Federal courts counsel against "considering wide ranging materials associated with the development of regulations" and give little to no weight to unpublished items that constitute a "hodgepodge of meeting minutes, staffers' notes, draft regulations, reports hearings and technical papers, many of which are anonymous." *Sikorsky Aircraft Corp. v. United States*, 102 Fed. Cl. 38, 55 (2011); *Perry v. Martin Marietta Corp.*, 47 F.3d 1134 (Fed. Cir. 1995)). This approach is consistent with the U.S. Supreme Court's explanation of the types of documents that represent an agency's policy positions and interpretations for purposes of deference. *Kisor v. Wilkie*, 588 U.S. 558, 577, 139 S. Ct. 2400, 2416-17 (2019) ("In other words, [an interpretation] must be the agency's 'authoritative' or 'official position,' rather than any more ad hoc statement not reflecting the agency's views. . . Not everything the agency does comes from, or is even in the name of, [the agency head]. So, for example, we have deferred to 'official staff memoranda' that were 'published in the Federal Register,' even though never approved by the agency head. But there are limits. The interpretation must at the least emanate from those actors, using those vehicles, understood to make authoritative policy in the relevant context.") (internal citations omitted).

[3] The petitioners have offered no certification or authentication confirming that the source of these materials is from the state archives.

Notably, the Tiedemann Declaration includes a long block quotation of an email from an Idaho Deputy Attorney General to DEQ without providing any response from DEQ. Tiedemann Dec. at 8, ¶ 19. The content of this email is irrelevant on its face because, without a response from DEQ, it provides no insight into DEQ's rulemaking process or the correct interpretation of the regulations at issue. Even with the response, it would be inadmissible. However, this highlights the prejudice that would result from considering such incomplete and unreliable information.

Additionally, the Tiedemann Declaration quotes and heavily relies on an "undated" draft letter for which Mr. Tiedemann merely *presumes* the identity of the author and the recipient. Tiedemann Dec. at 11, ¶ 27 (quoting "[a] undated TAPs rulemaking concept letter" which Mr. Tiedemann claims is "addressed to a 'Robert' (presumably Robert Wilkoz) and presumably from another DEQ staffer"). By failing to identify the date of the letter and merely assuming the identity of the involved parties, Mr. Tiedemann failed to produce evidence sufficient to support a finding that the letter is what Mr. Tiedemann claims it is. Accordingly, Mr. Tiedemann and the Petitioners have failed to authenticate this letter.

Moreover, the statements that Mr. Tiedemann references from this undated draft letter constitute hearsay because the statements were not made by Mr. Tiedemann and are offered to "prove the truth of the matter asserted." *See* I.R.E. 801. While the I.R.E. includes a hearsay exception for certain types of public records, the exception does not apply when an opponent shows "that the source of information or other circumstances indicate a lack of trustworthiness." I.R.E. 801(8). Without any information to confirm the date of this draft letter or the parties involved, or full context of the comment in light of responses and other information that was available at the time, the draft letter is not trustworthy and constitutes hearsay.

As the draft documents and informal communications that the Tiedemann Declaration relies upon constitute irrelevant, unauthenticated, and hearsay evidence under the I.R.E., the Hearing Officer should strike these documents or, at a minimum, afford them no weight under IDAPA Rule 476. Perpetua reserves the right to raise further objections to Mr. Tiedemann's testimony, including whether he is qualified to provide expert opinion on the Idaho air permitting rules or related rulemaking history.

CONCLUSION

The Hearing Officer should strike from the Tiedemann Declaration the following: paragraphs 10.a, 10.b., 10.c., 10.d.; 14; paragraphs 17 through 24[4]; 26 through 30[5]; 32; 34; 36 through 39; 40; 43 through 47; 49 through 50; section headers A, B, C, and D; and all referenced exhibits (Exhibits A, B, C, D, E, and F). The Hearing Officer should strike from the von Lindern Declaration the following: paragraphs 15.a through 15.d, 16, 18, 19, 51, 52, 60, 68, 71, and 96; certain language in paragraphs 26, 29, 36, 37, 45, 50, 55, 58, 61, 65, 66, 67, 72, 77, and 80; section headers A, C, E; and the titles of Figures 1, 3, 5a, 5b. If the Hearing Officer decides that portions of the declaration or exhibits should not be stricken, Perpetua respectfully requests that, where applicable, the Hearing Officer consider this evidence with less weight and provide Perpetua with an opportunity to brief these matters as a matter of due process.[6]

[4] The Tiedemann Declaration does not contain a Paragraph 23.

[5] The Tiedemann Declaration includes two Paragraph 27s. Perpetua seeks to strike both. Also, the Tiedemann Declaration includes paragraph A.9. after paragraph A.28. Perpetua assumes that Petitioners intended this to be paragraph "29."

[6] *Cf. Cowan v. Bd. of Comm'rs*, 143 Idaho 501, 512 (2006) (discussing procedural due process requirement that a defendant be given an opportunity respond and be heard).

EXHIBIT A

Language to Strike in the Tiedemann Declaration

Paragraph or Section Header	Language to Strike	Justification to Strike
¶ 10.a	Based on my review of case materials and extensive CAA permitting and compliance experience in private practice, with the State of Idaho, and with a non-profit organization, I conclude as follows: DEQ's application of the 16/70 Project-specific adjustment factor to the ambient arsenic air concentration analysis, and the use of exposure duration adjustments like the 16/70 calculations is not supported by the historic TAPs rulemaking record. It was thus inappropriate for DEQ to use such an adjustment factor to demonstrate compliance with the Air Rules.	Presents legal opinion and conclusory statement in violation of Rule 485. Petitioners have not demonstrated qualification of expert to testify regarding the rulemaking analysis in violation of Rule 485. Testimony relies solely on unreliable, unauthenticated hearsay evidence in violation of Rule 485.
¶ 10.b	Based on my review of case materials and extensive CAA permitting and compliance experience in private practice, with the State of Idaho, and with a non-profit organization, I conclude as follows: DEQ's interpretation of the TAPs AACCs as averaging periods rather than enforceable "standards" is misplaced and is not supported by the historic TAPs rulemaking record;	Presents legal opinion in violation and conclusory statement of Rule 485. Petitioners have not demonstrated qualification of expert to testify regarding the rulemaking analysis in violation of Rule 485.

Paragraph or Section Header	Language to Strike	Justification to Strike
		Testimony relies solely on unreliable, unauthenticated hearsay evidence in violation of Rule 485.
¶ 10.c	Based on my review of case materials and extensive CAA permitting and compliance experience in private practice, with the State of Idaho, and with a non-profit organization, I conclude as follows: DEQ use of a 5-year rolling average for TAPs emission calculations is neither supported by the TAPs rule, the historic TAPs rulemaking record, nor by limitations under the Permit conditions;	Presents legal opinion and conclusory statement in violation of Rule 485. Petitioners have not demonstrated qualification of expert to testify regarding the rulemaking analysis in violation of Rule 485. Testimony relies solely on unreliable, unauthenticated hearsay evidence in violation of Rule 485.
¶ 10.d	Based on my review of case materials and extensive CAA permitting and compliance experience in private practice, with the State of Idaho, and with a non-profit organization, I conclude as follows: There was sufficient evidence to support the T-RACT analysis limiting the non-West End pit lifetime production limit, but West End Pit production is not properly constrained below the less than life-of-mine time frame.	Presents legal opinion in violation of Rule 485.

Paragraph or Section Header	Language to Strike	Justification to Strike
Section Header A	Application of the 16/70 Project-specific adjustment factor for assessing compliance with the TAPs rule is inconsistent with the rulemaking history, intent, and plain language of the TAPs rule.	Presents legal opinion in violation of Rule 485. Petitioners have not demonstrated qualification of expert to testify regarding the rulemaking analysis in violation of Rule 485. Testimony relies solely on unreliable, unauthenticated hearsay evidence in violation of Rule 485.
¶ 14	Based on my review of the historical records related to the development of the TAPs Rule, it is evident that the AACCs were developed as annual emission limits, with the intent that compliance is demonstrated on a year-over-year basis. The records demonstrate that the use of an exposure duration adjustment, like the 16/70 Project-specific adjustment factor used for the SGP, was directly considered by DEQ, and ultimately rejected. If implemented, using project-specific adjustment factors would create a permitting protocol that is antithetical to the intended protections of the TAPs Rule, the AACCs, and annual, year-over-year limits. My own personal experience working as a Permitting Engineer for DEQ, the Air Rules themselves, the historical TAPs Rule rulemaking record, and greater context of U.S. Environmental Protection Agency (EPA) guidance all support this conclusion.	Presents legal opinion in violation of Rule 485. Provides legal opinion or analysis in violation of Rule 485. Petitioners have not demonstrated qualification of expert to testify regarding the rulemaking analysis in violation of Rule 485. Testimony relies solely on unreliable, unauthenticated hearsay evidence in

Paragraph or Section Header	Language to Strike	Justification to Strike
		violation of Rule 485.
¶ 17	The Air Rules themselves and the historical TAPs rulemaking record reinforce my personal experience with TAPs compliance and demonstrate that, in its original TAPs rulemaking process, DEQ directly considered, but ultimately rejected, concepts like the 16/70 Project-specific adjustment factor and exposure duration adjustments generally, except for sources expected to operate for less than 5 years.	Presents legal opinion in violation of Rule 485.
¶ 18	In an August 13, 1992 letter from DEQ's Mr. Frank Wilkoz to Ms. Joan Cloonan, Idaho Association of Commerce and Industry, Mr. Wilkoz provided a first draft of the original TAPs rules for review while adding context within a "Explanation of Additions and Changes" section. Mr. Wilkoz served as DEQ's Technical Services Bureau Chief and was heavily involved in the development of the original TAPs rulemaking and subsequent modification while Ms. Cloonan served as an industry stakeholder and provided input to the process. Mr. Wilkoz's "Explanation of Additions and Changes" section provides insight to how DEQ intended to permit remediation and short term sources. Most significantly Mr. Wilkoz writes: However, a remediation source cannot be allowed to produce emissions that have the potential to expose human receptors to a full lifetime dose of a TAP over a short period of time, especially a carcinogen, even in the interest of environmental clean up. Further, a single very large dose of a carcinogen, while not a full lifetime dose, has the potential to cause toxics related cancers due to the nature of dose response interaction of carcinogens at the cellular level. To allow such doses would subvert the very purpose of a clean up. **Corresponds to Exhibit A.**	Petitioners have not demonstrated reliability of historical records, therefore testimony relies on unreliable, unauthenticated information. 1992 email is hearsay. Remainder of paragraph A.18 after the first sentence relies solely on hearsay in violation of Rule 485. Petitioners have not demonstrated qualification of expert to testify regarding the rulemaking analysis in violation of Rule 485.
¶ 19	In an email dated August 14, 1992, Idaho Deputy Attorney General Curt Fransen emailed DEQ's Mr. Tim Teater and Mr. Frank Wilkoz directly raising these questions regarding large-dose short-term exposures.4 During the TAPs rulemaking period, Mr. Teater served as an Air Quality	Petitioners have not demonstrated reliability of historical records, therefore testimony

Paragraph or Section Header	Language to Strike	Justification to Strike
	Toxicologist and was also heavily involved in the development of the original TAPs rulemaking and subsequent modifications. In his email, Mr. Fransen questions: 16.01.01012,13.g.iii. and iv. The standard for remediation sources raises some questions of a general nature. I don't have any answers but wonder if it makes scientific sense to directly convert risk of additional cancer based on lifetime exposure to risk of additional cancer based on less than lifetime exposure by assuming a directly proportional relationship between years of exposure and risk. Sorry that I can't properly express that but you probably get the drift. Other questions that seem to arise from simply allowing higher exposure where the length of exposure is shorter include the unknown or potential combined and synergistic effect of many short term or remediation sources or other sources in the same area and the potential of serial (one after another) short term or remediation sources. Lastly, how will the operational life of a source be determined. What if an applicant says they only intend to operate for five years (for whatever reason) so want the higher emission number to apply. There is incentive for facilities to argue they will be short-term. The spectre of serial short-term sources arises. Perhaps the definition can be clarified so there is less wiggle room. **Corresponds to Exhibit B.**	relies on unreliable, unauthenticated information. 1992 email is hearsay. Testimony in paragraph A.19 relies solely on hearsay in violation of Rule 485. Petitioners have not demonstrated qualification of expert to testify regarding the rulemaking analysis in violation of Rule 485.
¶ 20	In a later and related email sent from Mr. Teater to Mr. Wilkosz on August, 26, 1992,6 Mr. Teater states: We will need to talk about the environmental remediation source limit of five years to get a break on emissions. I am opposed to making that greater than five years. It seems that after five years most remediation sources would have emission BRC (Below Regulatory Concern) anyway. If not then they need to be treated as any other source. **Corresponds to Exhibit C.**	Petitioners have not demonstrated reliability of historical records, therefore testimony relies on unreliable, unauthenticated information. 1992 email is hearsay and relies solely on hearsay in violation of Rule 485.

Paragraph or Section Header	Language to Strike	Justification to Strike
		Petitioners have not demonstrated qualification of expert to testify regarding the rulemaking analysis in violation of Rule 485. Testimony relies solely hearsay evidence in violation of Rule 485.
¶ 21	A further review of the historical TAPs rulemaking record provides support for treating the AACC as annual, year-over-years limit rather than supporting the use of unique operational scenarios and exposure duration adjustments.	Presents legal opinion in violation of Rule 485. Petitioners have not demonstrated reliability of historical records, therefore testimony relies on unreliable, unauthenticated information.
¶ 22	Regardless, and more importantly, the only less-than-lifetime exposure duration adjustment DEQ ultimately included within the original TAPs rule (or any subsequent versions) was the less than 5-yaer, ten-fold adjustment factor currently contained under IDAPA 58.01.01.210.15.	Presents legal opinion in violation of Rule 485.
¶ 24	Said another way, there is a high concentration dose of arsenic received over a short duration that is equivalent in risk to some corresponding low concentration dose of arsenic received over a longer duration. This is the underlying assumption that DEQ relies on when it applied the 16/70 Project-specific adjustment factor to assessing TAPs compliance for the SGP Permit.	Presents legal opinion and conclusory statement in violation of Rule 485.

Paragraph or Section Header	Language to Strike	Justification to Strike
¶ 26	Furthermore, the historical TAPs rulemaking record shows DEQ specifically rejected previously existing EPA Superfund risk assessment guidance and its use of exposure duration adjustments in consideration of risk and TAP exposure. The following documents confirm this conclusion.	Presents legal opinion and conclusory statement in violation of Rule 485. Petitioners have not demonstrated qualification of expert to testify regarding the rulemaking analysis in violation of Rule 485.
¶ 27	A undated TAPs rulemaking concept letter(herein referred to as the TAPs Concept Letter) addressed to a "Robert" (presumably Robert Wilkoz) and presumably from another DEQ staffer outlines the rationale behind changes within a modified draft TAPs rule. Within the letter it is stated: We also do not accept the EPA superfund risk assessment guidelines. Superfund guidelines are based on the concept that the exposures are of limited duration and do not have a large potential for multiple exposures. We can not make those assumptions for sources in Idaho, many of which involve either long term exposures or exposures to substances with a potential for multiple exposures. In Idaho, we are attempting to protect the public from the deleterious effect of multiple sources of a given pollutant or the additive effects of multiple pollutants over the course of a 70 year lifetime. If we could assure only a single exposure occupance, then accepting higher temporary risk might be justifiable. In addition we must consider the effects of the pollutant on the elderly, the very young and the infirm. By using "worse case" assumptions we are then able, under very limited conditions and when the public health would not be compromised, to deviate from the one in a million standard and apply a one in one hundred thousand as noted in the NSR policy. The use of this conservative approach allows us	Petitioners have not demonstrated reliability of historical records, therefore testimony relies on unreliable, unauthenticated information. Undated concept letter is hearsay and this testimony relies solely on hearsay in violation of Rule 485. Petitioners have not demonstrated qualification of expert to testify regarding the rulemaking analysis in violation of Rule 485.

Paragraph or Section Header	Language to Strike	Justification to Strike
	to be sure that actual risk is no greater than the risk figure on which we base our policy. **Corresponds to Exhibit D.**	
¶ 27	A January 23, 1992 unsigned draft letter to Mr. Charles Woods, Marketing Manager for MDT Corporation13 (a presumed TAPs rulemaking industry stakeholder) from a DEQ staffer (presumably Mr. Wilkoz) states: Our policy is based on a 1:1,000,000 risk at the nearest public access to the source. Risk is computed by multiplying the predicted (by the model) ambient concentration by the unit risk factor (URF) as published by the US EPA. Idaho does not accept the Superfund risk assessment method for computing risk except for single, relatively short term exposures. Our risk assessment for continuous industrial or other large sources is based on the possibility of multiple, long term exposures. **Corresponds to Exhibit E.**	Petitioners have not demonstrated reliability of historical records, therefore testimony relies on unreliable, unauthenticated information. Undated concept letter is hearsay and this testimony relies solely on hearsay in violation of Rule 485. Petitioners have not demonstrated qualification of expert to testify regarding the rulemaking analysis in violation of Rule 485.
¶ 28	A TAPs rule that allows for exposure duration adjustments and a risk assessment approach creates a problematic precedent, as is made evident by the following hypothetical scenario. If the SGP (or any subsequent source) is allowed to operate using exposure duration adjustments, an adjacent receptor (i.e., a human being) would be exposed to more than the intended annual allowable concentration of arsenic (the AACC) for 16 years. If, before the SGP operations end, the receptor moves and lives or works next to another facility or a new facility starts operations next to the SGP that applies an exposure duration adjustment for TAPs compliance (a process which could repeat indefinitely), by the end of the receptor's lifetime, it has been exposed to a TAPs concentration over the AACC for its entire life and its lifetime risk exceeds the intended 1-in-100,000 cancer risk	Presents legal opinion in violation of Rule 485. Third sentence is testimony made relying solely on hearsay email which must be excluded under Rule 485.

Paragraph or Section Header	Language to Strike	Justification to Strike
	level. In this scenario, the "spectre of serial short-term sources," as feared by Mr. Fransen in his email is apparent. Allowing the SGP to use the 16/70 Project-specific adjustment factor opens the door to a world in which the current AACCs in the TAPs Rule are effectively replaced by higher concentrations due to shorter than 70-year sources.	
¶ 9	Contrast a hypothetical scenario where exposure duration adjustments are not allowed and the TAP AACCs are annual limits that must be met year-over-year by every facility in Idaho. In this case, no facility may emit TAPs at a concentration greater than the AACCs and a 1-in-100,000 excess cancer risk is preserved no matter where a receptor lives, works, or travels in Idaho during their entire life, and no matter what other facilities start operations. This scenario creates a simple and easy to implement rule that is broadly protective of human health and the environment and, as the Schilling Declaration itself notes, was the intent of the originally TAP rulemaking process. Furthermore, this scenario is supported by the historical TAPs rulemaking record and best fits the intent of DEQ.	Presents legal opinion in violation of Rule 485. For last sentence specifically, Petitioners have not demonstrated qualification of expert to testify regarding the rulemaking analysis.
¶ 30.a	Given the full review of the above evidence and based on my experience as a Permit Engineer at DEQ, I conclude as follows: During the TAPs rulemaking process, DEQ specifically considered the use of exposure duration adjustments and use of calculations akin to the 16/70 Project-specific adjustment factor, but ultimately did not incorporate their use within the TAPs rules;	Presents legal opinion and conclusory statement in violation of Rule 485. Petitioners have not demonstrated qualification of expert to testify regarding the rulemaking analysis.
¶ 30.b	Given the full review of the above evidence and based on my experience as a Permit Engineer at DEQ, I conclude as follows: DEQ intended the AACCs to be annual, year-over-year concentration limits and included only a single short-term adjustment factor within the original TAPs rule for sources operating for 5-years or less;	Presents legal opinion and conclusory statement in violation of Rule 485.

Paragraph or Section Header	Language to Strike	Justification to Strike
		Petitioners have not demonstrated qualification of expert to testify regarding the rulemaking analysis.
¶ 30.c	Given the full review of the above evidence and based on my experience as a Permit Engineer at DEQ, I conclude as follows: DEQ's application of the 16/70 Project-specific adjustment factor to demonstrate compliance with TAPs is not supported by the intent or language of the TAPs rule, and results in a degradation of the protection of human health and the environment that is otherwise the purpose of the TAPs rule.	Presents legal opinion and conclusory statement in violation of Rule 485. Petitioners have not demonstrated qualification of expert to testify regarding the rulemaking analysis.
Section Header B	DEQ and Perpetua incorrectly assume the 1-in-100,000 cancer risk rate, rather than the AACC, is the applicable enforceable "standard."	Presents legal opinion in violation of Rule 485.
¶ 32	Labeling AACCs as "increments" versus "standards" is simply a naming convention rooted in previously existing CAA policy; the enforceable standard is the AACC as a year-over-year limit.	Presents legal opinion in violation of Rule 485.
¶ 34	The AACCs as "increments" are different in that they do not consider background concentrations of TAPs. Unlike Criteria Pollutants, DEQ does not regularly monitor the ambient concentrations of TAPs. There simply are too many TAPs (there are over 80 carcinogenic TAPs alone listed in IDAPA 58.01.01.586), they are state-specific (unlike Criteria Pollutants), and the cost to do so is generally accepted as prohibitive. Thus, during the historic TAPs rulemaking process the AACCs were implemented as "increments" versus "standards." Said another way, while it is infeasible to monitor and enforce an ultimate TAPs concentration standard, it is feasible to estimate the incremental increase in TAPs concentrations that a facility would cause.	Presents legal opinion in violation of Rule 485. Petitioners have not demonstrated qualification of expert to testify regarding the rulemaking analysis.

Paragraph or Section Header	Language to Strike	Justification to Strike
¶ 36	Both the TAPs AACCs and PSD increments are maximum allowable increases from a specific source. In developing the TAPs Rules, DEQ would have certainly been aware of the concept and naming convention of "increments." The TAPs definition of increments is best viewed through the lens of a compliance period, rather than implying they represent an averaging period, as the Lewis Declaration does.	Presents legal opinion in violation of Rule 485. Petitioners have not demonstrated qualification of expert to testify regarding the rulemaking analysis.
¶ 37	Evidence from the historical TAPs rulemaking record reinforces this and the conclusion that the use of the term "increment" within TAPs was to differentiate them from including background concentrations as "standards" do. During the 1995 period, DEQ made revisions to the original and previously promulgated TAPs rule. As part of that process, DEQ developed a TAPs rule amendment summary document.23 Within that document DEQ notes: The proposed rule will divide consideration of incremental increases of TAP emissions into individual source and facility wide categories. Net emissions is a concept that adds increases and decreases of emissions from new sources of TAP together to obtain a net amount. That net amount is then compared to acceptable ambient levels also called increments for a permitting decision. The acceptable ambient level is referred to as an increment because TAP emissions increases are limited to an incremental increase as opposed to an absolute limited ambient concentration. **Corresponds to Exhibit F.**	Presents legal opinion and conclusory statement violation of Rule 485. Petitioners have not demonstrated qualification of expert to testify regarding the rulemaking analysis. Petitioners have not demonstrated reliability of historical records, therefore testimony relies on unreliable, unauthenticated information.
¶ 38	On the other hand, if you assume DEQ intended the 1-in-100,000 cancer risk to be the enforceable standard and not the AACC as annual, year-over-year limits, it would have needed to incorporate additional variables into the TAPs Rule to guide applicants on how to assess that risk. Completing a risk assessment that analyzes a facility's excess cancer risk traditionally involves consideration of more variables and factors than just exposure duration.	Presents legal opinion in violation of Rule 485. Petitioners have not demonstrated qualification of expert to testify regarding the

Paragraph or Section Header	Language to Strike	Justification to Strike
	Sensitive populations, comorbidities, and synergistic effects of combined toxic exposure all affect the ultimate cancer risk from a facility's airborne toxic emissions. However, as mentioned above, the original TAPs rulemaking process rejected the risk assessment method and prioritized creating a simple and easy to implement rule that is still protective of human health and the environment. Ultimately, using the AACCs as the "enforceable standard" is a far more effective standard to use in fulfilling this goal.	rulemaking analysis. Petitioners have not demonstrated reliability of historical records, therefore testimony relies on unreliable, unauthenticated information.
¶ 39.a	Given the full review of the above evidence, I conclude as follows: The labeling of the AACCs as "increments" versus "standards" is a naming convention rooted in previously existing CAA policy and is a distinction in the consideration of pollutant background concentrations rather than an averaging period concept.	Presents legal opinion and conclusory statement in violation of Rule 485.
¶ 39.b	Given the full review of the above evidence, I conclude as follows: DEQ intended the enforceable "standard" to be the AACC as an annual, year-over-year limit.	Presents legal opinion and conclusory statement in violation of Rule 485.
Section Header C	Use of a 5-year rolling average for demonstrating compliance with the TAPs ruleT-RACT is inappropriate and not supported by Permit conditions.	Presents legal opinion in violation of Rule 485.
¶ 40	Use of a 5-year rolling average for demonstrating compliance with the TAPs ruleT-RACT is inappropriate and not supported by Permit conditions.	Presents legal opinion in violation of Rule 485.
¶ 43	This outcome creates a problematic precedent as is evident by another hypothetical scenario. Consider again the "spectre of serial short-term sources" and the scenario in which a receptor is exposed to consecutive sources that have applied an exposure duration adjustments discussed above in Paragraph 28. In a modified scenario, the receptor is adjacent to the SGP for four years of high TAPs emissions, but then relocates adjacent to a different TAPs source before a fifth year of low SGP TAP emissions occurs. The new	Presents legal and analysis opinion in violation of Rule 485. Second sentence relies solely on hearsay in violation of Rule 485.

Paragraph or Section Header	Language to Strike	Justification to Strike
	TAPs source is also a less than 70-year source using exposure duration adjustments with TAPs concentrations above the AACCs. The receptor will be consistently exposed to TAPs concentration potentially well over the AACC, and is accruing an excess cancer risk level above 1-in-100,000. Again, the AACCs are effectively replaced by higher concentrations due to less than 70-year sources using exposure duration adjustment factors and/or emission period averaging.	
¶ 44	In order to avoid such a scenario, the Air Rules and the historical TAPs rulemaking record speak for themselves.	Presents legal opinion in violation of Rule 485. Petitioners have not demonstrated qualification of expert to testify regarding the rulemaking analysis.
¶ 45.a	Given the full review of the above evidence, I conclude as follows: Calculation of the SGP's arsenic emissions by using a 5-year rolling average is contrary to the intent of the original TAPs rulemaking process and the Air Rules stating that the AACC are an annual, year-over-year limit	Presents legal opinion and conclusory statement in violation of Rule 485. Petitioners have not demonstrated qualification of expert to testify regarding the rulemaking analysis.
¶ 45.b	Given the full review of the above evidence, I conclude as follows: Using a 5-year rolling average inappropriately allows individual years of excess TAPs emissions to be masked within an averaged period.	Presents legal opinion and conclusory statement in violation of Rule 485.

Paragraph or Section Header	Language to Strike	Justification to Strike
		Petitioners have not demonstrated qualification of expert to testify regarding the rulemaking analysis.
Section Header D	There is insufficient evidence to support the T-RACT analysis limiting the non-West End pit production limit.	Presents legal opinion in violation of Rule 485.
¶ 46	However, Board was right in question whether the production from all pits was properly constrained.	Presents conclusory statement and legal opinion in violation of Rule 485.
¶ 47	The AACCs are limits for which compliance must be demonstrate on an annual year-over-year basis.	Presents legal opinion in violation of Rule 485.
¶ 49	In order to comply with the AACCs and demonstrate TAPs compliance, DEQ should have: (1) determined the worst arsenic generation scenario from any single year of the SGP (likely to include 100% production from the West End Pit); (2) compared the modeled operation boundary arsenic concentration from the worst generation scenario to the AACC to evaluate TAPs compliance; and (3) include a maximum annual ore generation permit limit from the pit(s) that correspond to the worst arsenic generation to ensure TAPs compliance.	Presents legal analysis and opinion in violation of Rule 485.
¶ 50.a	Given the full review of the above evidence, I conclude as follows: a. DEQ did not appropriately analyze the maximum annual emissions scenario from the SGP and instead diluted the SGP'd arsenic emissions through the 5-year rolling average calculation.	Presents legal opinion and conclusory statement in violation of Rule 485.
¶ 50.b	Given the full review of the above evidence, I conclude as follows: The permit does not sufficiently constrain ore production from the SGP's pit(s) on an annual basis.	Presents legal opinion and conclusory statement in violation of Rule 485.

EXHIBIT B

Language to Strike in the von Lindern Declaration

Paragraph or Section Header	Language to Strike	Justification to Strike
¶ 15.a	I have reviewed Idaho Board of Environmental Quality's Final Order and understand and agree with the Board's conclusions that: DEQ Did Not Act Reasonably and in Accordance with Law When it Analyzed the Ambient Arsenic Air Concentrations for the SGP;	Presents legal opinion and conclusory statement in violation of Rule 485.
¶ 15.b	I have reviewed Idaho Board of Environmental Quality's Final Order and understand and agree with the Board's conclusions that: DEQ did not Act Reasonably in Using a Five-Year Rolling Average for T-RACT that was not Properly Supported by Permit Conditions;	Presents legal opinion and conclusory statement in violation of Rule 485.
¶ 15.c	I have reviewed Idaho Board of Environmental Quality's Final Order and understand and agree with the Board's conclusions that: There was Insufficient Evidence to Support the T-RACT Analysis Limiting the Non-West End Pit Production Limit;	Presents legal opinion and conclusory statement in violation of Rule 485.
¶ 15.d	I have reviewed Idaho Board of Environmental Quality's Final Order and understand and agree with the Board's conclusions that: DEQ Did Not Act Reasonably and in Accordance with Law When it Applied the 16/70 Calculation to the Ambient Arsenic Air Concentration Analysis.	Presents legal opinion and conclusory statement in violation of Rule 485.
¶ 16	I have reviewed the transcript of the May 1, 2024 special meeting of the Idaho Board of Environmental Quality. I also concur with Vice Chair McMillan's testimony that: . . . DEQ has misinterpreted how the acceptable ambient concentration for carcinogens, the AACC, must be applied if it is to comply with our air quality rules. … DEQ's creation and application of a project-specific adjustment factor is not supported by Idaho's air quality rules.	Presents legal opinion and conclusory statement in violation of Rule 485.

Paragraph or Section Header	Language to Strike	Justification to Strike
	… the creation of a project-specific adjustment factor suggests that there is a significant ignorance about cancer, carcinogens, and carcinogenesis. … the short-sighted project-specific adjustment factor to the Stibnite Gold Project, DEQ created a misleading risk analysis that greatly underestimates the actual cancer risk	
Section Header A	DEQ's application of the 16/70 Project-specific adjustment factor is inappropriate science and public health policy.	Presents legal opinion and conclusory statement in violation of Rule 485.
¶ 18	DEQ has failed to properly implement Section 586 and T-RACT for the SGP PTC by introducing a 16/70 SGP Project-specific adjustment factor to allocate the full 70-year lifetime allowable cancer risk to the 16-year Life of Mine (LOM). The calculation averages the risk resulting from SGP emissions over the life of the receptor. This adjustment allows the SGP to emit as much as 70 years of allowable carcinogenic emissions in 16 years. This type of "adjustment factor," also known as risk amortization or cancer dose-averaging, undermines both the health protectiveness and the regulatory certainty of the TAPs rule. In the context of the existing TAPs rule, as applied the last 30 years, using the 16/70 Project-specific adjustment factor is an incorrect interpretation and represents unsound science and public health policy.	Presents legal opinion in violation and conclusory statement of Rule 485.
¶ 19	Specifically, DEQ misinterprets the purpose and function of the **maximum one-year annual average ambient air carcinogen concentration** in implementing the TAPs rule. It is important to review the development of the TAPs rule in understanding the strategy represented by this one-year annual standard. The Schilling Declaration asserts that the TAPs rule was developed nearly thirty years ago to accommodate DEQ's predecessor agency IDHW-DOE and the regulated communities' request to adopt rules that are: 1) are reasonably protective of public health, but still afford flexibility to facilities and projects; 2) are relatively easy to understand and implement; and 3) do not require excessive expenditure of time and	Presents legal opinion and conclusory statement in violation of Rule 485.

Paragraph or Section Header	Language to Strike	Justification to Strike
	resources by DEQ and the permittee during the permitting process.	
Title of Figure 1	Cumulative Risk (CR) and Margin of Safety (MOS) under Properr Implementation of TAPS Rules	Presents legal opinion and conclusory statement in violation of Rule 485.
¶ 26	If the TAPs rule is properly implemented, the cumulative incremental risk is shown by the diagonal line proceeding from birth to age 70 years (i.e., risk is allowed to accumulate at an annual rate of (1x10-5)/70 per year, or (AACC*URF/70) under T-RACT. The gray area below the diagonal line represents the portion of allowable lifetime risk accumulating from the incremental source.	Presents legal opinion in violation of Rule 485.
¶ 29	Using the 70-year basis proposed by DEQ and Perpetua allows Perpetua to emit a lifetime of allowable emissions in 16 years, and undermines the health protectiveness of the rule and increases cancer risk.	Presents legal opinion in violation of Rule 485.
¶ 36	This shortsighted conclusion is incorrect, unprecedented, and not supported by EPA guidelines.	Presents legal opinion statement in violation of Rule 485.
¶ 37	DEQ's misinterpretation would allow emissions and consequent exposures of more than two orders of magnitude greater risk than the AACC (1.2 X 10-4 equivalent risk) for six years.	Presents legal opinion in violation of Rule 485.
Title of Figure 3	Comparison of Cumulative Risk (CR) for 6-year Project emitting a Carcinogen with a Mutagenic MOA using the Project-specific (16/70) Adjustment Factor and Proper TAPS Application	Presents legal opinion and conclusory statement in violation of Rule 485.
¶ 45	Conversely, proper application of the TAPs rule using the maximum one-year annual average ambient air carcinogen concentration is shown by the lower cumulative risk line (gray line). Proper implementation of the TAPs rule would result in 4.6x10-6 cumulative cancer risk at age six years, as shown in Figure 3.	Presents legal opinion in violation of Rule 485.

Paragraph or Section Header	Language to Strike	Justification to Strike
Title of Figure 5a	Cumulative Risk (CR) and Margin of Safety (MOS) under Proper Implementation of Idaho TAPS Rules for 3 Successive 6-year Projects	Presents legal opinion in violation of Rule 485.
¶ 50	The TAPs rule is health protective if properly implemented.	Presents legal opinion in violation of Rule 485.
Title of Figure 5b	Cumulative Risk (CR) and Margin of Safety (MOS) under Proper Implementation of Idaho TAPS Rules for 3 Successive 6-yea Projects emitting Carcinogen Exhibiting a Mutagenic Mod of Action (MOA*)	Presents legal opinion in violation of Rule 485.
¶ 51	The inappropriate averaging is allegedly justified by ad hoc risk assessment calculations and risk management protocols that undermine both the simplicity and the health protectiveness of the TAPs rule. The MOS is compromised, the public is no longer secure, and the regulated industry is now obliged to include cancer risk and health impact assessments in TAPs PTC applications to support the assertions of health protectiveness.	Presents legal opinion in violation of Rule 485.
¶ 52	There are no provisions in the Air Rules to allow manipulation of the required maximum one-year annual average ambient air carcinogen concentration or the AACC, or to submit risk calculations.	Presents legal opinion in violation of Rule 485.
¶ 55	Vice Chairman McMillan further indicated that DEQ's application of what he called the "short-sighted" Project-specific adjustment factor to the Stibnite Gold Project created a misleading risk analysis that greatly underestimates the actual cancer risk. In his view: *The Idaho rules are not ambiguous*. There is an acceptable risk associated with the AACC standard. There is an acceptable risk associated with DEQ-approved T-RACT projects, and there is an acceptable risk associated with the short-term project that is five years or less. There are no other acceptable risks identified in Idaho's air quality rules. I agree with Dr. McMillan's statement. (emphasis added)	Highlighted language offers legal opinion in violation.
¶ 58	DEQ erroneously substitutes the 5-year rolling average emissions for the maximum one-year potential emissions required under Section 586 and T-RACT.	Presents legal opinion in violation of Rule 485.
¶ 60	Instead, DEQ substituted the 5-year rolling average for the required maximum one-year emission rate. There is no provision in the TAPs rule for altering or adjusting the	Presents legal opinion in violation of Rule 485.

Paragraph or Section Header	Language to Strike	Justification to Strike
	predicted maximum one-year annual average. This erroneous substitution significantly reduces the MOS inherent in proper allocation of the one-year maximum emission rates. To be health protective, the prescriptive Section 586 rule explicitly (not typically) requires predicting the **maximum one-year annual average contaminant concentration** using prescribed emissions estimates, and assuring that concentration is not exceeded during the life of the facility.	
¶ 61	It is not possible from the available information provided by DEQ to determine how this 5-year rolling average compares to the maximum one-year emission rate that should have been used.	Presents legal opinion and conclusory statement in violation of Rule 485.
Section Header C	Ambient air arsenic concentrations and cancer risk are underestimated for the SGP by improper application of the non-WEP emissions scenarios.	Presents legal opinion in violation of Rule 485.
¶ 65	In the context of properly applying the TAPs rule, the non-WEP adjustment factor is irrelevant. DEQ's obligation is to identify the emission scenario that produces the maximum one-year annual average ambient air carcinogen concentration. That value is the maximum WEP2 scenario, and would not consider non-WEP scenarios unless the non-WEP emissions sources were operating contemporaneously during the WEP2 emission maximum year. In that case, any non-WEP scenario operating in the same year as the WEP2 maximum configuration would add to, not dilute, the critical receptor maximum ambient air concentration.	Presents legal opinion in violation of Rule 485.
¶ 66	DEQs applying the SGP Project-specific non-WEP adjustment factor effectively converts the 5-year alleged annual average value (0.00698 $\mu g/m^3$) to an arbitrary 0.00416 $\mu g/m^3$ 16-year LOM average carcinogenic concentration.	Presents legal opinion in violation of Rule 485.
¶ 67	The final effect of DEQ's application of an arbitrary multi-averaging non-WEP adjustment factor can be estimated by comparing the WEP2 and non-WEP average ambient air carcinogen estimates (i.e., (0.00698 µg/m3 / 0.00416 µg/m3), or by a factor of 1.7.	Presents legal opinion in violation of Rule 485.

Paragraph or Section Header	Language to Strike	Justification to Strike
Section Header D	The combined application of the SGP 16/70 Project-specific adjustment factor, the 5-year rolling average adjustment factor, and the non-WEP adjustment factor increase cancer risk and negate the health protectiveness of the TAPs rule.	Presents legal opinion in violation of Rule 485.
¶ 68	The conclusions in the DEQ Board's Final Order correctly identified the three Project-specific adjustment factors that undermine the health protectiveness of the TAPs rule for carcinogenic risk. The Board correctly concluded that application of these adjustment factors underestimates cancer risk. DEQ applied the: 1) 5-year rolling average; 2) non-WEP; and 3) SGP 16/70 LOM adjustment factors sequentially to the input and the output of the predictive air quality model. As a result, the dilution effects are multiplicative, rather than additive.	Presents legal opinion in violation of Rule 485.
¶ 70	DEQs sequential application of the three SGP Project-specific adjustment factors underpredict cancer risk by 13 times, as these carcinogenic risk levels are employed in properly implementing the TAPs rule.	Presents legal opinion in violation of Rule 485.
¶ 72	As DEQ admits,34 cancer dose-averaging has seldom, if ever, been used in TAPs carcinogenic risk compliance evaluations for a stationary source under the Clean Air Act in Idaho. Although there is a history of using cancer dose-averaging in risk assessment and risk management protocols for short-term remediation projects at contaminated sites, applying it to the SGP PTC is unprecedented. In implementing the SGP 16/70 Project-specific adjustment factor, DEQ has deviated from the long-held prescribed TAPs rule protocol of guaranteeing the **maximum one-year annual average carcinogen concentration** will not exceed the AACC or T-RACT AACC for each year of the Project. This thirty-year health protective strategy has provided the public comfort that cancer risk exposures are within acceptable limits both near the source and Statewide.	Presents legal opinion in violation of Rule 485.
Section Header E	DEQ's SGP Project-specific adjustment factors represent a significant change in the regulation of carcinogenic risk in Idaho that increases both cancer risk and regulatory burden.	Presents legal opinion in violation of Rule 485.
¶ 77	These questions demonstrate the short-sightedness of DEQ's acquiescence to Perpetua in allowing dose-averaging concepts to be applied to the Section 586 TAPs rule. Proper application of the rule inherently precludes risk averaging to maintain health protectiveness, without requiring applicants	Presents legal opinion in violation of Rule 485.

Paragraph or Section Header	Language to Strike	Justification to Strike
	to address the issues without guidance. The regulatory burden placed on future applicants by this modified policy is potentially immense.	
¶ 80	Idaho's current TAPs rule MOS appropriately accommodates both these conclusions if properly implemented as illustrated in Figure 1, above.	Presents legal opinion in violation of Rule 485.
¶ 94	This opinion concludes that DEQs use of the ad hoc SGP Project-specific adjustment factors undermines the health protectiveness of the TAPs rule. The TAPs rule was specifically developed to avoid requiring risk assessment analyses by providing an inherent margin of safety (MOS). These SGP Project-specific adjustment factors facilitate cancer dose-averaging risk calculations that allow the SGP to significantly increase arsenic emissions based on short-term Life of Mine (LOM) assumptions, but to nevertheless average the risk associated with those increased emission over 70-years.	Presents legal opinion in violation of Rule 485.
¶ 96	There is neither a provision, nor a need, for risk assessment if the TAPs Rules are properly implemented based on annual compliance with **maximum one-year annual average ambient air carcinogen concentration**. This application of the TAPs rule has served Idaho well for three decades. This policy change allowing risk averaging through the SGP Project-specific adjustment factors not only undermines the health protectiveness of the individual applicant source, but also the Statewide strategy that keeps all Idahoans safe with minimal regulatory burden.	Presents legal opinion in violation of Rule 485.

Attorneys for Intervenor-Respondent Perpetua Resources Idaho, Inc.

