maximum activity rates provided in Table 3.

Table 3. MINING ACTIVITY RATES FOR POTENTIAL EMISSION CALCULATIONS.

Activity	Maximum Rate		Comments
Drilling	600	holes per blast	--
Blasting	2	blasts per day	--
	1	blast per hour	--
Material extraction and hauling	180,000	tons per day	Ore or DR
Onsite dozing	144	hours per day	6 dozers operating continuously
Onsite grading	72	hours per day	3 graders operating continuously
Onsite water trucking	48	hours per day	2 trucks operating continuously

The potential hourly emission rates for ore processing and mining operation activities were calculated by dividing the daily rate by the 24 hour-per-day operation schedule, and annual rates were calculated by multiplying maximum daily emissions with 365 days per year. This is conservative because the mine is expected to operate for only 355 days per year.

The maximum mine production rate is approximately 42.7 million (MM) tons per year (ton/yr); however, a maximum daily production rate of 180,000 ton/day used for potential emission calculations results in a conservatively higher production rate of approximately 65.7 MMton/yr, approximately 50 percent higher than the projected production rate.

Midas Gold will employ newer model year mining and maintenance machines (excavators, shovels, haul trucks, dozers, graders, portable light plants, etc.) that are expected to meet or exceed applicable regulatory emission standards. Non-road mobile equipment engines are exempt from permitting requirements; therefore, the tailpipe emissions resulting from fuel combustion in the non-road mobile equipment are not quantified for the SGP facility. Background concentrations from McCall, 38 miles west of the SGP, were used in the cumulative NAAQS impact analyses (Section 4.1.2) to conservatively account for the impact contribution of traffic emissions.

The approximately 38-mile long Burntlog Route mine access road will be outside the project ambient air boundary and open to the public. Traffic emissions on public roads generally are considered to be part of background concentrations. Therefore, emissions on the Burntlog Route mine access road that are outside of the project boundary are not included in the SGP analyses. However, the emissions associated with the portion of the Burntlog Route mine access road that is within project boundary (from the south gate to the process area) are included in the SGP analyses. These include dust emissions generated from travel of maintenance equipment, light-duty pickup trucks and buses used for employee, visitor, and contractor transportation, and heavy-duty trucks used for cargo (including fuel, consumables, machine parts, ore processing supplies, ore concentrate, etc.) and services (including food supplies, trash, recyclables, etc.) transportation.

3.1.1 Criteria Pollutant Modeling Applicability and Modeled Emission Rates

If project-specific emission increases for criteria pollutants would qualify for a BRC permit exemption as per Idaho Air Rules Section 221 if it were not for potential emissions of one or more pollutants exceeding the BRC threshold of 10 percent of emissions defined by Idaho Air Rules as significant, then a NAAQS compliance demonstration may not be required for those pollutants with emissions below BRC levels. DEQ's regulatory interpretation policy of exemption provisions of Idaho Air Rules is that: "*A DEQ NAAQS compliance assertion will not be made by the DEQ modeling group for specific criteria pollutants having a project emissions increase below BRC levels, provided the proposed project would have qualified for a Category I Exemption for BRC emissions quantities except for the emissions of another criteria pollutant*" (DEQ 2014). The interpretation policy also states that the exemption criteria of uncontrolled potential to emit (PTE) not to exceed 100 ton/year (Idaho Air Rules Section 220.01.a.i) is not applicable when evaluating whether a NAAQS impact analyses is required. A permit will be issued limiting PTE below 100 ton/year, thereby negating the need to maintain calculated uncontrolled PTE under 100 ton/year. The BRC exemption cannot be used to exempt a project from a pollutant-specific NAAQS compliance demonstration in most cases where a PTC is required for the action regardless of emission quantities, such as the modification of an existing emission or throughput limit.

A NAAQS compliance demonstration must be performed for pollutant increases that would not qualify for the BRC exemption from the requirement to demonstrate compliance with NAAQS.

Site-specific air impact modeling analyses may not be necessary for some pollutants, even where such emissions do not qualify for the BRC exemption. DEQ has developed modeling applicability thresholds, below which a site-specific modeling analysis is not required. DEQ generic air impact modeling analyses that were used to develop the modeling thresholds provide a conservative SIL analysis for projects with emissions below identified threshold levels. Project-specific modeling applicability thresholds are provided in the *Idaho Air Modeling Guideline* (DEQ 2013). These thresholds were based on assuring an ambient impact of less than the established SIL for specific pollutants and averaging periods.