BEFORE THE BOARD OF ENVIRONMENTAL QUALITY

STATE OF IDAHO

IN THE MATTER OF AIR QUALITY PERMIT TO CONSTRUCT P-2019.0047, NEZ PERCE TRIBE, IDAHO CONSERVATION LEAGUE, and SAVE THE SOUTH FORK SALMON, Petitioners, v. IDAHO DEPARTMENT OF ENVIRONMENTAL QUALITY, Respondent. PERPETUA RESOURCES IDAHO, INC., Intervenor-Respondent.	AGENCY CASE No. 0101-22-01 OAH Case No. 23-245-01 **AMENDED MOTION TO STRIKE EXPERT DECLARATIONS OF WILLIAM TIEDEMANN AND IAN H. VON LINDERN**

INTRODUCTION

Intervenor-Respondent Perpetua Resources Idaho, Inc. ("Perpetua") moves to strike paragraphs and sentences from the Declaration of William Tiedemann ("Tiedemann Declaration") and the Declaration of Ian H. von Lindern ("von Lindern Declaration"), and the related exhibits attached thereto. The specific language Perpetua seeks to strike is identified in the tables attached to this motion as Exhibits A and B.

Perpetua moves to strike these paragraphs, sentences, and exhibits because (I) they constitute conclusory statements and legal opinions and (II) they present and rely on evidence that is irrelevant, unauthenticated, and constitutes hearsay. As a result, nearly all of the Tiedemann Declaration and significant sections of the von Lindern Declaration are inadmissible under the Idaho Rules of Administrative Procedure ("IDAPA Rules"). The Hearing Officer must strike the identified sentences, paragraphs, and corresponding exhibits from the record. Perpetua makes this motion on the grounds and authorities below.

Perpetua files this motion to preserve, for the record, its objections to the Tiedemann Declaration and von Lindern Declaration. Perpetua does not oppose the Hearing Officer taking this motion under advisement and allowing Petitioners to respond to the motion on the same schedule already set for post-hearing statements, if the Hearing Officer deems it necessary.

To the extent that the Hearing Officer does not strike the identified testimony, the Hearing Officer should provide Perpetua with the opportunity to file an overlength post-hearing statement, if necessary, to address the many conclusions and legal opinions in the Tiedemann and von Lindern Declarations which constitute legal arguments that cannot be appropriately addressed at a hearing.

ARGUMENT

I. The Tiedemann and von Lindern Declarations are Replete with Conclusions and Legal Opinions that are Inadmissible.

Under IDAPA Rule 485, "[e]xpert testimony that is conclusory, offers legal opinions, or which is based solely upon hearsay, is inadmissible." IDAPA 62.01.01.485. Idaho courts similarly exclude expert opinions that are "speculative, conclusory, or unsubstantiated by facts in the record." *Ryan v. Beisner*, 123 Idaho 42, 46 (Ct. App. 1992) (applying the Idaho Rules of Evidence or "I.R.E."). An expert witness's testimony offers an impermissible legal conclusion when it invades the role of the reviewing authority—here, the Hearing Officer—to determine the applicable law. *See Ybarra v. Legis. of Idaho*, 166 Idaho 902, 908 (2020).

While factual materials from a non-attorney witness may be helpful, "the legal analysis of a non-lawyer, expert witness is not." *Id.* Indeed, "the problem with testimony containing a legal conclusion is in conveying the witness's unexpressed, and perhaps erroneous, legal standards to the [factfinder]" which "invades the [Hearing Officer's] province…to determine the applicable law." *Ballard v. Kerr*, 160 Idaho 674, 694 (2016) (internal punctuation omitted) (citing *Torres v. Cty. of Oakland*, 758 F.2d 147, 150 (6th Cir. 1985)).

Despite this clear prohibition on conclusions and legal opinions in expert testimony, the Tiedemann and von Lindern Declarations are replete with both. Mr. Tiedemann repeatedly provides his own legal interpretations of the Idaho air permitting rules, expressly provides "conclusions" on legal questions before the Hearing Officer,[1] and attempts to support his conclusions by interpreting the legal significance of unsubstantiated documents that preceded the

[1] *See, e.g.,* Tiedemann Dec. at 4, ¶ 10 (Mr. Tiedemann states that "[b]ased on my review of case materials and extensive CAA permitting and compliance experience in private practice, with the State of Idaho, and with a non-profit organization, I conclude as follows" before providing legal conclusions on the issues before the Hearing Officer).

promulgation of the regulations at issue. Indeed, the Tiedemann Declaration reads more like a legal brief than an expert declaration.

Similarly, the von Lindern Declaration includes Mr. von Lindern's statements that he agrees with specific legal conclusions made the Idaho Board of Environmental Quality ("BEQ") as well as legal conclusions in testimony made by a BEQ member. *See, e.g.,* von Lindern Dec. at 6, ¶¶ 15-16. Additionally, the von Lindern Declaration repeatedly characterizes DEQ's application of the Idaho air permitting rules as "misinterpretation" and "arbitrary," *see, e.g., id.* at 8, ¶ 19; *id.* at 28, ¶ 66, while referring to Petitioners' preferred interpretation of the rules as the "proper implementation" and "proper application," *see, e.g., id.* at 19, ¶ 45; *id.* at 33, ¶ 77.

Such content is wholly inappropriate for expert declarations and is inadmissible in this case under IDAPA Rule 485. Mr. Tiedemann and Mr. von Lindern are not attorneys or legal experts, yet they present erroneous legal interpretations throughout their Declarations that invade the Hearing Officer's role to make conclusions of law. *See* IDAPA 62.01.01.252.01(d) (authorizing presiding officers to make "findings of fact" and "conclusions of law"). As a result, the Hearing Officer should strike the paragraphs, sentences, and language of the Tiedemann and von Lindern Declarations identified in Exhibits A and B, respectively.

II. The Tiedemann and von Lindern Declarations Inappropriately Present and Rely on Evidence that is Irrelevant, Unauthenticated, and Constitutes Hearsay.

The Hearing Officer may exclude evidence that is "irrelevant, unduly repetitious, or excludable on constitutional or statutory grounds." Idaho Code § 67-5251; IDAPA 62.01.01.475. Additionally, IDAPA Rule 476 provides that the Hearing Officer is "entitled to weigh the quality of the evidence presented, including the credibility of witnesses." IDAPA 62.01.01.476. While the Hearing Officer is not bound by the I.R.E., the Hearing Officer "may

assign less weight to evidence that would otherwise be inadmissible under the Idaho Rules of Evidence." *Id.* Thus, the I.R.E. inform the Hearing Officer's decisions on this motion.

Under the I.R.E., evidence is admissible only if it is relevant and authenticated. I.R.E. 401, 901; *Med. Recovery Servs., Ltd. Liab. Co. v. Eddins*, No. 47848, 2021 Ida. LEXIS 126, at *18 (July 9, 2021). Evidence is relevant when "it has any tendency to make a fact more or less probable than it would be without the evidence" and "the fact is of consequence in determining the action." I.R.E. 401. However, to authenticate evidence, "the proponent must produce evidence sufficient to support a finding that the item is what the proponent claims it is." I.R.E. 901(a); *see Eddins*, 2021 Ida. LEXIS 126, at *18 (quoting I.R.E. 901(b)(1) and explaining that authentication of a writing may be made by a witness with knowledge that "an item is what it is claimed to be"). The Hearing Officer may give less credence to evidence that does not meet the above I.R.E. criteria. IDAPA 62.01.01.476.

Additionally, "hearsay" is inadmissible under the I.R.E. unless it qualifies for an exception. I.R.E. 802. "Hearsay" is an out of court statement offered as evidence to "prove the truth of the matter asserted." I.R.E. 801(c). Although the Hearing Officer is not bound by hearsay rules of evidence generally, when expert testimony is based solely on hearsay statements, it is inadmissible. IDAPA 62.01.01.485.

The Tiedemann Declaration presents and relies heavily on irrelevant evidence that Mr. Tiedemann fails to authenticate. *See Eddins*, 2021 Ida. LEXIS 126, at *18. Mr. Tiedemann cherry-picks thirty-year-old informal emails, stakeholder letters, and draft documents from Idaho Department of Environmental Quality ("DEQ") archives and labels them as definitive evidence of the BEQ's rulemaking intent. Mr. Tiedemann claims that these documents are part of the historical rulemaking record for regulatory provisions at issue in this case and repeatedly relies

on these documents to support his erroneous, unreliable, and inadmissible legal conclusions. *See, e.g.*, Tiedemann Dec. at 6-9, ¶ 14.

These documents are irrelevant because Mr. Tiedemann did not establish that they were part of the actual rulemaking record that is appropriate for the Hearing Officer to consider when interpreting the BEQ's intent in adopting the rules at issue.[2] Indeed, Mr. Tiedemann and the Petitioners fail to offer any evidence to authenticate these documents as part of the rulemaking record. Although the documents might be included in state archives, draft documents and informal emails regarding internal DEQ deliberations do not illustrate either DEQ's or BEQ's final policy or intent concerning how the rules should be applied or interpreted.[3]

---

[2] If the meaning of a statute or regulation is ambiguous after analyzing its plain language and employing traditional methods of interpretation, courts review administrative history but do not consider draft documents and unpublished, informal communications that fail to illustrate the final intent of the statute or regulation. For instance, Idaho courts have held that the opinions and beliefs of one legislator, even one who drafted a bill, cannot establish the entire Legislature's intent. *Gillihan v. Gump*, 140 Idaho 264, 268, 92 P.3d 514, 518 (2004) *abrogated on other grounds by Gonzalez v. Thacker*, 148 Idaho 879, 231 P.3d 524 (2009). The same is true here—the communications of individual DEQ employees and a Deputy Attorney General, employed by the Office of the Attorney General, do not represent the intent of DEQ and BEQ.

Federal courts counsel against "considering wide ranging materials associated with the development of regulations" and give little to no weight to unpublished items that constitute a "hodgepodge of meeting minutes, staffers' notes, draft regulations, reports hearings and technical papers, many of which are anonymous." *Sikorsky Aircraft Corp. v. United States*, 102 Fed. Cl. 38, 55 (2011); *Perry v. Martin Marietta Corp.*, 47 F.3d 1134 (Fed. Cir. 1995)). This approach is consistent with the U.S. Supreme Court's explanation of the types of documents that represent an agency's policy positions and interpretations for purposes of deference. *Kisor v. Wilkie*, 588 U.S. 558, 577, 139 S. Ct. 2400, 2416-17 (2019) ("In other words, [an interpretation] must be the agency's 'authoritative' or 'official position,' rather than any more ad hoc statement not reflecting the agency's views. . . Not everything the agency does comes from, or is even in the name of, [the agency head]. So, for example, we have deferred to 'official staff memoranda' that were 'published in the Federal Register,' even though never approved by the agency head. But there are limits. The interpretation must at the least emanate from those actors, using those vehicles, understood to make authoritative policy in the relevant context.") (internal citations omitted).

[3] The petitioners have offered no certification or authentication confirming that the source of these materials is from the state archives.

Notably, the Tiedemann Declaration includes a long block quotation of an email from an Idaho Deputy Attorney General to DEQ without providing any response from DEQ. Tiedemann Dec. at 8, ¶ 19. The content of this email is irrelevant on its face because, without a response from DEQ, it provides no insight into DEQ's rulemaking process or the correct interpretation of the regulations at issue. Even with the response, it would be inadmissible. However, this highlights the prejudice that would result from considering such incomplete and unreliable information.

Additionally, the Tiedemann Declaration quotes and heavily relies on an "undated" draft letter for which Mr. Tiedemann merely *presumes* the identity of the author and the recipient. Tiedemann Dec. at 11, ¶ 27 (quoting "[a] undated TAPs rulemaking concept letter" which Mr. Tiedemann claims is "addressed to a 'Robert' (presumably Robert Wilkoz) and presumably from another DEQ staffer"). By failing to identify the date of the letter and merely assuming the identity of the involved parties, Mr. Tiedemann failed to produce evidence sufficient to support a finding that the letter is what Mr. Tiedemann claims it is. Accordingly, Mr. Tiedemann and the Petitioners have failed to authenticate this letter.

Moreover, the statements that Mr. Tiedemann references from this undated draft letter constitute hearsay because the statements were not made by Mr. Tiedemann and are offered to "prove the truth of the matter asserted." *See* I.R.E. 801. While the I.R.E. includes a hearsay exception for certain types of public records, the exception does not apply when an opponent shows "that the source of information or other circumstances indicate a lack of trustworthiness." I.R.E. 801(8). Without any information to confirm the date of this draft letter or the parties involved, or full context of the comment in light of responses and other information that was available at the time, the draft letter is not trustworthy and constitutes hearsay.

Similarly, the von Lindern Declaration includes testimony regarding his participation in "an advisory committee role" in DEQ meetings regarding the development of the Idaho air permitting rules at issue, including his rendition of the experience and perspectives of those involved, von Lindern Dec. at 9, ¶ 20. While Mr. von Lindern does not quote individual statements from such meetings, he provides unreliable, irrelevant information about what he perceived to be the objectives of the agency and industry. In addition to being irrelevant because whatever he believes to have been the purpose does not allow him to substitute his own judgment for that of the Hearing Officer, these statements are conclusory and suffer the same unreliability issues as hearsay and other references to unauthenticated documents: Mr. von Lindern provides no underlying authenticated documentation or support to confirm the trustworthiness of his reported observations.[4] While he does not specify what others *may* have said to support his conclusions (and doing so would be impermissible under hearsay rules) the same unreliability concerns apply.

As the draft documents,informal communications, and unsupported recollections that the Tiedemann and von Lindern Declaration rely upon constitute irrelevant, unauthenticated, and hearsay evidence under the I.R.E., the Hearing Officer should strike these documents or, at a minimum, afford them no weight under IDAPA Rule 476. Perpetua reserves the right to raise further objections to Mr. Tiedemann's testimony, including whether he is qualified to provide expert opinion on the Idaho air permitting rules or related rulemaking history.

[4] Furthermore, the opinions and beliefs of one participant in a rulemaking process does not establish the intent of the DEQ and BEQ in promulgating the rules. *See Gillihan v. Gump*, 140 Idaho 264, 268, 92 P.3d 514, 518 (2004), *supra* note 2.

CONCLUSION

The Hearing Officer should strike from the Tiedemann Declaration the following: paragraphs 10.a, 10.b., 10.c., 10.d.; 14; paragraphs 17 through 24[5]; 26 through 30[6]; 32; 34; 36 through 39; 40; 43 through 47; 49 through 50; section headers A, B, C, and D; and all referenced exhibits (Exhibits A, B, C, D, E, and F). The Hearing Officer should strike from the von Lindern Declaration the following: paragraphs 15.a through 15.d, 16, 18, 19, 20, 51, 52, 60, 68, 71, and 96; certain language in paragraphs 26, 29, 36, 37, 45, 50, 55, 58, 61, 65, 66, 67, 72, 77, and 80; section headers A, C, E; and the titles of Figures 1, 3, 5a, 5b. If the Hearing Officer decides that portions of the declaration or exhibits should not be stricken, Perpetua respectfully requests that, where applicable, the Hearing Officer consider this evidence with less weight and provide Perpetua with an opportunity to brief these matters as a matter of due process.[7]

[5] The Tiedemann Declaration does not contain a Paragraph 23.

[6] The Tiedemann Declaration includes two Paragraph 27s. Perpetua seeks to strike both. Also, the Tiedemann Declaration includes paragraph A.9. after paragraph A.28. Perpetua assumes that Petitioners intended this to be paragraph "29."

[7] *Cf. Cowan v. Bd. of Comm'rs*, 143 Idaho 501, 512 (2006) (discussing procedural due process requirement that a defendant be given an opportunity respond and be heard).

CERTIFICATE OF SERVICE

I HEREBY CERTIFY that on the 15th day of October 2024, I caused a true and correct copy of this Motion to Strike to be served on the following persons:

Via Email to:

EXHIBIT A

Language to Strike in the Tiedemann Declaration

Paragraph or Section Header	Language to Strike	Justification to Strike
¶ 10.a	Based on my review of case materials and extensive CAA permitting and compliance experience in private practice, with the State of Idaho, and with a non-profit organization, I conclude as follows: DEQ's application of the 16/70 Project-specific adjustment factor to the ambient arsenic air concentration analysis, and the use of exposure duration adjustments like the 16/70 calculations is not supported by the historic TAPs rulemaking record. It was thus inappropriate for DEQ to use such an adjustment factor to demonstrate compliance with the Air Rules.	Presents legal opinion and conclusory statement in violation of Rule 485. Petitioners have not demonstrated qualification of expert to testify regarding the rulemaking analysis in violation of Rule 485. Testimony relies solely on unreliable, unauthenticated hearsay evidence in violation of Rule 485.
¶ 10.b	Based on my review of case materials and extensive CAA permitting and compliance experience in private practice, with the State of Idaho, and with a non-profit organization, I conclude as follows: DEQ's interpretation of the TAPs AACCs as averaging periods rather than enforceable "standards" is misplaced and is not supported by the historic TAPs rulemaking record;	Presents legal opinion in violation and conclusory statement of Rule 485. Petitioners have not demonstrated qualification of expert to testify regarding the rulemaking analysis in violation of Rule 485.

Paragraph or Section Header	Language to Strike	Justification to Strike
		Testimony relies solely on unreliable, unauthenticated hearsay evidence in violation of Rule 485.
¶ 10.c	Based on my review of case materials and extensive CAA permitting and compliance experience in private practice, with the State of Idaho, and with a non-profit organization, I conclude as follows: DEQ use of a 5-year rolling average for TAPs emission calculations is neither supported by the TAPs rule, the historic TAPs rulemaking record, nor by limitations under the Permit conditions;	Presents legal opinion and conclusory statement in violation of Rule 485. Petitioners have not demonstrated qualification of expert to testify regarding the rulemaking analysis in violation of Rule 485. Testimony relies solely on unreliable, unauthenticated hearsay evidence in violation of Rule 485.
¶ 10.d	Based on my review of case materials and extensive CAA permitting and compliance experience in private practice, with the State of Idaho, and with a non-profit organization, I conclude as follows: There was sufficient evidence to support the T-RACT analysis limiting the non-West End pit lifetime production limit, but West End Pit production is not properly constrained below the less than life-of-mine time frame.	Presents legal opinion in violation of Rule 485.

Paragraph or Section Header	Language to Strike	Justification to Strike
Section Header A	Application of the 16/70 Project-specific adjustment factor for assessing compliance with the TAPs rule is inconsistent with the rulemaking history, intent, and plain language of the TAPs rule.	Presents legal opinion in violation of Rule 485. Petitioners have not demonstrated qualification of expert to testify regarding the rulemaking analysis in violation of Rule 485. Testimony relies solely on unreliable, unauthenticated hearsay evidence in violation of Rule 485.
¶ 14	Based on my review of the historical records related to the development of the TAPs Rule, it is evident that the AACCs were developed as annual emission limits, with the intent that compliance is demonstrated on a year-over-year basis. The records demonstrate that the use of an exposure duration adjustment, like the 16/70 Project-specific adjustment factor used for the SGP, was directly considered by DEQ, and ultimately rejected. If implemented, using project-specific adjustment factors would create a permitting protocol that is antithetical to the intended protections of the TAPs Rule, the AACCs, and annual, year-over-year limits. My own personal experience working as a Permitting Engineer for DEQ, the Air Rules themselves, the historical TAPs Rule rulemaking record, and greater context of U.S. Environmental Protection Agency (EPA) guidance all support this conclusion.	Presents legal opinion in violation of Rule 485. Provides legal opinion or analysis in violation of Rule 485. Petitioners have not demonstrated qualification of expert to testify regarding the rulemaking analysis in violation of Rule 485. Testimony relies solely on unreliable, unauthenticated hearsay evidence in

Paragraph or Section Header	Language to Strike	Justification to Strike
		violation of Rule 485.
¶ 17	The Air Rules themselves and the historical TAPs rulemaking record reinforce my personal experience with TAPs compliance and demonstrate that, in its original TAPs rulemaking process, DEQ directly considered, but ultimately rejected, concepts like the 16/70 Project-specific adjustment factor and exposure duration adjustments generally, except for sources expected to operate for less than 5 years.	Presents legal opinion in violation of Rule 485.
¶ 18	In an August 13, 1992 letter from DEQ's Mr. Frank Wilkoz to Ms. Joan Cloonan, Idaho Association of Commerce and Industry, Mr. Wilkoz provided a first draft of the original TAPs rules for review while adding context within a "Explanation of Additions and Changes" section. Mr. Wilkoz served as DEQ's Technical Services Bureau Chief and was heavily involved in the development of the original TAPs rulemaking and subsequent modification while Ms. Cloonan served as an industry stakeholder and provided input to the process. Mr. Wilkoz's "Explanation of Additions and Changes" section provides insight to how DEQ intended to permit remediation and short term sources. Most significantly Mr. Wilkoz writes: However, a remediation source cannot be allowed to produce emissions that have the potential to expose human receptors to a full lifetime dose of a TAP over a short period of time, especially a carcinogen, even in the interest of environmental clean up. Further, a single very large dose of a carcinogen, while not a full lifetime dose, has the potential to cause toxics related cancers due to the nature of dose response interaction of carcinogens at the cellular level. To allow such doses would subvert the very purpose of a clean up. **Corresponds to Exhibit A.**	Petitioners have not demonstrated reliability of historical records, therefore testimony relies on unreliable, unauthenticated information. 1992 email is hearsay. Remainder of paragraph A.18 after the first sentence relies solely on hearsay in violation of Rule 485. Petitioners have not demonstrated qualification of expert to testify regarding the rulemaking analysis in violation of Rule 485.
¶ 19	In an email dated August 14, 1992, Idaho Deputy Attorney General Curt Fransen emailed DEQ's Mr. Tim Teater and Mr. Frank Wilkoz directly raising these questions regarding large-dose short-term exposures.4 During the TAPs rulemaking period, Mr. Teater served as an Air Quality	Petitioners have not demonstrated reliability of historical records, therefore testimony

Paragraph or Section Header	Language to Strike	Justification to Strike
	Toxicologist and was also heavily involved in the development of the original TAPs rulemaking and subsequent modifications. In his email, Mr. Fransen questions: 16.01.01012,13.g.iii. and iv. The standard for remediation sources raises some questions of a general nature. I don't have any answers but wonder if it makes scientific sense to directly convert risk of additional cancer based on lifetime exposure to risk of additional cancer based on less than lifetime exposure by assuming a directly proportional relationship between years of exposure and risk. Sorry that I can't properly express that but you probably get the drift. Other questions that seem to arise from simply allowing higher exposure where the length of exposure is shorter include the unknown or potential combined and synergistic effect of many short term or remediation sources or other sources in the same area and the potential of serial (one after another) short term or remediation sources. Lastly, how will the operational life of a source be determined. What if an applicant says they only intend to operate for five years (for whatever reason) so want the higher emission number to apply. There is incentive for facilities to argue they will be short-term. The spectre of serial short-term sources arises. Perhaps the definition can be clarified so there is less wiggle room. **Corresponds to Exhibit B.**	relies on unreliable, unauthenticated information. 1992 email is hearsay. Testimony in paragraph A.19 relies solely on hearsay in violation of Rule 485. Petitioners have not demonstrated qualification of expert to testify regarding the rulemaking analysis in violation of Rule 485.
¶ 20	In a later and related email sent from Mr. Teater to Mr. Wilkosz on August, 26, 1992,6 Mr. Teater states: We will need to talk about the environmental remediation source limit of five years to get a break on emissions. I am opposed to making that greater than five years. It seems that after five years most remediation sources would have emission BRC (Below Regulatory Concern) anyway. If not then they need to be treated as any other source. **Corresponds to Exhibit C.**	Petitioners have not demonstrated reliability of historical records, therefore testimony relies on unreliable, unauthenticated information. 1992 email is hearsay and relies solely on hearsay in violation of Rule 485.

Paragraph or Section Header	Language to Strike	Justification to Strike
		Petitioners have not demonstrated qualification of expert to testify regarding the rulemaking analysis in violation of Rule 485. Testimony relies solely hearsay evidence in violation of Rule 485.
¶ 21	A further review of the historical TAPs rulemaking record provides support for treating the AACC as annual, year-over-years limit rather than supporting the use of unique operational scenarios and exposure duration adjustments.	Presents legal opinion in violation of Rule 485. Petitioners have not demonstrated reliability of historical records, therefore testimony relies on unreliable, unauthenticated information.
¶ 22	Regardless, and more importantly, the only less-than-lifetime exposure duration adjustment DEQ ultimately included within the original TAPs rule (or any subsequent versions) was the less than 5-yaer, ten-fold adjustment factor currently contained under IDAPA 58.01.01.210.15.	Presents legal opinion in violation of Rule 485.
¶ 24	Said another way, there is a high concentration dose of arsenic received over a short duration that is equivalent in risk to some corresponding low concentration dose of arsenic received over a longer duration. This is the underlying assumption that DEQ relies on when it applied the 16/70 Project-specific adjustment factor to assessing TAPs compliance for the SGP Permit.	Presents legal opinion and conclusory statement in violation of Rule 485.

Paragraph or Section Header	Language to Strike	Justification to Strike
¶ 26	Furthermore, the historical TAPs rulemaking record shows DEQ specifically rejected previously existing EPA Superfund risk assessment guidance and its use of exposure duration adjustments in consideration of risk and TAP exposure. The following documents confirm this conclusion.	Presents legal opinion and conclusory statement in violation of Rule 485. Petitioners have not demonstrated qualification of expert to testify regarding the rulemaking analysis in violation of Rule 485.
¶ 27	A undated TAPs rulemaking concept letter(herein referred to as the TAPs Concept Letter) addressed to a "Robert" (presumably Robert Wilkoz) and presumably from another DEQ staffer outlines the rationale behind changes within a modified draft TAPs rule. Within the letter it is stated: We also do not accept the EPA superfund risk assessment guidelines. Superfund guidelines are based on the concept that the exposures are of limited duration and do not have a large potential for multiple exposures. We can not make those assumptions for sources in Idaho, many of which involve either long term exposures or exposures to substances with a potential for multiple exposures. In Idaho, we are attempting to protect the public from the deleterious effect of multiple sources of a given pollutant or the additive effects of multiple pollutants over the course of a 70 year lifetime. If we could assure only a single exposure occupance, then accepting higher temporary risk might be justifiable. In addition we must consider the effects of the pollutant on the elderly, the very young and the infirm. By using "worse case" assumptions we are then able, under very limited conditions and when the public health would not be compromised, to deviate from the one in a million standard and apply a one in one hundred thousand as noted in the NSR policy. The use of this conservative approach allows us	Petitioners have not demonstrated reliability of historical records, therefore testimony relies on unreliable, unauthenticated information. Undated concept letter is hearsay and this testimony relies solely on hearsay in violation of Rule 485. Petitioners have not demonstrated qualification of expert to testify regarding the rulemaking analysis in violation of Rule 485.

Paragraph or Section Header	Language to Strike	Justification to Strike
	to be sure that actual risk is no greater than the risk figure on which we base our policy. **Corresponds to Exhibit D.**	
¶ 27	A January 23, 1992 unsigned draft letter to Mr. Charles Woods, Marketing Manager for MDT Corporation13 (a presumed TAPs rulemaking industry stakeholder) from a DEQ staffer (presumably Mr. Wilkoz) states: Our policy is based on a 1:1,000,000 risk at the nearest public access to the source. Risk is computed by multiplying the predicted (by the model) ambient concentration by the unit risk factor (URF) as published by the US EPA. Idaho does not accept the Superfund risk assessment method for computing risk except for single, relatively short term exposures. Our risk assessment for continuous industrial or other large sources is based on the possibility of multiple, long term exposures. **Corresponds to Exhibit E.**	Petitioners have not demonstrated reliability of historical records, therefore testimony relies on unreliable, unauthenticated information. Undated concept letter is hearsay and this testimony relies solely on hearsay in violation of Rule 485. Petitioners have not demonstrated qualification of expert to testify regarding the rulemaking analysis in violation of Rule 485.
¶ 28	A TAPs rule that allows for exposure duration adjustments and a risk assessment approach creates a problematic precedent, as is made evident by the following hypothetical scenario. If the SGP (or any subsequent source) is allowed to operate using exposure duration adjustments, an adjacent receptor (i.e., a human being) would be exposed to more than the intended annual allowable concentration of arsenic (the AACC) for 16 years. If, before the SGP operations end, the receptor moves and lives or works next to another facility or a new facility starts operations next to the SGP that applies an exposure duration adjustment for TAPs compliance (a process which could repeat indefinitely), by the end of the receptor's lifetime, it has been exposed to a TAPs concentration over the AACC for its entire life and its lifetime risk exceeds the intended 1-in-100,000 cancer risk	Presents legal opinion in violation of Rule 485. Third sentence is testimony made relying solely on hearsay email which must be excluded under Rule 485.

Paragraph or Section Header	Language to Strike	Justification to Strike
	level. In this scenario, the "spectre of serial short-term sources," as feared by Mr. Fransen in his email is apparent. Allowing the SGP to use the 16/70 Project-specific adjustment factor opens the door to a world in which the current AACCs in the TAPs Rule are effectively replaced by higher concentrations due to shorter than 70-year sources.	
¶ 9	Contrast a hypothetical scenario where exposure duration adjustments are not allowed and the TAP AACCs are annual limits that must be met year-over-year by every facility in Idaho. In this case, no facility may emit TAPs at a concentration greater than the AACCs and a 1-in-100,000 excess cancer risk is preserved no matter where a receptor lives, works, or travels in Idaho during their entire life, and no matter what other facilities start operations. This scenario creates a simple and easy to implement rule that is broadly protective of human health and the environment and, as the Schilling Declaration itself notes, was the intent of the originally TAP rulemaking process. Furthermore, this scenario is supported by the historical TAPs rulemaking record and best fits the intent of DEQ.	Presents legal opinion in violation of Rule 485. For last sentence specifically, Petitioners have not demonstrated qualification of expert to testify regarding the rulemaking analysis.
¶ 30.a	Given the full review of the above evidence and based on my experience as a Permit Engineer at DEQ, I conclude as follows: During the TAPs rulemaking process, DEQ specifically considered the use of exposure duration adjustments and use of calculations akin to the 16/70 Project-specific adjustment factor, but ultimately did not incorporate their use within the TAPs rules;	Presents legal opinion and conclusory statement in violation of Rule 485. Petitioners have not demonstrated qualification of expert to testify regarding the rulemaking analysis.
¶ 30.b	Given the full review of the above evidence and based on my experience as a Permit Engineer at DEQ, I conclude as follows: DEQ intended the AACCs to be annual, year-over-year concentration limits and included only a single short-term adjustment factor within the original TAPs rule for sources operating for 5-years or less;	Presents legal opinion and conclusory statement in violation of Rule 485.

Paragraph or Section Header	Language to Strike	Justification to Strike
		Petitioners have not demonstrated qualification of expert to testify regarding the rulemaking analysis.
¶ 30.c	Given the full review of the above evidence and based on my experience as a Permit Engineer at DEQ, I conclude as follows: DEQ's application of the 16/70 Project-specific adjustment factor to demonstrate compliance with TAPs is not supported by the intent or language of the TAPs rule, and results in a degradation of the protection of human health and the environment that is otherwise the purpose of the TAPs rule.	Presents legal opinion and conclusory statement in violation of Rule 485. Petitioners have not demonstrated qualification of expert to testify regarding the rulemaking analysis.
Section Header B	DEQ and Perpetua incorrectly assume the 1-in-100,000 cancer risk rate, rather than the AACC, is the applicable enforceable "standard."	Presents legal opinion in violation of Rule 485.
¶ 32	Labeling AACCs as "increments" versus "standards" is simply a naming convention rooted in previously existing CAA policy; the enforceable standard is the AACC as a year-over-year limit.	Presents legal opinion in violation of Rule 485.
¶ 34	The AACCs as "increments" are different in that they do not consider background concentrations of TAPs. Unlike Criteria Pollutants, DEQ does not regularly monitor the ambient concentrations of TAPs. There simply are too many TAPs (there are over 80 carcinogenic TAPs alone listed in IDAPA 58.01.01.586), they are state-specific (unlike Criteria Pollutants), and the cost to do so is generally accepted as prohibitive. Thus, during the historic TAPs rulemaking process the AACCs were implemented as "increments" versus "standards." Said another way, while it is infeasible to monitor and enforce an ultimate TAPs concentration standard, it is feasible to estimate the incremental increase in TAPs concentrations that a facility would cause.	Presents legal opinion in violation of Rule 485. Petitioners have not demonstrated qualification of expert to testify regarding the rulemaking analysis.

Paragraph or Section Header	Language to Strike	Justification to Strike
¶ 36	Both the TAPs AACCs and PSD increments are maximum allowable increases from a specific source. In developing the TAPs Rules, DEQ would have certainly been aware of the concept and naming convention of "increments." The TAPs definition of increments is best viewed through the lens of a compliance period, rather than implying they represent an averaging period, as the Lewis Declaration does.	Presents legal opinion in violation of Rule 485. Petitioners have not demonstrated qualification of expert to testify regarding the rulemaking analysis.
¶ 37	Evidence from the historical TAPs rulemaking record reinforces this and the conclusion that the use of the term "increment" within TAPs was to differentiate them from including background concentrations as "standards" do. During the 1995 period, DEQ made revisions to the original and previously promulgated TAPs rule. As part of that process, DEQ developed a TAPs rule amendment summary document.23 Within that document DEQ notes: The proposed rule will divide consideration of incremental increases of TAP emissions into individual source and facility wide categories. Net emissions is a concept that adds increases and decreases of emissions from new sources of TAP together to obtain a net amount. That net amount is then compared to acceptable ambient levels also called increments for a permitting decision. The acceptable ambient level is referred to as an increment because TAP emissions increases are limited to an incremental increase as opposed to an absolute limited ambient concentration. **Corresponds to Exhibit F.**	Presents legal opinion and conclusory statement violation of Rule 485. Petitioners have not demonstrated qualification of expert to testify regarding the rulemaking analysis. Petitioners have not demonstrated reliability of historical records, therefore testimony relies on unreliable, unauthenticated information.
¶ 38	On the other hand, if you assume DEQ intended the 1-in-100,000 cancer risk to be the enforceable standard and not the AACC as annual, year-over-year limits, it would have needed to incorporate additional variables into the TAPs Rule to guide applicants on how to assess that risk. Completing a risk assessment that analyzes a facility's excess cancer risk traditionally involves consideration of more variables and factors than just exposure duration.	Presents legal opinion in violation of Rule 485. Petitioners have not demonstrated qualification of expert to testify regarding the

Paragraph or Section Header	Language to Strike	Justification to Strike
	Sensitive populations, comorbidities, and synergistic effects of combined toxic exposure all affect the ultimate cancer risk from a facility's airborne toxic emissions. However, as mentioned above, the original TAPs rulemaking process rejected the risk assessment method and prioritized creating a simple and easy to implement rule that is still protective of human health and the environment. Ultimately, using the AACCs as the "enforceable standard" is a far more effective standard to use in fulfilling this goal.	rulemaking analysis. Petitioners have not demonstrated reliability of historical records, therefore testimony relies on unreliable, unauthenticated information.
¶ 39.a	Given the full review of the above evidence, I conclude as follows: The labeling of the AACCs as "increments" versus "standards" is a naming convention rooted in previously existing CAA policy and is a distinction in the consideration of pollutant background concentrations rather than an averaging period concept.	Presents legal opinion and conclusory statement in violation of Rule 485.
¶ 39.b	Given the full review of the above evidence, I conclude as follows: DEQ intended the enforceable "standard" to be the AACC as an annual, year-over-year limit.	Presents legal opinion and conclusory statement in violation of Rule 485.
Section Header C	Use of a 5-year rolling average for demonstrating compliance with the TAPs ruleT-RACT is inappropriate and not supported by Permit conditions.	Presents legal opinion in violation of Rule 485.
¶ 40	Use of a 5-year rolling average for demonstrating compliance with the TAPs ruleT-RACT is inappropriate and not supported by Permit conditions.	Presents legal opinion in violation of Rule 485.
¶ 43	This outcome creates a problematic precedent as is evident by another hypothetical scenario. Consider again the "spectre of serial short-term sources" and the scenario in which a receptor is exposed to consecutive sources that have applied an exposure duration adjustments discussed above in Paragraph 28. In a modified scenario, the receptor is adjacent to the SGP for four years of high TAPs emissions, but then relocates adjacent to a different TAPs source before a fifth year of low SGP TAP emissions occurs. The new	Presents legal and analysis opinion in violation of Rule 485. Second sentence relies solely on hearsay in violation of Rule 485.

Paragraph or Section Header	Language to Strike	Justification to Strike
	TAPs source is also a less than 70-year source using exposure duration adjustments with TAPs concentrations above the AACCs. The receptor will be consistently exposed to TAPs concentration potentially well over the AACC, and is accruing an excess cancer risk level above 1-in-100,000. Again, the AACCs are effectively replaced by higher concentrations due to less than 70-year sources using exposure duration adjustment factors and/or emission period averaging.	
¶ 44	In order to avoid such a scenario, the Air Rules and the historical TAPs rulemaking record speak for themselves.	Presents legal opinion in violation of Rule 485. Petitioners have not demonstrated qualification of expert to testify regarding the rulemaking analysis.
¶ 45.a	Given the full review of the above evidence, I conclude as follows: Calculation of the SGP's arsenic emissions by using a 5-year rolling average is contrary to the intent of the original TAPs rulemaking process and the Air Rules stating that the AACC are an annual, year-over-year limit	Presents legal opinion and conclusory statement in violation of Rule 485. Petitioners have not demonstrated qualification of expert to testify regarding the rulemaking analysis.
¶ 45.b	Given the full review of the above evidence, I conclude as follows: Using a 5-year rolling average inappropriately allows individual years of excess TAPs emissions to be masked within an averaged period.	Presents legal opinion and conclusory statement in violation of Rule 485.

Paragraph or Section Header	Language to Strike	Justification to Strike
		Petitioners have not demonstrated qualification of expert to testify regarding the rulemaking analysis.
Section Header D	There is insufficient evidence to support the T-RACT analysis limiting the non-West End pit production limit.	Presents legal opinion in violation of Rule 485.
¶ 46	However, Board was right in question whether the production from all pits was properly constrained.	Presents conclusory statement and legal opinion in violation of Rule 485.
¶ 47	The AACCs are limits for which compliance must be demonstrate on an annual year-over-year basis.	Presents legal opinion in violation of Rule 485.
¶ 49	In order to comply with the AACCs and demonstrate TAPs compliance, DEQ should have: (1) determined the worst arsenic generation scenario from any single year of the SGP (likely to include 100% production from the West End Pit); (2) compared the modeled operation boundary arsenic concentration from the worst generation scenario to the AACC to evaluate TAPs compliance; and (3) include a maximum annual ore generation permit limit from the pit(s) that correspond to the worst arsenic generation to ensure TAPs compliance.	Presents legal analysis and opinion in violation of Rule 485.
¶ 50.a	Given the full review of the above evidence, I conclude as follows: a. DEQ did not appropriately analyze the maximum annual emissions scenario from the SGP and instead diluted the SGP'd arsenic emissions through the 5-year rolling average calculation.	Presents legal opinion and conclusory statement in violation of Rule 485.
¶ 50.b	Given the full review of the above evidence, I conclude as follows: The permit does not sufficiently constrain ore production from the SGP's pit(s) on an annual basis.	Presents legal opinion and conclusory statement in violation of Rule 485.

EXHIBIT B

Language to Strike in the von Lindern Declaration

Paragraph or Section Header	Language to Strike	Justification to Strike
¶ 15.a	I have reviewed Idaho Board of Environmental Quality's Final Order and understand and agree with the Board's conclusions that: DEQ Did Not Act Reasonably and in Accordance with Law When it Analyzed the Ambient Arsenic Air Concentrations for the SGP;	Presents legal opinion and conclusory statement in violation of Rule 485.
¶ 15.b	I have reviewed Idaho Board of Environmental Quality's Final Order and understand and agree with the Board's conclusions that: DEQ did not Act Reasonably in Using a Five-Year Rolling Average for T-RACT that was not Properly Supported by Permit Conditions;	Presents legal opinion and conclusory statement in violation of Rule 485.
¶ 15.c	I have reviewed Idaho Board of Environmental Quality's Final Order and understand and agree with the Board's conclusions that: There was Insufficient Evidence to Support the T-RACT Analysis Limiting the Non-West End Pit Production Limit;	Presents legal opinion and conclusory statement in violation of Rule 485.
¶ 15.d	I have reviewed Idaho Board of Environmental Quality's Final Order and understand and agree with the Board's conclusions that: DEQ Did Not Act Reasonably and in Accordance with Law When it Applied the 16/70 Calculation to the Ambient Arsenic Air Concentration Analysis.	Presents legal opinion and conclusory statement in violation of Rule 485.
¶ 16	I have reviewed the transcript of the May 1, 2024 special meeting of the Idaho Board of Environmental Quality. I also concur with Vice Chair McMillan's testimony that: . . . DEQ has misinterpreted how the acceptable ambient concentration for carcinogens, the AACC, must be applied if it is to comply with our air quality rules. … DEQ's creation and application of a project-specific adjustment factor is not supported by Idaho's air quality rules.	Presents legal opinion and conclusory statement in violation of Rule 485.

Paragraph or Section Header	Language to Strike	Justification to Strike
	… the creation of a project-specific adjustment factor suggests that there is a significant ignorance about cancer, carcinogens, and carcinogenesis. … the short-sighted project-specific adjustment factor to the Stibnite Gold Project, DEQ created a misleading risk analysis that greatly underestimates the actual cancer risk	
Section Header A	DEQ's application of the 16/70 Project-specific adjustment factor is inappropriate science and public health policy.	Presents legal opinion and conclusory statement in violation of Rule 485.
¶ 18	DEQ has failed to properly implement Section 586 and T-RACT for the SGP PTC by introducing a 16/70 SGP Project-specific adjustment factor to allocate the full 70-year lifetime allowable cancer risk to the 16-year Life of Mine (LOM). The calculation averages the risk resulting from SGP emissions over the life of the receptor. This adjustment allows the SGP to emit as much as 70 years of allowable carcinogenic emissions in 16 years. This type of "adjustment factor," also known as risk amortization or cancer dose-averaging, undermines both the health protectiveness and the regulatory certainty of the TAPs rule. In the context of the existing TAPs rule, as applied the last 30 years, using the 16/70 Project-specific adjustment factor is an incorrect interpretation and represents unsound science and public health policy.	Presents legal opinion in violation and conclusory statement of Rule 485.
¶ 19	Specifically, DEQ misinterprets the purpose and function of the **maximum one-year annual average ambient air carcinogen concentration** in implementing the TAPs rule. It is important to review the development of the TAPs rule in understanding the strategy represented by this one-year annual standard. The Schilling Declaration asserts that the TAPs rule was developed nearly thirty years ago to accommodate DEQ's predecessor agency IDHW-DOE and the regulated communities' request to adopt rules that are: 1) are reasonably protective of public health, but still afford flexibility to facilities and projects; 2) are relatively easy to understand and implement; and 3) do not require excessive expenditure of time and	Presents legal opinion and conclusory statement in violation of Rule 485.

Paragraph or Section Header	Language to Strike	Justification to Strike
	resources by DEQ and the permittee during the permitting process.	
¶ 20	I was invited by the IDHW-DOE Air Quality Bureau to engage in development of those rules at that time in an advisory committee role based on my previous experience outlined above. My recollection is that much of the IDHW-DOE's and regulated industries' initial experience with risk assessment analyses was in implementing Risk Assessment Guidance for Superfund at CERCLA sites. Both IDHW-DOE and the regulated community were supportive of avoiding the onerous burden of incorporating similar risk assessment and risk management protocols into Idaho's TAPa rule. In short, after considerable effort, IDHW-DOE was successful in developing the Section 58610 and T-RACT11 rule with a strategy that simultaneously avoids requiring PTC applicants to submit risk assessment and risk management protocols, yet is protective of human health.	Testimony relies solely on unreliable, unauthenticated hearsay evidence in violation of Rule 485.
Title of Figure 1	Cumulative Risk (CR) and Margin of Safety (MOS) under Properr Implementation of TAPS Rules	Presents legal opinion and conclusory statement in violation of Rule 485.
¶ 26	If the TAPs rule is properly implemented, the cumulative incremental risk is shown by the diagonal line proceeding from birth to age 70 years (i.e., risk is allowed to accumulate at an annual rate of (1x10-5)/70 per year, or (AACC*URF/70) under T-RACT. The gray area below the diagonal line represents the portion of allowable lifetime risk accumulating from the incremental source.	Presents legal opinion in violation of Rule 485.
¶ 29	Using the 70-year basis proposed by DEQ and Perpetua allows Perpetua to emit a lifetime of allowable emissions in 16 years, and undermines the health protectiveness of the rule and increases cancer risk.	Presents legal opinion in violation of Rule 485.
¶ 36	This shortsighted conclusion is incorrect, unprecedented, and not supported by EPA guidelines.	Presents legal opinion statement in violation of Rule 485.
¶ 37	DEQ's misinterpretation would allow emissions and consequent exposures of more than two orders of magnitude greater risk than the AACC (1.2 X 10-4 equivalent risk) for six years.	Presents legal opinion in violation of Rule 485.

Paragraph or Section Header	Language to Strike	Justification to Strike
Title of Figure 3	Comparison of Cumulative Risk (CR) for 6-year Project emitting a Carcinogen with a Mutagenic MOA using the Project-specific (16/70) Adjustment Factor and Proper TAPS Application	Presents legal opinion and conclusory statement in violation of Rule 485.
¶ 45	Conversely, proper application of the TAPs rule using the maximum one-year annual average ambient air carcinogen concentration is shown by the lower cumulative risk line (gray line). Proper implementation of the TAPs rule would result in 4.6x10-6 cumulative cancer risk at age six years, as shown in Figure 3.	Presents legal opinion in violation of Rule 485.
Title of Figure 5a	Cumulative Risk (CR) and Margin of Safety (MOS) under Proper Implementation of Idaho TAPS Rules for 3 Successive 6-year Projects	Presents legal opinion in violation of Rule 485.
¶ 50	The TAPs rule is health protective if properly implemented.	Presents legal opinion in violation of Rule 485.
Title of Figure 5b	Cumulative Risk (CR) and Margin of Safety (MOS) under Proper Implementation of Idaho TAPS Rules for 3 Successive 6-yea Projects emitting Carcinogen Exhibiting a Mutagenic Mod of Action (MOA*)	Presents legal opinion in violation of Rule 485.
¶ 51	The inappropriate averaging is allegedly justified by ad hoc risk assessment calculations and risk management protocols that undermine both the simplicity and the health protectiveness of the TAPs rule. The MOS is compromised, the public is no longer secure, and the regulated industry is now obliged to include cancer risk and health impact assessments in TAPs PTC applications to support the assertions of health protectiveness.	Presents legal opinion in violation of Rule 485.
¶ 52	There are no provisions in the Air Rules to allow manipulation of the required maximum one-year annual average ambient air carcinogen concentration or the AACC, or to submit risk calculations.	Presents legal opinion in violation of Rule 485.
¶ 55	Vice Chairman McMillan further indicated that DEQ's application of what he called the "short-sighted" Project-specific adjustment factor to the Stibnite Gold Project created a misleading risk analysis that greatly underestimates the actual cancer risk. In his view:	Highlighted language offers legal opinion in violation.

Paragraph or Section Header	Language to Strike	Justification to Strike
	The Idaho rules are not ambiguous. There is an acceptable risk associated with the AACC standard. There is an acceptable risk associated with DEQ-approved T-RACT projects, and there is an acceptable risk associated with the short-term project that is five years or less. There are no other acceptable risks identified in Idaho's air quality rules. I agree with Dr. McMillan's statement. (emphasis added)	
¶ 58	DEQ erroneously substitutes the 5-year rolling average emissions for the maximum one-year potential emissions required under Section 586 and T-RACT.	Presents legal opinion in violation of Rule 485.
¶ 60	Instead, DEQ substituted the 5-year rolling average for the required maximum one-year emission rate. There is no provision in the TAPs rule for altering or adjusting the predicted maximum one-year annual average. This erroneous substitution significantly reduces the MOS inherent in proper allocation of the one-year maximum emission rates. To be health protective, the prescriptive Section 586 rule explicitly (not typically) requires predicting the **maximum one-year annual average contaminant concentration** using prescribed emissions estimates, and assuring that concentration is not exceeded during the life of the facility.	Presents legal opinion in violation of Rule 485.
¶ 61	It is not possible from the available information provided by DEQ to determine how this 5-year rolling average compares to the maximum one-year emission rate that should have been used.	Presents legal opinion and conclusory statement in violation of Rule 485.
Section Header C	Ambient air arsenic concentrations and cancer risk are underestimated for the SGP by improper application of the non-WEP emissions scenarios.	Presents legal opinion in violation of Rule 485.
¶ 65	In the context of properly applying the TAPs rule, the non-WEP adjustment factor is irrelevant. DEQ's obligation is to identify the emission scenario that produces the maximum one-year annual average ambient air carcinogen concentration. That value is the maximum WEP2 scenario, and would not consider non-WEP scenarios unless the non-WEP emissions sources were operating contemporaneously during the WEP2 emission maximum year. In that case, any non-WEP	Presents legal opinion in violation of Rule 485.

Paragraph or Section Header	Language to Strike	Justification to Strike
	scenario operating in the same year as the WEP2 maximum configuration would add to, not dilute, the critical receptor maximum ambient air concentration.	
¶ 66	DEQs applying the SGP Project-specific non-WEP adjustment factor effectively converts the 5-year alleged annual average value (0.00698 µg/m^3) to an arbitrary 0.00416 µg/m^3 16-year LOM average carcinogenic concentration.	Presents legal opinion in violation of Rule 485.
¶ 67	The final effect of DEQ's application of an arbitrary multi-averaging non-WEP adjustment factor can be estimated by comparing the WEP2 and non-WEP average ambient air carcinogen estimates (i.e., (0.00698 µg/m3 / 0.00416 µg/m3), or by a factor of 1.7.	Presents legal opinion in violation of Rule 485.
Section Header D	The combined application of the SGP 16/70 Project-specific adjustment factor, the 5-year rolling average adjustment factor, and the non-WEP adjustment factor increase cancer risk and negate the health protectiveness of the TAPs rule.	Presents legal opinion in violation of Rule 485.
¶ 68	The conclusions in the DEQ Board's Final Order correctly identified the three Project-specific adjustment factors that undermine the health protectiveness of the TAPs rule for carcinogenic risk. The Board correctly concluded that application of these adjustment factors underestimates cancer risk. DEQ applied the: 1) 5-year rolling average; 2) non-WEP; and 3) SGP 16/70 LOM adjustment factors sequentially to the input and the output of the predictive air quality model. As a result, the dilution effects are multiplicative, rather than additive.	Presents legal opinion in violation of Rule 485.
¶ 70	DEQs sequential application of the three SGP Project-specific adjustment factors underpredict cancer risk by 13 times, as these carcinogenic risk levels are employed in properly implementing the TAPs rule.	Presents legal opinion in violation of Rule 485.
¶ 72	As DEQ admits,34 cancer dose-averaging has seldom, if ever, been used in TAPs carcinogenic risk compliance evaluations for a stationary source under the Clean Air Act in Idaho. Although there is a history of using cancer dose-averaging in risk assessment and risk management protocols for short-term remediation projects at contaminated sites, applying it to the SGP PTC is unprecedented. In implementing the SGP 16/70 Project-specific adjustment factor, DEQ has deviated from the long-held prescribed TAPs rule protocol of guaranteeing the **maximum one-year annual average carcinogen concentration** will not exceed the AACC or T-RACT	Presents legal opinion in violation of Rule 485.

Paragraph or Section Header	Language to Strike	Justification to Strike
	AACC for each year of the Project. This thirty-year health protective strategy has provided the public comfort that cancer risk exposures are within acceptable limits both near the source and Statewide.	
Section Header E	DEQ's SGP Project-specific adjustment factors represent a significant change in the regulation of carcinogenic risk in Idaho that increases both cancer risk and regulatory burden.	Presents legal opinion in violation of Rule 485.
¶ 77	These questions demonstrate the short-sightedness of DEQ's acquiescence to Perpetua in allowing dose-averaging concepts to be applied to the Section 586 TAPs rule. Proper application of the rule inherently precludes risk averaging to maintain health protectiveness, without requiring applicants to address the issues without guidance. The regulatory burden placed on future applicants by this modified policy is potentially immense.	Presents legal opinion in violation of Rule 485.
¶ 80	Idaho's current TAPs rule MOS appropriately accommodates both these conclusions if properly implemented as illustrated in Figure 1, above.	Presents legal opinion in violation of Rule 485.
¶ 94	This opinion concludes that DEQs use of the ad hoc SGP Project-specific adjustment factors undermines the health protectiveness of the TAPs rule. The TAPs rule was specifically developed to avoid requiring risk assessment analyses by providing an inherent margin of safety (MOS). These SGP Project-specific adjustment factors facilitate cancer dose-averaging risk calculations that allow the SGP to significantly increase arsenic emissions based on short-term Life of Mine (LOM) assumptions, but to nevertheless average the risk associated with those increased emission over 70-years.	Presents legal opinion in violation of Rule 485.
¶ 96	There is neither a provision, nor a need, for risk assessment if the TAPs Rules are properly implemented based on annual compliance with **maximum one-year annual average ambient air carcinogen concentration**. This application of the TAPs rule has served Idaho well for three decades. This policy change allowing risk averaging through the SGP Project-specific adjustment factors not only undermines the health protectiveness of the individual applicant source, but also the Statewide strategy that keeps all Idahoans safe with minimal regulatory burden.	Presents legal opinion in violation of Rule 485.

BEFORE THE OFFICE OF ADMINISTRATIVE HEARINGS
STATE OF IDAHO

IN THE MATTER OF AIR QUALITY PERMIT TO CONSTRUCT P-2019.0047	BEQ Case No. 0101-22-01
NEZ PERCE TRIBE, IDAHO CONSERVATION LEAGUE, and SAVE THE SOUTH FORK SALMON, Petitioners, v. DEPARTMENT OF ENVIRONMENTAL QUALITY, Respondent, and PERPETUA RESOURCES IDAHO, INC., Intervenor.	OAH Case No. 23-245-01 THIRD AMENDED SCHEDULING ORDER, NOTICE OF HEARING, AND PREHEARING ORDER

On October 15, 2024, the parties and hearing officer convened for a prehearing conference via Zoom. Based on the discussion and agreements reached among the parties and hearing officer at the conference and in subsequent email exchanges, the following dates, deadlines, and procedures shall govern the remainder of these administrative proceedings:

Thursday, October 17, 2024, 9:00 a.m.: Day 1 of hearing on the merits, Joe R. Williams Building, 700 W. State Street, 1st floor East Conference Room, Boise, Idaho 83702.

Friday, October 18, 2024, 9:00 a.m.: Day 2 of hearing on the merits, Joe R. Williams Building, 700 W. State Street, 1st floor East Conference Room, Boise, Idaho 83702.

Friday, November 8, 2024: Deadline for all parties to file post-hearing briefs. Post-hearing briefs shall be limited to 25 pages of content, excluding first page and certificate of service.

Friday, November 8, 2024: Deadline for Petitioners to file response to Perpetua's Amended Motion to Strike of October 15, 2024. Petitioners' response shall be limited to 8 pages of content excluding first page, certificate of service, and attachments, which is effectively the same page count as the Amended Motion.

Wednesday, November 13, 2024: Deadline for Perpetua to file a reply brief in support of its Amended Motion to Strike, limited to 5 pages of content, excluding first page and certificate of service.

In addition to the above dates and deadlines, the parties and hearing officer agreed to the following procedures with respect to the hearing-on-the-merits:

Because the parties are filing pre-hearing briefs and post-hearing briefs, opening and closing statements are not necessary.

The order of presentation at hearing shall be: DEQ, Perpetua, Petitioners.

Generally speaking, the parties and hearing officer believe it is reasonable to allocate approximately 4 hours of hearing time each for DEQ, Perpetua, and Petitioners, including time for cross-examination and questions from the hearing officer. For example, DEQ filed expert witness declarations of Kevin Schilling and Norka Paden. The goal and expectation is that direct examination, cross-examination, and hearing officer questioning of Mr. Schilling and Ms. Paden will be completed in roughly 4 hours of hearing time, excluding breaks, *etc*.

For the most part, the parties are already aware of the other parties' likely hearing exhibits because the expert witness declarations included the majority of the exhibits that will be used at hearing. In addition, the parties expressed a preference for minimizing the service and receipt of

additional hard copies of exhibits and instead prefer to rely on the electronic versions in the record to the maximum extent possible. Therefore, the parties and hearing officer agreed that if an exhibit to be proffered at hearing is an existing exhibit to an expert witness declaration, the proffering party only needs to produce one hard copy of the exhibit at the hearing. If a party intends to proffer an exhibit that is not an existing exhibit to an expert witness declaration, it should produce four hard copies of the exhibit at the hearing.

Labeling of exhibits shall be as follows: DEQ, 100-199; Perpetua, 200-299; Petitioners, 300-399.

Finally, because the prehearing conference and this order/notice have occurred within a relatively truncated period of time, the hearing officer intends to begin the hearing on October 17 by confirming it accurately reflects the understandings of the parties.

Dated this 16th day of October, 2024.

Dylan Lawrence
Hearing Officer

Case Docket No. 0101-22-01
OAH Case No. 23-245-01

DEPARTMENT OF ENVIRONMENTAL QUALITY'S POST-HEARING BRIEF

I. INTRODUCTION

On October 17 and 18, 2024, the Department of Environmental Quality ("DEQ"), Perpetua Resources, Inc. ("Perpetua"), and Petitioners Nez Perce Tribe, Idaho Conservation League, and Save the South Fork Salmon (collectively, "Petitioners") participated in an evidentiary hearing in the above captioned matter. The hearing was conducted in accordance with the Board of Environmental Quality's (the "Board") May 9, 2024 *Final Order*, REC 3695-3720, and June 12, 2024 *Order on Petitions for Reconsideration and/or Clarification of Final Order*, REC 3835-43. In the Board's Final Order, the Board "remand[ed] this matter back for the development of further evidence regarding the ambient air concentrations of arsenic that will be produced by the Stibnite Gold Project ("SGP") and whether those levels comply with the Air Rules." REC 3717. In particular, the Board remanded the matter to the Hearing Officer for further evidence because it found as follows:

> (1) DEQ did not act reasonably and in accordance with law when it applied the 16/70 calculation to the ambient arsenic air concentration analysis;
>
> (2) DEQ did not act reasonably in using a five-year rolling average for T-RACT that was not properly supported by permit conditions; and,
>
> (3) there was insufficient evidence to support the T-RACT analysis limiting the non-West End Pit production limit.

See REC 3712-15. The Board's remand asked DEQ to provide the necessary evidence on these sub-issues (hereinafter the "Remaining Issues") to demonstrate that DEQ acted reasonably and in accordance with the law. *See* REC 3842 (the parties "must focus only on the development of additional factual evidence on the ambient arsenic air concentration analysis performed by DEQ for the PTC"). The additional evidence presented on remand—through both written expert declarations and oral testimony—does in fact clearly demonstrate that DEQ acted reasonably and in accordance with law when it issued the Permit to Construct ("PTC").

II. PERPETUA'S MOTION TO STRIKE

Prior to the hearing, Perpetua filed its *Motion to Strike Expert Declarations Of William Tiedemann and Ian H. von Lindern* on October 14, 2024, and an *Amended Motion to Strike Expert Declarations Of William Tiedemann and Ian H. von Lindern* on October 15, 2024 ("Amended Motion"). REC 6929-6990. The Amended Motion moves to strike specific paragraphs and exhibits of the declarations of William Tiedemann and Dr. Ian H. von Lindern, Petitioners' two witnesses. As explained in the Amended Motion, the declarations contain statements that are merely legal opinions expressed as conclusory statements. In addition, they provide and rely upon evidence that is irrelevant, hearsay, and cannot be authenticated.

In addition to striking the declarations, as argued in the Amended Motion, the Hearing Officer should strike documentary evidence used by Mr. Tiedemann at the hearing, as well as testimony of Mr. Tiedemann given at the hearing. At the hearing, DEQ asked Mr. Tiedemann questions related to the authenticity and relevance of the documents attached to his declaration. *See* Tr. 364-373.[1] Mr. Tiedemann was unable to authenticate his attached exhibits and continued to express only his own assumptions related to the documents. *Id*. These unauthenticated documents, and the conclusions derived from them, should be struck.

Additionally, and significantly, both DEQ and Perpetua objected to Mr. Tiedemann's testimony as an expert witness. Mr. Tiedemann's written and oral testimony covered a variety of topics, including legal interpretation of the Rules for the Control of Air Pollution in Idaho, IDAPA 58.01.01, *et seq.* (the "Air Rules") and speculation on toxicological and scientific modelling issues. Mr. Tiedemann does not possess the requisite experience or knowledge to opine on these topics as an expert.

[1] All transcript citations herein reference the transcript from the hearing held on October 17 and 18, 2024.

As to interpretation of the Air Rules, his legal conclusions relate to the substantive legal issues before the Hearing Officer and are improper topics for expert testimony. *See Ybarra v. Legislature by Bedke*, 166 Idaho 902, 908, 466 P.3d 421, 427 (2020) (The Idaho Supreme Court has "previously held that testimony containing conclusions of law by an expert witness is generally inadmissible"). When an expert witness offers a legal conclusion it "invade[s] the province of the court to determine the applicable law." *Ballad v. Kerr*, 160 Idaho 674, 694, 378 P.3d 464, 484 (2016). Thus, as to an expert's scientific, technical, or other specialized knowledge that may help the trier of fact to understand the evidence or to determine a fact in issue, the legal analysis of a non-lawyer, expert witness is not helpful. *See Ybarra, supra* (striking numerous legal conclusions contained in the expert's declaration).

Moreover, as clarified by the Board, the development of additional factual evidence "must focus only" on "the ambient arsenic air concentration analysis performed by DEQ for the PTC." REC 3842 (emphasis added). Mr. Tiedemann's testimony ventures far afield from this narrow topic. The development of the TAPs rules over 30 years ago is less important than the analysis DEQ actually conducted in 2022—and, Mr. Tiedemann did not personally participate in the development of those rules, nor is he a qualified legal expert able to opine on regulatory history and interpretation. For these reasons, and those further presented in Perpetua's Amended Motion, Mr. Tiedemann's analysis and legal conclusions related to the Air Rules are an improper evidentiary basis for the fact finder to consider. The Hearing Officer should strike it from the record and afford it no weight.

Additionally, DEQ disagrees that Mr. Tiedemann has the requisite scientific, technical, or other specialized knowledge to provide the Hearing Officer expert testimony that assists in the development of the record. In this remand, the Board was explicit that the matter would return to the Hearing Officer for the "development of further evidence regarding the ambient air

concentrations of arsenic that will be produced by the SGP." REC 3717. Specifically, the Board indicated that the additional factual record should derive from "a toxicologist or other qualified expert regarding the cancer risk." REC 3716.

Mr. Tiedemann was tendered as an expert witness "in mechanical engineering, air permitting, and environmental compliance." Tr. 324:6-7. None of these topics relate to toxicology, nor cancer risk assessment. Consequently, even if Mr. Tiedemann has the requisite knowledge to be considered an expert in these fields—a claim DEQ strongly debates—his expertise is not relevant to the narrow and specific issues on remand. Consequently, Mr. Tiedemann's testimony is irrelevant and should be excluded. *See* IDAPA 62.01.01.475 (evidence is excludable under Idaho Code § 67-5251); I.C. § 67-5251(1) ("[T]he presiding officer may exclude evidence that is irrelevant"). Given the significant technical expertise required to analyze this matter and Mr. Tiedemann's lack of relevant experience in toxicology or cancer risk assessment, his scientific testimony—as well as his foray into legal conclusions and regulatory interpretation—has no probative value, confuses the issues, and poses a risk of unfair prejudice. Such evidence should be excluded. *See* I.R.E. 403.

DEQ joins in the Amended Motion and asks the Hearing Officer to strike those enumerated paragraphs and exhibits of the declarations of both Mr. Tiedemann and Dr. von Lindern, as outlined in the motions. Additionally, DEQ herein asks that the Hearing Officer strike the oral testimony of Mr. Tiedemann concerning legal conclusions and topics outside his proffered expertise of mechanical engineering, air permitting, and environmental compliance. DEQ understands that the Hearing Officer is not bound by the Idaho Rules of Evidence, except as provided in OAH Rule 475. To the extent the Amended Motion and DEQ's present request to strike is denied, DEQ encourages the Hearing Officer to assign little weight, if any, to the

testimony that would be inadmissible under the Idaho Rules of Evidence. *See* IDAPA 62.01.01.476.

III. STANDARD OF REVIEW & BURDEN OF PROOF

The Board "must determine whether DEQ 'has acted reasonably and in accordance with law' when issuing the Permit . . ." REC 3697. As to the Remaining Issues, the Board found DEQ did not act reasonably and in accordance with law because it lacked sufficient evidence to support DEQ's analysis. REC 3706; *see also* REC 3714-15 ("the other four issues brought before the Board have been finally decided and cannot be reopened on remand").

Upon remand, Petitioners still bear the burden of proof as the party challenging DEQ's issuance of the PTC. IDAPA 62.01.01.477 ("the burden of proof is on the party requesting or challenging an agency action or order"). The Petitioners' must meet their burden by a preponderance of the evidence. *Id*. Thus, the Hearing Officer must determine whether Petitioners presented competent evidence establishing that DEQ was not reasonable and did not act in accordance with the law when it issued the PTC; and specifically, whether DEQ's analysis of the arsenic ambient air concentrations was unreasonable and unlawful. The Hearing Officer, and the Board, must only consider whether DEQ was reasonable and acted in accordance with the law—not whether a person disagrees with DEQ's reasonable and lawful approach.

Throughout this contested case, and including the current remand, it has been clear that expert opinions and testimony are necessary. *See* REC 3375 (in the December 5, 2023 *Amended Memorandum Decision on Motions for Summary Judgment and Preliminary Order*, the Hearing Officer discussed the technical nature of the air permit matters and determined that DEQ staff were expert witnesses); REC 3716 (the Board seeks expert testimony from a toxicologist or other qualified expert). Because the PTC at issue, as well as the questions of cancer risk and arsenic concentrations, are technical and complex, expert testimony has been essential. *See* REC 3375.

Importantly, DEQ's "experience, technical competence, and specialized knowledge may be utilized in the evaluation of the evidence." I.C. § 67-5251(5).

Prior to the hearing, DEQ, Perpetua, and Petitioners each provided two expert declarations. At the hearing, the parties presented those same witnesses to testify as experts. The expert witness testimony was meant to provide the "further evidence" requested by the Board. That testimony proves that DEQ both acted reasonably and lawfully. Specifically, the written and oral testimony of DEQ and Perpetua's expert witnesses establish that the SGP permit DEQ issued to Perpetua meets all requirements of the Air Rules and that DEQ acted reasonably and in accordance with law when it performed its analysis and created PTC conditions related to the arsenic emissions from the SGP. Thus, Petitioners are unable to prove, and have been unable to prove, that their assertion—DEQ acted unreasonably and unlawfully—is "more probably true than not true." *See* I.C.J.I. 1.20.1 (providing civil jury instructions for the preponderance of the evidence burden of proof).

IV. REGULATORY SCHEME

The testimony from DEQ and Perpetua's expert witnesses demonstrate that the Air Rules support DEQ's arsenic emissions analysis, air impact analysis, and the related permit conditions DEQ imposed for the SGP. For the Remaining Issues, the applicable sections of the Air Rules have been outlined several times in this proceeding, which include: Sections 203, 161, 210, 586, and the definition of "toxic air pollutant carcinogenic increments" in Section 006.125 of the Air Rules.[2] *See* REC 3416-17, 3707-10, 6894-96. In general terms, the parties appear to agree on the relevance and applicability of these specific rule sections listed above. However, the Board primarily questioned whether DEQ had authority to factor in the project duration for the SGP's arsenic

[2] DEQ issued the PTC to Perpetua on June 17, 2022. Thus, the 2022 version of the Air Rules are cited and relied upon.

emissions and the resulting impact to air. This questioning was based on a fundamental misunderstanding of the Air Rules.

Section 203 of the Air Rules states that DEQ cannot issue a permit to construct unless the permit applicant can demonstrate to the satisfaction of the Department, "using the methods provided in Section 210," that "the emissions of toxic air pollutants from the stationary source . . . would not injure or unreasonably affect human health or animal life or vegetation as required by Section 161." IDAPA 58.01.01.203.03. An applicant has demonstrated compliance with Section 210 when the modeled maximum ambient air impact is less or equal to the applicable acceptable ambient concentration ("AACC") for carcinogens as provided in IDAPA 58.01.01.586. *See* IDAPA 58.01.01.210. The AACC in IDAPA 58.01.01.586 "is calculated by dividing the acceptable lifetime risk (1 in 1,000,000) by the [unit risk factor ("URF")]," which is "4.3E-03µg/m3 for arsenic." REC 4282. The URF, which is developed by the Environmental Protection Agency (EPA) is the risk probability from exposure to 1 $\mu g/m^3$ of a substance continuously (24 hours/day and 365 days/year) over a lifetime of exposure (assumed to be 70 years). REC 3922.

Section 210.12 then allows a permit applicant to "use [Toxic Air Pollutant Reasonably Available Control Technology ("T-RACT")] to demonstrate preconstruction compliance for toxic air pollutants listed in Section 586." IDAPA 58.01.01.210.12. T-RACT "is an emission standard based on the lowest emission of toxic air pollutants that a particular source is capable of meeting by the application of control technology that is reasonably available, as determined by the Department…" IDAPA 58.01.01.210. When an applicant uses T-RACT, the allowable cancer risk changes from 1-in-1,000,000 to 1-in-100,000.

DEQ used the methods in Section 210 to determine the SGP's compliance with Section 161. Because Perpetua proposed to use T-RACT, the arsenic emissions from SGP could not create a lifetime cancer risk of greater than 1-in-100,000. Tr. 62:16-21. Perpetua then modeled the

emissions from the SGP, based on its "maximum design rate." Tr. 266:23-25. The modeling relied upon many conservative assumptions, using worst case scenarios. *See* Tr. 269:23-272:3. Mr. Schilling explained the next steps in the process, stating:

> During development of final SGP permitting analyses, [Perpetua] expressed concern that compliance with AACCs could not be demonstrated with the conservative assumptions used in previous analyses, including the assumption that the SGP was a permanent source rather than one of 16-year duration. Rather than revise the analytical approach to provide a less conservative assessment of impacts, I proposed that compliance with carcinogenic TAP increments could be based on cumulative cancer risk of the limited-duration project rather than the worst-case annual impact for a project of limited duration. Since the AACC annual average is an expression of a 1- in-1,000,000 cancer risk limit for permitting projects, modeled impacts (annual contaminant concentration) must be adjusted to an exposure concentration that is appropriately comparable to the annual average AACC. Therefore, annual impacts for a project with a 16-year duration could be multiplied by a 16/70 factor to more appropriately compare to the AACC, which is based on a 70-year exposure duration.

REC 3924-25. "So, in Perpetua's case, in order to develop an appropriate factor to compare or an appropriate concentration to compare to the AACC, [DEQ] needed to account for the exposure duration." Tr. 35:1-4.

DEQ's application of the project specific adjustment is consistent with the purpose and intent of the TAPs rules. Mr. Schilling stated that, in his experience based on personally participating in the development of the TAPs rules, the "carcinogenic TAP AACCs were established to ensure that impacts of any carcinogenic TAPs from a project or facility would not cause a lifetime cancer risk over 1-in-1,000,000 or 1-in-100,000 when using T-RACT." REC 3926. He explained:

> Going all the way back to the toxics policy that was used in permitting, the cornerstone of that was focused on project risk. In other words, any particular project, whether it is a new facility or a modification, not causing a risk to exceed one in a million or one in 100,000, some things changed with T-RACT going from policy to regulation.

Tr. 18:5-12. Thus, "DEQ continually asserted that carcinogenic TAPs resulting from a permitting project should be regulated to prevent an unacceptable excess cancer risk based on a 70-year lifetime." REC 3922. In simple terms, from the beginning of their development, the cornerstone of the TAPs rules is that total increased pollutant-specific cancer risk from a project over the project's life cannot exceed the lifetime cancer risk limit imposed by the rules.

This approach, as described by Mr. Schilling, makes sense given the Air Rules' reference to and reliance upon EPA's URFs. Section 586 specifically lists the URF for each pollutant. Thus, "DEQ adopted EPA's cancer risk values and risk assessment methodology when it promulgated the Air Rules for toxic air pollutants from stationary sources." REC 4282. Stated another way, "[c]ancer risks used to establish AACCs were based on EPA's cancer risk model (using established EPA URFs)." REC 3926. When asked if the Air Rules rely upon the URFs, Mr. Schilling responded by stating: "I believe it is really the cornerstone of the whole TAPs program for regulating carcinogenic compounds." Tr. 20:8-10. According to Mr. Schilling, inclusion of the URF demonstrates that "it's a project cancer risk that is the focus rather than an annual strict increment." Tr. 38:7-8. And, as Dr. Paden explained: "Under EPA's methodology for human health risk assessments, cancer risk calculations are done using a lifetime exposure set at 70 years," meaning the risk calculations use a lifetime of 70 years. REC 3877.

Further, Petitioners wrongly argue that a permittee must comply with the AACCs on an annual basis. That assertion is simply not supported by the rule language or the rule history. The Air Rules define "toxic air pollutant carcinogenic increments" as:

> Those ambient air quality increments based on the probability of developing excess cancers over a seventy (70) year lifetime exposure to one (1) microgram per cubic meter (1 ug/m3) of a given carcinogen and expressed in terms of a screening emission level or an acceptable ambient concentration for a carcinogenic toxic air pollutant. They are listed in Section 586.

IDAPA 58.01.01.006.125. All the parties appear to agree that the TAPs rules are incremental, meaning the rules are "just a base-allowed impact for that project" and "it doesn't concern itself with what goes on at the whole rest of the facility or what goes at the neighboring facility or what is already there for background." Tr. 36:16-20. Significantly, the rules were not intended to be annual limits. *See* Tr. 277-278, Tr. 416; Tr. 450. Instead, the rules create an increment that is "one in 1 million over a lifetime of exposure," Tr. 36:25-37:1. The lifetime increment is what the permittee must comply with, not an annual limit.

In summary, the TAPs rules require that a project not exceed the lifetime allowable risk from a project. That risk is a 1-in-1,000,000, or 1-in-100,000 if T-RACT is used, increased risk. Again, the AACCs are not annual limits, but an annual average "expression of a 1-in-1,000,000 cancer risk limit for permitting projects." *See* REC 3924-25. This requires DEQ to adjust exposure duration to "to an exposure concentration that is appropriately comparable to the annual average AACC." REC 3925. A permanently operating project is the underlying assumption for using a 70-year lifetime and exposure duration. Where a project will not operate permanently, however, a specific adjustment for the actual life of the project is reasonable. Consequently, DEQ's use of a project specific adjustment factor is supported by the regulations outlined above.

V. EXPERT TESTIMONY ON THE REMAINING ISSUES

Before reviewing the expert testimony provided on remand, a review of the applicable standard of review for technical agency decisions is appropriate.[3] When analysis "requires a high level of technical expertise," a court must defer to "the informed discretion of the responsible [] agencies." *Kleppe v. Sierra Club*, 427 U.S. 390, 412 (1976). "When specialists express conflicting

[3] The discussion hereinbelow outlines appropriate customary tools of interpretation utilized before the deferential rule of agency interpretation in *Chevron, U.S.A., Inc. v. Nat. Res. Def. Council, Inc.*, 467 U.S. 837 (1984) and after its overruling by *Loper Bright Enterprises v. Raimondo*, 144 S. Ct. 2244 (2024). *See* I.C. § 67-5279(5) (requiring application of customary tools of interpretation when interpretating statute).

views, an agency must have discretion to rely on the reasonable opinions of its own qualified experts even if, as an original matter, a court might find contrary views more persuasive." *Marsh v. Oregon Nat. Res. Council*, 490 U.S. 360, 378 (1989). A court "will uphold a decision of less than ideal clarity if the agency's path may reasonably be discerned." *Bowman Transp., Inc.*, 419 U.S. at 286 (citing *Colorado Interstate Gas Co. v. FPC*, 324 U.S. 581, 595 (1945)) (emphasis added).

"When examining this kind of scientific determination, as opposed to simple findings of fact, a reviewing court must generally be at its most deferential") *Baltimore Gas & Electric Co. v. Natural Resources Defense Council, Inc.*, 462 U.S. 87, 103 (1983) (emphasis added). This is particularly true for statistical and modeling analysis. *See Appalachian Power Co. v. EPA*, 135 F.3d 791, 802 (D.C. Cir. 1998) (per curiam) (identifying statistics as "the prime example of those areas of technical wilderness into which judicial expeditions are best limited to ascertaining the lay of the land"). The court "will examine each step of [the agency's] analysis to satisfy ourselves that the agency has not departed from a rational course, and only when the model bears no rational relationship to the characteristics of the data to which it is applied will we conclude the use of the model was arbitrary and capricious." *Huntsman Petrochemical LLC v. Env't Prot. Agency*, 114 F.4th 727, 735 (D.C. Cir. 2024) (emphasis added) (cleaned up).

A. The Expert Testimony Demonstrates that DEQ Acted Reasonably and in Accordance with Law in Using the Project Specific 16/70 Adjustment.

i. The applicable standard for compliance with the TAPs rules is the cancer risk in ambient air resulting from allowable emissions of the proposed project for the life of the project.

The cornerstone of the carcinogenic TAP rules is limiting project-caused cancer risk to less than 1-in-1,000,000, or 1-in-100,000 when T-RACT is used. The Board misunderstood the Air Rules, finding that "nowhere in the Air Rules does it provide that a project that will operate more than 5 years, but less than 70 years may be adjusted in proportion to the amount of time it will

operate." REC 3715. This conclusion is based on the improper assumption that the Air Rules require compliance with the AACCs on an annual basis, and not compliance with the lifetime cancer risk increment. Based on the testimony provided at the hearing and in the declarations, the Air Rules support DEQ implementing the TAPs rules as it did.

First, the definition of "Toxic Air Pollutant Carcinogenic Increments" supports DEQ's analysis. The definition, provided above, "references the [one] in a million cancer risk being the criteria, and that the AACCs are an expression of that for a continuation exposure over the lifetime." Tr. 20:15-18; *see* IDAPA 58.01.01.006.125. The definition is also "expressed in terms of the screening emission limit or the acceptable ambient concentration of a carcinogen," and the use of the word "expressed," in Mr. Schilling's opinion, "makes it clear that it focuses on a total project-imposed cancer risk rather than a specific year by year." Tr. 32:9-14.

Further, Section 586, which contains the AACCs, also provides the URFs, which were created by EPA. The URF[4] is "the toxicity value that you compare an exposure concentration to to estimate risk from that exposure." Tr. 182:24-183:1. As Dr. Paden explained, "DEQ has in the rules that [A]ACC uses the inhalation unit risk which comes from EPA," and that Section 586 contains "a footnote there that indicates that value is taken from EPA." Tr. 137:5-8. Thus, the inclusion of the URF in Section 586 demonstrates that "it's a project cancer risk that is the focus rather than an annual strict increment." Tr. 38:7-8. When Mr. Schilling was asked what the impact would be to the TAPs rules if the URFs were not included in Section 586, he stated:

> It would be less clear that it's project risk we're concerned about. I wouldn't say it would be clear that the intent would be just an annual standard because through the rulemaking process and that entire thing and background, project risk was always sort of the cornerstone focus.

[4] Ms. Lopez testified that the unit risk factors are the same as the inhalation unit risk. *See* Tr. 182:9-13.

Tr. 37:22-38:3. In simple terms, the rules are focused on the overall risk of the project based on exposure over a lifetime.

Dr. von Lindern testified that the "annual compliance with [the AACC] is the cornerstone of the rule, as opposed to some of the opinions that we've had here previously." Tr. 416:22-25. He also continually referred to the AACC as a *maximum annual* or *maximum one year* concentration. *See, e.g.,* REC 6108, 6110, 6112. However, when asked where the term "maximum one-year annual average ambient air carcinogen concentration" came from, he responded by stating that it is "how you should interpret [section] 586, which says 'annual averages.'" Tr. 484:24-25 (emphasis added). He also admitted that the terminology was not actually in the rules. Tr. 485:2.

This was not the only instance where Dr. von Lindern's expressed his desire for the Air Rules to operate differently than they actually do. For example, Dr. von Lindern continually discussed a "margin of safety" and the impacts to sensitive populations. *See* Tr. 417:9-15; REC 6112. But as he again admitted, the margin of safety is not in the Air Rules, Tr. 478:11-12 ("that's my term to help explain this"), and that the URFs already take into account sub-susceptible groups, Tr. 484:6. Finally, even though EPA does not list arsenic as having a mutagenic mode of action, he continually stated it *should be* and instead noted it was "one of the most controversial things going on in EPA." Tr. 483:2-3; *see also* Tr. 479:25-480:2.

DEQ acted reasonably and lawfully when it used a project specific exposure adjustment factor in determining Perpetua's compliance with the Air Rules. For the reasons discussed above, the Air Rules support using the adjustment factor because compliance is based on the *life of the project.* "[T]o develop an appropriate factor to compare or an appropriate concentration to compare to the AACC, [DEQ] needed to account for the exposure duration." Tr. 35:1-4. Mr. Schilling aptly described DEQ's implementation of the rules as follows:

> I believe we take a stance with the rules that implements the rules to our best understanding and reasonable understanding of what they are. We have a case where a lot of different stakeholders wish the rules were either more stringent or less stringent and would like to see them account for co-contributing sources, additive carcinogenic effects, other things that may have just come out in the last 30 years since the rules have been promulgated that deal with new toxicological concepts and whatever else. But we are dealing with the rules we have and we implement them to what we believe is a reasonable and fair assessment to our regulated community. And sometimes we face challenging things that don't completely fit in the box we anticipated them to fit in. And we look at the rules and interpret them accordingly. We firmly believe that making this assessment based on what's in the rules as defining project risk as the cornerstone. We feel it is appropriate to make that exposure duration adjustment.

Tr. 56:23-57:19. Although Petitioners clearly feel differently, their opinions are not supported by rule language. Petitioners cannot demonstrate by a preponderance of the evidence that DEQ acted unreasonably or unlawfully.

ii. The PTC does not need a specific condition limiting the mine operations to 16 years.

As already discussed, DEQ used a 16-year life of mine in calculating the risk, ultimately creating a 16 over 70-year project adjustment for exposure duration. But because the PTC contains production limits, a 16-year limit in the PTC is unnecessary. Mr. Schilling explained that the production limits cap Perpetua's production so that, "in the absence of a time limit in there, they could actually extend operations longer." Tr. 120:15-16. And, if Perpetua "went at a slower pace they would need to extend it longer." Tr. 120:17-18. However, "by extending it longer, since our emissions are proportional on production and concentrations are proportional on emissions and risk is dependent upon the total exposure, you're going to arrive at the same risk whether it would be 16 years or 70 years." Tr. 120:19-24. Ms. Lopez agreed with this assertion, stating: "Exposure to a higher concentration for a shorter amount of time is the risk equivalent of a higher -- lower concentration for a longer period of time." Tr. 208:14-17. Thus, the 16-years is simply a worst-case scenario for annual impacts, wherein Perpetua would be operating at the maximum capacity, as allowed by the PTC conditions.

iii. DEQ's analysis of arsenic emissions, and the corresponding PTC conditions, are protective of public health.

The arsenic analysis performed by DEQ, which included the project specific adjustment factor, is protective of public health. In its Final Order, the Board stated that it "has not found sufficient evidence in the record to convince it that the 16/70 analysis performed by DEQ was equally or more protective of human and animal life and vegetation as what is provided for by the Air Rules." REC 3717. The testimony from DEQ and Perpetua's expert witnesses clearly provides sufficient evidence demonstrating that DEQ's arsenic analysis was equally or more protective.

As has been discussed herein, the Air Rules, specifically the AACCs, rely upon and incorporate EPA's science and methodologies. *See* REC 3876, REC 4284. The URFs in Section 586 were developed by EPA and "reflect[] many years of research and evaluation. . ." REC 4282. Using EPA's methodology for calculating cancer risk, both Dr. Paden and Ms. Lopez concluded that the use of the project specific adjustment factor did not unreasonably increase the risk and was in fact in compliance with the T-RACT 1-in-100,000 increment. *See* Tr. 134:23, 201:2.

Both Dr. Paden and Ms. Lopez calculated the cancer risk from the SGP using EPA's formula for human health risk assessments where cancer risk calculations are done using a variable exposure duration and an assumed 70-year lifetime. REC 3877. That formula is as follows:

EC = (CA x ET x EF x ED)/AT

Where: EC ($\mu g/m^3$) = exposure concentration;
CA ($\mu g/m^3$) = contaminant concentration in air;
ET (hours/day) = exposure time;
EF (days/year) = exposure frequency;
ED (years) = exposure duration; and
AT (lifetime in years 70 x 365 days/year x 24 hours/day) = averaging time

Id.