If total project-specific emission rate increases of a pollutant are below Level I Modeling Applicability Thresholds, then project-specific air impact analyses are not necessary for permitting. Use of Level II Modeling Applicability Thresholds is conditional, requiring DEQ approval. DEQ approval is based on dispersion-affecting characteristics of the emission sources such as stack height, stack gas exit velocity, stack gas temperature, distance from sources to ambient air, presence of elevated terrain, and potential exposure to sensitive public receptors.

For the SGP analyses, several modeling scenarios were considered to evaluate the worst-case air impacts from the SGP facility. The different modeling scenarios are discussed in Section 3.1.3. Table 4 provides a comparison between facility-wide maximum PTE for the highest-emitting scenario (W3) and modeling applicability thresholds. The short-term and long-term PTE emissions are equal to the sum of process and ancillary emissions and mining fugitive emissions. It is important to note that the process and ancillary source emissions remain the same for each modeling scenario discussed in Section 3.1.3.

Table 4. SITE-SPECIFIC CRITERIA POLLUTANT MODELING APPLICABILITY.

Source Category	Carbon Monoxide (CO)	Nitrogen Oxides (NOx)		$PM_{2.5}$[a]		PM_{10}[b]	Sulfur Dioxide (SO_2)		Lead (Pb)
	lb/hr[c]	ton/yr[d]	lb/hr	ton/yr	lb/hr	lb/hr	ton/yr	lb/hr	lb/month[e]
Process and ancillary	33.5	37.9	55.4	36.4	13.4	21.7	6.5	1.88	0.0437
Mining fugitive	1,742.0	17.1	46.8	98.9	22.5	224.7	0.03	0.09	--
Total	1,775.5	55.0	102.2	135.3	35.9	246.4	6.5	1.97	0.0437
Level I threshold	15.0	1.2	0.2	0.35	0.054	0.22	1.2	0.21	14.0
Modeling required	Yes	Yes	Yes	Yes	Yes	Yes	Yes	Yes	No

a. Particulate matter with an aerodynamic diameter less than or equal to a nominal 2.5 micrometers.
b. Particulate matter with an aerodynamic diameter less than or equal to a nominal 10 micrometer.
c. Pounds per hour.
d. Tons per year.
e. Pounds per month.

As indicated in Table 4, the SGP facility-wide maximum PTE are greater than the respective Level I thresholds for all criteria pollutants and averaging periods except for Pb. Therefore, modeling is triggered for applicable averaging periods for CO, NOx, $PM_{2.5}$, PM_{10}, and SO_2. Modeling is not required for Pb. The use of Level II modeling thresholds was not approved by DEQ for this project.

Tables 5-7 list criteria pollutant emission rates used in the cumulative NAAQS impact analyses for the worst-case modeling scenarios. Significant Impact Level (SIL) analyses were not performed. Based on the magnitude of the facility-wide emissions and preliminary modeling analyses, it was determined that the impacts from the SGP emissions exceeded the SIL for most criteria pollutants. Therefore, SIL

analyses were considered redundant and not performed for this report. Table 5 lists the source-specific modeled emission rates for 24-hour and annual $PM_{2.5}$ and 24-hour PM_{10} (worst-case modeling scenario: W5). Table 6 lists the source-specific modeled emission rates for 1-hour and 8-hour CO and annual NO_2 (worst-case modeling scenario: W1). Table 7 lists the source-specific modeled emission rates for 1-hour NO_2 and 1-hour and 3-hour SO_2 (worst-case modeling scenario: B1). Modeling scenarios are discussed in Section 3.1.3. For 1-, 3-, and 8-hour averaging times, hourly emission rates provided in pounds per hour were used. For 24-hour averaging time, daily emission rates provided in pounds per day were used. For the annual averaging time, annual emission rates provided in tons per year were used. All modeled emission rates in Tables 5-7 are listed in units of pounds per hour (lb/hr). The total modeled input emission rates (highest emission scenario) are listed in Table 8.

Table 5. MODELED 24-HOUR PM_{10}, 24-HOUR $PM_{2.5}$, AND ANNUAL $PM_{2.5}$ EMISSION RATES FOR CUMULATIVE NAAQS IMPACT ANALYSES (WORST-CASE MODELING SCENARIO, W5).

Type of Source	Source ID	Description	24-hour PM_{10} (lb/hr)[a]	24-hour $PM_{2.5}$ (lb/hr)	Annual $PM_{2.5}$ (lb/hr)
Point Sources	LS1L	Mill Lime Silo #1 Loading	3.54E-03	5.21E-04	2.50E-05