And Ms. Lopez testified:

> Using the highest modelled annual average arsenic concentration from the project of 0.00414 µg/m^3 (REC 716) the calculation of the air concentration adjusted for exposure from the SGP is as follows:

$$\left[0.00414\,\frac{\mu g}{m3}\,x\,24\,\frac{hours}{day}\,x\,\frac{1\,day}{24\,hours}\,x\,365\,\frac{days}{year}\,x\,16\,years\right] / \left[365\,\frac{days}{year}\,x\,70\,years\right] = 0.00095\,\frac{\mu g}{m3}$$

REC 4284. As Ms. Lopez explained:

> This calculation took the exposure, the CA, contaminate concentration in air, which was the emissions from the mine, multiplied it by 24 hours a day, 365 days a year, for 16 years, and then divided by the averaging time in years to develop an exposure concentration that is equal to .00095.

Tr. 197:13-19.

Simply put, the result of these calculations demonstrated that the arsenic emissions from the SGP resulted in a .00095 µg/m3 arsenic concentration averaged over a lifetime. Thus, Ms. Lopez concluded that "[t]he actual risk is four in a million or approximately one in 240,000." Tr. 200:18-19; *see also* Tr. 136:1-5 (Dr. Paden similarly concluded: "But most importantly, the 16 years that we are discussing in this hearing, and that four in 1 million cancer risk. So that is the below the T-RACT which is below our rule standard for cancer risk. This is less than the T-RACT adjusted risk increment of 1-in-100,000.").

Clearly, the formulas above account for exposure duration. Dr. Paden testified that it is common practice when performing a risk assessment to adjust the exposure duration. Tr. 144:22. She explained, stating:

> In fact, usually when we are talking about residential exposures you can use different values from EPA, 26 [years]. Or when you are valuating a receptor that could be -- a receptor who is going to be exposed, a recreational person who is going to go to the site only for a short amount of time, you can use that exposure duration, that way you don't overestimate the risk. So if you have information that is provided to me as a risk assessor and they tell me I am going to look at the risk here, to be more accurate I can use that information and put the 26, the 16, 15, whatever number the person is going to get exposed to get an accurate calculation of the cancer risk.

Tr. 143:24-144:13. Ms. Lopez agreed, stating "[c]omparing unadjusted emissions to the AACC would result in an over-estimation of cancer risk because the dose will not continue for the 70-year lifetime exposure assumed in the development of the AACC." REC 4283.

The expert testimony demonstrates that DEQ did not underestimate the cancer risk caused by the project. The expert testimony also demonstrates that the project specific adjustment was reasonable – calculating cancer risk naturally requires one to consider the exposure duration. REC 3877, REC 4286. The adjustment has also been shown to be lawful – the AACCs are based on EPA's methodologies and adjusting the exposure length is consistent with EPA methodology. *See* REC 3876-77, 4286. And the testimony of Dr. Paden and Ms. Lopez establish that "the highest air concentration of arsenic from the project is below the acceptable lifetime risk established by the T-RACT AACC." REC 4285.

iv. DEQ did not depart from any agency precedent in performing its analysis regarding arsenic emissions.

DEQ did not break from any established agency precedent when it factored in the duration of the project, both in terms of a 16-year lifetime and an overall production limit. Mr. Schilling testified that, in his experience, "we have not encountered applications that were over five years, but less than 70." Tr. 67:1-2. He also indicated that a permittee only has to indicate how long it will operate "if they want to take credit for a shorter than permanent duration in their permitting -- in their permit itself." Tr. 68:8-10. This is not a situation where DEQ had previously considered and rejected a project specific adjustment. This is also not a situation where DEQ has an explicit mandate preventing it from doing so. In fact, the Air Rules support DEQ's decision.

Petitioners' witnesses claimed that DEQ did in fact depart from agency practice. *See, e.g.,* Tr. 466:8-10; Tr. 340:5-9. But neither witness described a situation where DEQ was confronted with a project-specific duration adjustment but denied it based upon some agency position or

practice. When asked, Mr. Tiedemann stated that, in his time at DEQ, no permit applicant asked for a project specific adjustment (of less than 70 years but greater than 5). *See* Tr. 363:7-8. Mr. Schilling explained that when Perpetua did in fact make this request of DEQ, DEQ considered it, focusing on ultimate compliance with lifetime cancer risk, ensured it was a "reasonable approach to our interpretation," and then ultimately moved forward. Tr. 124:20-125:3. Thus, in reality, DEQ followed its typical permitting process where "you start with an application and the analysis gets refined over time." Tr. 30:11-13.

B. The Expert Testimony Demonstrates that DEQ Acted Reasonably and in Accordance with Law in Using a Five-Year Rolling Average.

Next, the testimony demonstrated that the five-year rolling average production limit for assessing compliance with the AACC is both reasonable and lawful. Again, the Board wrongly assumes that the AACCs provide annual compliance limits. But "long-term exposure to a given concentration over the life of the project is the critical parameter for the risk-based AACCs." REC 3919. Mr. Schilling explained:

> It goes back to the same cornerstone of the rules being project-imposed risk. As long as project-imposed risk is the criteria and we have a duration of the project of 16 years, what really matters for demonstrating, whether it complies or not, is where are we at after 16 years.

Tr. 39:14-19. Thus, the "[u]se of a 5-year averaging period for limiting processing rates easily accomplishes this requirement for a project with a 16-year duration, and it provides for reasonable periodic assurance of compliance with the long-term limit." REC 3926. Again, DEQ does not simply determine if the SGP complied with the lifetime AACC at the end of the project. Instead, DEQ uses "something less than 16 years as a responsible vehicle to identify when things might… be going wrong at an earlier time." *Id.*

The PTC also contains "sideboards" on production. Mr. Lewis and Mr. Schilling described these sideboards stating, "there are shorter-term processing limits in [the PTC]," Tr. 43:20-21, and

"[i]t's the 135,000 tons per day has sideboards and, you know, other short-term limits that you have to demonstrate compliance with," Tr. 291:12-14. But because Perpetua also has year to year operational variability given its operations, the five-year rolling average is actually more representative of emissions – not simply capturing one year that may be much different from any other year, operation-wise. *See* Tr. 291:21-24. Dr. Paden confirmed that "if a five-year rolling average was actually more representative because of the variability of the project, [that] would . . . actually be the best number to use as the representative number." Tr. 174:22-175:2.

Because DEQ demonstrated that the use of project adjustment factor was protective of public health, it follows that the five-year rolling average is also protective. When Perpetua's counsel asked Mr. Lewis, if "the five-year rolling average is a way to disguise whether or not this permit is going to allow Perpetua to exceed the T-RACT limits," Mr. Lewis stated: "That's just a complete mischaracterization of what's going on." Tr. 292:5-12. And, in fact, Perpetua's counsel confirmed that, "even at its peak mining production, on any one given day, even if you strung it together every day for an entire year… [the SGP] still wouldn't exceed the T-RACT control limit." Tr. 292:19-22. If Perpetua can demonstrate that it will comply with the AACCs, understanding that it is a lifetime risk for the 16-year project, then a five-year rolling average is a reasonable method for measuring compliance.

C. The Expert Testimony Demonstrates that DEQ Acted Reasonably and in Accordance with Law as there was Sufficient Evidence to Support the T-RACT Analysis Limiting the Non-West End Pit Production Limit.

Finally, the Board concluded "there was insufficient evidence in the record to demonstrate exactly how or whether the non-West End Pit production was limited and, if it was, the Board of Environmental Quality could not find any PTC conditions able to enforce that reduction." REC 3714. According to the testimony of Mr. Schilling and Mr. Lewis, the PTC appropriately and effectively limited both West End Pit and non-West End Pit production. *See* REC 3927; REC

4139; Tr. 45; Tr. 281. Mr. Schilling explained: "There's sort of two main limits. There's a total mine limit in there of 788.4 million tons. And then there is a west end pit-specific limit of 50 percent of that, which is 394.2 million tons." Tr. 45:11-15. Further, a "limit to the non-west end pit production sources was not needed because even if 100 percent of the production is from non-west end pit sources, we're still in compliance." Tr. 45:18-21. This was important because, as Mr. Lewis explained, "pound for pound, the West End Pit resulted in higher ambient air impacts." Tr. 307:14-16.

These limits are contained in the PTC as condition 3.6, which "limits total hauling and excavation from the mine to 788.4 million tons" and it "limits hauling and excavation from the West End Pit to 394.2 million tons, which is equal to 50% of total allowable production." REC 3927; *see also* REC 4139. Thus, a limit to the non-West End Pit was not necessary based on the following relationship:

$$\text{Production}_{\text{Non-WEP}} = \text{Production}_{\text{total}} - \text{Production}_{\text{WEP}}$$

See REC 3928. Therefore, DEQ acted both reasonably and lawfully, as a limit on non-West End Pit sources is not required and would not make sense in the context of the existing limit on total production and West End Pit production.

VI. CONCLUSION

As discussed above, the expert witness testimony demonstrates that DEQ acted reasonably and lawfully when it issued the PTC, and specifically in its analysis of arsenic emissions. When DEQ performed the arsenic emissions analysis, and in particular when it applied the project specific adjustment, DEQ both followed the Air Rules and was protective of public health. Thus, as to each of the Remaining Issues, Petitioners have failed to meet their burden, and the Hearing Officer must find in DEQ's and Perpetua's favor.

DATED this 8th day of November, 2024.

I. INTRODUCTION

The scope of the Board of Environmental Quality (the "Board") remand in this matter is limited to the development of factual evidence "regarding the ambient air concentrations of arsenic that will be produced by the Stibnite Gold Project [the "Project"] and whether those levels comply with the Air Rules."[1] REC 3717; *see also* REC 3841-3842. On remand, to address the Board's questions, the Idaho Department of Environmental Quality ("DEQ") and Perpetua Resources Idaho, Inc. ("Perpetua") presented the expert testimony of Kevin Schilling (DEQ's Stationary Source Modeling Supervisor), two toxicologists—Dr. Norka Paden (a DEQ Toxicological Risk Assessor) and Theresa Lopez (a Principal Toxicologist with Tetra Tech, Inc.)—and Kevin Lewis (an expert in air quality modeling and permitting for mining projects).

DEQ and Perpetua's expert witnesses demonstrated that DEQ properly assessed ambient concentrations of arsenic from the Project in compliance with the Rules for the Control of Air Pollution in Idaho, IDAPA 58.01.01 *et seq.* (2022) (the "Idaho Air Rules").[2] They explained that DEQ adopted cancer risk values and assessment methodology established by the United States Environmental Protection Agency ("EPA"). They explained that EPA evaluates incremental excess cancer risk from continuous exposure over a 70-year lifetime, not one year. They explained how ambient arsenic concentrations from the Project will be 41% of the acceptable cancer risk of 1-in-100,000, adjusted to reflect an enforceable maximum production scenario based on the Permit to Construct ("PTC"). They explained how the duration of the Project under this maximum production scenario would be 16 years and that a longer duration does not change arsenic emissions or the acceptable cancer risk.

[1] For a review of the issues on remand and discussion of procedural history, see Perpetua's Prehearing Statement (submitted Oct. 11, 2024). REC 6902-6915.

[2] All citations are to the 2022 version of the Idaho Air Rules.

Petitioners' witnesses—William Tiedemann (a regulatory conservation associate with the Idaho Conservation League) and Dr. Ian von Lindern (a chemical engineer)—are not qualified to opine on complex areas of air quality modeling and risk assessment of ambient concentrations of arsenic. They offered nothing more than conclusory statements and policy preferences as alternatives to DEQ's science-based decision making. Their views cannot be substituted for the agency's technical competence and specialized knowledge. Petitioners have not met their burden to establish, by a preponderance of the evidence, that DEQ acted unreasonably or contrary to the Idaho Air Rules. The Hearing Officer should find that DEQ and Perpetua's expert testimony supports the reasonableness of DEQ's analyses and compliance with the Idaho Air Rules and the sufficiency of the PTC conditions. DEQ's permit decision should be affirmed.

II. STANDARD OF REVIEW

The Board "must determine whether DEQ 'has acted reasonably and in accordance with the law.'" REC 3697 (quoting *In the Matter of Sunnyside Park Utilities' Application for Sewage Disposal Permit*, Final Order on Petition for Review of Preliminary Order, at p. 10 (BEQ Dkt. 0103-07-02, Apr. 7, 2009)). The burden of establishing that DEQ acted unreasonably or inconsistently with the law falls on Petitioners, who must prove their allegations by a preponderance of the evidence. IDAPA 62.01.01.477. A "preponderance of the evidence" is evidence that, when weighed with that opposed to it, has more convincing force and from which results a greater probability of truth. *Harris v. Elec. Wholesale*, 141 Idaho 1, 3, 105 P.3d 267, 269 (2004) (citation omitted).

The Board's analysis appropriately considers DEQ's "experience, technical competence, and specialized knowledge" to evaluate evidence.[3] *See* Idaho Code § 67-5251(5); *see also* Idaho

[3] The Idaho Legislature recently amended the standard for judicial review under the Idaho Administrative Procedure Act to prohibit deference to agency interpretations, Idaho Code

Code § 67-5251(4)(b) (authorizing the Board to take official notice of "generally recognized technical or scientific facts within the agency's specialized knowledge"); Michael S. Gilmore & Dale D. Goble, *The Idaho Administrative Procedure Act: A Primer for the Practitioner*, 30 Idaho L. Rev. 273, 319 (1994) ("[T]he agency's repeated exposure to a specialized subject matter is a source of specialized knowledge that is useful in evaluating evidence."). A decision rooted in an agency's technical competence and specialized knowledge is generally accorded great weight. *See Appalachian Power Co. v. EPA*, 135 F.3d 791, 802 (D.C. Cir. 1998) ("Statistical analysis is perhaps the prime example of those areas of technical wilderness into which judicial expeditions are best limited to ascertaining the lay of the land"); *Earth Island Inst. v. U.S. Forest Serv.*, 351 F.3d 1291, 1301 (9th Cir. 2003) ("an agency is entitled to wide discretion in assessing the scientific evidence").

This is particularly persuasive when an agency is performing emissions assessments and modeling, including in the context of risk assessments. *See Huntsman Petrochemical LLC v. EPA*, 114 F.4th 727, 735 (D.C. Cir. 2024). In *Huntsman*, the D.C. Circuit rejected a challenge to the EPA cancer risk assessment of ethylene oxide under the hazardous air pollutant standards in the Clean Air Act. *Id*. The court held that while the petitioners' proposed alternative "approach

---

§ 67-5279(5), but the standard for judicial review does not apply to the Hearing Officer or the Board's review of the PTC. *See* REC 3377 (explaining that the statute's standards "are not directly applicable"). Nor does the amendment change the appropriate recognition of an agency's "experience, technical competence, and specialized knowledge" involving complex technical matters and scientific data, whether on administrative or judicial review. In a similar vein, while the U.S. Supreme Court recently eliminated judicial deference to agency interpretations of law under the federal Administrative Procedure Act, the Court reiterated that the Act "does mandate that judicial review of agency policymaking and factfinding be deferential." *Loper Bright Enters. v. Raimondo*, 144 S. Ct. 2244, 2261 (2024). Furthermore, in the context of legal interpretations, the Court explained that "although an agency's interpretation of a statute 'cannot bind a court,' it may be especially informative 'to the extent it rests on factual premises within [the agency's] expertise.'" *Id*. at 2267 (quoting *Bureau of Alcohol, Tobacco & Firearms v. FLRA*, 464 U.S. 89, 98 n. 8 (1983)).

to statistical modeling … may have advantages," *id*. at 742, EPA's action was "reasonable" because EPA "adequately explained its modeling approach and decisions" in light of the technical nature of the evidence before it, *id*. at 737.

III. DEQ'S ASSESSMENT OF THE PROJECT'S IMPACT ON INCREMENTAL CANCER RISK UNDER THE IDAHO TAP RULES

DEQ evaluated the Project's ambient arsenic concentration and associated incremental excess cancer risk under Idaho's toxic air pollutants ("TAPs") rules, which are based on EPA cancer risk values and assessment methodologies. Following EPA's approach, DEQ analyzed the health impacts of carcinogens based on long-term chronic exposure rather than short-term or acute exposure. *See* Tr. 145:6-146:13 (Paden); *see also* REC 4293-4294.

A. DEQ's assessment of preconstruction compliance with the TAPs rules relies on cancer risk values and risk assessment methodology established by EPA.

Based on the official rulemaking record and as explained by Mr. Schilling, the TAPs rules offer a simplified project-specific, risk-based approach to evaluate arsenic emissions. *See* Tr. 17:7-22:9 (Schilling); REC 3921-3924 (¶¶ 12-19). DEQ's evaluation starts with IDAPA 58.01.01.161. *See* IDAPA 58.01.01.203.03. Section 161 requires DEQ to assess arsenic emissions and determine that the emissions will not injure or unreasonably affect human or animal life or vegetation. Preconstruction compliance with Section 161 can be shown using the methods provided in IDAPA 58.01.01.210. *See id*.; Tr. 25:7-26:3 (Schilling). Under Section 210, preconstruction compliance is determined on a project basis and based on project-specific conditions. *See* IDAPA 58.01.01.210; *see also* Tr. 18:1-13, 20:6-12, 37:10-38:22 (Schilling).

Compliance with Section 210 is shown when a source's modeled maximum annual average ambient concentration of the carcinogenic TAP is less than or equal to the acceptable ambient concentration for a carcinogen ("AACC") established in IDAPA 58.01.01.586. *See* IDAPA 58.01.01.210. AACCs for each carcinogen are derived from a Unit Risk Factor ("URF")

developed and published by EPA. *See* IDAPA 58.01.01.106.19 (identifying "URF" as "Unit Risk Factor from the US Environmental Protection Agency"); *see also* Tr. 20:6-18 (explaining that URFs are the "cornerstone of the whole TAPs program for regulating carcinogenic compounds"), 21:5-10 (Schilling); Tr. 138:15-139:5 (Paden); Tr. 181:15-182:19 (Lopez); REC 4282 (¶ 16). EPA refers to the URF as the Inhalation Unit Risk factor ("IUR").[4] Tr. 181:15-182:19, 188:10-22 (Lopez); REC 4282 (¶¶ 12-14), 4295; *see also* REC 3878 (¶ 14).

URFs/IURs represent a chemical-specific risk based on exposure to 1 µg/m3 of that substance continuously (24 hours/day and 365 days/year) over a lifetime (assumed to be 70 years).[5] Tr. 19:11-20:18 (Schilling); REC 3922 (¶ 15); Tr. 135:2-13, 138:18-13 (Paden); REC 3876-3877 (¶¶ 11-12); Tr. 181:15-182:1 (Lopez); REC 4282 (¶¶ 12-13), 4295; *see also* Ex. 210. EPA develops URFs/IURs based on years of scientific study, taking into account the exposure of sensitive subpopulations and measuring excess cancer risk above the background risk a person faces in their everyday lives. Tr. 138:6-139:5, 146:15-24, 147:16-148:5, 153:13-154:12, 171:20-172:21 (Paden); Tr. 181:23-182:1, 185:6-12, 188:2-22, 190:8-191:6 (Lopez); REC 4293-4295. Because URFs/IURs align with continuous exposure over a 70-year lifetime, the value does not represent the lifetime risk of developing cancer after a single exposure. REC 4287 (¶ 42), 4295-4296, 4303.

The AACC represents the ambient concentration that a person could be exposed to continuously for a 70-year lifetime before the cancer risk exceeds 1-in-1,000,000. Tr. 20:6-18,

[4] During the hearing, URFs and IURs were referred to interchangeably.

[5] A lifetime cancer risk of 1-in-1,000,000 means that if 1 million people are continuously exposed to a specific concentration of a substance (as established by the URF/IUR) for 70 years, one person may develop cancer. To put this risk in perspective, the National Oceanic and Atmospheric Administration estimates that the chances of getting struck by lightning are much higher—1-in-15,300 in a lifetime. REC 4295 n. 1.

31:21-32:14 (Schilling); REC 3922-3923 (¶¶ 15, 17); Tr. 126:9-14 (Paden) (the AACCs "are an expression of the one in a million cancer risk for a 70-year exposure"); REC 3876-3877 (¶¶ 11-12); Tr. 194:18-195:8 (Lopez); REC 4282-4283 (¶¶ 16-18), 4295-4296. The AACC is calculated by dividing the acceptable lifetime cancer risk of 1-in-1,000,000 by the URF/IUR. REC 3876-3877 (¶ 11); Tr. 194:18-195:8 (Lopez); REC 4282-4283 (¶¶ 16-17), 4295-4296; *see also* Tr. 21:5-10 (Schilling); REC 3922 (¶ 15).

Relevant here, the URF/IUR for arsenic is 4.3E-3 per $\mu g/m^3$ ($0.0043/\mu g/m^3$), which converts to an AACC of 2.3E-4 $\mu g/m^3$ ($0.00023\ \mu g/m^3$) at an incremental lifetime cancer risk of 1-in-1,000,000. *See* IDAPA 58.01.01.586. Because both the numerator (the cancer risk) and denominator (the URF/IUR) assume a 24-hour, per day exposure for 365 days per year for 70 years, the calculation of the arsenic AACC is simply the risk divided by the URF/IUR:

0.000001 / 0.0043 per µg/m3 = 0.00023 µg/m3.

Tr. 136:6-137:10 (Paden); REC 3876-3877 (¶ 11); Tr. 194:18-195:8 (Lopez); REC 4282 (¶ 16), 4296; *see also* REC 3922 (¶ 15).

Thus, the arsenic AACC represents the ambient concentration that aligns with an acceptable incremental cancer risk probability of no more than 1-in-1,000,000 assuming 70 years of constant exposure. This is made clear by the definition of "Toxic Air Pollutant Carcinogenic Increments" in the Idaho Air Rules:

> Those ambient air quality increments based on the probability of developing excess cancers over a seventy (70) year lifetime exposure to one (1) microgram per cubic meter (1 ug/m^3) of a given carcinogen and expressed in terms of a screening emission level or an acceptable ambient concentration for a carcinogenic toxic air pollutant. They are listed in Section 586.

IDAPA 58.01.01.006.125; *see also* Tr. 31:19-32:14 (Schilling) (explaining the definition is important to identify a 1-in-1,000,000 cancer risk and the link to the AACC and to "make[] it

clear that it focuses on a total project-imposed cancer risk rather than a specific year by year.").

While the AACCs are expressed as annual average ambient concentrations in Section 586, this reference does not mean that the AACCs are annual limits (as explained in Section IV.A.1 below). Rather, the AACCs are ambient concentrations that align with the incremental cancer risk assuming an exposure duration over a 70-year lifetime. Interpreting the AACCs as an annual limit is contrary to the development of URF/IUR values and EPA's determination of risk-based acceptable exposures over a 70-year lifetime. Tr. 48:18-21, 56:2-5 (Schilling); REC 3923 (¶ 17); Tr. 509:2-19 (Lopez); 4286-4287 (¶¶ 37-41), 4302-4303. In other words, there is *no toxicological basis* to treat the AACC as an annual limit because that would improperly assume a single annual exposure would result in incremental lifetime cancer risk. *See* Tr. 145:6-24 (Paden) ("We do not evaluate cancer risk for an acute exposure, but for chronic exposure.").

B. DEQ compared the Project's arsenic exposure concentration to the T-RACT AACC and accounted for the enforceable maximum production limits.

In this case, DEQ found Perpetua demonstrated preconstruction compliance for arsenic emissions using the method set forth in Section 210.12. Section 210.12 allows an applicant to use reasonable achievable control technology for TAPs ("T-RACT") to demonstrate compliance with Section 161. IDAPA 58.01.01.210.12.a. The Idaho Air Rules define T-RACT as an "emission standard" based on the lowest emission of TAPs. IDAPA 58.01.01.007.12. T-RACT may be based on the application of an operational requirement incorporated into the permit—*e.g.*, PTC Conditions 3.5 and 3.6 establish production limits to control fugitive dust emissions from the Project.[6] *See* IDAPA 58.01.010.210.14.e. Where T-RACT is used to control emissions, the

[6] Fugitive dust emissions are the primary source of arsenic from the Project. Because these emissions are "addressed" by National Emission Standards for Hazardous Air Pollutants (NESHAP), 40 C.F.R. Part 63, Subpart EEEEEEE, they normally would be excluded from TAP compliance demonstrations. *See* IDAPA 58.01.01.210.20.b. In response to public comments,

allowable incremental cancer risk probability over a 70-year lifetime of constant exposure is 1-in-100,000, or 10 times the AACC. IDAPA 58.01.01.210.12.b. This is called the T-RACT AACC, which for arsenic is 0.0023 $\mu g/m^3$.

The plain language of Section 210.12.b requires DEQ to *compare* the "approved T-RACT ambient concentration" from the source to the cancer risk increment reflected by the T-RACT AACC:

> Compare the source's or modification's approved T-RACT ambient concentration at the point of compliance for the toxic air pollutant to the amount of the toxic air pollutant that would contribute an ambient air cancer risk probability of less than one to one hundred thousand (1:100,000) (which amount is equivalent to ten (10) times the applicable acceptable ambient concentration listed in Section 586).

Id.; *see also* Tr. 20:8:18 (Schilling). Toxicologists refer to the approved T-RACT ambient concentration from the source as the "exposure concentration." *See*, *e.g.*, Tr. 141:17-143:1 (Paden); Tr. 191:12-193:2, 197:9-19 (Lopez).

As explained in more detail below, the exposure concentration is calculated from the modeled maximum annual average ambient concentration, which accounts for T-RACT—*e.g.*, here, the maximum production limits under PTC Conditions 3.5 and 3.6 would effectively limit the Project's exposure duration to 16 years if Perpetua operated at the maximum allowed levels without interruption. If under this scenario the exposure concentration is less than or equal to the T-RACT AACC, "no further procedures for demonstrating preconstruction compliance will be required for that toxic air pollutant as part of the application process." *See* IDAPA 58.01.01.210.12.c; *see also* Tr. 65:4-18 (Schilling).

DEQ determined that the Project's arsenic exposure concentration, adjusted to reflect the

---

DEQ took a conservative approach and included these fugitive emissions in assessing TAP emissions under Section 210. *See* REC 4133-4134 (¶ 18).

PTC's maximum production limits and related exposure duration, is 0.00095 µg/m^3, which is less than the T-RACT AACC of 0.0023 µg/m^3. REC 3877 (¶¶ 12-14); Tr. 197:9-19, 200:2-201:25 (Lopez); REC 4284-4285 (¶¶ 24-25), 4300-4301. This reflects an incremental lifetime cancer risk of 1-in-240,000, which is well below the acceptable cancer risk probability of 1-in-100,000. Tr. 200:2-201:25 (Lopez); REC 4284-4285 (¶¶ 24-30), 4300-4301.

IV. ARGUMENT

Over the two-day hearing, DEQ and Perpetua provided comprehensive expert testimony in support of DEQ's evaluation of arsenic emissions from the Project and compliance with the TAPs rules. Specifically, the testimony established:

(1) the Project's modeled arsenic exposure concentration must be adjusted for exposure duration, based on the production limits in the PTC, for an apples-to-apples comparison to the T-RACT AACC to demonstrate compliance with the Idaho Air Rules;

(2) the 135,000 ton per day five-year rolling average for daily production does not increase cancer risk because total production (and therefore emissions) is limited and cumulative arsenic exposure over the life of the Project does not change; and

(3) the total life-of-mine production limit and the 50% production limit on the West End Pit necessarily limit production from the non-West End Pits and are designed to ensure incremental lifetime cancer risk remains below the T-RACT AACC.

Petitioners' arguments that the AACCs are annual limits that cannot be adjusted for exposure duration are unavailing. As set forth in Perpetua's Motion to Strike and consistent with objections made by DEQ and Perpetua during the hearing, Mr. Tiedemann and Dr. von Lindern are not qualified as experts in the fields of air quality modeling, permitting, or toxicology. Furthermore, their testimony in many instances is factually incorrect, articulates nothing more

than their policy preferences and uninformed interpretation of the TAPs rules, and fails to account for DEQ's expertise in implementing complex rules within its technical expertise.

A. DEQ and Perpetua presented expert evidence demonstrating that DEQ properly adjusted for exposure duration to derive the Project's maximum arsenic exposure concentration based on the PTC's enforceable production limits.

When comparing the Project's arsenic exposure concentration to the T-RACT AACC pursuant to Section 210.12.b, DEQ adjusted the exposure concentration to account for enforceable operational conditions. REC 698, 710. DEQ and Perpetua presented expert toxicological and other scientific evidence demonstrating that DEQ acted consistent with scientific principles governing cancer risk assessment and the Idaho Air Rules. When adjusted for maximum production and finite production levels under the PTC —and thus maximum arsenic emissions—the Project's duration is 16 years and the incremental cancer risk associated with the Project is 1-in-240,000, which is below a cancer risk probability of 1-in-100,000.

1. The T-RACT AACC is not an annual limit but represents an ambient concentration that aligns with an acceptable incremental cancer risk of no more than 1-in-100,000 over a 70-year lifetime of continuous exposure.

Section 586 states that "[t]he AACC in this section are annual averages." IDAPA 58.01.01.586. To treat the AACCs as annual limits would ignore the plain language of Section 586 and conflict with the cumulative, long-term nature of the cancer risk that is the foundation of the TAPS rules. Tr. 48:18-21 ("the important criteria is project imposed risk rather than treating the AACC as an annual limit"), 56:2-5 (Schilling); REC 3923 (¶ 17); Tr. 509:2-19 (Lopez); 4286-4287 (¶¶ 37-41), 4302-4303. *See also United Sav. Ass'n of Tex. v. Timbers of Inwood Forest Assoc*., 484 U.S. 365, 371 (1988) (interpretation of regulations, like statutes, is a "holistic endeavor" and must ensure that "the permissible meanings produce[] a substantive effect that is compatible with the rest of the law."); *see also Mason v. Donnelly Club*, 135 Idaho 581, 586, 21 P.3d 903, 908 (2001).

The AACCs are expressed as annual averages in Section 586, but they are not annual limits. Section 586 does not use the term annual limit and does not specify compliance on an annual basis. Nor does Section 210.12. *See* IDAPA 58.01.01.210.12. If IDEQ had intended to treat an annual average as an annual limit, it would have done so. *See United States v. Bucher*, 375 F.3d 929, 932 (9th Cir. 2004) ("To interpret a regulation, we look first to its plain language. As with legislation, we presume the drafters said what they meant and meant what they said."). Rather, the reference to an annual average is appropriately viewed in the context of the project-specific concentrations that are modeled as annual averages as opposed to maximum concentrations. Tr. 52:5-17 (Schilling).

The use of a maximum *annual average* in modeling reflects a long-term averaging period. Tr. 301:17-20 (Lewis). But the model output from any single year cannot be compared against the AACC as an annual limit because the AACC is based on 70 years of exposure—not one year of exposure. Tr. 73:12-15 (Schilling) (comparing the AACC to the annual average concentration modeled is "not appropriate . . . [b]ecause we still center on the fact that what matters is project-imposed cancer risk and not a year-by-year evaluation."); Tr. 237:16-25, 238:1-6, Tr. 311:7-14 (noting that the model produces an "annual average concentration" and that "is not on a 70-year lifetime basis.") (Lewis). For that reason, the annual average concentration must be adjusted "to the same basis as the AACC lifetime exposure concentration" or 70 years. Tr. 304:22-25 (Lewis); *see also* Tr. 301:6-8, 305:1-2 (Lewis); Tr. 507:5-15 ("If a one-year exposure is to be used to compare to the AACC, he's ignoring the fact that there's still a 70-year lifetime that needs to be accounted for in that one-year average.") (Lopez).

This approach is consistent with the science underpinning carcinogenic risk, which reflects the cumulative dose over a lifetime. Tr. 135:10-13 (Paden); Tr. 507:5-15 (Lopez). DEQ

and Perpetua's expert toxicologists established that incremental cancer risk is based on cumulative exposure and the AACC reflects an ambient concentration to which a person may be exposed for 24 hours per day, 365 days a year, for 70 years at a resulting incremental cancer risk of 1-in-1,000,000 or in the case of the T-RACT AACC 1-in-100,000. Tr. 135:2-137:10 (Paden); REC 3876-3839 (¶¶ 11-15); Tr. 204:15-24 (Lopez); REC 4283 (¶ 17). The AACC values adopted by DEQ in Section 586 align with incremental cancer risk over the default exposure duration of a 70-year lifetime—not any single year—and therefore compliance is appropriately assessed on this long-term basis and not on an annual basis.[7] Tr. 73:12-15 (Schilling); Tr. 237:18-25, 238:1-6, 509:2-19 (Lopez); REC 4283 (¶ 18), 4286-4287 (¶¶ 38-39), 4302-4303. Otherwise, if the AACC were treated as an annual limit, it "significantly lowers acceptable risk" and would translate into a risk of 1-in-7 million. Tr. 217:6-18 (Lopez); REC 4287 (¶ 39).

Petitioners do not dispute that the incremental cancer risk at the heart of the AACCs is based on 70-year cumulative exposure. But in the declaration and testimony of Dr. von Lindern, he repeatedly refers to the AACCs as the "maximum one-year-annual average ambient air carcinogen concentration." *See*, *e.g.*, Tr. 436:14-15, 452:5-7 (von Lindern); REC 6108, 6110. Dr. von Lindern conceded that this phrase does not exist in the TAPs rules but is his own interpretive gloss on the reference to "annual average" in Section 586. Tr. 484:18-485:2 (von Lindern). Dr. von Lindern is not a toxicologist, Tr. 406:11-13 (von Lindern), and his testimony about risk

[7] Use of an averaging period greater than one year is an accepted feature of air regulations and permitting, particularly where the health risk being addressed results from long-term chronic exposure, rather than acute exposure. REC 4136 (¶ 30). For example, the $PM_{2.5}$ National Ambient Air Quality Standard of 9.0 μg/m³ addresses health risks associated with long-term exposure, but while the standard is based on an annual average, determinations of compliance are not limited to a single year—rather, compliance is based on a three-year average. 40 CFR § 50.20(a); 40 C.F.R. Part 50, Appendix N; *see* 89 Fed. Reg. 16202, 16203 (Mar. 6, 2024).

assessments was inaccurate, *see* Tr. 499:2-509:19 (Lopez).[8]

Indeed, as Ms. Lopez pointed out in her rebuttal testimony, using a "maximum one-year annual average ambient air carcinogen concentration" ignores the 70-year lifetime that underpins the AACCs. Tr. 509:2-19 (Lopez). While Dr. von Lindern might prefer that the TAPs rules reflect his interpretation, he offered no evidence to refute the scientific testimony and judgment of toxicologists Dr. Paden and Ms. Lopez. *See Huntsman*, 114 F.4th at 735 (agency "evaluation of scientific data within its area of expertise" should be afforded "an extreme degree" of reliance, and particularly so for "statistical and modeling analysis." (internal quotation marks and citation omitted)).

2. Adjusting the exposure concentration to reflect exposure duration is consistent with the Air Rules.

DEQ and Perpetua's expert toxicologists provided extensive testimony demonstrating that if a source operates less than the 70-year lifetime on which the AACCs are based, the exposure duration must be adjusted in proportion to the amount of time the source will operate. REC 3923-3925 (¶¶ 16-19, 22-23), 3929 (¶¶ 31-33); REC 3876-3878 (¶¶ 8-9, 12-15); REC 4283-4285 (¶¶ 20-30), 4292-4293, 4296, 4298-4300). Cancer risk cannot be evaluated without considering the length of time a potential receptor will be exposed to a carcinogen—referred to as "exposure duration." Tr. 34:10-35:8, 56:18-57:19 (Schilling); Tr. 140:1-145:15 (Paden); Tr. 189:15-190:5, 192:6-194:15, 197:9-198:5, 215:1-218:3, 229:11-232:19 (Lopez). By adopting

[8] Mr. Tiedeman's testimony regarding the TAPs rules was not credible either. During the hearing, he revealed that his air quality permitting experience while employed at DEQ was very limited and that he had little to do with TAPs permitting or compliance; what experience he had was supervised by more senior colleagues. Tr. 352:2-363:8 (Tiedemann). In addition, Mr. Tiedeman acknowledged that during his former employment at Brown and Caldwell, he was asked to review the Project, voiced no objections to it, and later requested to be reassigned away from the Project based on his personal views about the mining industry. Tr. 386:11-392:2 (Tiedemann).

EPA's IURs, DEQ adopted EPA's cancer risk methodology for analyzing TAP ambient concentrations. Tr. 135:2-137:10 (Paden); Tr. 213:11:3-214:14, 231:13-232:19 (Lopez). That includes EPA's recognition that inhalation risk assessments require the timeframe over which inhalation exposure occurs and that exposure duration is not always 70 years. *See id*.

EPA uses an equation that explicitly adjusts an estimated ambient concentration based on site-specific information, including an assumption that exposure will occur for less than 70 years:

EC = (CA x ET x EF x ED) / AT

Where: EC (µg/m3) = exposure concentration;
CA (µg/m3) = contaminant concentration in air;
ET (hours/day) = exposure time;
EF (days/year) = exposure frequency;
ED (years) = exposure duration; and
AT (lifetime in years 70 x 365 days/year x 24 hours/day) = averaging time

REC 3923 (¶ 16); REC 3877 (¶ 12); 4284 (¶ 22). In the equation, the exposure concentration (EC) is calculated from the modeled maximum annual average ambient concentration, referred to as the "contaminant concentration in air" (CA), and the temporal parameters. REC 3877 (¶ 12); 4284 (¶ 22). The temporal parameters in the equation include the exposure time (ET) in hours per day, the exposure frequency (EF) in days per year, the exposure duration (ED) in years, and the averaging time (AT), which is the amount of time over which exposure is averaged for chronic assessments. REC 3877 (¶ 12); 4284 (¶ 22). The averaging time (the denominator) is the only constant. The other temporal inputs are variable based on site or project specifics.

Since EPA's IUR values are adopted at Section 586 as URFs and AACCs with an expected 70-year lifetime exposure, DEQ must adjust the exposure concentration to reflect the exposure duration to ensure the comparison to the AACC is proper. Tr. 34:10-35:8, 56:18-57:19 (Schilling); Tr. 140:1-145:15 (Paden); Tr. 189:15-190:5, 192:6-194:15, 197:20-198:5, 215:1-218:3, 229:11-232:19 (Lopez). If not, as the Hearing Officer previously recognized, the

"comparison of emissions that will only take place for 16 years to a standard that is based on an assumed 70-year exposure period is an 'apples to oranges' comparison." REC 3418. Thus, when comparing the Project's arsenic exposure concentration to the arsenic T-RACT AACC pursuant to Section 210.12.b, DEQ properly adjusted the exposure concentration to account for a 16-year exposure duration of the Project. REC 3875-3879 (¶¶ 4-17); REC 4280-4281 (¶ 10), 4283-4287 (¶¶ 20-42).

Consistent with EPA's toxicity values, DEQ calculated the Project's exposure concentration using the highest annual modeled concentrations based on a 16-year exposure duration to ensure the exposure concentration was comparable to the assumption of the 70-year exposure duration found in the AACC. REC 3926-3927 (¶ 27), 3929 (¶ 32); REC 3876 (¶¶ 9-10). The adjustment is illustrated in the following formula utilized by DEQ:

$$Lifetime\ exposure\ \left(\frac{\mu g}{m^3}\right) = \frac{Highest\ annual\ concentration\ \left(\frac{\mu g}{m^3}\right) \times 16\ (mine\ operation\ years)}{70\ (years, lifetime\ exposure)}$$

REC 710; *see also* REC 3876 (¶ 10). The lifetime exposure in the formula is the Project's arsenic exposure concentration. DEQ's formula is equivalent to EPA's formula, as both account for exposure duration. *See* Tr. 139:15-145:24 (Paden); Tr. 191:12-194:15, 197:9-198:5 (Lopez).

The highest annual modeled concentration of arsenic from the Project, operating under the maximum production scenario allowed by the PTC, was 0.00416 µg/m^3. *See* REC 714; Tr. 302:3-303:10 (Lewis).[9] Using EPA's equation for proper implementation of the URF to reflect exposure duration, DEQ adjusted the duration to reflect the highest allowable maximum production scenario and corresponding exposure duration of 16 years of operation to determine the annual average exposure concentration of arsenic for the Project is 0.00095 µg/m^3:

[9] REC 2144 shows an adjusted ambient concertation of 0.00095 µg/m3, which is 0.00416 µg/m^3 * 16/70.

EC = 0.00416 µg/m^3 x 16 years / 70 years = 0.00095 µg/m^3

See REC 714; *see also* REC 3923 (¶ 18); REC 3877-3878 (¶¶ 13-14); REC 4284-4285 (¶¶ 22-25), 4300-4301. Compared to the T-RACT AACC (0.0023 µg/m^3) as required by Section 210.12, the Project's annual average exposure concentration of arsenic is far less, and thus the lifetime exposure of arsenic is less than a 1-in-100,000 cancer risk, which demonstrates that the Project's arsenic emissions will not injure or unreasonably affect human health and the environment. REC 3877 (¶¶ 12-14); Tr. 197:9-19, 200:2-201:25 (Lopez); REC 4284-4285 (¶¶ 24-25), 4300-4301. Based on the annual average exposure concentration of 0.00095 µg/m3, the incremental increase in cancer risk from the Project's arsenic emissions over the life of the Project is 1-in-240,000, which is below the acceptable T-RACT incremental lifetime cancer risk of 1-in-100,000. Tr. 200:2-201:25 (Lopez); REC 4284-4285 (¶¶ 24-30), 4300-4301.

The expert testimony at the hearing demonstrated that comparing the Project's arsenic exposure concentration to the T-RACT AACC under Section 210.12 requires the exposure concentration to be adjusted from a lifetime exposure to the Project's exposure duration for the highest maximum production scenario to provide an "apples-to-apples" comparison to the T-RACT AACC. IDAPA 58.01.01.210.15, which addresses project durations shorter than five years, is an example of adjusting the TAPs analysis for exposure duration. While Petitioners argue DEQ can adjust for exposure duration only under Section 210.15, the rule proves DEQ's scientific understanding of EPA's equation that applies project-specific T-RACT limits to adjust the cancer risk evaluation for a source with an operational life of less than 70 years. *See* REC 3923-3924 (¶ 19); Tr. 229:11-230:8 (Lopez); REC 4286 (¶¶ 32-35), 4301-4302. And nowhere in the Idaho Air Rules is DEQ prohibited from following proper scientific method.

As addressed in the next subsection, the PTC's T-RACT production limits translate to an

exposure duration shorter than 70 years. A shorter exposure duration means the Project's highest arsenic exposure concentration was shown to be less than the T-RACT AACC, the same scientific justification that underlies Section 210.15. In the end, the evidence supported the underlying rule-based mathematics that DEQ used to calculate the highest arsenic exposure concentration from a 16-year exposure duration and to properly compare that exposure concentration to the T-RACT AACC.

3. DEQ's PTC conditions properly restrict production and emissions and a further limit on years of operation is not necessary.

The largest source of arsenic emissions from the Project is haul road dust. REC 62, 226. Because higher production and more activity on the haul roads generate more emissions, the PTC imposes production limits as T-RACT—and not a limit on years of operation—to ensure that emissions are controlled and the resulting incremental lifetime cancer risk does not exceed the T-RACT AACC. Tr. 116:13-23, 117:24-119:6, 119:25-121:3 (Schilling); Tr. 202:1-203:17, Tr. 212:11-213:21 (Lopez); Tr. 315:16-19 ("Years don't equal emissions. Production equals emissions. That's why it's permitted that way.") (Lewis). The production limits serve as surrogate emission limits on fugitive dust sources. REC 722, 923, 939-940. That means that the Project's arsenic emissions—and cancer risk from those emissions—are directly tied to the production limits DEQ established in the PTC. *See* Tr. 314:12-317:2 (Lewis).

Condition 3.5 of the PTC includes two limits on daily production: 180,000 tons per day and 135,000 tons per day based on a five-year rolling average. REC 385. Condition 3.6 establishes a life-of-mine production limit of 788.4 million tons and a total production limit on the West End Pits of 394.2 million tons. REC 385. If Perpetua produces at the highest daily allowable levels without interruption, Perpetua will reach the total production limit in the PTC in 16 years (788.4 million tons total / 135,000 tons per day x 365 days per year = 16 years). *See*

REC 710; Tr. 317:3-14 (Lewis) (noting that the calculation appropriately "limit[s] the parameter that was directly used to calculate the emissions."). This scenario equates to the highest modeled ambient concentrations of arsenic, using the most conservative emissions and modeling assumptions that resulted in predicted arsenic impacts between one and two orders of magnitude higher than actual impacts.[10] REC 4134-4135 (¶ 20-25); *see also* Tr. 269:23-277:5 (Lewis).

Because arsenic emissions are a function of production and not years of operation, the exposure concentration and incremental cancer risk do not change if it takes longer than 16 years to exhaust the 788.4 million ton life-of-mine production. Tr. 202:1-203:17 (Lopez). Because "emissions are proportional on production and concentrations are proportional on emissions and risk is dependent upon the total exposure, you're going to arrive at the same risk whether it would be 16 years or 70 years." Tr. 120:19-24 (Schilling). Therefore, adding a 16-year permit limit is unnecessary—and would unnecessarily limit operational flexibility with no additional protection for public health and the environment—as it would not alter the Project's incremental lifetime cancer risk probability. Tr. 202:11-22 (Lopez).

To illustrate that testimony, Attachment A sets out the year-by-year calculations of the Project's lifetime modeled arsenic exposure concentration for two scenarios: (1) 16 years of operation, and (2) 70 years of operation, both at the life-of-mine production limit of 788.4

[10] Dr. von Lindern's testimony regarding the emissions calculations and modeling performed by DEQ and Perpetua are inaccurate and reveal a misunderstanding of the record. First, even Petitioners concede that Dr. von Lindern is not an expert in the area of emissions estimations or modeling. Tr. 405:19-406:1 (von Lindern). Second, he did not understand the record basis for his assertions. *See* Tr. 467:18-24, 468:12-472:21 (von Lindern). Third, assertions made in his declaration regarding modeling adjustments, which culminate in Figure 6, REC 6695 (¶¶ 68-70), are inaccurate as described in testimony by Mr. Lewis, *see* Tr. 488:19-494:12. In a complex area within the agency's technical expertise, it is DEQ approach that is properly granted deference, *see Huntsman*, 114 F.4th at 735, and Dr. von Lindern's testimony should be afforded no weight.

million tons. REC 385. For 16 years of operation, the modeled maximum annual average ambient concentration is 0.00416 µg/m3. *See* REC 714; Tr. 302:3-303:10 (Lewis). This annual average concentration is applied to each year of operations through 16 years (788.4 million tons total / 135,000 tons per day x 365 days per year = 16 years). REC 710. The resulting annual average arsenic exposure concentration (adjusted for exposure duration) is 0.00095 µg/m3, which is below the T-RACT AACC of 0.0023 µg/m3.

For 70 years of operation, the production is lowered to 30,857 tons per day in order to comply with the life-of-mine production limit (788.4 million tons total / 30,857 tons per day x 365 days per year = 70 years). Because ambient concentration is proportional to emissions and emissions are proportional to production, the lower production rate still results in a lower modeled maximum annual average ambient concentration of 0.00095 µg/m3 (0.00416 µg/m3 * 30,857 ton/day / 135,000 tons per day = 0.00095 µg/m3). Tr. 120:19-24 (Schilling). In both cases, Attachment A illustrates the expert testimony establishing that with the total lifetime mine production limit of 788.4 million tons, the lifetime modeled arsenic exposure concentrations (the annual average concentration averaged over 70 years) in both the 16-year and 70-year cases are the same at 0.00095 µg/m3, which is 41% of the T-RACT AACC of 0.0023 µg/m3, as required by Section 210.12.

In sum, whether the Project is mined in 16 years or 70 years, or anywhere in between, annual production will necessarily be limited by the PTC's total life-of-mine production limits, total emissions and cumulative exposure will remain the same, and the Project cancer risk will remain at only 41% of the allowable T-RACT AACC. Tr. 116:15-23, 120:12-25, 121:1-3 (Schilling); Tr. 202:11-22, 203:15-18 (Lopez).

B. DEQ and Perpetua's expert evidence showed that DEQ properly used a five-year rolling average production limit as a T-RACT long-term limit.

The PTC's life-of-mine production limit, as further constrained by the 135,000 ton per day production limit on a five-year rolling average, are the T-RACT long-term limits. These permit limits ensure the mine will be operated in a manner required by the compliance demonstration under Section 210.12.d and that the Project's maximum arsenic concentrations will be below the acceptable T-RACT incremental cancer risk. Tr. 114:17-115:6 (Schilling); Tr. 280:20-25, 283:15-19 (Lewis). As explained by DEQ and Perpetua's experts, the 180,000 ton per day short-term limit addresses short-term National Ambient Air Quality Standards, while the 135,000 ton per day limit on a five-year rolling average is a long-term T-RACT limit designed to match the lifetime (long-term) exposure risk reflected by the AACC. Tr. 284:4-22 (Lewis).

As discussed, the AACCs are not annual limits and do not require an annual compliance demonstration. Based on from EPA's URFs/IURs, they represent the ambient concentration that aligns with an acceptable incremental cancer risk probability of no more than 1-in-1,000,000 assuming 70 years of constant exposure. Therefore, it is the total production and associated cumulative arsenic exposure that drive compliance with the T-RACT AACC. It follows that a five-year rolling average compliance period represents a shorter and more conservative compliance demonstration period than 70 years and ensures that cumulative exposure will remain below the T-RACT AACC. Tr. 39:11-40:25 (Schilling); Tr. 219:25-220:12 (Lopez); Tr. 318:1-13 (Lewis) ("[T]he simplest way to characterize it is that we have a lifetime exposure increment. And so five years is certainly less than a lifetime"); *see also* REC 3926 (¶ 26); REC 4288 (¶¶ 46-47), 4303; REC 4138 (¶ 43).

As a result, even if annual production were to occur at the maximum daily rate of 180,000 tons for any one year (or even two or three years), the PTC's life-of-mine production

limit, combined with the 135,000 ton per day production limit on a five-year rolling average, would require Perpetua to substantially reduce production during the applicable rolling-average period to ensure permit compliance. Tr. 61:1-16 (Schilling); Tr. 282:13-18 (Lewis). Thus, under the PTC production limits, a period of operations at 180,000 tons per day, followed by the mandated reduction in other years to meet the five-year rolling average, will not increase or decrease the incremental cancer risk estimated using maximum modelled annual concentrations over a 70-year lifetime—because the ultimate exposure concentration remains the cumulative emissions over the years of operation, divided by the 70-year lifetime. Tr. 118:3-6 (Schilling); REC 3926 (¶ 26); Tr. 208:14-209:2 (Lopez); REC 4287-4288 (¶¶ 43-47); Tr. 291:9-24 (Lewis). This does not constitute "dose averaging" as asserted by Dr. von Lindern, and it does not affect total production. *See* Tr. 457:1-4 (von Lindern). As long as total production complies with the five-year rolling average of 135,000 tons per day and the life-of-mine limit, total production and therefore emissions remain at or below the T-RACT production limits that were used to demonstrate compliance with the incremental cancer risk probability of 1-in-240,000.

Use of a rolling average is common in air permits to provide operational flexibility and assure compliance. REC 3925 (¶ 24); Tr. 294:11-17 (Lewis). Expert testimony confirmed that the 135,000 ton per day five- year rolling average production limit limits arsenic emissions, protects the incremental excess cancer risk, conforms with the TAPs rules, and is protective of human health and the environment. Tr. 39:14-19 (Schilling); Tr. 174:22-175:2 (Paden); Tr. 284:14-285:1 (Lewis). Along with the life-of-mine production limit, the rolling average allows flexibility, acknowledges operational variability, and achieves DEQ's permitting objective in ensuring compliance with the TAPs rules. Tr. 80:19-81:6 (Schilling); Tr. 260:2-17 (Lewis).

Because the AACCs are not based on exposure in any single year, and because the highest exposure concentration for the shortest possible exposure duration (16 years) demonstrated compliance with the T-RACT AACC, DEQ acted reasonably in determining that a production limit based on a five-year rolling average is protective of public health and the environment and ensures the Project is operated as described in the compliance demonstration under Sections 210.12 and 586.

C. DEQ and Perpetua's expert evidence showed that the PTC already limits production from the non-West-End Pits, and no separate limit is necessary.

The final issue raised by the Board concerns the two life-of-mine production limits in Condition 3.6: (1) a limit on total mine production of 788.4 million tons and (2) a limit on West End Pit production of 394.2 million tons, which is 50% of total production. REC 385. While Condition 3.6 does not expressly limit non-West End Pit production, DEQ limited production by 50% from both the West End Pit and the non-West End Pits in calculating the highest arsenic ambient concentrations from the Project. REC 710. The Board found "there was insufficient evidence in the record to demonstrate exactly how or whether the non-West End Pit production was limited" and if it was, "could not find any PTC conditions able to enforce that reduction." REC 3714.

The expert testimony of Mr. Schilling and Mr. Lewis explained that a separate production limit on the non-West End Pits was not necessary. They testified that modeling scenarios based on full production from the non-West End Pits (*i.e.*, the entirety of mine production or 788.4 million tons) for the shortest possible exposure duration (16 years) demonstrated compliance with the T-RACT AACC. Tr. 45:16-21 (Schilling); REC 3927-3928 (¶¶ 28, 30); REC 4140 (¶49). Modeling scenarios based on 50% production from the West End Pit and the remaining 50% from the non-West End Pits (*i.e.*, 394.2 million tons + 392.4 million tons = 788.4 million

tons) for the shortest duration of the mine (16 years) also demonstrated compliance with the T-RACT AACC. Tr. 116:13-23 (Schilling); Tr. 277:3-278:9 (Lewis).

If the West End Pit is mined to its maximum allowed production of 394.2 million tons (which results in the maximum modeled annual average ambient concentration), then total production from the non-West End Pits is inherently limited to the remaining 50%. Tr. 47:22-48:18 (Schilling); Tr. 281:1-282:7 (Lewis). Because Condition 3.6 limits West End Pit production to 394.2 million tons and total production to 788.4 million tons, an additional production limit on the non-West End Pits is unnecessary and would be redundant. Tr. 45:11-21 (Schilling); REC 3927 (¶ 28); Tr. 281:1-282:7 (Lewis); REC 4140-4141 (¶¶ 52-53).

Thus, the non-West End Pits are already limited by the total production limit and demonstrate compliance with the T-RACT AACC at total production limit of 788.4 million tons. Tr. 45:16-21 (Schilling); Tr. 281:1-282:7 (Lewis); REC 4140 (¶49). An additional production limit on the non-West End Pits offers no further protection to the public health or the environment. Tr. 281:1-282:7 (Lewis); REC 4140-4141 (¶ 53).

V. CONCLUSION

At the evidentiary hearing, DEQ and Perpetua demonstrated that DEQ acted reasonably and in compliance with Sections 161, 203, 210.12, and 586 of the Idaho Air Rules when permitting the Project's arsenic emissions. Based on DEQ and Perpetua's expert testimony, the Hearing Officer should enter findings of fact and conclusions of law that DEQ properly adjusted the Project's arsenic T-RACT ambient concentration based on an exposure duration tied to the T-RACT production limits equating to a 16-year duration, that a five-year rolling average production limit is consistent with the arsenic T-RACT AACC, and that no additional production limit is necessary to limit emissions from the non-West End Pits.

Attorney for Save the South Fork Salmon

BEFORE THE BOARD OF ENVIRONMENTAL QUALITY
STATE OF IDAHO

IN THE MATTER OF AIR QUALITY PERMIT TO CONSTRUCT P-2019.0047	)	Agency Case No. 0101-22-01
	)	OAH Case No. 23-245-01
NEZ PERCE TRIBE, IDAHO CONSERVATION LEAGUE, and SAVE THE SOUTH FORK SALMON	)	**PETITIONERS' POST-HEARING STATEMENT**
Petitioners,	)	
v.	)	
IDAHO DEPARTMENT OF ENVIRONMENTAL QUALITY,	)	
Respondent,	)	
and	)	
PERPETUA RESOURCES IDAHO, INC.	)	
Intervenor-Respondent.	)	

INTRODUCTION

Over the course of the hearing in the above-captioned case, held on October 17-18, 2024, Petitioners Nez Perce Tribe, Idaho Conservation League, and Save the South Fork Salmon presented compelling evidence that the Permit to Construct ("Permit" or "PTC") issued by the Idaho Department of Environmental Quality ("DEQ") to Perpetua Resources Idaho, Inc. ("Perpetua") for the proposed Stibnite Gold Project ("SGP" or "Project") does not demonstrate compliance with the Rules for Control of Air Pollution in Idaho, ("Air Rules"), IDAPA 58.01.01, and if allowed to proceed, will create a significant threat to public health and cause a dangerous precedent of applying project-specific adjustments to carcinogenic toxic air pollutant assessments found nowhere in the Air Rules. DEQ and Perpetua (collectively, "Respondents") failed to provide the Hearing Officer with evidence to support their contention that their calculation of ambient arsenic concentration in their T-RACT analysis complies with the Air Rules, or that using the 16/70 Project-specific adjustment factor to assess excess cancer risk was in accordance with the Air Rules or scientifically justified.

Petitioners detail their argent below with the aid of the hearing transcript (hereinafter referred to as "Tr.") for the hearing held on October 17-18, 2024.

LEGAL STANDARDS

Petitioners brought this contested case to challenge DEQ's action in issuing the Permit for the Stibnite Gold Project. Under the Idaho Administrative Procedures Act, an agency action like DEQ issuing the Permit will be overturned where its findings, inferences, conclusions, or decisions are: "(a) in violation of constitutional or statutory provisions; (b) in excess of the statutory authority of the agency; (c) made upon unlawful procedure; (d) not supported by substantial evidence on the record as a whole; or (e) arbitrary, capricious, or an abuse of

discretion." Idaho Code ("I.C.") § 67-5279(3); *see 917 Lusk v. City of Boise*, 158 Idaho 12, 14 (2015). "An action is capricious if it was done without a rational basis. It is arbitrary if it was done in disregard to the facts and circumstances presented or without adequate determining principles." *Am. Lung Ass'n of Idaho/Nev. v. Idaho State Dep't of Agric.*, 142 Idaho 544, 547 (2006) (citations omitted).

APPLICABLE AIR RULES

The Air Rules' requirements for controlling the emission of toxic air pollutants ("TAPs") begin with IDAPA 58.01.01.161. Section 161 is the overarching policy or qualitative standard that should be applied to the emission of toxic contaminants, such as arsenic. It provides:

> Any contaminant that is by its nature toxic to human or animal life or vegetation ***must not be emitted in such quantities or concentrations as to alone, or in combination with other contaminants, injure or unreasonably affect human life or vegetation.***

(emphasis added). To obtain a permit to construct an applicant must demonstrate, to the satisfaction of the Department that:

> ***Using the methods provided in Section 210***, the emissions of toxic air pollutants from the stationary source or modification would not injure or unreasonably affect human or animal life or vegetation ***as required by Section 161***. Compliance with all applicable toxic air pollutant carcinogenic increments and toxic air pollutant non- carcinogenic increments demonstrates preconstruction compliance with Section 161 ***with regard to the pollutants listed in Section 585 and 586.***

IDAPA 58.01.01.203.03 (emphasis added). Thus, if a TAP is listed in IDAPA 58.01.01.585 or 586 ("Section 586"), it must be evaluated under the methods provided in Section 210.

Section 586 of the Air Rules consists of a table that lists each carcinogenic TAP that is covered by the rules–including arsenic. Section 586 includes "the screening emissions levels (EL) and acceptable ambient concentrations (AACC)" for each toxic carcinogenic pollutant listed. The EL listed for arsenic is "1.5E-06 lb/hr" and the AACC for arsenic is "2.3E-04 $\mu g/m^3$."

The AACC is the carcinogen concentration in air in which daily exposure would limit the risk of cancer to 1 in 1 million over a lifetime, which is identified as 70 years. The AACCs listed in the table in Section 586 are based on "annual averages." IDAPA 58.01.01.586.

Section 210.01 provides that the applicant must first identify what TAPs will be emitted by the project. IDAPA 58.01.01.210.01. Then the applicant must use "standard scientific and engineering principles and practices to estimate the emission rate" of the pollutant. IDAPA 58.01.01.210.02.a. If the EL exceeds the levels listed in Section 586, then the applicant must continue with further analysis under Section 210.

The applicant must then use "the modeling methods provided in Subsection 202.02 to estimate the ambient concentrations at specific receptor sites for any toxic air pollutant emitted from the point(s) of emission." IDAPA 58.01.01.210.03.a.5. The "point of compliance is the receptor site that is estimated to have the highest ambient concentration of the toxic air pollutant of all the receptor sites . . .." IDAPA 58.01.01.210.03.b. Preconstruction compliance for toxic pollutants can be demonstrated using any of the methods "described in Subsection 210.05 through 210.08 and may use any applicable specialized method described in Subsection 210.09 through 210.12." IDAPA 58.01.01.210.04.

Applicable here are the compliance methods described in Section 210.12, which provides for the use of "T-RACT" to demonstrate preconstruction compliance for toxic pollutants listed in Section 586. T-RACT stands for "Toxic Air Pollutant Reasonably Available Control Technology" and "is an emission standard based on the lowest emission of toxic air pollutants that a particular source is capable of meeting by the application of control technology that is reasonably available, as determined by the Department, considering technological and economic feasibility." IDAPA 58.01.01.210. The applicant must comply with IDAPA 58.01.01.210.13 and

210.14 to first get approval by DEQ to proceed under the T-RACT provisions before it can be used in the modeling. If T- RACT is used, it allows for a comparison of:

> [T]he source's . . . approved T-RACT ambient concentration at the point of compliance for the toxic air pollutant to the amount of the toxic air pollutant that would contribute an ambient air cancer risk probability of less than one to one hundred thousand (1:100,000) (which amount is equivalent to ten (10) times the applicable acceptable ambient concentration listed in Section 586).

IDAPA 58.01.01.210.12.b. Thus, if the source's approved T-RACT ambient concentration meets the AACC listed in Section 586 times 10, then "no further procedures for demonstrating preconstruction compliance will be required for that toxic air pollutant as part of the application process." IDAPA 58.01.01.210.12.c. DEQ must then include appropriate conditions in the permit to ensure that the T-RACT is implemented so that the 10-times ambient concentrations can be met. IDAPA 58.01.01.210.12.d.

Section 210 provides one further analysis that has bearing in this case. Section 210.15 provides that "short term" projects "may utilize a short-term adjustment factor of ten (10). "For a carcinogen, multiply either the applicable acceptable ambient concentration (AACC) or the screening emission rate, but not both, by ten (10), to demonstrate preconstruction compliance." IDAPA 58.01.01.210.15. "Short Term Source" is defined as any new stationary source "with an operational life no greater than five (5) years from the inception of any operations to the cessation of actual operations." IDAPA 58.01.01.007.08. Thus, short term sources are also allowed 10 times the AACC, which would represent a 1 in 100,000 cancer risk, as long as the operational source life is no greater than five (5) years.

As noted above, the AACC levels found in Section 586 "conservatively represents a long-term exposure (70 years) that would result in a 1 in 1,000,000 cancer risk." REC 1242. Neither the AACC limit, nor the 10-fold higher T-RACT limit could not be met for the Stibnite

Gold Project. Thus, Respondents applied two adjustments to the arsenic calculations to reduce calculated emissions: (1) decreasing maximum potential annual mine production from 180,000 tons per day ("T/day") to 135,000 T/day based on a five-year rolling average limit; and (2) decreasing maximum potential annual production from the West End Pit by applying a 50% annual limit. The T-RACT amount allowed for in Section 210.12 represents a 1 in 100,000 lifetime excess cancer risk. IDAPA 58.01.01.210.12.b. But even using T-RACT, the AACC levels, as adjusted to 10-times higher by IDAPA 58.01.01.210.12.b, still could not be met. REC 1243–1244. It was at that point that Respondents decided to focus on excess cancer risk rather than the AACC limits as the applicable standard, and apply the 16/70 Project-specific adjustment to the calculation of arsenic emissions. REC 1243–1244, *see also* REC 698–706. Using this final of three adjustments to the arsenic concentration–which Respondents now claim is a "cancer risk assessment"–is found nowhere in the Air Rules, and as discussed further below, is not supported by applicable science.

ARGUMENT

I. The 16/70 Adjustment Is Unlawful, Not Supported by the Evidence, and Should be Rejected.

A. The Plain Language of the Air Rules Does Not Allow Using a Project-specific Adjustment Factor.

Based on the the Air Rules provisions above, the Board correctly concluded that the 16/70 Project-specific adjustment factor DEQ used here is "nowhere" found in the rules:

> The Air Rules clearly provide an AACC standard in Section 586. They then clearly provide an adjustment to that AACC standard when T-RACT can be used to control emissions. IDAPA 58.01.01.210.12.b. The Air Rules also clearly allow for a 10-times adjustment to the AACC when a project is going to operate for 5 years or less. IDAPA 58.01.01.210.15. But nowhere in the Air Rules does it provide that a project that will operate more than 5

> years but less than 70 years may be adjusted in proportion to the amount of time it will operate.

REC 3715. This should be the end of the story on the 16/70 Project-specific adjustment factor issue.

DEQ is not free to disregard the plain language of the Air Rules, even if it has some rationale for doing so. Agency rules (like the Air Rules) have the full force and effect of law. *See Mead v. Arnell*, 117 Idaho 660, 664–65 (1990). As the Idaho Supreme Court has explained: "We must follow the law as written. If it is socially or economically unsound, the power to correct it is legislative, not judicial." *Herndon v. West*, 87 Idaho 335, 339 (1964). "Regulations, like statutes, are interpreted according to canons of construction." Black & Decker Corp. v. C.I.R., 986 F.2d 60, 65 (4th Cir. 1993).

Under the canon of *generalia specialibus non derogant*, when there is a conflict between a general provision and a specific provision, the specific provision prevails. "The canon provides that a 'narrow, precise, and specific' statutory provision is not overridden by another provision 'covering a more generalized spectrum' of issues." *Perez-Guzman v. Lynch*, 835 F.3d 1066, 1075 (9th Cir. 2016) (quoting *Radzanower v. Tourche Ross & Co.*, 426 U.S. 148, 153–54 (1976)). "[T]he assumption being that the more specific of two conflicting provisions 'comes closer to addressing the very problem posed by the case at hand and is thus more deserving of credence.'" *Perez-Guzman*, 835 F.3d at 1075 (quoting Antonin Scalia & Bryan A. Garner, Reading Law: The Interpretation of Legal Texts 183 (2012)). The Idaho Supreme Court applies this cannon. *See Tomich v. City of Pocatello*, 127 Idaho 394, 400 (1995); *Mickelsen v. City of Rexburg*, 101 Idaho 305, 307 (1980).

Again here, Air Rules Section 203.03 requires "no permit to construct shall be granted" unless DEQ determines that the applicant has shown: "Using the methods provided in

Section 210, the emissions of toxic air pollutants from the . . . source . . . would not injure or unreasonably affect human health or animal life or vegetation as required by Section 161." (emphasis added). To protect human health, Section 586 sets a numeric arsenic AACC limit at an annual average of 0.00023 $\mu g/m^3$. Section 210 creates two specific exceptions to meeting the AACC (which is an annual emissions factor), allowing a 10-fold higher AACC where the applicant makes a T-RACT demonstration (Section 210.12) and/or where a project is short-term (5 years or less) (Section 210.15). These specific, numerical provisions in Sections 586 and 210 cannot be disregarded to fall back on a more general, qualitative standard in Air Rule Section 161, which provides that a toxic air pollutant "shall not be emitted in such quantities or concentrations as to alone, or in combination with other contaminants, injure or unreasonably affect human or animal life or vegetation." REC 3419.

Nor can the explicit AACC annual average value listed in Section 586 be ignored by reverse engineering using the URFs and cancer risk calculations, as DEQ now says it is doing. This method is nowhere found in the "methods in Section 210" and has never been used by DEQ before. *See* REC 1194 (Schilling memo admitting this is "a complete change in the regulatory approach used to demonstrate compliance with toxics," and it "abandons the Section 210 approach"). Section 210 sets forth clear and straightforward methods for checking a source's annual arsenic concentration against the annual arsenic value listed in Section 586 (or 10 times that value for T-RACT, like for the SGP, and short-term sources). Instead of using these methods in Section 210, DEQ abandoned this approach, and has come up with a new method, which instead of using the actual annual arsenic concentration DEQ and Perpetua modeled to occur due to the SGP's arsenic emissions, averages 16 years of emissions over 70 years, to compare them to 10 times the AACC. This is a fabrication. This is not a cancer risk assessment. von Lindern

Test., Tr. 434-435, 465. And Respondents during the three years of permit development and two years of this contested case proceeding never, until now, consulted a toxicologist on whether spreading out the Project's arsenic emissions and cancer risk over 70 years was appropriate. Paden Test., Tr. 154; Lopez Test., Tr. 234. DEQ must follow Section 210 and compare the annual average arsenic concentrations from the SGP to the T-RACT adjusted AACC listed Section 586. *See* IDAPA58.01.01.210.12.

Another cannon of construction requires interpreting regulations to avoid rendering provisions superfluous—which is what DEQ's approach here does to the Air Rules explicit short-term source adjustment for projects that last 5 years or less. "A statute should be construed so that effect is given to all its provisions, so that no part will be rendered superfluous or insignificant." *Brown v. Caldwell Sch. Dist. No. 132*, 127 Idaho 112, 117 (1995). Again, Section 210 specifically provides for AACC adjustments for in two situations: projects that have demonstrated T-RACT; and short-term five-year-or-less projects. DEQ cannot just make up a third adjustment found nowhere in the Rules. This is especially so since there is already an adjustment in the Air Rules for short-term sources for which everyone agrees the SGP does not qualify. If DEQ can adjust AACCs based on project duration, as it has done here, then the short-term adjustment in Section 215 is superfluous. DEQ's interpretation cannot stand.

Thus, the 16/70 adjustment is not allowed by the plain language of the Air Rules and must be rejected, whether or not DEQ or Perpetua can offer any rationale for using it.

B. The 16/70 Approach Undermines the Air Rules, Creates a Dangerous Precedent for Idahoans, and Allows Higher Cancer Risk.

Not only does the plain language of the Air Rules foreclose DEQ's approach, but this approach is contrary to the intent of the Air Rules and would create a dangerous precedent allowing Idahoans to be exposed to *higher* cancer risks than under DEQ's longstanding pre-SGP

interpretation of the Air Rules: where TAPs values listed in Section 586 are annual limits that must be met by a source every year of emissions.

Around the time of the TAPs rulemaking, a number of concerns were raised about creating exceptions for short term sources, even for remediation projects being undertaken to clean up the environment. *See* REC 6055-6056 (Tiedemman Decl. ¶¶ 18–21). Health concerns were raised about exposing people to a large dose of carcinogen during short periods. REC 6071-6084 (*Id.* at Exh. A). Health concerns were raised about the risk of "combined and synergistic effect of many short term . . . or other sources . . . and the potential of serial (one after another) short term . . . sources," the risk of creating an "incentive for facilities to argue they will be short-term," and the risk of a "spectre of serial short-term sources." REC 6086 (*Id.* at Exh. B).

IDHW echoed these concerns in response to comments, stating that for the TAPs it "strived to take a balanced approach taking into account the needs of industry to operate and the need to protect human health and the environment." REC 6056-6057 (Tiedemann Decl. ¶ 21); *see also* REC 4298, 4300-4302 (Lopez Decl., Memo in Supp. at 8, 10–12) (citing to same IDHW response to comments). IDHW added: "Since it is not possible to account for such real life factors as lifetime exposures, additive or multiplicative effects of exposures to the large variety of industrial chemicals in use in Idaho, it is necessary to make our emissions standards generally applicable and reasonably conservative." REC 6057 (Tiedemann Decl. ¶ 21). This was reflected in Dr. von Lindern's testimony, who was involved during TAPs Rule rulemaking, testified as to his recollection from those hearings confirmed that "one of the main objectives of developing the TAPs – these rules was to avoid risk assessment." von Lindern Test., Tr. 416. This is also reflected in the Air Rules, which include specific adjustments for T-RACT and short-term sources but are otherwise generally applicable to all sources—including the SGP.

Under DEQ's longstanding, pre-SGP precedent in applying the TAPs Rule, Idahoans are better protected from these risks. As Dr. von Lindern and Mr. Tiedemann showed, where the AACC values are treated as limits that must be met by sources in Idaho every year, no single source nor any combination of sources will expose an Idahoan to more than the AACC concentration (or 10 times the AACC concentration for T-RACT or short-term sources) at any time over their 70-year life, no matter how many sources they might encounter or where they might encounter them in the state; and accordingly, the cancer risk over that entire 70 years will not exceed the applicable cancer risk (1 in 1 million, or 1 in 100,000 for T-RACT or short-term sources). *See* REC 6109-6113 (Dr. von Lindern Decl. ¶¶ 21–29); REC 6060-60621 (Tiedemman Decl. ¶¶ 28–29). "That's the way TAPs has been implemented [on] every other project that's been done in Idaho to date." von Lindern Test., Tr. 421.

By contrast, under DEQ's approach, Dr. von Lindern explained that it:

> would concentrate 70 years of cumulative risk . . . into . . . however many years you're adjusting that project, whether it be six years or 16 years or something like that. * * * I understand from their interpretation that you could apply this risk factor to as low as 6 over 70. * * * [For a 16-year project,] [t]hey would they completely used their entire lifetime exposure by the end of adolescence.

von Lindern Test., Tr. 421-423.

Furthermore, Idahoans could be exposed to one source (like the SGP) at levels higher than the listed AACC values, and then be exposed to additional sources during the rest of their life such that the cancer risk over their life exceeds the Air Rules risk levels. *See* REC 6120 (Figure 4 of von Lindern Decl.). Dr. von Lindern testified that because the AACC is an "incremental standard," "DEQ is not allowed to consider past exposures. The next project gets another full boat of lifetime exposure. [in the 6 year] example, by age 12, you're twice the

amount. By age 18, you're three times your total cumulative lifetime exposure." von Lindern Test., Tr. 443. For example, DEQ and Perpetua have modeled the SGP to result in 0.00416 $\mu g/m^3$ average annual arsenic concentration. REC 0361 (brief explaining how to reverse the 16/70 adjustment); REC 3876 (Paden Decl. ¶ 9). This is *181 percent* of the T-RACT adjusted AACC for arsenic of 0.0023 $\mu g/m^3$. REC 0361. If a person were exposed to 0.00416 $\mu g/m^3$ of arsenic for 16 years, and then were exposed to another arsenic source(s)—even if that source complied with but was close to the T-RACT adjusted AACC value—then that person will have more than a full allowable 70-year exposure to arsenic and corresponding cancer risk.

> The TAPs rule is health protective if properly implemented. Applying risk averaging through the use of the 16/70 Project-specific adjustment factors eliminates the [margin of safety] and substantially increases cancer risk, especially considering the incremental nature of the rule.

REC 6122 (von Lindern Decl. ¶ 50). As the Board stated:

> There is an acceptable risk associated with the AACC standard. There is an acceptable risk associated with DEQ-approved T-RACT projects, and there is an acceptable risk associated with the short-term project that is five years or less. There are no other acceptable risks identified in Idaho's air quality rules.

TR 0160. The 16/70 Project-specific adjustment factor creates a misleading risk analysis that greatly underestimates actual cancer risk.

C. DEQ's & Perpetua's Cancer Risk Assessment is Not Scientifically Valid and Fails to Show that the SGP Is Equally or More Protective of Human and Animal Life and Vegetation

The Board not only faulted DEQ for using the 16/70 Project-specific adjustment factor because that approach is nowhere found in the Air Rules, but it also faulted DEQ for failing to show that the 16/70 adjustment factor was sufficiently protective of human health and the environment:

> The arsenic analysis performed by DEQ must be viewed within the wider lens of IDAPA 58.01.01.161 and 203 which require that toxic pollutants must "not be emitted in such quantities or concentrations as to alone, or in combination with other contaminants, injure or unreasonably affect human or animal life or vegetation." see also IDAPA 58.01.01.203.03. The Board of Environmental Quality has not found sufficient evidence in the record to convince it that the 16/70 analysis performed by DEQ was equally or more protective of human and animal life and vegetation as what is provided for by the Air Rules. Therefore, the Board of Environmental Quality remands this matter back for the development of further evidence regarding the ambient air concentrations of arsenic that will be produced by the SGP and whether those levels comply with the Air Rules.

REC 3716-3717. Even if the Hearing Officer determines that compliance with the TAPs rule can be accomplished through a risk assessment assessing excess cancer risk, Respondents have failed to show that the 16/70 Project-specific adjustment factor is a scientifically valid risk assessment, that they followed any scientifically valid risk assessment protocol, and that application of their simple equation to the SGP emissions accounts for total health risk the Project will create.

1. Respondents 16/70 Project-specific adjustment factor is not scientifically valid and it does not follow any standard risk assessment protocol.

Testimony from Respondents' toxicologists, Dr. Paden and Ms. Lopez, failed to establish that application of the 16/70 Project-specific adjustment factor to arsenic emissions is a scientifically valid method for assessing excess cancer risk for this Project. Ms. Lopez's testimony relied on one statement from Appendix A, titled "Major Default Options," from EPA's 2005 Guidelines for Carcinogen Risk Assessment (Ex. 221) to justify applying the 16/70 Project-specific adjustment factor. Lopez Test., Tr. 221-22. However, reading from several areas of the document, Dr. von Lindern testified that the document as a whole does not support applying an exposure duration adjustment to assess cancer risk for this project. Von Lindern Test., Tr. 424-429.

A true risk assessment is comprehensive and multi-variable. For example, the State of Washington requires "health impact assessments" (HIA) for some sources of toxic air emissions. REC 6251-6262 (von Lindern Decl., Exh. C (DEC Guidance)). According to the Washington Department of Ecology, the techniques in its guidance manual "are common to other regulatory risk assessment applications." REC 6251 (*Id.5).*. "An HIA looks at how emissions of toxic air pollutants from a specific project will affect public health. It involves several steps, including hazard identification, exposure analysis, toxic response, and risk characterization." *Id.*

For an HIA, the applicant must disclose the total daily intake of TAPs attributable to the source "as well as the background sources." REC 6253 (*Id.* at 19). The applicant must estimate exposure durations, "[d]etail the exposure parameters associated with sensitive population subgroups," "[i]dentify the potentially exposed populations," and "[g]ive special emphasis to any subpopulations that might be unusually susceptible to any TAPs emitted by your project." *Id.* In the risk/hazard assessment section, the applicant must also include a toxicity discussion, which should discuss: toxic effects of the TAPs; exposure levels associated with specific effects; exposure patterns and duration of exposure; any quantitative, chronic toxicity values (including hazard-based concentrations, cancer unit risk factor estimates, and slope factor or carcinogenic potency estimates); and any quantitative intermediate and short-term acute toxicity values. *Id.*

For an HIA, the applicant must also provide risk/hazard information, including a qualitative discussion of the risks; quantitative discussion of the risks with toxicity measures, calculated cancer risks, and the hazard index; discussion of uncertainties in the risk assessment; discussion of acceptability of risk; and discussion of extent to which the proposed facility might affect human health.. REC 6253-6254 (*Id.* at 19–20). Applicants are to disclose uncertainties of their risk assessment, including: uncertainty in emission estimates; uncertainty in air dispersion

models; interactive effects of exposure to more than one carcinogen or toxicant; uncertainty in exposure estimates; and uncertainty about the extent of toxicant susceptibility variation within populations. REC 6254 (*Id.* at 20).

DEQ's and Perpetua's toxicologist declarations lack most of these common risk assessment techniques, including uncertainties in emissions and modeling, and interactive effects of exposure to more than one carcinogen, among others identified above. *See* Paden Decl; Lopez Decl.

2. DEQ and Perpetua Fail to Account for Combined Effects of Other Carcinogens as Required by Air Rule Section 161

Air Rule Section 161 requires protection from toxic pollutants like arsenic from a source both alone and "in combination with other contaminants." But neither DEQ nor Perpetua factored in exposure to other contaminants, either during the 16-year SGP, or any other time during someone's lifetime. They only consider arsenic from the SGP. The SPG will itself emit other toxic and hazardous air pollutants. REC 433-44 (table of TAP/HAP emissions). Idahoans may already be exposed to background concentrations of other contaminants. And as already explained, someone exposed to the SGP might be exposed to other sources of arsenic and other contaminants throughout the other 54 years of their 70 year life. But these exposures are not accounted for in the risk assessments. *See* Lopez Decl.; Paden Decl; REC 6137 (von Lindern Decl. ¶ 90).

3. DEQ and Perpetua Fail to Account for Sensitive Populations, Mutagenic MOA, and Non-carcinogenic Risk

The cancer risks DEQ and Perpetua calculated fail to account for the health risks of short-duration, high exposure to arsenic for sensitive populations, including pregnant women, the

fetus, and pre-school children, who accumulate dose and risk at high rates. REC 6117-6118 (von Lindern Decl. ¶¶ 40–44).

DEQ and Perpetua also failed to consider mutagenic modes of action (MOA). While this is not definitively settled, and current EPA policy does not require accounting for this, there is evidence suggesting that arsenic in combination with other co-stressors has shown mutagenic MOA. REC 6135-6136 (*Id.* ¶ 84). As such, a comprehensive risk assessment would use age dependent adjustment factors, *id.*, which neither DEQ nor Perpetua has done.

DEQ and Perpetua also failed to consider non-carcinogenic arsenic health effects, especially to children. *See* REC 6136-6137 (*Id.* ¶¶ 85–88). Non-carcinogenic arsenic health effects can become the risk driver at sites where children may ingest, in addition to inhaling, arsenic laden dusts. REC 6136 (*Id.* ¶ 85. Incidental ingestion of mining-related fugitive dusts is the major exposure route for heavy metals in mining communities in Idaho. REC 6136-6137 (*Id.* ¶ 88.)

In summary, each of the problems above would be avoided by treating the AACCs limits that must be met by source each year of operations, as DEQ had always done prior to the SGP. These problems—the disregard for the Air Rules as written, the dangerous precedent, and the underestimation of cancer risk from the SGP—are all amplified by DEQ's use of the five-year rolling average and its treatment of production from the different mining pits, discussed in the next section.

II. DEQ and Perpetua's calculated ambient arsenic concentration is not consistent with and is less protective than the annual average AACC limit specified in Section 586 of the Air Rules.

The Board of Environmental Quality held that the "AACC limits set forth in Section 586 are based on annual averages." REC 3713; *see also* REC 3707. Furthermore, calculations of the

annual average emission rate of a source is based on "the maximum capacity of the source . . . with the effect of any physical or operational limitations that [have] been specifically described . . ." REC 3708 (citing IDAPA 58.01.01.210.02.c). Calculation of the maximum capacity of the source is also required if an applicant is proceeding under the T-RACT provisions of the Air Rules. REC 3708 (citing IDAPA 58.01.01.210.02.d). Specifically, Air Rule 210.2.d provides:

> The T-RACT emissions rate of a toxic air pollutant from a source . . is calculated using the *maximum* capacity of the source or modification under its physical and operational design with the effect of:
>
> i. Any physical or operational limitation other than control equipment that has been specifically described in a written and certified submission to the Department; and
>
> ii. An emission standard that is T-RACT.

(emphasis added).[1] Thus, demonstrating compliance with the AACC limits set forth in Section 586 must be based on the calculation of the maximum annual average ambient TAP concentration that a source, given physical and operational limitations, can potentially emit. "You don't permit on actual emissions. You permit on, you know, maximum potential emissions." Lewis Test. Tr. 491.

Here, record and expert witness testimonial evidence demonstrate that the five-year rolling average and the West End pit production adjustments serve to significantly reduce the maximum potential emissions the Project is capable of producing under the PTC. Using less than

[1] In addition to Section 210 of the Air Rules, there are several other provisions that explicitly state that *maximum* emissions are the relevant measure for calculating emissions. *See*, *e.g.*, Air Rules 006.36 (defining "allowable emissions" as "calculated using the *maximum* rated capacity of the source or facility") (emphasis added); *id.* 006.36 (definition the "potential to emit" as the "*maximum* capacity of a facility or stationary source to emit an air pollutant under its physical and operational design") (emphasis added); *id.* 007.05.a ("for the purposes of Sections 200 through 228" of the Air Rules, defining "projected actual emissions" as the "*maximum* annual rate . . . at which an existing emissions unit is projected to emit a regulated air pollutant . . .") (emphasis added).

maximum potential emissions also undermines and underestimates Respondents' cancer "risk assessment."

A. The five-year rolling average does not "comport[ ] with the annual AACC limits." Rather, it underestimates the maximum annual average arsenic concentration and thus, underestimates the excess cancer risk.

Testimony from Mr. Lewis demonstrates that using the five-year rolling average to calculate the annual average ambient arsenic concentration underestimates the potential maximum annual average that could be emitted under the permit's operational limitations, and thus is not synonymous with the AACC limit and undermines Respondents' cancer risk calculations. Table C of the TAP Addendum, as confirmed by Mr. Lewis's testimony, shows that the annual average ambient arsenic concentration calculated for the five-year rolling average (after application of the 16/70 Project-specific adjustment factor) is 0.00095 $\mu g/m^3$. REC 6888; Lewis Test., Tr. 285. Although the maximum annual average arsenic concentration were the mine to operate at the full potential of 180,000 T/day was never calculated during the permit's development, Mr. Lewis testified that hypothetically using the 180,000 T/day production limit would increase the annual average arsenic concentration to 0.00126 $\mu g/m^3$, or 33 percent higher. Lewis Test., Tr. 285, 289. In other words, Perpetua's calculation of the annual arsenic emissions using the five-year rolling average is at least 1.3 times lower than the maximum permissible emissions under permit conditions.[2]

Dr. von Lindern testified that, using Perpetua's own data in the TAP Addendum, he estimated that the annual average arsenic concentration using the five-year rolling average may underestimate the maximum annual arsenic concentration by as much as 1.8 times. von Lindern Test., Tr. 455.

[2] 0.00126 $\mu g/m^3$) / (0.00095 $\mu g/m^3$) = 1.33.

Mr. Lewis confirmed that using a five-year rolling average based on 135,000 T/day is inappropriate for calculating the maximum annual average arsenic concentration because permit conditions do not restrict Perpetua from having several years of maximum production of 180,000 T/day as long as the five-year average is at or below 135,000 T/day:

> Q. Okay. And tell me what those conditions are as you understand them.
>
> A. . . . So in condition 3.5 of the permit, there's two limits in there. I characterize one of them as a short-term limit, and that is 180,000 tons per day. . . . In that same condition, there's another limit that's 135,000 tons per day, but that's over a five-hear rolling average, so that's considered a long-term limit.

von Lindern Test., Tr. 280. Mr. Schilling confirmed this to be the case:

> Q. . . . [I]f we just round off at 180,000 [tons] as the daily limit and 135,000 [tons] as the five-year rolling average daily limit . . ., [Perpetua] could produce up to 180,000 tons per day out of the mine, but they would have to operate in a manner that would allow them to average no more than 135,000 tons per day on that five-year rolling average basis; is that right?
>
> A. Yes. Yes.

Schilling Test., Tr. 61. Thus, it is possible that in any given five-year period, Perpetua could have up to three years of emissions that correspond to a maximum operations rate of 180,000 T/day, followed by two years of less production, as depicted below for three successive five-year rolling average periods covering eight years of mining operations:[3]

Tons/day	**60,000**	**75,000**	**180,000**	**180,000**	**180,000**	**60,000**	**75,000**	**180,000**
Years 1-5	1	2	3	4	5			
Years 2-6		2	3	4	5	6		
Years 3-7			3	4	5	6	7	
Years 4-8				4	5	6	7	8

[3] Mr. Schilling testified that for calculating the five-year rolling average"each year [the rolling average] shifts and drops off the later year and adds on the newer year." Schilling Test., Tr. 44.

Using the five-year rolling average of 135,000 T/day allows Perpetua to hide up to nine years of annual arsenic emissions at the maximum allowed 180,000 T/day production rate during the total 16 years of the life of mine. Mr. Schilling confirmed as much:

> *Idaho Air Rules* Section 586 state that AACCs are annual averages. The implication of the stated issue is that when a standard or increment is specified for a certain averaging-period, then any limits imposed on operations should be for the same averaging period or a shorter averaging period. For example, an operational limit designed to limit emissions that is based on a 5-year averaging period would not be adequate for assuring compliance with the annual average standard. ***This is because variability in operational rates within the 5-year operational period could result in a violation of the annual standard*** while still complying with the five-year operational limit in the period.

Schilling Decl. ¶ 24 (emphasis added).

The evidence presented at the hearing confirms that Board's findings that "the five-year rolling average allows for a smoothing out of the peak concentrations of ambient arsenic," and "allows considerable daily and annual increases in exposures which are contrary to limits set forth in the Air Rules." REC 3713.

B. DEQ and Perpetua's calculation of the ambient arsenic concentration incorrectly applies Permit Condition 3.5 that limits WEP production to 50 % of total life-of-mine production.

The Board found that there was insufficient evidence to support Respondents' T-RACT analysis that limited the non-West End pit production limit. REC 3713-14. However, it is the Respondents' misapplication of the West End pit life-of-mine production limit that allows the maximum annual average arsenic concentration to go unanalyzed, and thus does not meet the Air Rule's requirement to calculate the maximum annual potential emissions and directly compare it to the T-RACT AACC limit.

Permit Condition 3.6 limits West End pit production to a total life-of-mine production of 394.2 million tons. REC (PTC citation); Schilling Test., Tr. 45, 48. Mr. Lewis's testimony

confirms that this limit is a life-of-mine, or total, production limit, and does not limit West End pit production on an annual basis except to the extent that production from any pit is limited to 180,000 T/day and a 135,000 T/day five-year rolling average. Lewis Test., Tr. 282.

Mr. Lewis also confirmed that, based on the permit conditions, a scenario of more than 50% production from the West End pit in any given year is a possibility:

> Q. Okay. And then the 180,000 tons per day, that's the maximum in a 24-hour period that can be taken out of all the mines in total; is that right?
>
> A. That's correct.
>
> Q. So regardless of which location you're in in the moment, you cannot take more than 180,000 tons a day out, . . .
>
> * * *
>
> "You just don't mine from all of [the pits] the same amount at the same time. . . . [A]s the mine develops, . . . you might start out at the Yellow Pine Pit and then, you know, move over to the West End Pit."

Lewis Test., Tr. 261. Because the permit does not limit annual West End pit mine production to 50%, Perpetua's maximum potential emissions would actually be 100% West End pit production at a maximum of 180,000 T/day. While this 180,000 T/day production can not happen every day over the 16-year life of the mine due to the five-year rolling average limit of 135,000 T/day, Perpetua could certainly mine 180,000 T/day from the West End pit every day for multiple years over, far exceeding the annual compliance period for the AACC. According to Mr. Lewis's testimony, having 180,000 T/day production from the West End pit in any given year(s) while still meeting the 394.2 million tons life of mine production limit is a real potential.

A theoretical mining scenario applying permit limitations (180,000 T/day maximum production; 135,000 T/day five-year rolling average; and maximum total life-of-mine West End

pit production of 394.2 million tons) where production occurs only from the West End pit is depicted below:

Mine Year	1	2	3	4	5	6	7	8
Thousand Tons/day	180	180	180	60	75	180	180	45
Million tons mined/year (running total)	65.7	131.4	197.1	219.0	246.375	312.075	377.775	394.2

Therefore, Perpetua could mine the entire 394.2 million tons from the West End pit for eight years, with five of those years up to the 180,000 T/day limit.

Correct application of the West End pit production permit limits is critical to calculating the maximum annual potential emission required under the Air Rules because West End pit production is the most problematic for arsenic concentration at the point of compliance because of its location and prevailing wind patterns. Schilling Test., Tr. 48-49; Lewis Test., Tr. 261, 270, 307 ([P]ound for pound, the West End Pit resulted in higher ambient air impacts.").

Mr. Lewis testified that Perpetua initially calculated the arsenic concentration of the worst-case scenario (100% West End pit production):

> Q. Do you recall, though, if W2 includes production from other pits or is it just accounting for a scenario where it would be a hundred percent West End Pit production?
>
> A. No, it's 50 percent West End Pit production combined with the worst-case modeling from the non-West End [ ] Pit production.
>
> * * *

> Q. Okay. So for the record, [the number in Exhibit 304] is 0.00698 . . . . So what is the – what does this table represent? . . .
>
> A. Yeah, sure. This table represents, again, modeling at 135,000 tons per day, and in this case, it's – it's the annual average concentration that the model spits out. And it is not on a 70-year lifetime basis. And for this W2 scenario, the number I just mentioned, that is not including the permit condition that limits the West End Pit to 50 percent of the total.
>
> * * *
>
> Q. . . . And so as far as comparing the W2 in the chart in Table C above [in Exhibit 304] and the W2 in the spreadsheet below, the difference there is that the W2 above contains a 50 percent production limit [from the West End pit] and W2 below is a hundred percent –
>
> A. Correct.

Lewis Test. Tr. 309, 311-12. However, rather than using the arsenic emissions calculations that would more closely represent the maximum annual potential emissions,[4] Perpetua focused on "project imposed risk rather than treating the AACC as an annual limit in itself." Schilling Test. Tr. 48.

The dilution–or dose averaging, as Dr. von Lindern stated, is seen in the equation in the TAP Addendum, and was recognized by the Board in its final order. REC 3712 (citing REC 710). Dr. von Lindern testified that the arsenic concentration that Perpetua finally derived and that was used by the Respondents' toxicologists to assess excess cancer risk was a series of averaging techniques that resulted in an underestimation of maximum potential emissions by 41 percent.

> A. So W2 was the – as far as I understand, is the maximum, and it would be that W2 year that would – that should be reflected as the maxim to calculate the one-year standard. You can't do it because they use the five-year standard for the input. But this identifies the maximum year that should have been used in the calculation.

[4] The calculations are based on the five-year rolling average of 135,000 T/day production average, and thus do not represent the maximum potential scenario within any given year of 180,000 T/day production.

> This step was then to take – this gets hard because it's an average of the average of the average of the average. But it's the average of Y1 through H4, which each are five-year rolling averages, as I understand, to begin with, and it averages that with W2. And that's where that .00416, whatever that number was that [Dr. Paden and Ms. Lopez] used.

von Lindern Test., Tr. 458-459. Dr. von Lindern's testimony was confirmed by Mr. Lewis, Lewis Test. Tr. 309 ([I]t's 50 percent West End Pit production combined with the worst-case modeling from the non-West End [ ] Pit production."), and is depicted using the numbers from the lower table in Exhibit 304 in the equation below:

$$\frac{\frac{(0.00124 + 0.00206 + 0.00123 + 0.00102 + 0.00228 + 0.00082 + 0.00090)}{7} + 0.00698}{2} = 0.00416^{5}$$

The above equation, using ambient arsenic concentrations from the lower table in Exhibit 304, shows that Respondents' arsenic calculations were not developed using the worst-case annual emissions scenario–the annual emissions scenario results when 180,000 T/day are mined from the West End pit for several consecutive years–a scenario the PTC currently does not preclude. Instead Respondents, using the above equation, averaged arsenic emissions from a West End pit scenario with an average of seven non-West-End pit scenarios, and all using the five-year rolling average to start. To date, Perpetua/DEQ have never publicly demonstrated what

[5] 0.00416 was the number to which both Dr. Paden and Ms. Lopez applied the 16/70 Project-specific adjustment factor in their alleged risk assessment analysis. *See* REC 3876 (Paden Decl.); REC 4284 (Lopez Decl).

ambient arsenic concentrations would result on an annual basis if 180,000 T/day is mined from the West End pit for a full year.

CONCLUSION

Figures 6 and 7 of Dr. von Lindern's Declaration depict the effects of each of Respondents' mathematical tricks used to reduce the apparent maximum annual average arsenic concentration. REC 6130, 6139; *see also* von Lindern Test., Tr. 460-462. "[T]he effect of the serial application of SGP Project-specific five-year rolling average and non-WEP Project-specific adjustment factors on cumulative cancer risk" is that it allows an "individual receptor [to] experience a full lifetime allowable carcinogenic 1x10-5 equivalent exposure by year 13." REC 6139. The 16/70 "Project-specific adjustment factor is what allegedly gets them into compliance by diluting it another 78 percent." von Lindern Test., Tr. 460-61.

Petitioners have demonstrated not only that this after-the-fact, alleged Project-specific adjustment factor "risk assessment" by Respondents' toxicologists is not supported by any scientific evidence, but also it is nowhere in the Air Rules. DEQ's approval of the use of these adjustment factors to bring a project into compliance with the TAPs rule creates dangerous future precedent, undermines the administration of Idaho's air quality program, and erodes the health protections that are the basis of the Air Rules. The Board recognized this at the hearing on the parties motions for summary judgment:

> Application of the project-specific adjustment factor allows DEQ to ignore 16 years of higher cancer initiation risk. The PTC proposes to allow 16 years higher daily carcinogen doses, and disguises such doses using a non-rules-based mathematics. Use of the project-specific adjustment factor ignores 16 years of cancer initiation due to higher carcinogenic arsenic dose that is otherwise allowed by rule. The AACC, the T-RACT, and short-term project AACCs dictate an annual average compliance.

> DEQ further violates this compliance point by instituting a five-year rolling average compliance. Such a creative compliance point allows even further departure from our air quality goals, and specifically compliance with Section 161 of our air quality rules.

TR 0160. The Hearing Officer should therefore find that DEQ did not act reasonably and in accordance with the law when demonstrating compliance with the TAPs rule for arsenic emissions, and should remand the permit back to DEQ to correct the errors.

Attorney for Save the South Fork Salmon

BEFORE THE BOARD OF ENVIRONMENTAL QUALITY
STATE OF IDAHO

IN THE MATTER OF AIR QUALITY PERMIT TO CONSTRUCT P-2019.0047	)	Agency Case No. 0101-22-01
	)	OAH Case No. 23-245-01
NEZ PERCE TRIBE, IDAHO CONSERVATION LEAGUE, and SAVE THE SOUTH FORK SALMON	)	**PETITIONERS' RESPONSE OPPOSING PERPETUA'S MOTION TO STRIKE EXPERT DECLARATIONS**
Petitioners,	)	
v.	)	
IDAHO DEPARTMENT OF ENVIRONMENTAL QUALITY,	)	
Respondent,	)	
and	)	
PERPETUA RESOURCES IDAHO, INC.	)	
Intervenor-Respondent.	)	

Petitioners Nez Perce Tribe, Idaho Conservation League, and Save the Fork Salmon file this response opposing the Motion to Strike filed on October 15, 2024, by Intervenor-Respondent Perpetua Resources Idaho, Inc. ("Perpetua") asking the Hearing Officer to strike specific sentences, paragraphs, and exhibits from the Expert Declaration of William Tiedemann and the Expert Declaration of Dr. Ian von Lindern. For the same, the Hearing Officer denied the objections Perpetua made when Mr. Tiedemman and Dr. von Lindern testified at the hearing on October 18, 2024, so too should Perpetua's Motion to Strike be denied.

ARGUMENT

I. Procedural Rules 475 and 476, and the Board's Remand Order Encourage Taking Evidence, Not Excluding It.

This contested case is governed by the Office of Administrative Hearing's Idaho Rules of Administrative Procedure, IDAPA 62.01.01 *et seq*. *See* IDAPA 62.01.01.001.02. Rule 475 provides that the Hearing Officer is "not bound by the Idaho Rules of Evidence," with some exceptions. IDAPA 62.01.01.475. Rule 475 also directs: "*Evidence should be taken* by the presiding officer to assist the parties' development of the record, *not excluded* to frustrate that development." *Id.* (emphases added). Relatedly, Rule 476 provides that the Hearing Officer is entitled to "weigh the quality of evidence presented" and "may assign less weight to evidence that would otherwise be inadmissible under the Idaho Rules of Evidence." IDAPA 62.01.01.476.

Here, in both the initial Order and the Order on Reconsideration, the Board of Environmental Quality remanded to the Hearing Officer to develop the record. REC 3717 (The Board "remands this matter back for the development of further evidence regarding the ambient air concentrations of arsenic that will be produced by the SGP and whether those levels comply with the Air Rules."); REC 3841 ("The parties will have an opportunity to develop a full factual record on the arsenic issue before the Hearing Officer on remand."). Moreover, the Board

emphasized that it "will not limit the scope of the proceedings on remand or the types of evidence that may be presented, other than to restate that they must focus only on the development of additional factual evidence on the ambient arsenic air concentration analysis performed by DEQ for the PTC." REC 3841-42. Under Rule 475 and 476, and the Board's orders, the Hearing Officer should deny Perpetua's Motion to Strike, should admit Petitioners' expert declarations and the documents attached to them in full, and can weigh the quality of the evidence.

II. Procedural Rule 485 Similarly Allows Admitting Expert Opinions.

Rule 485 allows the Hearing Officer to "admit, weigh, and consider expert opinions," which are "generally admissible if the the proffering party demonstrates the relevancy of the expert opinions, as well as demonstrates the general reliability of the expert opinions, both as to methodology and qualifications of the expert." IDAPA 62.01.01.485. Mr. Tiedemman and Dr. von Lindern's declarations themselves demonstrate the relevance and reliability of their opinions, and can be weighed and considered by the Hearing Officer.

Perpetua seeks to strike specific isolated sentences based on this part of Rule 485: "Expert testimony that is conclusory, offers legal opinions, or which is based solely upon hearsay is inadmissible." *Id.* However, each of the "conclusions" in Mr. Tiedemman's and Dr. von Lindern's declarations Perpetua complains about is not "conclusory"; rather, each conclusion is based on supporting facts and expert opinion. Moreover, none of the statements Perpetua complains about are based "solely" upon hearsay (or any hearsay). And each statement Perpetua says is a "legal conclusion" is the expert's opinion, based on their relevant experience and is supported factually. Perpetua's and DEQ's expert declarations are full of similar supposed "legal conclusion" types of statements, including statements in section headings, in summaries of

expert opinions, in conclusions, and elsewhere. *See*, *e.g.* Lewis Decl. ¶¶ 12, 18, 28–38, 39–44, 55, 57–60, 62; Lopez Decl. ¶¶ 10.b, 26, 37, 38; Schilling Decl. ¶¶ 6, 20, 26, 31, 34. The Hearing Officer is fully capable of considering these statements and weighing them without being duped into accepting any legal conclusions proffered by any of the experts.

III. Exhibits to the Tiedemann Declaration Are Admissible.

Perpetua argues the exhibits to the Tiedemann Declaration are unauthenticated, hearsay, and irrelevant. Perpetua is wrong.

Mr. Tiedemann authenticated the exhibits by stating that they are true and correct copies of public records obtained from DEQ. Tiedemann Test., Tr. 327–29. For "Evidence about public records," the Idaho Rule of Evidence 901(b)(7) provides that all that is required to authenticate is evidence that (A) a document was recorded or filed in a public office as authorized by law; or (B) a public record or statement is from the office where items of this kind are normally kept. Mr. Tiedemann obtained through a public records request to DEQ under the Idaho Public Records Act, which defines "public record" to include, but not be limited to:

> any writing containing information relating to the conduct or administration of the public's business prepared, owned, used or retained by any state agency, independent public body corporate and politic or local agency regardless of physical form or characteristics. Provided, however, that personal notes created by a public official solely for his own use shall not be a public record as long as such personal notes are not shared with any other person or entity.

Idaho Code § 74-101(13).

Mr. Tiedemann's exhibits and his statements about those documents are not based on hearsay. First, the hearsay exemption for public records in Idaho Rule of Evidence 803 applies. Second, Procedural Rule 478 allows the Hearing Officer to admit, weigh, and consider hearsay evidence. IDAPA 62.01.01.478. Third, the documents are not being relied on for the truth of the

matters asserted in them, meaning they are not hearsay. The documents show various officials and other people involved in the toxic air pollutant ("TAP") rulemaking raised concerns about using the Environmental Protection Agency's risk assessments and about granting exceptions for short-term sources. Mr. Tiedemann (and Petitioners) do not rely on the documents to prove the truth of those concerns; just the fact that these concerns were raised.

Finally, the documents are relevant. Petitioners acknowledge that the language of the Rules for the Control of Air Pollution in Idaho ("Air Rules"), IDAPA 58.01.01, themselves are most relevant, and as the Board already held in this matter:

> The Air Rules clearly provide an AACC standard in Section 586. They then clearly provide an adjustment to that AACC standard when T-RACT can be used to control emissions. IDAPA 58.01.01.210.12.b. The Air Rules also clearly allow for a 10-times adjustment to the AACC when a project is going to operate for 5 years or less. IDAPA 58.01.01.210.15. But nowhere in the Air Rules does it provide that a project that will operate more than 5 years but less than 70 years may be adjusted in proportion to the amount of time it will operate.

REC 3715. The documents attached to the Tiedemman Declaration are relevant though, too, as they help confirm the Board's conclusion above about what the plain language of the Air Rules show.

CONCLUSION

Based on the foregoing, the Hearing Officer should deny Perpetua's motion to strike and allow and consider all evidence submitted or presented by Petitioners in this matter.

Attorneys for Intervenor-Respondent Perpetua Resources Idaho, Inc.

BEFORE THE BOARD OF ENVIRONMENTAL QUALITY

STATE OF IDAHO

IN THE MATTER OF AIR QUALITY PERMIT TO CONSTRUCT P-2019.0047, NEZ PERCE TRIBE, IDAHO CONSERVATION LEAGUE, and SAVE THE SOUTH FORK SALMON, Petitioners, v. IDAHO DEPARTMENT OF ENVIRONMENTAL QUALITY, Respondent. PERPETUA RESOURCES IDAHO, INC., Intervenor-Respondent.	AGENCY CASE No. 0101-22-01 OAH Case No. 23-245-01 **REPLY IN SUPPORT OF MOTION TO STRIKE EXPERT DECLARATIONS OF WILLIAM TIEDEMANN AND IAN H. VON LINDERN**

Intervenor-Respondent Perpetua Resources Idaho, Inc. ("Perpetua") files this Reply in support of its Motion to Strike sentences and paragraphs from the Declaration of William Tiedemann ("Tiedemann Declaration") and the Declaration of Ian H. von Lindern ("von Lindern Declaration") (collectively, "the Declarations"). Petitioners' Response in Opposition fails to justify why these conclusory statements and expressions of improper and erroneous legal opinion that are based on irrelevant, unauthenticated, and hearsay evidence should be admitted under the Idaho Rules of Administrative Procedure for contested cases ("IDAPA Rules"). Moreover, significant sections of the Tiedemann and von Lindern Declarations are inadmissible because they offer unqualified opinions beyond the witness' expertise and experience.[1]

ARGUMENT

Contrary to assertions made by Petitioners, the Tiedemann and von Lindern Declarations include numerous statements that are conclusory and offer legal opinions and therefore are properly excluded under IDAPA 62.01.01.485. *See* Mot. to Strike, Exhibits A and B. Furthermore, Petitioners offer no basis for consideration by the Hearing Officer of irrelevant statements based on hearsay and unauthenticated documents.

Perpetua does not dispute that the Hearing Officer should take evidence to develop the factual record consistent with the Board's Order. Pet. Opp. at 1 (citing IDAPA 62.01.01.475). But Rule 485 is clear that "[e]xpert testimony that is conclusory, offers legal opinions, or which is based solely upon hearsay, is inadmissible." IDAPA 62.01.01.485. Additionally, evidence is "excludable" under Rule 475 if it is "irrelevant." IDAPA 62.01.01.475 (incorporating Idaho Code § 67-5251(1)). For these reasons, the Hearing Officer should exclude from the record those

[1] During the Hearing, Perpetua objected to Mr. Tiedemann's status as an expert on DEQ rulemaking and the TAPs rule, Tr. 324:10-17, 325:9-25 (Tiedemann), as well as Dr. von Lindern's status as an expert on toxicology, Tr. 406:8-25, 407:1-2 (von Lindern).

portions of the Tiedemann and von Lindern Declarations referenced in Perpetua's Motion to Strike or, at a minimum, afford these statements no weight under IDAPA 62.01.01.476.

I. The Declarations Provide Inadmissible Legal Opinions.

Rather than applying their expertise to opine on DEQ's application of the Toxic Air Pollutants ("TAPs") rules, the Tiedemann and von Lindern Declarations attempt to interpret the rulemaking history of the TAPs rules and directly answer legal questions that are properly assessed by the Hearing Officer. Mot. to Strike at 2-3. Such legal analysis is the sole responsibility of the Hearing Officer, not a witness. *Id.* Petitioners do not refute that these statements constitute legal opinions but simply argue that each statement "is the expert's opinion." Pet. Opp. at 2. However, Mr. Tiedemann and Dr. von Lindern are not attorneys and have no expertise in the area of regulatory interpretation. *See* Tr. 320-321 (Tiedemann) (reviewing education and expertise); Tr. 393-408 (von Lindern) (same). Rather, their proffered testimony is a biased opinion based on what they wish the rules said and how they hope that they will be interpreted. And even if they did have pertinent experience to offer legal conclusions, Rule 485 expressly prohibits the admission of legal opinions. IDAPA 62.01.01.485.

Unlike the identified sections of the Tiedemann and von Lindern Declarations, the expert declarations filed by DEQ and Perpetua stay within the bounds of the respective witness' areas of expertise. REC 3921-3929 (Schilling Dec.) (explaining the technical requirements of the TAPs rules and reviewing DEQ's determinations for consistency); REC 4135-4143 (Lewis Dec) (same); REC 3876-3881 (Paden Dec.) (explaining the risk assessment methodology under the TAPs rules and reviewing DEQ's toxicological determinations); REC 4280-4288 (Lopez Dec.) (same). These expert declarations provide opinions on technical issues that aid the Hearing

Officer in addressing the legal questions before him but refrain from explicitly answering those questions or making legal conclusions based on the rulemaking history of the TAPs rules.

II. Petitioners Fail to Justify the Admission of Irrelevant, Unauthenticated, and Hearsay Evidence Relied on in the Declarations.

Perpetua's Motion to Strike identified significant portions of the Tiedemann Declaration that relied on unauthenticated documents, which Mr. Tiedemann incorrectly claimed were part of "the historic TAPs rulemaking record." REC 6051 (¶ 9) (Tiedemann Dec.). Petitioners argue that Mr. Tiedemann authenticated these documents by stating that they are copies of public records. Pet. Opp. at 3. Petitioners mischaracterize the relevant law.

The documents relied on by Mr. Tiedemann are not part of the official rulemaking record. As the State clarified during the hearing, documents must be "stamped with essentially a Bates number or record number" to be part of the official rulemaking record, and Mr. Tiedemann confirmed that the documents he relied on did not include such numbering. Tr. 365:21-24, 366:1-4 (Tiedemann). Accordingly, these documents are neither authenticated, *see* I.R.E. 901(a), nor relevant in interpreting DEQ intent and the TAPs rules [2] and should be excluded under Rule 475.

Despite Petitioners' arguments, they also constitute hearsay. The public documents exception does not apply here, where "the source of information or other circumstances indicate a lack of trustworthiness." Mot. to Strike at 6 (quoting I.R.E. 801(8) and explaining that the documents include draft and unsigned letters, two of which Mr. Tiedemann could only presume the authors and recipients); REC 6058-6060 (¶¶ 26-27) (Tiedemann Dec.). Additionally, Petitioners' claim that Mr. Tiedemann only relies on these documents to indicate that "concerns were raised" regarding DEQ's application of the TAPs rules, not to "prove the truth of those

[2] *See* Mot. to Strike at 5 n.3 (citing caselaw explaining that such unpublished, informal documents are not considered in regulatory interpretation).

concerns," Pet. Opp. at 3-4, is as unpersuasive as it is inaccurate. Indeed, Mr. Tiedemann relies on the content of these documents to support his interpretation of the TAPs rules. *See, e.g.*, REC 6058-6059 (¶¶ 26-27) (Tiedemann Dec.).

Petitioners do not even attempt to refute the unreliability and irrelevance of statements made by Dr. von Lindern regarding his perception of the TAPs rulemaking process. *See* Mot. to Strike at 7. Additionally, Dr. von Lindern repeatedly provided his opinion on which policies he believes should drive DEQ's application of the TAPs rules. *See, e.g.*, REC 6108 (¶ 18) (von Lindern Dec.) (claiming that DEQ's interpretation represents unsound policy); Tr. 450:14 (von Lindern) (stating that DEQ's analysis is "unacceptable" and "is not good policy"). Such commentary on which policies the TAPs rules *should* embody are irrelevant to this proceeding, which concerns only whether DEQ's determinations are consistent with the current TAPs rules.

III. The Declarations Offer Unqualified and Irrelevant Opinions.

Despite lacking the requisite expertise on DEQ rulemaking, toxicology, and air quality modeling,[3] Mr. Tiedemann and Dr. von Lindern opine on these topics. REC 6053-6061 (Tiedemann Dec.); Tr. 348-349, 367-374 (Tiedemann); REC 6125-6140 (von Lindern Dec.); Tr. 406-409, 457-478 (von Lindern).

As Mr. Tiedemann spent only two years at DEQ, where he had very limited experience with air quality permitting and had little to do with TAPs compliance, REC 6049-6050 (¶¶ 2-7) (Tiedemann Dec.); Tr. 352:2-363:8 (Tiedemann), he is not an expert on DEQ rulemakings or the TAPs rules, *see* Tr. 255:12-256:7 (Lewis) (explaining that two years at DEQ does not qualify someone as an expert). Dr. von Lindern is not a toxicologist, Tr. 406:11-14 (von Lindern), and

[3] Expert opinions are only admissible in a contested case "if the proffering party. . . demonstrates the general reliability of the expert opinions, both as to methodology and qualifications of the expert." IDAPA 62.01.01.485.

the Hearing Officer specifically did not approve Dr. von Lindern as an expert on toxicology, Tr. 408:13-22 (von Lindern). Highlighting his lack of toxicology expertise, Dr. von Lindern incorrectly concluded that DEQ's use of the 16/70 adjustment factor was an inappropriate use of "dose-averaging" that will expose children to dangerous levels of emissions based on the level of "carcinogenic potency" in early life stages. Tr. 431:24-25, 432:1-15, 432-435 (von Lindern); REC 6108 (¶18), REC 6115-6118. Indeed, expert toxicologist, Theresa Lopez, explained why this testimony "indicates that [Dr. von Lindern] does not understand toxicology." Tr. 499:12-16 (Lopez). Petitioners also do not assert that Dr. von Lindern is an expert on emissions estimates or modeling. *See* Tr. 405:19-406:1 (von Lindern). This was reflected in his reliance on the expertise of other witnesses to understand DEQ's modeling work. *See* Tr. 458:2-24, 459:1-2, 471:2-24 (von Lindern) (explaining that he struggled to understand DEQ's technical calculations and relied on Kevin Schilling's expertise).

Mr. Tiedemann and Dr. von Lindern's lack of expertise led to incorrect and irrelevant conclusions. Upon Perpetua's reservation of its objections to the testimony of Mr. Tiedemann and Dr. von Lindern, the Hearing Officer emphasized that he has the discretion to afford it the appropriate weight and credibility. Tr. 326:10-13 (Tiedemann); Tr. 409:8-12 (von Lindern). To the extent that the Hearing Officer does not exclude the testimony subject to Perpetua's objections, Perpetua asserts that the proper remedy is to afford the testimony no weight.

CONCLUSION

For the reasons explained above, Petitioners' Response fails to justify admission of the many conclusory statements, legal opinions, and otherwise irrelevant, unauthenticated, and hearsay evidence presented in the Tiedemann and von Lindern Declarations.

NEZ PERCE TRIBE, IDAHO CONSERVATION LEAGUE, and SAVE THE SOUTH FORK SALMON, Petitioners, v. DEPARTMENT OF ENVIRONMENTAL QUALITY, Respondent, and PERPETUA RESOURCES IDAHO, INC., Intervenor.	BEQ Case No. 0101-22-01 OAH Case No. 23-245-01 FINDINGS OF FACT, CONCLUSIONS OF LAW, AND PRELIMINARY ORDER

I. FACTUAL AND PROCEDURAL BACKGROUND

Perpetua Resources Idaho, Inc. is in the process of applying for a variety of permits for its proposed Stibnite Gold Project ("SGP") in Valley County, Idaho. The SGP would consist of conventional open-pit mining, ore preparation, and gold extraction operations. In August 2019, Perpetua applied to the Idaho Department of Environmental Quality ("DEQ") for an air quality permit for the construction and operation of the SGP, pursuant to the Rules for the Control of Air Pollution in Idaho in IDAPA 58.01.01 (the "Air Rules"). DEQ issued the final version of air quality permit-to-construct P-2019.0047 (the "Permit") on June 17, 2022.

On July 22, 2022, the Nez Perce Tribe, Idaho Conservation League, and Save the South Fork Salmon ("Petitioners") filed a joint petition to initiate a contested case (the "Petition") regarding the Permit, which they subsequently amended on January 11, 2023 (the "Petition"). The Petition alleges DEQ committed several errors in its development of the Permit and asks the Board of Environmental

Quality ("Board" or "BEQ") to vacate and withdraw the Permit and remand it to DEQ to correct such errors. On August 12, 2022, Perpetua filed a petition to intervene in the contested case proceeding, which the hearing officer granted on August 22, 2022.

Most relevant to this order are Paragraphs 55 and 56 of the Petition. They allege DEQ's evaluation of the toxic air pollutant ("TAP") arsenic underestimated emissions in three specific ways: (a) averaging emissions over a 5-year period; (b) averaging the estimated annual ambient modeling impacts across two multi-year scenarios; and (c) averaging the resultant 16-year total emissions over the 70-year human lifetime to assert compliance. (*See* Am. Pet. of 1/11/23, ¶¶ 55, 56.) Effectively, these allegations constituted three "sub-issues" of Claim No. 9 identified in the order on Perpetua's motion to dismiss. (*See* Order of 11/15/22, at p. 9.)

On September 6, 2022, Perpetua filed a motion to dismiss the Petition. The hearing officer ruled on that motion on November 15, 2022. In doing so, the hearing officer identified 13 individual claims of error in the Petition. Pursuant to a stipulated scheduling order, the Petitioners filed a motion for summary judgment on April 14, 2023, and DEQ and Perpetua filed motions for summary judgment on May 12, 2023. As a result of the motion to dismiss and the motions for summary judgment, the Hearing Officer ruled in favor of DEQ and Perpetua on all 13 individual claims of error. (*See* Orders of 1/15/22 and 10/31/23.)

After the summary judgment decision, the Petitioners filed a petition for review of the hearing officer's preliminary order with the Board, alleging: (1) the hearing officer erred, factually and legally, in upholding DEQ's determination that Perpetua has legal control of the Stibnite Road Access Route such that the Route need not comply with ambient air quality standards; (2) in finding that Perpetua will preclude the general public from accessing locations within the ambient air boundary, the hearing officer lacked a reasonable factual basis and misapplied applicable

regulations, policy, and guidance; (3) the hearing officer failed to decide Petitioners' claim that DEQ violated the Clean Air Act and applicable state and federal rules and regulations by allowing Perpetua to submit plans with important project details in the future–after Permit issuance and without public comment; or to the extent that this claim was decided, the hearing officer erred; (4) the hearing officer erroneously determined that the Permit includes enforceable conditions that will achieve 93.3% dust control; and (5) the hearing officer misinterpreted and misapplied applicable rules to uphold DEQ's decision to artificially dilute the ambient arsenic concentrations attributable to the SGP by 16/70. (*See* Pet. for Rev. of Prelim. Order of 11/14/23, at p. 1.)

After briefing and motion practice before the Board, the Board issued orders on May 9 and June 12, 2024. Collectively, these two orders affirmed the hearing officer's summary judgment rulings on the first four of the above issues, but found that the hearing officer erred in ruling in favor of DEQ and Perpetua on the fifth issue regarding arsenic emissions. Specifically, the Board concluded that "DEQ did not act reasonably and in accordance with law when it analyzed the ambient arsenic air concentrations for the SGP." (Order of 5/9/24, at pp. 12-23.)

Therefore, the Board remanded the matter back to the hearing officer in order to address the following issues: (a) whether DEQ acted reasonably in using a 5-year rolling average for T-RACT that was not supported by permit conditions (*see* Order of 5/9/23, at p. 18); (b) whether there was sufficient evidence to support DEQ's T-RACT analysis regarding non-West End Pit production (*see* Order of 5/9/23, at p. 19); and (c) whether DEQ acted reasonably and in accordance with law when it applied the 16/70 adjustment to the acceptable ambient concentration ("AACC") for arsenic. (*See* Order of 5/9/23, at p. 21.)

The Board's remand includes instructions to provide the parties with "an opportunity to develop a full factual record on the arsenic issue…." (*See* Order of 6/12/24, at pp. 6-7.) However,

the Board denied requests from DEQ and Perpetua to provide "clarification and instructions to the Hearing Officer regarding the proceedings on remand…." (*See* Order of 6/12/24, at pp. 7-8.) So, while the Board articulated three narrow substantive issues to address on remand, it provided wide discretion regarding the procedures.

On remand, the parties agreed expert witness testimony would be necessary to address the issues identified by the Board, and they expressed a preference to forgo traditional written discovery and depositions of expert witnesses to explore the issues. Instead, the parties chose to disclose their expert witness opinions through the filing of declarations. Therefore, from August to October 2024, the parties filed a total of six expert witness declarations. These declarations put the parties and hearing officer on notice of the proffering party's positions and opinions in advance of the hearing on the merits.

The hearing on the merits took place on October 17 and 18, 2024. All of the parties filed post-hearing statements on November 8, 2024, and Perpetua filed a reply brief in support of a previously filed motion to strike on November 13, 2024. Therefore, as of November 13, 2024, this matter has been fully submitted for decision by the hearing officer.

II. PRELIMINARY EVIDENTIARY RULINGS AND DISPOSITION OF PERPETUA'S MOTION TO STRIKE

The admissibility of exhibits was addressed during the hearing. The hearing officer did not deny any requests to admit an exhibit. The hearing officer admitted the following exhibits:

- Ex. 100 (Schilling (DEQ) decl.)
- Ex. 101 (Paden (DEQ) decl.)
- Ex. 200 (Lewis (Perpetua) decl.)
- Ex. 201 (Lopez (Perpetua) decl.)
- Ex. 203 (EPA Health Assessment guidance document)

- Ex. 205 (3/7/91 mem. from Wilkosz and Teater to Green)
- Ex. 208 (EPA Risk Assessment Guidance for Superfund, Vol. I: Human Health Evaluation Manual (Part 7 F, Supplemental Guidance for Inhalation Risk Assessment)
- Ex. 220 (demonstrative exhibit)
- Ex. 222 (poster with caluclations)
- Ex. 221 (EPA guidelines for carcinogen risk assessment)
- Ex. 300 (DEQ Position on the Arsenic Modeling Addendum to the Perpetua Resources Stibnite Gold Project Permit to Construct Application)
- Ex. 301 (TAPs Modeling Addendum; Statement of Basis)
- Ex. 302 (von Lindern decl.)
- Ex. 303, 304 (Table C; TAP Maximum Modeled Concentrations and AACs)
- Ex. 305 (Tiedemann decl.)

In advance of the hearing on the merits, Perpetua filed a motion to strike particular references within the expert witness declarations filed by the Petitioners. (*See* Mot. to Strike of 10/14/24; Am. Mot. to Strike of 10/15/24.) In addition, during the hearing, Perpetua and DEQ lodged multiple objections to testimony offered by the Petitioners' witnesses pursuant to OAH Rule of Procedure[1] 482. Pursuant to Procedural Rule 512, and for the reasons below, the hearing officer denies the request to formally "strike" references from the record. However, pursuant to Procedural Rule 476, the hearing officer has taken the motion and objections under advisement in the evaluation of the credibility and testimony of the witnesses.

The judicial Idaho Rules of Evidence do not strictly apply to administrative hearings. *See*

[1] Office of Administrative Hearings, Idaho Rules of Administrative Procedure, IDAPA 62.01.01.

IDA. ADMIN. PROC.R. 475, 476; *see also* IDAHO CODE § 67-5251. According to the procedural rules for administrative hearings, "[e]vidence should be taken by the presiding officer to assist the parties' development of the record, not excluded to frustrate that development." IDA. ADMIN. PROC.R. 475. In addition, "[a] presiding officer is entitled to weigh the quality of evidence presented, including the credibility of witnesses," and "may assign less weight to evidence that would otherwise be inadmissible under the Idaho Rules of Evidence." IDA. ADMIN. PROC.R. 476. Moreover, as previously referenced, when the Board remanded this matter to the hearing officer, it did so with instructions to provide the parties with "an opportunity to develop a full factual record on the arsenic issue…." (*See* Order of 6/12/24, at pp. 6-7.)

Overall, the testimony offered by the Petitioners' witnesses was relevant to the narrow arsenic issues identified by the Board for further deliberation. Had the Petitioners failed to comply with the Board's directive to "focus only on the development of additional factual evidence on the ambient arsenic air concentration analysis," *see* Order of 6/12/24, at pp. 7-8, formally striking testimony and sustaining objections would be appropriate. In light of the general relevance of the Petitioners' testimony and the relaxed rules of evidence, the hearing officer does not find a compelling reason to formally strike testimony from the record and therefore denies the motion and overrules reserved objections from the hearing pursuant to Rule of Procedure 482.

Subject to that ruling, the hearing officer notes for the record that he has taken the motion and objections under advisement in evaluating the evidence pursuant to Procedural Rule 476. In general, the hearing officer agrees that, often, the Protestants' witnesses Mr. Tiedemann and Dr. von Lindern testified regarding what they wished the Air Rules said, rather than what they actually say. The hearing officer also agrees that many of the exhibits offered by the Petitioners' witnesses consisted of isolated references from prior rulemakings that lacked explanation of their context or

relevance to the interpretation of the plain language of the existing Air Rules. The Findings of Fact below reflect the hearing officer's evaluation of the evidence pursuant to Procedural Rule 476.

III. FINDINGS OF FACT AND CONCLUSIONS OF LAW

A. Legal Background

1. Perpetua filed its air Permit application on August 20, 2019. (*See* R., at REC0418 (Statement of Basis).)

2. DEQ issued the Permit on June 17, 2022.

3. At the time Perpetua filed its Permit application and DEQ issued the Permit, a prior version of the Air Rules was in effect, which this Order will cite as the "2022 Air Rules."

4. In 2023, DEQ updated the Air Rules in connection with Governor Little's "zero-based regulation" effort, which this Order will cite as the "2023 Air Rules."[2] (*See* Tr. of 10/17/24, 34:2-4 (Schilling/DEQ).)

5. A "toxic air pollutant" ("TAP") is defined as, "[a]n air pollutant that has been determined by the Department to be by its nature, toxic to human or animal life or vegetation and listed in Section 585 or 586." *See* 2022 Air Rule 006.124, 2023 Air Rule 006.50.

6. Section 586 of the Air Rules identifies "arsenic compounds" as a TAP.

7. The TAPs program in Air Rule 586 is specific to the State of Idaho and is not part of Idaho's approved state implementation plan overseen by EPA pursuant to the federal Clean Air Act. (*See* Tr. of 10/17/24, 91:12-92:1 (Schilling/DEQ).)

8. Based on the plain language of Air Rules 161, 210, and 586, the evaluation of toxic air pollutant emissions under those rules is inherently project-specific and is focused on the increased

[2] The 2023 rulemaking renumbered some of the 2022 Air Rules. When references to both sets of rules are the same, this Order simply cites to the "Air Rules." When the same rule was renumbered in 2023, this Order will provide citations to both the 2022 Air Rules and the 2023 Air Rules.

cancer risk posed by the specific project proposed by the air permit application.

9. In other words, and by contrast, the TAPs evaluation is different than the evaluation of national ambient air quality standards ("NAAQs"), which is focused on the overall risk to the general public taking into account all sources of air pollution.

10. In a contested administrative proceeding, "[t]he agency's experience, technical competence, and specialized knowledge may be utilized in the evaluation of the evidence." IDAHO CODE § 67-5251(5).

B. As Long As the 16-Year Assumption Is Reasonable, DEQ Did Not Err in Adjusting Arsenic Exposure Concentration to Reflect an Exposure Duration of Less Than 70 Years, Because Doing So Is Standard Practice by EPA and Toxicologists

11. In order to obtain a permit to construct, the applicant must demonstrate preconstruction compliance with Air Rule 161. *See* Air Rule 203.03.

12. According to Air Rule 161, TAPs "shall not be emitted in such quantities or concentrations as to alone, or in combination with other contaminants, injure or unreasonably affect human or animal life or vegetation."

13. A permit applicant may demonstrate preconstruction compliance with Air Rule 161 "[u]sing the methods provided in Section 210." *See* Air Rule 203.03.

14. A permit applicant may demonstrate preconstruction compliance with Air Rule 161 by demonstrating "[c]ompliance with all applicable [TAP] carcinogen increments and toxic air pollutant non-carcinogenic increments….with regards to the pollutants listed in Sections 585 and 586."

15. The Air Rules define "T-RACT" as "[a]n emission standard based on the lowest emission of toxic air pollutants that a particular source is capable of meeting by the application of control technology that is reasonably available, as determined by the Department, considering technological and economic feasibility. If control technology is not feasible, the emission standard may be based

on the application of a design, equipment, work practice or operational requirement, or combination thereof." *See* 2022 Air Rule 007.12; 2023 Air Rule 210.

16. A permit applicant "may use T-RACT to demonstrate preconstruction compliance for [TAPs] listed in Section 586." *See* 2022 Air Rule 210.12; 2023 Air Rule 210.12(a).

17. For the SGP, T-RACT for arsenic consists of the use of chemicals and water to suppress emissions from the disturbance of unpaved mine haul roads. (*See generally* Mem. Dec. and Prelim. Order of 10/31/23, at pp. 34-46.)

18. In order to use T-RACT to demonstrate preconstruction compliance for TAPs under Section 586, it is first necessary to identify the source's "approved T-RACT ambient concentration at the point of compliance" for the relevant TAP (hereinafter, the "Approved Concentration"). *See* Air Rule 210.12(b).

19. Next, it is necessary to compare the Approved Concentration to "the amount of the [TAP] that would contribute an ambient air cancer risk probability of less than one to one hundred thousand (1:100,000)" (hereinafter, the "AACC" or "Acceptable Concentration.") *See* Air Rule 210.12(b).

20. The amount of the [TAP] that would contribute an ambient air cancer risk probability of less than one to one hundred thousand (1:100,000) is "equivalent to ten (10) times the applicable acceptable ambient concentration listed in Section 586." *See* Air Rule 210.12(b).

21. If the source's Approved Concentration is "less than or equal to" the Acceptable Concentration, then "no further procedures for demonstrating preconstruction compliance will be required for that toxic air pollutant as part of the application process." *See* 2022 Air Rule 210.12(c); *see also* 2023 Air Rule 210.12(c).

22. Under Section 586, the acceptable ambient concentration of arsenic is an annual average of $2.3E^{-04}$ $\mu g/m^3$.

23. Ten (10) times $2.3E^{-04}$ $\mu g/m^3$ equals $2.3E^{-03}$ $\mu g/m^3$.

24. Therefore, when T-RACT is utilized, the Acceptable Concentration for arsenic is an annual average of $2.3E^{-03}$ $\mu g/m^3$, *i.e.*, 0.0023 $\mu g/m^3$.

25. For more traditional emissions sources such as a factory, the predictability of the amount and location of emissions typically means that it is necessary to model only one emissions scenario. (*See* Tr. of 10/18/24, 268:23-269:1 (Lewis/Perpetua).)

26. Because the SGP has a complex emissions profile, in this case, Perpetua modeled fourteen "worst case" emissions scenarios. (*See* Tr. of 10/18/24, 268:19-269:8, 270:3-8 (Lewis/Perpetua).)

27. These modeling scenarios overestimate emissions by approximately 1.5 times to 3 times actual emissions. (*See* Tr. of 10/18/24, 273:14-19 (Lewis/Perpetua).)

28. For the SGP, the highest modeled annual average arsenic concentration was 0.00414 $\mu g/m^3$. (*See* Tr. of 10/18/24, 277:3-13 (Lewis/Perpetua).)

29. However, for projects such as the SGP in which exposure is known to be for less than 70 years, it is inappropriate to compare this concentration to the Acceptable Concentration in order to determine compliance with Section 586.

30. For projects such as the SGP in which exposure is known to be for less than 70 years, failure to account for the true exposure period results in overstating emissions from the project. (*See* Tr. of 10/17/24, 39:2-7 (Schilling/DEQ).)

31. The table of Acceptable Concentrations in Section 586 contains a column labeled "URF."

32. "URF" is a reference to "unit risk factors" developed by EPA. *See* 2022 Air Rule 106.19; 2023 Air Rule 586 (note below table). (*See also* Tr. of 10/17/24, 137:2-6 (Paden/DEQ).)

33. For air emissions, the URF is also described as inhalation unit risk ("IUR"). (*See* Tr. of 10/17/24, 182:16-19 (Lopez/Perpetua).)

REC 7100

34. The URFs/IURs developed by EPA are an estimate of the excess cancer risk resulting from continuous inhalation of a concentration of 1 microgram per cubic meter of a pollutant in the air over the course of an assumed 70-year lifetime. (*See* Tr. of 10/17/24, 135:10-13 (Paden/DEQ).)

35. Excess cancer risk is also described as an "increment." (*See* Tr. of 10/17/24, 35:10-37:5 (Schilling/DEQ).)

36. The URFs/IURs are developed by EPA after extensive research by scientists, public health officials, and industry representatives, and represent a consensus of the best science regarding the potency of a given carcinogen. (*See* Tr. of 10/17/24, 188:2-16 (Lopez/Perpetua).)

37. The URFs/IURs adopted by EPA take into account, and are protective of, sensitive populations that are at increased cancer risk, such as pregnant women and young children. (*See* Tr. of 10/17/24, 138:18-23, 147:24-148:5, 172:5-21 (Paden/DEQ); 188:17-22 (Lopez/Perpetua).)

38. The Acceptable Concentrations listed in the last column of the table in Section 586 are calculated based upon the URFs in the same table. (*See* Tr. of 10/17/24, 126:9-14 (Schilling/DEQ).)

39. Because Air Rule 586 incorporates the URFs/IURs adopted by EPA, its Acceptable Concentrations (*i.e.*, AACCs) are inherently expressed as the annual average concentration over the course of an assumed 70-year lifetime.

40. The 2022 Air Rules, which were in effect at the time Perpetua filed its Permit application and the time DEQ issued the Permit, expressly reference the assumed 70-year lifetime for evaluating increased cancer risk from TAPs exposure. (*See* 2022 Air Rule 006.125.)

41. While that specific reference was eliminated from the 2023 Air Rules as a result of the zero-based regulation initiative, the result is the same, because Air Rule 586 incorporates EPA's URFs, which are based on an assumed 70-year lifetime of exposure.

42. For the vast majority of projects for which an air permit is sought, the applicant and DEQ

assume the project will have an indefinite project life that exceeds the assumed 70-year lifetime on which the IURs/URFs are based. (*See* Tr. of 10/17/24, 21:12-25 (Schilling/DEQ).)

43. For projects with a project life of 70 years or more, direct comparison of the highest modeled annual average concentration to the Acceptable Concentration is appropriate for determining compliance with Section 586.

44. For projects with a known project life of less than 70 years, EPA adjusts the highest modeled annual average concentration to account for the different exposure durations in order to accurately calculate cancer risk with an Approved Concentration that is capable of comparison to the Acceptable Concentrations in Section 586. (*See* Tr. of 10/17/24, 143:21-144:1, 144:17-145:2 (Paden/DEQ); 190:1-5, 192:6-193:2 (Lopez/Perpetua).)

45. The Air Rules contain an adjustment factor for "short term" projects with an operational life of no more than five (5) years. *See* 2022 Air Rules 007.11, 210.15; 2023 Air Rules 007.08, 210.15.

46. For these short term projects, the Acceptable Concentration for carcinogens such as arsenic may be multiplied by 10. *See* Air Rule 210.15.

47. The adjustment factor in Section 210.15 was adopted primarily to address projects that are inherently short-term by nature, such as contamination remediation projects and pilot projects. (*See* Tr. of 10/17/24, 23:7-12 (Schilling/DEQ).)

48. The Air Rules do not expressly preclude adjusting exposure concentrations to account for projects with an operational life of more than 5 years and less than 70 years.

49. To the contrary, as previously referenced, Air Rule 586 contains an express reference to the URFs/IURs adopted by EPA, which are based on an assumed 70-year lifetime exposure.

50. EPA commonly utilizes the following formula to compare the exposure concentration from a project that operates for less than 70 years to the lifetime exposure concentration that would cause a

specified cancer risk: EC = (CA x ET x (1 day/24 hours) x EF x ED) / AT. (*See* Tr. of 10/17/24, 137:2-6, 139:15-21, 140:1-143:20 (Paden/DEQ); 191:14-20, 213:11-214:14 (Lopez/Perpetua); Ex. 101, ¶¶ 10-12 (Paden decl.).)

51. EC represents the adjusted exposure concentration, expressed in $\mu g/m^3$.

52. CA represents the modeled contaminant concentration in air, expressed in $\mu g/m^3$.

53. For the SGP, CA equals 0.00414 $\mu g/m^3$ for arsenic.

54. ET represents the exposure time and is assumed to be 24 hours/day.

55. EF represents the exposure frequency and is assumed to be 365 days/year.

56. ED represents the exposure duration in years.

57. DEQ assumed an exposure duration of 16 years for the SGP. The appropriateness of this assumption will be addressed in the next section of this order.

58. AT represents the averaging time expressed in number of days. As previously referenced, EPA assumes a continuous 70-year lifetime of exposure. Therefore, this variable is 365 days/year x 70 years = 25,550 days.

59. To account for an exposure duration of less than 70 years, the adjusted Acceptable Concentration is calculated as follows: (0.00414 $\mu g/m^3$ x 24 hours/day x 1 day/24 hours x 365 days/year x 16 years) / 25,550 days = 0.00095 $\mu g/m^3$. (*See* Tr. of 10/17/24, 197:9-19 (Lopez/Perpetua); Tr. of 10/18/24, 278:21-279:6 (Lewis/Perpetua).)

60. An arsenic concentration of 0.00095 ug/m^3 is less than the T-RACT-based Acceptable Concentration for arsenic of 0.0023 $\mu g/m^3$.

61. Stated another way, the excess cancer risk from arsenic emissions at the SGP is 1 in 240,000, which is a smaller excess cancer risk than the T-RACT-based standard of 1 in 100,000. (*See* Tr. of 10/17/24, 200:13-19 (Lopez/Perpetua).)

62. Therefore, as long as DEQ's assumption of a 16-year project life is reasonable, DEQ did not err in concluding that arsenic emissions from the SGP comply with Section 586.

C. Assuming a 16-Year Period of Exposure Without a Corresponding Permit Condition Was Reasonable Because Even if the SGP Operates for More Than 16 Years, the Cancer Risk Does Not Change As Long as the Permit's Production Limits Are Satisfied

63. For emissions modeling, Perpetua and DEQ assumed the SGP would have an operating lifetime of 16 years.

64. This assumption is based on the calculation of how long it would take Perpetua to deplete the mined resource at the maximum authorized production rates under the Permit. (See Tr. of 10/17/24, 197:20-198:5 (Lopez/Perpetua).)

65. In issuing an air permit, DEQ "may impose any reasonable conditions…." Air Rule 211.01.

66. When it issued the Permit, DEQ did not include a condition expressly limiting the SGP to 16 years of operation.

67. The importance of the assumed 16-year project life to the Section 586 analysis above raises the issue of whether the lack of a Permit condition limiting the SGP to 16 years of operation was error.

68. Generally speaking, in toxicology, there are three broad categories of exposures to contaminants based on the duration of exposure—acute, sub-chronic, and chronic. (Tr. of 10/17/24, 145:8-146:13 (Paden/DEQ).)

69. The analysis of acute exposure generally focuses on exposure to contaminants lasting 24 to 48 hours. (*Id*.)

70. The analysis of sub-chronic exposure generally focuses on exposure to contaminants lasting 30 to 90 days. (*Id*.)

71. The analysis of chronic exposure generally focuses on exposure to contaminants lasting for

several months or more than one year. (*Id*.)

72. The calculation of cancer risk is inherently an evaluation of chronic exposure. (*Id*.)

73. The calculation of cancer risk pursuant to EPA's IURs/URFs and Section 586 is linear, in that it is a function of only two variables—exposure concentration and exposure duration. (Tr. of 10/17/24 at 190:12-17, 202:11-203:17, 208:3-209:9, 211:12-212:1, 223:15-23 (Lopez/Perpetua); Ex. 208, p. 18 (EPA 2009, Risk Assessment Guidance); Ex. 221, app. A, p. A-10 (EPA 2005, Guidelines for Carcinogen Risk Assessment.)

74. This linear approach is generally considered to be conservatively protective of public health, including sensitive subpopulations. (*See* Tr. of 10/17/24, 190:12-17 (Lopez/Perpetua).)

75. Permit Condition No. 3.6 states: "The permittee shall haul no more than 788.4 million tons (MT) of ore and DR [development rock] from all deposits over the life of the mine and no more than 394.2 MT of ore and DR from the West End deposit over the life of the mine." (R., at REC0385.)

76. Even if the SGP operates for more than 16 years, the cancer risk from arsenic exposure calculated pursuant to EPA's IURs/URFs and Section 586 does not change as long as Perpetua complies with the production limits in Condition No. 3.6. (Tr. of 10/17/24, 169:18-170:5 (Paden/DEQ); 203:8-17, 208:3-209:2 (Lopez/Perpetua).)

77. Because the specific issues articulated by the Board on remand are limited to analysis of cancer risk from arsenic exposure, and because that risk does not change with a project life longer than 16 years if compliance with Condition No. 3.6 is achieved, DEQ's decision not to including a Permit condition specifically limiting the life of the SGP to 16 years was not error.

D. Using a 5-Year Rolling Average to Evaluate Arsenic Emissions from the SGP Was Reasonable, Given DEQ's Broad Discretion Regarding Monitoring Requirements Under the Air Rules, the Highly Variable Nature of SGP Emissions Over Time, and Section 586's Focus on Project-Based Excess Cancer Risk

78. Condition 3.5 of the Permit states: "The permittee shall haul no more than 180,000 tons per

day (T/day) of ore and DR. The permittee shall haul no more than 135,000 T/day of ore and DR, based on a 5-year rolling average."

79. As previously described, the Board remanded the matter back to the hearing officer to evaluate whether DEQ acted reasonably in using the above 5-year rolling average without further related permit conditions. (*See* Order of 5/9/23, at p. 18.)

80. When issuing a permit to construct, the Air Rules provide DEQ with authority to "impose any reasonable conditions upon an approval," including a variety of conditions relating to ensuring compliance. *See* Air Rule 211.01.

81. The Acceptable Concentrations listed in Section 586 are exposure concentrations for calculating cancer risk that are expressed as "annual averages." *See* Air Rule 586.

82. More specifically, the Acceptable Concentrations listed in Section 586 provide the basis for calculating the excess cancer risk created when humans are exposed to one (1) microgram per cubic meter of a given carcinogen at a specified concentration continuously for an assumed 70-year lifetime. (*See* 2022 Air Rule 006.125; *see also* Tr. of 10/17/24, 137:2-10 (Paden/DEQ), 195:4-8 (Lopez/Perpetua).)

83. In other words, if humans are exposed to the T-RACT-based Acceptable Concentration of arsenic continuously for 70 years, the probability that excess cancers will develop as a result of such exposure is 1 in 100,000, or 0.00001%. (*Id*.)

84. The Acceptable Concentrations are expressed as annual "averages," not annual "limitations." *See* Air Rule 586.

85. Because Section 586 and its Acceptable Concentrations are focused on calculating a cumulative cancer risk that accumulates over a continuous 70-year exposure period, it is not necessarily the case that monitoring emissions on an annual basis is necessary to achieve compliance

with those standards.

86. Aside from Section 211.01's statement that DEQ may impose "reasonable" conditions to achieve compliance, the hearing officer is not aware of any specific, applicable legal authorities governing the frequency and timing of any such monitoring requirements for the TAPs listed in Section 586.

87. On one end of the spectrum, in the short term, arsenic emissions at the SGP will be limited on a daily basis through Condition 3.5, which limits daily haulage of ore and DR to 180,000 tons. This short-term limit is primarily intended to ensure the SGP maintains compliance with NAAQS, rather than the TAPs program. (*See* Tr. of 10/17/24, 43:20-24 (Schilling/DEQ); Tr. of 10/18/24, 284:4-13 (Lewis/Perpetua).)

88. On the other end of the spectrum, in the long term, total arsenic emissions at the SGP will be limited through Condition 3.6, which limits total haulage of ore and DR for the life of the mine to 788.4 million tons facility-wide and to 394.2 million tons of ore and DR from the West End Pit.

89. Accordingly, even if Perpetua frontloads its daily haulage such that it is hauling 180,000 tons per day for as long as possible while maintaining compliance with the Permit, the overall cancer risk calculated pursuant to EPA and toxicological standards does not change because Condition 3.6 limits total exposure for the life of the SGP, however long that is.

90. In fact, even without limiting the five-year rolling average production to 135,000 tons per day as Condition 3.5 presently does, if Perpetua hauled up to 180,000 tons per day pursuant to the remainder of Condition 3.5, it would still not exceed the Acceptable Concentration.

91. This is because 180,000 tpd is 33.3% greater than 135,000 tpd. If the adjusted Acceptable Concentration of 0.00095 $\mu g/m^3$ is correspondingly increased by 33.3%, the result is 0.001267$\mu g/m^3$, which is still less than the Acceptable Concentration of 0.0023 $\mu g/m^3$ for arsenic.

(*See* Tr. of 10/18/24, 285:17-290:5, 296:25-297:10 (Lewis/Perpetua).)

92. For the vast majority of projects permitted by DEQ, the expected emissions over time are stable and predictable.

93. By contrast, levels of emissions of air pollutants from mining operations like the SGP can change greatly over time due to multiple factors, such as the mine's stage of development and the location of the specific deposit being mined at any given time. (*See* Tr. of 10/17/24, 41:2-19 (Schilling/DEQ); Tr. of 10/18/24, 259:23-260:24 (Lewis/Perpetua).)

94. For projects with highly variable emissions over time, assessing compliance strictly on an annual basis is not always appropriate. (*See* Tr. of 10/17/24, 40:2-7 (Schilling/DEQ).)

95. For projects like the SGP with highly variable emissions over time, a five-year rolling average of emissions is more representative of actual emissions from the project than evaluating emissions on an annual basis. (*See* Tr. of 10/17/24, 174:22-175:2 (Paden/DEQ); Tr. of 10/18/24, 291:21-24 (Lewis/Perpetua).)

96. Given all of these factors, pursuant to Air Rule 211.01, DEQ was reasonable and did not err in using the five-year rolling average to monitor and control emission from the SGP, and it is not necessary for the 135,000 tpd average production limit to be reduced to a daily limit in order to achieve compliance with Air Rule 586.

97. In fact, because Section 586 is focused on excess cancer risk posed by a project over the course of an assumed 70-year lifetime or the lifetime of a project that will last less than 70 years, the five-year rolling average approach in Condition 3.5 is stricter and more protective than Section 586 requires. (*See* Tr. of 10/17/24, 40:12-18 (Schilling/DEQ); 294:11-23 (Lewis/Perpetua).)

E. Because Production from the West End Pit Cannot Legally Exceed 50% of Total Production from the SGP, a Separate Permit Condition Limiting Production From Non-West End Pit Sources Is Not Necessary

98. As previously referenced, Condition 3.6 limits total haulage of ore and DR for the life of the

SGP to 788.4 million tons facility-wide and to 394.2 million tons of ore and DR from the West End Pit.

99. On remand, the Board expressed concern that it "could not identify a PTC condition that would limit the non-West End Pit production by 50%," even though it observed in the record the use of an equation that "shows that the non-West End Pit production was also limited by 50%." (Order of 5/9/24, at p. 20.)

100. Therefore, according to the Board, "there was insufficient evidence in the record to demonstrate exactly how or whether the non-West End Pit production was limited and, if it was, the Board of Environmental Quality could not find any PTC conditions able to enforce that reduction." (*Id*.)

101. A map of the SGP is attached hereto as Attachment A. (*See* Ex. 200, Figure 1; R. at REC4145 (Lewis Decl.).)

102. As the map depicts, the West End Pit ("WEP") is located close to the northeast boundary of the SGP.

103. As the map also depicts, the prevailing wind vector at the SGP is generally from the southwest to the northeast.

104. As a result of these factors (geography and wind), the highest modeled impacts to receptors at the SGP boundary came from emissions from the WEP area. (*See* Tr. of 10/18/24, 270:3-23 (Lewis/Perpetua).)

105. As previously referenced, Condition 3.6 limits total facility life-of-mine haulage to 788.4 million tons.

106. If 0% of the production occurs from the WEP and 100% occurs from non-WEP sources, then maximum modeled arsenic impacts remain well below the Acceptable Concentration.

107. As the production mix changes to introduce more production from the WEP and correspondingly less from non-WEP sources, there is a disproportionate increase in arsenic impacts.

108. The modeling demonstrates that when 50% of the production is from the WEP and 50% is from non-WEP sources, that is the point at which modeled impacts for arsenic equal the T-RACT-based AACC in Section 586.

109. In other words, if more than 50% of total production were to occur from the WEP, then the maximum modeled impact would exceed the Acceptable Concentration, and the SGP would be out of compliance with Section 586.

110. Therefore, under the Permit, production from the WEP cannot exceed 50% of total SGP-wide production.

111. A helpful visual depiction of this relationship is attached hereto as Attachment B. (*See* Ex. 100, p. 12, Figure 1 (Schilling Decl.).)

112. Because Condition 3.6 limits WEP production to 394.2 million tons, and because 394.2 million equals 50% of 788.4 million tons, Condition 3.6 limits WEP production to 50% of total authorized production.

113. If 50% of total production from the SGP occurs from the WEP, then production from non-WEP sources is automatically limited to 50% of total production under the plain language of Condition 3.6.

114. If non-WEP sources account for more than 50% of total production at the SGP, then the SGP must correspondingly reduce production from the WEP below 50%.

115. As haulage from the WEP decreases and haulage from non-WEP sources increases, the modeled arsenic impacts decrease further and further below the Acceptable Concentration.

116. Therefore, it was reasonable for DEQ not to include a specific Permit condition

limiting non-WEP haulage to 50% of total mine haulage for the life of the SGP.

IV. PRELIMINARY ORDER

Based on the foregoing findings of fact and conclusions of law, the Hearing Officer hereby concludes: (a) DEQ acted reasonably in using a 5-year rolling average for T-RACT that was not supported by further permit conditions; (b) there was sufficient evidence to support DEQ's T-RACT analysis regarding non-West End Pit production; and (c) DEQ acted reasonably and in accordance with law when it applied the 16/70 adjustment to the AACC for arsenic.

All of the individual claims of error asserted in the Petitioners' Petition have now been resolved. Subject to the rights of the parties to seek further relief pursuant to the procedures below, the hearing officer concludes that DEQ did not commit reversible error in issuing the Permit to Perpetua. It is so ordered.

V. RULE 626 NOTICE

Pursuant to Idaho Code Sections 67-5243 and 67-5245, BEQ Rule of Procedure 003, and OAH Rule of Procedure 626:

This is a preliminary order of the hearing officer. It can and will become final without further action of BEQ, and without any further notice to you, unless any party requests that either the hearing officer or the BEQ review it. If no such request is made within fourteen (14) days of the service of this preliminary order, the order will become final, and you will then have twenty-eight (28) days to file a petition for judicial review with a district court, pursuant to Idaho Code Sections 67-5270 through 67-5279.

If you disagree with this preliminary order, you may file a "motion for reconsideration" with the hearing officer, or you may file "exceptions" and/or a "petition for review" with BEQ. You are allowed to file all of these.

If you would like to file a motion for reconsideration of this preliminary order with the hearing officer, you must do so within fourteen (14) days of the service date of this order. After the hearing officer receives your motion for reconsideration, he has twenty-one (21) days to rule upon it. If he does not issue a ruling within twenty-one (21) days, your motion will be considered denied.

If another party has filed a motion for reconsideration of this preliminary order, you must file any opposition brief within fourteen (14) days from the service date of the motion for reconsideration. No further briefing by any party will be permitted unless the hearing officer, in his discretion, requests it.

You may also file any exceptions you may have to this preliminary order, with a supporting brief, directly with BEQ within fourteen (14) days of the service date of this order, unless BEQ sets a different deadline.

If another party has filed exceptions to this preliminary order with BEQ, you must file any opposition brief within fourteen (14) days from the service date of the exceptions. No further briefing by any party will be permitted unless BEQ, in its discretion, requests it.

You may also file a petition for review regarding this preliminary order, with a supporting brief which sets forth the basis for review, directly with BEQ within fourteen (14) days of the service date of this order, unless BEQ sets a different deadline. BEQ may also notify the parties within fourteen (14) days of the service date of this order, that they, by their own choice, are reviewing this preliminary order, which notice will identify the issues BEQ will review. If a motion for reconsideration has been filed with the hearing officer, your petition for review, or BEQ's notice, does not have to be filed until fourteen (14) days after the motion for reconsideration process with the hearing officer is complete.

If another party has filed a petition for review of this preliminary order with BEQ, you

must file any opposition brief within fourteen (14) days from the service date of the petition for review. No further briefing by any party will be permitted unless BEQ, in its discretion, requests it.

If you would like to request oral argument regarding any motion for reconsideration, exceptions, or petition for review, you must state so in your filings. The decision whether to have oral argument is a decision for the hearing officer or BEQ to make, and they may decide to not have oral argument, even if you or any other party has requested it.

If BEQ reviews a preliminary order, its has the option of either issuing a final order, remanding the matter back to the hearing officer, or holding additional hearings. You will be notified of BEQ's choice if the preliminary order is reviewed.

Dated this 7th day of January 2025.

Dylan Lawrence
Hearing Officer

CERTIFICATE OF SERVICE

I hereby certify that on this 7th day of January 2025, I caused to be served a true and correct copy of the foregoing by the following method to:

Hearing Officer

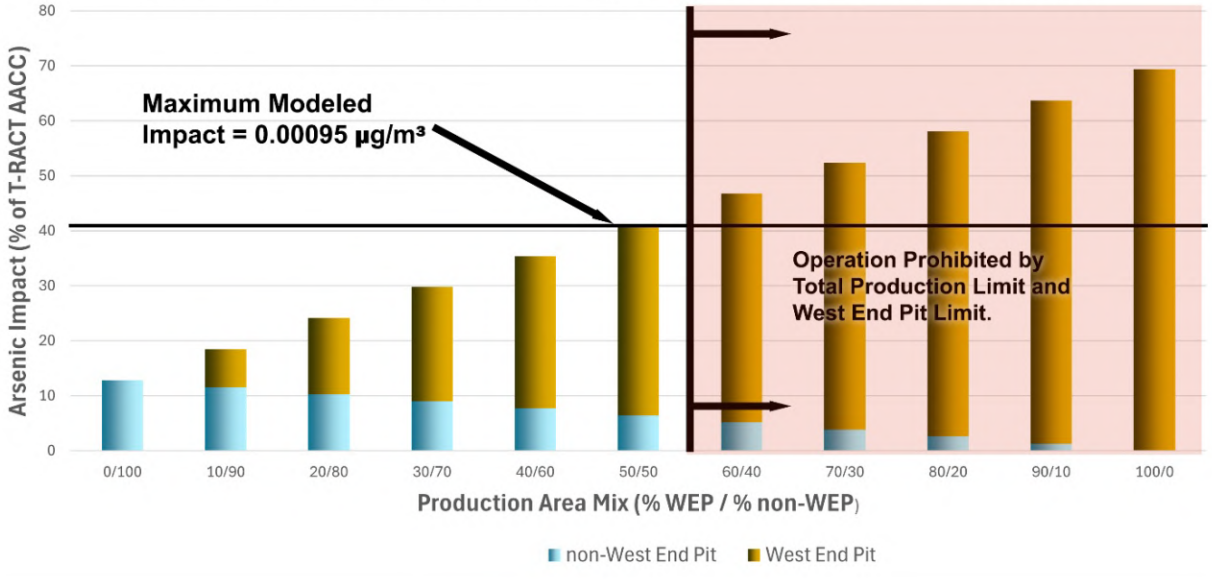
Attachment A

EXHIBIT A
Figure 1. Location of Maximum Arsenic Impacts

Attachment B

assure that applicable emissions do not exceed the arsenic T-RACT AACC. Non-West End Pit production is limited to the facility-wide 788.4-million-ton limit for total hauling and excavation at the mine if there were no West End Pit production.

29. Production is effectively limited from non-West End Pit sources because of the following relationship:



$$Production_{Non\text{-}WEP} = Production_{total} - Production_{WEP}$$

Where:

$Production_{Non\text{-}WEP}$ = production from non-West End Pit Sources
$Production_{total}$ = Total allowable production.
$Production_{WEP}$ = production from West End Pit Sources (not to exceed 50% of $Production_{total}$)

30. The effect of a limit on total production and West End Pit production can be observed by showing how maximum arsenic impacts change with changes in the fraction of total allowable production that occurs from the West End Pit. This was done for the single receptor that had the highest overall exposure concentration. Figure 1 shows how the total adjusted impact is affected by changes in the West End Pit production. The Figure shows how total impacts increase as West End Pit production increases and non-West End Pit production decreases. Figure 1 also shows how impacts would increase above the adjusted combined impact of 0.00095 µg/m^3 for West End Pit allowable production above 50% of the total allowable production from combined West End Pit and non-West End Pit sources.

Figure 1: Maximum Arsenic Impacts as a Function of the Percentage of Total Allowable Production that may Occur from West End Pit Sources

Attorney for Save the South Fork Salmon

BEFORE THE BOARD OF ENVIRONMENTAL QUALITY
STATE OF IDAHO

IN THE MATTER OF AIR QUALITY PERMIT TO CONSTRUCT P-2019.0047	)	Agency Case No. 0101-22-01
	)	OAH Case No. 23-245-01
NEZ PERCE TRIBE, IDAHO CONSERVATION LEAGUE, and SAVE THE SOUTH FORK SALMON	)	**PETITIONERS' PETITION FOR REVIEW OF JANUARY 7, 2025 PRELIMINARY ORDER, MEMORANDUM IN SUPPORT, AND REQUEST FOR HEARING**
Petitioners,	)	
v.	)	
IDAHO DEPARTMENT OF ENVIRONMENTAL QUALITY,	)	
Respondent,	)	
and	)	
PERPETUA RESOURCES IDAHO, INC.	)	
Intervenor-Respondent.	)	

Petitioners Nez Perce Tribe, Idaho Conservation League, and Save the South Fork Salmon hereby petition the Idaho Board of Environmental Quality (the "Board") for review of the Findings of Fact Conclusions of Law, and Preliminary Order ("Preliminary Order") issued on January 7, 2025, by the Hearing Officer in this matter. This Petition for Review is brought under Idaho Code §67-5245, IDAPA 62.01.01.626, and IDAPA 58.01.23.003.

PROCEDURAL BACKGROUND

In this contested case, Petitioners challenge the Idaho Department of Environmental Quality's ("DEQ" or "Department") approval of a permit to construct issued to Perpetua Resources Idaho, Inc. ("Perpetua") for the proposed Stibnite Gold Project (the "Project")—a massive open-pit mine in Valley County, Idaho.

On June 17, 2022, DEQ issued Permit to Construct P-2019.0047 (the "Permit"), which is the Permit at issue in this contested case. *See* REC 0367. On July 22, 2022, Petitioners timely filed the original Petition to Initiate Contested Case. REC 0001. On July 28, 2022, the Hearing Officer Dylan Lawrence was assigned to preside over this matter. On August 12, 2022, Perpetua filed a Petition to Intervene, which was granted on August 22, 2022.[1] REC 005; REC 006.

After the Parties engaged in limited discovery, the Parties filed cross-motions for summary judgment. REC 0323; REC 1204, 1207; REC 1276, 1279. On September 21, 2023, the Hearing Officer held a hearing on the cross motions for summary judgment. TR 0001. On October 31, 2023, the Hearing Officer issued a Memorandum Decision on Motions for Summary Judgment and Preliminary Order (the "2023 Preliminary Order"). *See* REC 3280.

In the 2023 Preliminary Order, the Hearing Officer rejected Respondents' arguments that Petitioners lacked standing to pursue this contested case, finding each Petitioner had standing to challenge the Permit. But the Hearing Officer ruled against Petitioners on all claims addressed in

[1] DEQ and Perpetua are collectively referred to as "Respondents" in this Petition.

the 2023 Preliminary Order and granted Summary Judgment to DEQ and Perpetua. REC 3280. On November 14, 2024, Petitioners sought the Board's review of the 2023 Preliminary Order. *See* REC 3342.

After briefing on the petition for review and a hearing held on April 8, 2024, before the Board, TR 0058, the Board issued a Final Order ("2024 Final Order") on May 9, 2024. *See* REC 3695. The Final Order affirmed the findings and conclusions of the October 2023 Preliminary Order with respect to issues regarding Perpetua's legal and physical control of the Stibnite Road Access Route; that DEQ acted reasonably when it allowed Perpetua to defer submitting detailed plans until after the Permit was issued; and that the Permit included enforceable conditions achieving a 93.3% dust control efficiency. REC 3717. The Board, however, concluded that "DEQ did not act reasonably and in accordance with law when it analyzed the ambient arsenic air concentrations" and remanded this issue "to the Hearing Officer for further factual development in accordance with the terms of this order." REC 3717.

More specifically, the Board held that DEQ: did not act reasonably in using a five-year rolling average for T-RACT that was not properly supported by permit conditions; there was insufficient evidence to support the T-RACT analysis limiting the non-West End Pit production limit; and DEQ did not act reasonably and in accordance with law when it applied the 16/70 calculation to the ambient arsenic air concentration analysis. REC 3712-15.

On remand, the parties submitted expert reports and pre- and post-hearing briefs. The Hearing Officer held a two-day hearing on October 17-18, 2024, where the Parties presented expert testimony. And on January 7, 2025, the Hearing Officer issued the Findings of Fact, Conclusions of Law, and Preliminary Order ("2025 Preliminary Order"). In the 2025 Preliminary Order, the Hearing Officer ruled against Petitioners on all claims related to the analysis of arsenic

emissions from the Stibnite Gold Project, and held that DEQ did not commit reversible error in issuing the Permit for the Stibnite Gold Project. 2025 Prelim. Or. at 21.

Petitioners hereby seek review of the 2025 Preliminary Order.

BASES FOR PETITION

The Hearing Officer erred in the 2025 Preliminary Order, which should be modified, amended, or revoked, and the Permit should be set aside, vacated, and remanded to DEQ, based on the following:

1. The 16/70 adjustment for arsenic is unlawful, sets a dangerous new precedent, and is not supported by the evidence; and

2. Using a five-year rolling average is not reasonable to assess compliance with arsenic limits; and the Permit's conditions are not sufficient to limit production from West End Pit and/or non-West End Pit sources to meet arsenic limits.

Each of these bases are explained in detail in the Memorandum in Support found below.

LEGAL STANDARDS

Petitioners brought this contested case to challenge DEQ's action in issuing the Permit for the Stibnite Gold Project. Under the Idaho Administrative Procedures Act, an agency action like DEQ issuing the Permit will be overturned where its findings, inferences, conclusions, or decisions are: "(a) in violation of constitutional or statutory provisions; (b) in excess of the statutory authority of the agency; (c) made upon unlawful procedure; (d) not supported by substantial evidence on the record as a whole; or (e) arbitrary, capricious, or an abuse of discretion." Idaho Code ("I.C.") § 67-5279(3); *see 917 Lusk v. City of Boise*, 158 Idaho 12, 14 (2015). "An action is capricious if it was done without a rational basis. It is arbitrary if it was done in disregard to the facts and circumstances presented or without adequate determining

principles." *Am. Lung Ass'n of Idaho/Nev. v. Idaho State Dep't of Agric.*, 142 Idaho 544, 547 (2006) (citations omitted).

APPLICABLE AIR RULES & THE STIBNITE GOLD PROJECT

The Air Rules' requirements for controlling the emission of toxic air pollutants ("TAPs") begin with IDAPA 58.01.01.161. Section 161 is the overarching policy or qualitative standard that should be applied to the emission of toxic contaminants, such as arsenic. It provides:

> Any contaminant that is by its nature toxic to human or animal life or vegetation ***must not be emitted in such quantities or concentrations as to alone, or in combination with other contaminants, injure or unreasonably affect human or animal life or vegetation.***

(emphasis added). To obtain a permit to construct an applicant must demonstrate, to the satisfaction of the Department that:

> ***Using the methods provided in Section 210***, the emissions of toxic air pollutants from the stationary source or modification would not injure or unreasonably affect human or animal life or vegetation ***as required by Section 161***. Compliance with all applicable toxic air pollutant carcinogenic increments and toxic air pollutant non- carcinogenic increments demonstrates preconstruction compliance with Section 161 ***with regard to the pollutants listed in Section 585 and 586.***

IDAPA 58.01.01.203.03 (emphasis added). Thus, if a TAP is listed in IDAPA 58.01.01.585 or 586 ("Section 586"), it must be evaluated under the methods provided in Section 210.

Section 586 of the Air Rules consists of a table that lists each carcinogenic TAP that is covered by the rules–including arsenic. Section 586 includes "the screening emissions levels (EL) and acceptable ambient concentrations (AACC)" for each toxic carcinogenic pollutant listed. The EL listed for arsenic is "1.5E-06 lb/hr" and the AACC for arsenic is "2.3E-04 $\mu g/m^3$." The AACC is the carcinogen concentration in air in which daily exposure would limit the risk of cancer to 1 in 1 million over a lifetime, which is identified as 70 years. The AACCs listed in the table in Section 586 are based on "annual averages." IDAPA 58.01.01.586.

Section 210.01 provides that the applicant must first identify what TAPs will be emitted by the project. IDAPA 58.01.01.210.01. Then the applicant must use "standard scientific and engineering principles and practices to estimate the emission rate" of the pollutant. IDAPA 58.01.01.210.02.a. If the EL exceeds the levels listed in Section 586, then the applicant must continue with further analysis under Section 210.

The applicant must then use "the modeling methods provided in Subsection 202.02 to estimate the ambient concentrations at specific receptor sites for any toxic air pollutant emitted from the point(s) of emission." IDAPA 58.01.01.210.03.a. The "point of compliance is the receptor site that is estimated to have the highest ambient concentration of the toxic air pollutant of all the receptor sites . . .." IDAPA 58.01.01.210.03.b. Preconstruction compliance for toxic pollutants can be demonstrated using any of the methods "described in Subsection 210.05 through 210.08 and may use any applicable specialized method described in Subsection 210.09 through 210.12." IDAPA 58.01.01.210.04.

Applicable here are the compliance methods described in Section 210.12, which provides for the use of "T-RACT" to demonstrate preconstruction compliance for toxic pollutants listed in Section 586. T-RACT stands for "Toxic Air Pollutant Reasonably Available Control Technology" and "is an emission standard based on the lowest emission of toxic air pollutants that a particular source is capable of meeting by the application of control technology that is reasonably available, as determined by the Department, considering technological and economic feasibility." IDAPA 58.01.01.210. The applicant must comply with IDAPA 58.01.01.210.13 and 210.14 to first get approval by DEQ to proceed under the T-RACT provisions before it can be used in the modeling. If T- RACT is used, it allows for a comparison of:

> [T]he source's . . . approved T-RACT ambient concentration at the point of compliance for the toxic air pollutant to the amount of the

> toxic air pollutant that would contribute an ambient air cancer risk probability of less than one to one hundred thousand (1:100,000) (which amount is equivalent to ten (10) times the applicable acceptable ambient concentration listed in Section 586).

IDAPA 58.01.01.210.12.b. Thus, if the source's approved T-RACT ambient concentration meets the AACC listed in Section 586 times 10, then "no further procedures for demonstrating preconstruction compliance will be required for that toxic air pollutant as part of the application process." IDAPA 58.01.01.210.12.c. DEQ must then include appropriate conditions in the permit to ensure that the T-RACT is implemented so that the 10-times ambient concentrations can be met. IDAPA 58.01.01.210.12.d.

Section 210 provides one further analysis that has bearing in this case. Section 210.15 provides that "short term" projects "may utilize a short-term adjustment factor of ten (10). "For a carcinogen, multiply either the applicable acceptable ambient concentration (AACC) or the screening emission rate, but not both, by ten (10), to demonstrate preconstruction compliance." IDAPA 58.01.01.210.15. "Short Term Source" is defined as any new stationary source "with an operational life no greater than five (5) years from the inception of any operations to the cessation of actual operations." IDAPA 58.01.01.007.08. Thus, short term sources are also allowed 10 times the AACC, which would represent a 1 in 100,000 cancer risk, as long as the operational source life is no greater than five (5) years.

Neither the AACC arsenic limit, nor the 10-fold higher T-RACT arsenic limit of 0.0023 $\mu g/m^3$, could be met for the Stibnite Gold Project. *See* REC 3710-12. Thus, Respondents adjusted the calculated arsenic emissions by (1) decreasing maximum potential annual mine production from 180,000 tons per day ("T/day") to 135,000 T/day based on a five-year rolling average limit; and (2) decreasing maximum potential annual production from the West End Pit by applying a 50% annual limit. *See id.* Even then, the Project's highest annual average arsenic

concentration of 0.00416 µg/m^3 exceeded the T-RACT limit of 0.0023 µg/m^3. So Respondents came up with and applied the novel 16/70 Project-specific adjustment to the calculated arsenic concentrations: multiplying the calculated highest annual average arsenic concentration of 0.00416 µg/m^3 by 16 and dividing by 70. *See id. See also* REC 1243–44, REC 698–706. This 16/70 adjustment reduced the supposed arsenic concentration to .00095 µg/m^3.

MEMORANDUM IN SUPPORT OF PETITION

I. The 16/70 Adjustment for Arsenic Is Unlawful, Sets a Dangerous New Precedent, and Is Not Supported by the Evidence.

A. The Plain Language of the Air Rules Does Not Allow Using a Project-specific Adjustment Factor.

The Board correctly concluded that the 16/70 Project-specific adjustment factor DEQ used here is "nowhere" found in the rules:

> The Air Rules clearly provide an [acceptable ambient concentration ("AACC")] standard in Section 586. They then clearly provide an adjustment to that AACC standard when T-RACT can be used to control emissions. IDAPA 58.01.01.210.12.b. The Air Rules also clearly allow for a 10-times adjustment to the AACC when a project is going to operate for 5 years or less. IDAPA 58.01.01.210.15. But nowhere in the Air Rules does it provide that a project that will operate more than 5 years but less than 70 years may be adjusted in proportion to the amount of time it will operate.

REC 3715.[2] This should be the end of the story on the 16/70 Project-specific adjustment factor issue.

Ignoring the Board's interpretation of the Air Rules, the Hearing Officer rationalized that adjusting the Stibnite Gold Project based on the 16 years it will operate is appropriate, because the "Air Rules do not expressly preclude" it. 2025 Prelim. Or. at 12 (¶ 48). This was an error.

Neither the Hearing Officer nor DEQ are free to disregard the plain language of the Air Rules, even if they have a supposed rationale for doing so. Agency rules (like the Air Rules) have the full force and effect of law. *See Mead v. Arnell*, 117 Idaho 660, 664–65 (1990). As the Idaho Supreme Court has explained: "We must follow the law as written. If it is socially or economically unsound, the power to correct it is legislative, not judicial." *Herndon v. West*, 87 Idaho 335, 339 (1964).

"Regulations, like statutes, are interpreted according to canons of construction." *Black & Decker Corp. v. C.I.R.*, 986 F.2d 60, 65 (4th Cir. 1993); *see also United States v. Korotkiy*, 118 F.4th 1202, 1209-10 (9th Cir. 2024).

Under the canon of *generalia specialibus non derogant*, when there is a conflict between a general provision and a specific provision, the specific provision prevails. "The canon provides that a 'narrow, precise, and specific' statutory provision is not overridden by another provision 'covering a more generalized spectrum' of issues." *Perez-Guzman v. Lynch*, 835 F.3d 1066, 1075

[2] The Board emphasized this point at its Special Meeting:

> Idaho rules are not ambiguous. There is an acceptable risk associated with the AACC standard. There is an acceptable risk associated with DEQ-approved T-RACT projects, and there is an acceptable risk associated with the short-term project that is five years or less. There are no other acceptable risks identified in Idaho's air quality rules.

May 1, 2024 BEQ Special Meeting, TR 0160.

(9th Cir. 2016) (quoting *Radzanower v. Tourche Ross & Co.*, 426 U.S. 148, 153–54 (1976)). "[T]he assumption being that the more specific of two conflicting provisions 'comes closer to addressing the very problem posed by the case at hand and is thus more deserving of credence.'" *Perez-Guzman*, 835 F.3d at 1075 (quoting Antonin Scalia & Bryan A. Garner, Reading Law: The Interpretation of Legal Texts 183 (2012)). The Idaho Supreme Court applies this canon. *See Tomich v. City of Pocatello*, 127 Idaho 394, 400 (1995); *Mickelsen v. City of Rexburg*, 101 Idaho 305, 307 (1980).

Again here, Air Rules Section 203.03 requires "no permit to construct shall be granted" unless DEQ determines that the applicant has shown: "Using the methods provided in Section 210, the emissions of toxic air pollutants from the . . . source . . . would not injure or unreasonably affect human health or animal life or vegetation as required by Section 161." (emphasis added). To protect human health, Section 586 sets a numeric arsenic AACC limit at an annual average of 0.00023 $\mu g/m^3$. Section 210 creates two specific exceptions to meeting the AACC (which is an annual emissions factor), allowing a 10-fold higher AACC where the applicant makes a T-RACT demonstration (Section 210.12) and/or where a project is short-term (5 years or less) (Section 210.15). These specific, numerical provisions in Sections 586 and 210 cannot be disregarded to fall back on a more general, qualitative standard in Air Rule Section 161, which provides that a toxic air pollutant "shall not be emitted in such quantities or concentrations as to alone, or in combination with other contaminants, injure or unreasonably affect human or animal life or vegetation." REC 3419.

Nor can the explicit AACC annual average value listed in Section 586 be ignored by reverse engineering cancer risk calculations, as DEQ and Perpetua now say they are doing. This method is nowhere found in the "methods in Section 210" and has never been used by DEQ

before. *See* REC 1194 (Schilling memo admitting this is "a complete change in the regulatory approach used to demonstrate compliance with toxics," and it "abandons the Section 210 approach"). Section 210 sets forth clear and straightforward methods for checking a source's annual arsenic concentration against the annual arsenic value listed in Section 586 (or 10 times that value for T-RACT, like for the Stibnite Gold Project, and short-term sources).

Instead of using these methods in Section 210, DEQ abandoned this approach and came up with a new method that does not use the highest modeled annual arsenic concentration, but averages 16 years of emissions over 70 years, to compare them to 10 times the AACC. This is a fabrication. This is not a cancer risk assessment. von Lindern Test., TR. 434-35, 465. And Respondents–during the three years of permit development and two years of this contested case proceeding–never, until now, consulted a toxicologist on whether spreading out the Project's arsenic emissions and cancer risk over 70 years was appropriate. Paden Test., TR 154; Lopez Test., TR 234. DEQ must follow Section 210 and compare the annual average arsenic concentrations from the Stibnite Gold Project to the T-RACT adjusted AACC listed Section 586. *See* IDAPA58.01.01.210.12.

Another canon of construction requires interpreting regulations to avoid rendering provisions superfluous—which is what DEQ's approach here does to the Air Rules's explicit short-term source adjustment for projects that last 5 years or less. "A statute should be construed so that effect is given to all its provisions, so that no part will be rendered superfluous or insignificant." *Brown v. Caldwell Sch. Dist. No. 132*, 127 Idaho 112, 117 (1995). Again, Section 210 specifically provides for AACC adjustments for in two situations: projects that have demonstrated T-RACT; and short-term five-year-or-less projects. DEQ cannot just make up a third adjustment found nowhere in the Rules. This is especially so since there is already an

adjustment in the Air Rules for short-term sources for which everyone agrees the Stibnite Gold Project does not qualify. If DEQ can adjust AACCs based on project duration, as it has done here, then the short-term adjustment in Section 215 is superfluous. DEQ's interpretation cannot stand.

Thus, the 16/70 adjustment is not allowed by the plain language of the Air Rules and must be rejected, whether or not DEQ or Perpetua can offer any rationale for using it.

B. The 16/70 Approach Undermines the Air Rules, Creates a Dangerous Precedent for Idahoans, and Allows Higher Cancer Risk.

Not only does the plain language of the Air Rules foreclose DEQ's approach, but this approach is contrary to the intent of the Air Rules and would create a dangerous precedent allowing Idahoans to be exposed to *higher* cancer risks than under DEQ's longstanding pre-Stibnite Gold Project interpretation of the Air Rules: where TAPs values listed in Section 586 are annual limits, or increments, that must be met by a source every year of emissions. The Hearing Officer completely ignored this regulatory framework and erred in finding that Respondent's ad-hoc approach to assessing compliance with Section 586 was valid.

Around the time of the TAPs rulemaking, a number of concerns were raised about creating exceptions for short term sources, even for remediation projects being undertaken to clean up the environment. *See* REC 6055-56 (Tiedemman Decl. ¶¶ 18–21). Health concerns were raised about exposing people to a large dose of carcinogen during short periods. REC 6071-84 (*Id.* at Exh. A). Health concerns were raised about the risk of "combined and synergistic effect of many short term . . . or other sources . . . and the potential of serial (one after another) short term . . . sources," the risk of creating an "incentive for facilities to argue they will be short-term," and the risk of a "spectre of serial short-term sources." REC 6086 (*Id.* at Exh. B).

The Idaho Department of Health and Welfare ("IDHW"), DEQ's predecessor agency, echoed these concerns in response to comments, stating that for the TAPs it "strived to take a balanced approach taking into account the needs of industry to operate and the need to protect human health and the environment." REC 6056-57 (Tiedemann Decl. 21); *see also* REC 4298, 4300-02 (Lopez Decl., Memo in Supp. at 8, 10–12) (citing the same IDHW response to comments). IDHW added: "Since it is not possible to account for such real life factors as lifetime exposures, additive or multiplicative effects of exposures to the large variety of industrial chemicals in use in Idaho, it is necessary to make our emissions standards generally applicable and reasonably conservative." REC 6057 (Tiedemann Decl. 21). This was reflected in Dr. von Lindern's testimony, who was involved during TAPs Rule rulemaking, testified as to his recollection from those hearings confirmed that "one of the main objectives of developing the TAPs – these rules was to avoid risk assessment." von Lindern Test., TR 416. This is also reflected in the Air Rules, which include specific adjustments for T-RACT and short-term sources but are otherwise generally applicable to all sources—including the Stibnite Gold Project.

Under DEQ's longstanding, pre-Stibnite Gold Project precedent in applying the TAPs Rule, Idahoans are better protected from these risks. Because the AACCs are increments (as opposed to ambient air quality standards), Section 586 "would not account for the cumulative lifetime exposures associated with the earlier projects in a new source [permit to construct] application, and are not allowed to consider risk associated with those earlier projects. At Stibnite, for example, should [Perpetua] apply to open another pit at the mine, DEQ would be required to ignore the cumulative lifetime risk and cancer burden imposted by the proposed

[Stibnite Gold Mine] 16-year [life of mine] scenario." REC 6121 (von Lindern Decl. 48); *see also* REC 6121-24 (*Id.* at ¶¶49-52).

As Dr. von Lindern and Mr. Tiedemann showed, where the AACC values are treated as limits, or increments, that must be met by sources in Idaho every year, no single source nor any combination of sources will expose an Idahoan to more than the AACC concentration (or 10 times the AACC concentration for T-RACT or short-term sources) at any time over their 70-year life, no matter how many sources they might encounter or where they might encounter them in the state; and accordingly, the cancer risk over that entire 70 years will not exceed the applicable cancer risk (1 in 1 million, or 1 in 100,000 for T-RACT or short-term sources). *See* REC 6109-13 (Dr. von Lindern Decl. ¶¶ 21–29); REC 6060-62 (Tiedemman Decl. ¶¶ 28–29).

"That's the way TAPs has been implemented [on] every other project that's been done in Idaho to date." von Lindern Test., TR 421.

By contrast, under DEQ's approach, Dr. von Lindern explained that it:

> would concentrate 70 years of cumulative risk . . . into . . . however many years you're adjusting that project, whether it be six years or 16 years or something like that. * * * I understand from their interpretation that you could apply this risk factor to as low as 6 over 70. * * * [For a 16-year project,] [t]hey would they completely used their entire lifetime exposure by the end of adolescence.

von Lindern Test., TR 421-423.

Furthermore, Idahoans could be exposed to one source (like the Stibnite Gold Project) at levels higher than the listed AACC values, and then be exposed to additional sources during the rest of their life such that the cancer risk over their life exceeds the Air Rules risk levels. *See* REC 6120 (Figure 4 of von Lindern Decl.). Dr. von Lindern testified that because the AACC is an "incremental standard," "DEQ is not allowed to consider past exposures. The next project gets

another full boat of lifetime exposure. [in the 6 year] example, by age 12, you're twice the amount. By age 18, you're three times your total cumulative lifetime exposure." von Lindern Test., TR 443. For example, DEQ and Perpetua have modeled the Stibnite Gold Project to result in 0.00416 μg/m^3 average annual arsenic concentration. REC 0361 (Pet'rs' Mot. Summ. J.) (explaining how to reverse the 16/70 adjustment); REC 3876 (Paden Decl. 9). This is *181 percent* of the T-RACT adjusted AACC for arsenic of 0.0023 μg/m^3. REC 0361 (Pet'rs' Mot. Summ. J.). If a person were exposed to 0.00416 μg/m^3 of arsenic for 16 years, and then were exposed to another arsenic source(s)—even if that source complied with but was close to the T-RACT adjusted AACC value—then that person will have more than a full allowable 70-year exposure to arsenic and corresponding cancer risk.

> The TAPs rule is health protective if properly implemented. Applying risk averaging through the use of the 16/70 Project-specific adjustment factors eliminates the [margin of safety] and substantially increases cancer risk, especially considering the incremental nature of the rule.

REC 6122 (von Lindern Decl. 50). As the Board stated:

> There is an acceptable risk associated with the AACC standard. There is an acceptable risk associated with DEQ-approved T-RACT projects, and there is an acceptable risk associated with the short-term project that is five years or less. There are no other acceptable risks identified in Idaho's air quality rules.

TR 0160. The 16/70 Project-specific adjustment factor creates a misleading risk analysis that greatly underestimates actual cancer risk.

C. DEQ's & Perpetua's Cancer Risk Assessment is Not Scientifically Valid and Fails to Show that the Stibnite Gold Project Is Equally or More Protective of Human and Animal Life and Vegetation

The Board not only faulted DEQ for using the 16/70 Project-specific adjustment factor because that approach is nowhere found in the Air Rules, but it also faulted DEQ for failing to

show that the 16/70 adjustment factor was sufficiently protective of human health and the environment:

> The arsenic analysis performed by DEQ must be viewed within the wider lens of IDAPA 58.01.01.161 and 203 which require that toxic pollutants must "not be emitted in such quantities or concentrations as to alone, or in combination with other contaminants, injure or unreasonably affect human or animal life or vegetation." see also IDAPA 58.01.01.203.03. The Board of Environmental Quality has not found sufficient evidence in the record to convince it that the 16/70 analysis performed by DEQ was equally or more protective of human and animal life and vegetation as what is provided for by the Air Rules. Therefore, the Board of Environmental Quality remands this matter back for the development of further evidence regarding the ambient air concentrations of arsenic that will be produced by the [Stibnite Gold Project] and whether those levels comply with the Air Rules.

REC 3716-17. Even if the Hearing Officer determines that compliance with the TAPs rule can be accomplished through an excess cancer risk assessment, Respondents have failed to show that the 16/70 Project-specific adjustment factor is a scientifically valid risk assessment, that they followed any scientifically valid risk assessment protocol, and that application of their simple equation to the Stibnite Gold Project emissions accounts for the total health risk the Project will create.

1. Respondents 16/70 Project-specific adjustment factor is not scientifically valid and it does not follow any standard risk assessment protocol.

The Hearing Officer found that using a project-specific adjustment factor was reasonable "because doing so is standard EPA practice." 2025 Prelim. Or. at 9. Testimony from Respondents' toxicologists, Dr. Paden and Ms. Lopez, failed to establish that application of the 16/70 Project-specific adjustment factor to arsenic emissions is a scientifically valid method for assessing excess cancer risk for this Project.

Both Dr. Paden and Ms. Lopez relied on EPA guidance for their cancer risk assessments that was specifically developed "to provide a recommended approach for developing the information necessary to assist risk assessment and risk management decision-making at waste sites . . . .". REC 5257 (EPA's Risk Assessment Guidance for Superfund); *see* REC 3876-79 (Paden Decl. ¶¶ 11-15); REC 4305-08 (Lopez Decl., Memo. in Supp., Attach. B) (providing calculations of risk associated with air concentration using equations from EPA's superfund guidance). The 16/70 Project-specific adjustment factor is "a classic example of dose-averaging in risk analyses applied to contaminated hazardous waste sites," but an inappropriate technique to use when the Air Rules provide for increments. REC 6117 (von Lindern Decl. 42). There are no provisions in the Air Rules and no evidence was presented from federal Clean Air Act guidance or otherwise that provides for adjusting toxic air pollutant exposure concentration in assessing compliance with increments, as DEQ has done.

Ms. Lopez's testimony relied on one statement from Appendix A, titled "Major Default Options," from EPA's 2005 Guidelines for Carcinogen Risk Assessment[3] to justify applying the 16/70 Project-specific adjustment factor. Lopez Test., TR 221-22. However, reading from several areas of the document, Dr. von Lindern testified that the document as a whole demonstrates that dose-averaging is not a standard practice, and does not support applying an exposure duration adjustment to assess cancer risk for this project. von Lindern Test., TR 424-429.

A true risk assessment is comprehensive and multi-variable. For states that require a cancer risk assessment for evaluating the emissions of toxic air pollutants, considering the total daily intake of a toxic air pollutant attributable to the source as well as the background sources is standard practice. REC 6132 (von Lindern Decl. ¶¶ 74); *see* REC 6235-68 (*Id.*, Exh. C (State of Washington Department of Ecology Guidance Document)); Pet'r's Post-Hearing Brief at 13.

[3] This document was offered into evidence at the October 17-18, 2024 OAH Hearing at Ex. 221.

Other standard practices include considering uncertainties in emissions and modeling, interactive effects of exposure to more than one carcinogen, and others.

For example, the State of Washington requires "health impact assessments" (HIA) for some sources of toxic air emissions. REC 6251-6262 (von Lindern Decl., Exh. C (DEC Guidance)). According to the Washington Department of Ecology, the techniques in its guidance manual "are common to other regulatory risk assessment applications." REC 6251 (von Lindern Decl., Exh. C*)*. "An HIA looks at how emissions of toxic air pollutants from a specific project will affect public health. It involves several steps, including hazard identification, exposure analysis, toxic response, and risk characterization." *Id.*

For an HIA, the applicant must disclose the total daily intake of TAPs attributable to the source "as well as the background sources." REC 6253 (*Id.* at 19). The applicant must estimate exposure durations, "[d]etail the exposure parameters associated with sensitive population subgroups," "[i]dentify the potentially exposed populations," and "[g]ive special emphasis to any subpopulations that might be unusually susceptible to any TAPs emitted by your project." *Id.* In the risk/hazard assessment section, the applicant must also include a toxicity discussion, which should discuss: toxic effects of the TAPs; exposure levels associated with specific effects; exposure patterns and duration of exposure; any quantitative, chronic toxicity values (including hazard-based concentrations, cancer unit risk factor estimates, and slope factor or carcinogenic potency estimates); and any quantitative intermediate and short-term acute toxicity values. *Id.*

For an HIA, the applicant must also provide risk/hazard information, including a qualitative discussion of the risks; quantitative discussion of the risks with toxicity measures, calculated cancer risks, and the hazard index; discussion of uncertainties in the risk assessment; discussion of acceptability of risk; and discussion of extent to which the proposed facility might

affect human health. REC 6253-54 (*Id.* at 19–20). Applicants are to disclose uncertainties of their risk assessment, including: uncertainty in emission estimates; uncertainty in air dispersion models; interactive effects of exposure to more than one carcinogen or toxicant; uncertainty in exposure estimates; and uncertainty about the extent of toxicant susceptibility variation within populations. REC 6254 (*Id.* at 20).

Respondents' toxicologists' assessments were based on a single emissions calculation, not performed by either toxicologist but provided to them by Respondents, and without a full understanding, how the emissions calculation were derived. *See generally* REC 3873-3916 (Paden Decl.); REC 4277-4318 (Lopez Decl.); *see also* Paden Test., TR 156; Lopez Test., TR 234. Furthermore, their declarations lack most of these common risk assessment techniques, including uncertainties in emissions and modeling, and interactive effects of exposure to more than one carcinogen, among others identified above. *See generally* REC 3873-3916 (Paden Decl.); REC 4277-4318 (Lopez Decl.). The Hearing Officer's finding that Respondents' cancer risk assessments followed standard EPA practice and were scientifically valid and complied with the Air Rules was wrong.

2. DEQ and Perpetua Fail to Account for Combined Effects of Other Carcinogens as Required by Air Rule Section 161

Air Rule Section 161 requires protection from toxic pollutants like arsenic from a source both alone and "in combination with other contaminants." But neither DEQ nor Perpetua factored in exposure to other contaminants, either during the 16-year Stibnite Gold Project, or any other time during someone's lifetime. They only consider arsenic from the Stibnite Gold Project. The Stibnite Gold Project will itself emit other toxic and hazardous air pollutants. REC 433-44 (table of TAP/HAP emissions). Idahoans may already be exposed to background concentrations of other contaminants. And as already explained, someone exposed to the Stibnite

Gold Project might be exposed to other sources of arsenic and other contaminants throughout the other 54 years of their 70 year life. But these exposures are not accounted for in the risk assessments. *See* REC 3873-3916 (Paden Decl.); REC 4277-4318 (Lopez Decl); REC 6137 (von Lindern Decl. 90).

3. DEQ and Perpetua Fail to Account for Sensitive Populations, Mutagenic MOA, and Non-carcinogenic Risk

The cancer risks DEQ and Perpetua calculated fail to account for the health risks of short-duration, high exposure to arsenic for sensitive populations, including pregnant women, the fetus, and pre-school children, who accumulate dose and risk at high rates. REC 6117-18 (von Lindern Decl. ¶¶ 40–44).

DEQ and Perpetua also failed to consider mutagenic modes of action (MOA). While this is not definitively settled, and current EPA policy does not require accounting for this, there is evidence suggesting that arsenic in combination with other co-stressors has shown mutagenic MOA. REC 6135-36 (*Id.* 84). As such, a comprehensive risk assessment would use age dependent adjustment factors, *id.*, which neither DEQ nor Perpetua has done.

DEQ and Perpetua also failed to consider non-carcinogenic arsenic health effects, especially to children. *See* REC 6136-37 (*Id.* ¶¶ 85–88). Non-carcinogenic arsenic health effects can become the risk driver at sites where children may ingest, in addition to inhaling, arsenic laden dusts. REC 6136 (*Id.* 85. Incidental ingestion of mining-related fugitive dusts is the major exposure route for heavy metals in mining communities in Idaho. REC 6136-37 (*Id.* ¶ 88.)

In summary, each of the problems above would be avoided by treating the AACCs limits that must be met by source each year of operations, as DEQ had always done prior to the Stibnite Gold Project. These problems—the disregard for the Air Rules as written, the dangerous precedent, and the underestimation of cancer risk from the Stibnite Gold Project—are all

amplified by DEQ's use of the five-year rolling average and its treatment of production from the different mining pits, discussed in the next section.

II. The Hearing Officer erred in finding that using a five-year rolling average was reasonable to assess compliance with Section 586, and that Permit conditions were sufficient to limit production from West End Pit and/or non-West End Pit sources.

The Board unequivocally determined that the Section 586 AACCs were "limits;" those limits were "based on annual averages;" and that Section 586 required compliance on an annual basis. REC 3717. The Board held that the Permit "conditions were inadequate to ensure that the 135,000 T/day used in the ambient arsenic air concentration analysis would not be exceeded for some portion of the five-year rolling period." REC 3713. The Hearing Officer disregarded the Board's findings, and made a fatal error in his analysis that the total emissions over the 16 years the mine would operate spread out for 70 years. 2025 Prelim. Or. at 16-17 (¶¶ 84-89). This error was propagated in the Hearing Officer's finding that the Permit conditions limiting total life-of-mine production and total West End Pit production effectively decreased modeled arsenic impacts "further and further below the [AACC]." *Id.* at 19-20 (¶¶ 107-115).

Permit Condition 3.5 limits daily production to a total of 180,000 T/day, with a five-year rolling average of 135,000 T/day. REC 385. DEQ's permit writer, Mr. Schilling, confirmed that using a five-year rolling average was inappropriate for calculating the annual average arsenic concentration because the permit conditions do not restrict Perptua from having several years of maximum production of 180,000 T/day when the five-year average is at or below 135,000 T/day:

> *Idaho Air Rules* Section 586 state that AACCs are annual averages. The implication of the stated issue is that when a standard or increment is specified for a certain averaging-period, then any limits imposed on operations should be for the same averaging period or a shorter averaging period. For example, an operational limit designed to limit emissions that is based on a 5-year averaging period would not be adequate for assuring compliance with the annual average standard. ***This is because variability in***

> ***operational rates within the 5-year operational period could result in a violation of the annual standard*** while still complying with the five-year operational limit in the period.

REC 3925 (Schilling Decl. ¶24 (emphasis added)); *see also* Schilling Test., TR 61; Pet'rs' Post-hearing Statement at 18-19. This should have been the end of the inquiry and confirms the Board's finding that there is "no evidence in the record explaining how the five-year rolling average comports with the annual AACC limits." REC 3713.

In an attempt to demonstrate that even with 180,000 T/day annual average production, the Project will not exceed the arsenic AACC, Respondents' expert, Mr. Lewis used the wrong starting numbers. Mr. Lewis's back-of-the-envelope calculation indicated that 180,000 T/day production was approximately 33.3% higher than 135,000 T/day production, and therefore emissions would be correspondingly higher (0.00095 μg/m^3 versus 0.00126 μg/m^3), but still be below the 0.0023 μg/m^3 AACC in Section 586. Lewis Test., TR 287-89[4]. However, Mr. Lewis used the wrong starting numbers by using 0.00095 μg/m^3–the emissions calculations that had been adjusted by the 16/70 adjustment factor, which is for purposes of assessing excess cancer risk, and not compliance with Section 586. The Hearing Officer continued this error in his decision. *See* 2025 Prelim. Or. at 17 (¶ 91).

"[N]owhere in the Air Rules does it provide that [emission calculations for a project] may be adjusted in proportion to the amount of time it operates." REC 3715. Therefore, the appropriate number to compare to the AACC is 0.00095 μg/m^3 with the adjustment factor backed out of it:

[4] *See also* Exhibit 222, which was admitted as evidence at the October 17-18, 2024 OAH Hearing.

$$0.00095\ \mu g/m^3\ (70/16) = 0.00416\ \mu g/m^3$$ [5]

The emissions calculation for the five-year rolling average with the Project-specific adjustment factor thus is and always was above the AACC limit, as will be the arsenic emissions at 180,000 T/day production, just 33.3% higher (0.0055 $\mu g/m^3$). The Hearing Officer's holding, then, that neither the 135,000 T/day five-year rolling average nor the 180,000 T/day production limit exceed the AACC is wrong.

Moreover, the Hearing Officer's erred in his analysis of the West End Pit production issue. First, he erred in finding that "the highest modeled annual average arsenic concentration was 0.00414 $\mu g/m^3$." *See* 2025 Prelim. Or. at 10 (¶ 28). The highest modeled emission scenario (or, using the language of Section 586, the maximum annual average) is based on the highest amount of production given conditions or limitations in the Permit. Lewis Test., TR 266-67. The Permit conditions relevant to emissions calculations in this case are (1) Permit Condition 3.5, which provides for a maximum production of 180,000 T/day, with a five year rolling average of 135,000 T/day, and (2) Permit Condition 3.6, which limits the life of mine maximum production to 788.4 million tons, with a maximum of 50%, or 394.2 million tons from the West End Pit. REC 385. Notably, the Board already found that Permit Condition 3.6 does not limit the annual production from the West End Pit to 50% production (e.g., 90,000 T/day with a five-year rolling average of 67,500 T/day), but just the total life of mine production to 50%. REC 3713 n.7 (stating that Condition 3.6 "does not provide a limitation on the daily amount of hauling that could occur [from the West End Pit].").

Consideration of the total possible production from the West End Pit in determining the maximum annual arsenic concentration is important because its geography and prevailing wind

[5] This is the number that both Respondents' experts used in their excess cancer risk assessment. REC 4284 (Lopez Decl. 24); REC 3876 (Paden Decl. 9).

resulted in "the highest modeled impacts to receptors at the [Project] boundary came from emissions for the [West End Pit] area." 2025 Prelim. Or. at 19 (¶¶ P101-04). There is no theoretical limit, i.e., permit condition, that limits West End Pit production, and DEQ's own expert witness confirmed that there is no practical limit. In other words, 100% West End Pit production is a realistic possibility:

> You just don't mine from all of [the pits] the same amount at the same time. . . . [A]s the mine develops, . . . you might start out at the Yellow Pine Pit and then, you know, move over to the West End Pit.

Lewis Test., TR 261. Therefore, under Permit Condition 3.6 that limits West End Pit production to half the total ore production–to 384.2 million total tons–at a maximum five-year rolling average of 135,000 T/day, Perpetua could produce and haul ore exclusively from the West End Pit for eight years, with five of those years possibly reaching up to 180,000 T/day. *See* Pet'rs' Post-hearing Statement at 20-21.

But that is not the scenario considered when emissions were calculated to be 0.00416 μg/m^3. Dr. von Lindern testified that the 0.00416 μg/m^3 is calculated by averaging the average of seven non-West End Pit emissions scenarios with the one West End Pit emission scenario,[6] and this averaging technique worked to reduce the apparent emissions by a factor of 1.7. REC 6129 (von Lindern Decl. 67).

---

[6] $\dfrac{\dfrac{(0.00124 + 0.00206 + 0.00123 + 0.00102 + 0.00228 + 0.00082 + 0.00090)}{7} + 0.00698}{2} = 0.00416$

The emissions calculations for the different production scenarios are represented as five-year rolling averages, and are found in Table C: TAP Maximum Modeled Concentrations and Applicable AACs. This document was admitted into evidence at the October 17-18, 2024 OAH Hearing as Exhibit 304.. The first seven emissions calculations are for different scenarios of 100% non-West End Pit production. The 0.00698 μg/m^3 value is for a 100% West End Pit production scenario. von Lindern Test., TR 458-459; Lewis Test., TR 311-12.

The record documents and testimony show that the annual average arsenic concentration based on a 135,000 T/day five year rolling average is 0.00698 μg/m^3. October 17-18, 2024 Hearing, Exh. 304; *see* Petr's Post Hearing Statement at 21-23. Using Respondents' back-of-the-envelope calculation that emissions from 180,000 T/day will be 33.3% higher than from 135,000 T/day, Lewis Test., TR 287-89, the highest annual average arsenic emissions are estimated to be 0.0093 μg/m^3–significantly higher than Section 586's AACC for arsenic of 0.0023 μg/m^3. Neither Perpetua nor DEQ has yet to date calculated the highest annual average arsenic emissions. Lewis Test., TR 283-84.

Because Respondents' dose-averaging excess cancer risk assessment (if accepted as a valid method) is based on 0.00414 μg/m^3–emissions that do not represent the highest maximum modeled emissions[7]–Respondents' conclusion that the Project will not increase cancer risk above 1 in 100,000 are not reliable. The Board should eschew Respondents' mathematical tricks that only serve to hide the true threat to public health, reject the Hearing Officer's conclusions that DEQ acted reasonably in determining the Project's maximum annual average arsenic emissions, and send the Permit back to DEQ for re-evaluation.

CONCLUSION

Respondents' post-hoc excess cancer risk "assessment," concocted after comments from Petitioners' on three draft permits over three years, and after an additional two years of contested case proceedings, and hidden from public scrutiny, is a farce. The Hearing Officer's Preliminary Order flies in the face of findings made by this Board in its May 9, 2024 Final Order, creates ad-hoc rules found nowhere in DEQ regulations, is unreasonable and ignores much of the scientific evidence before it, and is dangerous for public health and damaging precedent for clean air. The Board should therefore hold unlawful and set aside the Permit and should remand to

[7] *See* REC 4284 (Lopez Decl. 24); REC 3876 (Paden Decl. 9).

DEQ to either deny the Permit or to issue a Permit that complies with the Air Rules and the Board's orders.

Petitioners' request the Board hold a hearing on this Petition.

Attorney for Save the South Fork Salmon

BEFORE THE BOARD OF ENVIRONMENTAL QUALITY
STATE OF IDAHO

IN THE MATTER OF AIR QUALITY PERMIT TO CONSTRUCT P-2019.0047	)	Agency Case No. 0101-22-01
	)	OAH Case No. 23-245-01
NEZ PERCE TRIBE, IDAHO CONSERVATION LEAGUE, and SAVE THE SOUTH FORK SALMON	)	**PETITIONER SAVE THE SOUTH FORK SALMON'S MOTION FOR RECONSIDERATION BASED ON NEW EVIDENCE**
Petitioners,	)	
v.	)	
IDAHO DEPARTMENT OF ENVIRONMENTAL QUALITY,	)	
Respondent,	)	
and	)	
PERPETUA RESOURCES IDAHO, INC.	)	
Intervenor-Respondent.	)	

Petitioner Save the South Fork Salmon ("SSFS") hereby moves the Idaho Board of Environmental Quality (the "Board") for reconsideration of the Board's May 9, 2024 Final Order regarding the issue of whether the Stibnite Road Access Route was appropriately excluded from ambient air protections in the permit to construct the Department of Environmental Quality ("DEQ") issued to Perpetua Resources Idaho ("Perpetua"). Specifically, the U.S. Forest Service's January 3, 2025 Final Record of Decision for the Stibnite Gold Project, and supporting documents, provide relevant new information that address the issue of whether Perpetua has legal control to preclude public access from the Stibnite Road Access Route.

On June 12, 2024, the Board issued an Order on petitions for Reconsideration and/or Clarification of Final Order, which stayed the statutory deadlines under Idaho Code ("I.C.") § 67-5246 for the May 9, 2024 Final Order until other issues (ambient arsenic concentration) remanded back to the Hearing Officer were resolved. REC 3840 (stating the Board "will stay issuance of a final order on all five issues until the remand before the Hearing Officer is complete and all statutory deadlines for review of the Hearing Officer's Orders have run."). This Motion for Reconsideration is timely brought under Idaho Code §§ 67-5246, 67-5276 and IDAPA 04.11.01.740.

BACKGROUND

In this contested case, Petitioners Nez Perce Tribe, Idaho Conservation League, and Save the South Fork Salmon challenge the Idaho Department of Environmental Quality's ("DEQ" or "Department") approval of a permit to construct issued to Perpetua Resources Idaho, Inc. ("Perpetua") for the proposed Stibnite Gold Project (the "Project"): a massive open-pit mine in Valley County, Idaho.

On June 17, 2022, DEQ issued permit to construct P-2019.0047 (the "Permit"), which is the Permit at issue in this contested case. On July 22, 2022, Petitioners timely filed the original Petition to Initiate Contested Case. One of the claims Petitioners raised was that DEQ acted unreasonably and not in accordance with the law when it determined, without specific evidence, that Perpetua would have legal control of the Stibnite Road Access Route (the "Route") such that it could exclude the Route from ambient air.

After briefing and a hearing on cross-motions for summary judgment in front of the Board, on May 9, 2024, the Board issued a Final Order, ruling in Petitioners' favor on one issue, and ruling against Petitioners on four other issues, including the ambient air boundary issue. *See* REC 3695-3719. Specifically, the Board held that in assessing whether to include the Stibnite Road Access Route within the ambient air boundary, it was reasonable–in the absence of other evidence in the record–for DEQ to rely on Perpetua's representations in its application form that it would have legal control over the Route's access. REC 3701.

The Board recognized that the absence of evidence in the record as to whether the Forest Service would require continuing public access over the Route was due to the federal environmental review process under the National Environmental Policy Act not being completed, and no final decision by the Forest Service had been made. REC 3700. At the hearing, DEQ recognized that "should the [Forest Service] ultimately require public access through the [Stibnite Gold Project], the ambient air boundary analysis will have to be reevaluated." REC 3700 (citing TR 0080 (March 14, 2024 Board Hearing at 88-89)).

On June 12, 2024, the Board issued an Order on Petitions for Reconsideration and/or Clarification of Final Order, ruling it "will stay issuance of a final order on all five issues until

the remand before the Hearing Officer is complete and all statutory deadlines for review of the Hearing Officer's Orders have run." REC 3840.

MEMORANDUM IN SUPPORT

1. The Forest Service's decision leaves the Stibnite Road Access Route open to public use; it does not allow Pereptua to preclude public access.

On January 3, 2025, the Forest Service completed the environmental review process and issued a Final Environmental Impact Statement ("FEIS") and Record of Decision ("ROD"). The Forest Service's final decision documents unequivocally establish that the Stibnite Road Access Route is for public use and that Perpetua does not have absolute legal authority to preclude such use:

- Stibnite Road connects to Thunder Mountain Road on the southeastern portion of the Stibnite mine site and currently provides public access through the mine area. Thrower Decl., Exh. 2 at 3-423.

- A new 12-foot-wide gravel road will be constructed **to provide public access from Stibnite Road (FR50412) to Thunder Mountain Road (FR 50375) through the Stibnite Gold Project.** During operations, the public access road will be used to travel through the Stibnite Gold Project and will provide seasonal use, open to all vehicles. Thrower Decl., Exh. 1 at 74 (Table 6) (emphasis added).

- During operations, the public access road through the Operations Area Boundary[1] would provide seasonal use, open to all vehicles; access would not be provided in winter when impassable (current county maintenance standards) and signs would inform the public of seasonal and temporary closures. Public vehicles passing through would be required to check-in with mine personnel at the North or South SGP entry points and would receive a safety briefing and would also be required to check-out with the SGP personnel upon exhibiting the SGP. For safety purposes, public access would be separated from other SGP roads by berms, security fencing, and the underpass to allow the public road to pass beneath the mine haul road. Thrower Decl., Exh. 2 at 2-20.

[1] The Operations Area Boundary is identical to the ambient air boundary defined in the Permit. REC 0415 (Statement of Basis Permit to Construct No. P-2019.0047, June 17, 2022).

These documents establish that: (1) the Stibnite Road Access Route will be constructed primarily to provide public access through the mine site; (2) the road will be open to "all vehicles" seasonally in a similar manner to current county maintenance standards; (3) the Route for public access will be separated from other mine roads and features where the public will not be allowed to access; and (4) although Perpetua has control to impose safety restrictions on the Route, the Route is open for public use. Consequently, although Perpetua has control to restrict public access for safety purposes, it does not have control to preclude public access completely.

2. Without legal control to preclude public access, and consistent with EPA policy, DEQ guidance, and the Clean Air Act, DEQ cannot exclude the Stibnite Road Access Route from ambient air.

As discussed in Petitioners' briefs before the Board on the Parties' cross-motions for summary judgment, REC 339-43; REC 2336-40, the Clean Air Act's regulatory definition of ambient air, 40 C.F.R. 50.1(e), EPA's long-standing policy on ambient air, REC 1138-49, and DEQ's guidance, REC 1096, 1109-10, establish that air within a facility's boundaries is ambient air unless the facility can demonstrate that *public access is precluded*. In its final decision, the Forest Service has decided that public access is granted--*not precluded*. The Forest Service's decision requires Perpetua to leave the Stibnite Road Access Route open to public access through the mine site and only authorizes Perpetua to restrict or control access based on safety reasons. [cite]. Because public access is not precluded,the Stibnite Road Access Route must receive ambient air protections. Petitioners refer the Board to their briefs on cross-motions for summary judgment on the issue. REC 339-43; REC 2336-40.

CONCLUSION

Based on new information in the Forest Service's decision documents for the Stibnite Gold Project, the Board should remand the Permit back to DEQ for reconsideration of the ambient air boundary analysis.

Dated January 24, 2025

Attorney for Save the South Fork Salmon

BEFORE THE BOARD OF ENVIRONMENTAL QUALITY
STATE OF IDAHO

IN THE MATTER OF AIR QUALITY PERMIT TO CONSTRUCT P-2019.0047	)	Agency Case No. 0101-22-01 OAH Case No. 23-245-01
NEZ PERCE TRIBE, IDAHO CONSERVATION LEAGUE, and SAVE THE SOUTH FORK SALMON Petitioners, v. IDAHO DEPARTMENT OF ENVIRONMENTAL QUALITY, Respondent, and PERPETUA RESOURCES IDAHO, INC. Intervenor-Respondent.	)	**DECLARATION OF JULIA THROWER**

I, JULIA THROWER, hereby declare as follows:

1. The following facts are personally known to me, and if called as a witness, I could and would competently testify thereto. I am over eighteen years of age.

2. I am counsel of record representing Petitioner Save the South Fork Salmon in this matter.

3. The attached Exhibits 1-2 are true and correct copies of the following documents, which were obtained online from the Payette National Forest Stibnit Gold Project EIS website: https://www.fs.usda.gov/project/?project=50516.

4. Exhibit 1 contains an excerpt of the U.S. Forest Service, Payette and Boise National Forests, Final Record of Decision, Stibnite Gold Project, Valley County, Idaho (January 2025).

5. Exhibit 2 contains excerpts from the U.S. Forest Service, Stibnite Bold Project Final Environmental Impact Statement (January 2025).

I declare under penalty of perjury that the foregoing is true and correct to the best of my knowledge, information and belief, and based on my personal experiences.

Signed this 24th day of January 2025, in McCall, Idaho.

REC 7156

2.4.4.4 Public Access

During construction of the SGP and completion of the Burntlog Route, to the degree practicable, the public would continue to have access on forest roads currently available to the public (**Figure 2.4-1**). However, public access through the Operations Area Boundary on Stibnite Road would be restricted for a period of approximately one year while a new through-site public access road is constructed. A new 4-mile long, 12-foot-wide gravel road would be constructed to provide public access from Stibnite Road (FR 50412) to Thunder Mountain Road through the SGP (**Figure 2.4-2**). The road would be constructed on a widened bench on the west side within the Yellow Pine pit, then head south of the Yellow Pine pit, where this road would utilize an underpass to cross under a SGP haul road and continue southward, parallel to and on the east side of the mine haul road on a partially revegetated portion of a former haul road (**Figure 2.4-2**). Southwest of the ore processing area, the public access road would connect with Thunder Mountain Road and continue toward the worker housing facility, exiting the SGP to the southeast.

During operations, the public access road through the Operations Area Boundary would provide seasonal use, open to all vehicles; access would not be provided in winter when impassable (current county maintenance standards) and signs would inform the public of seasonal and temporary closures. Public vehicles passing through would be required to check-in with mine personnel at the North or South SGP entry points and would receive a safety briefing and would also be required to check-out with SGP personnel upon exiting the SGP. For safety purposes, public access would be separated from other SGP roads by berms, security fencing, and the underpass to allow the public road to pass beneath the mine haul road. No stopping or deviating from the public access road would be allowed. Perpetua could restrict access to any vehicles due to concerns related to public or employee health and safety, such as during road construction and maintenance, blasting, highwall scaling, mining in the immediate area of the road, and similar operations.

Public access along Johnson Creek Road during the life of the SGP would be unchanged; however, closures spanning from a half-day to multiple days could occur due to construction activities. Total closures of half-day to multiple days could occur during construction work on Stibnite Road between the village of Yellow Pine and the SGP, part of Thunder Mountain Road, and Burnt Log Road.

Public access on existing segments of the Burnt Log Road would be restricted for limited periods of time to upgrade road segments during construction of the Burntlog Route. Other routes available for public use are shown on **Figure 2.4-1**.

Public access by foot via existing trails or on roads would be restricted within the Operations Area Boundary shown on **Figure 2.4-2**. Security personnel, fencing (including wildlife exclusion fencing), and signs would restrict public access to vehicular traffic on the designated public access roadway inside the Operations Area Boundary.

Johnson Creek Road

During non-winter conditions (roads clear of snow), the Operations Area Boundary can be accessed from the City of Cascade by traveling northeast on Warm Lake Road for about 34 miles to Landmark, then north on Johnson Creek Road for approximately 25 miles to the village of Yellow Pine, and approximately 14 miles east on the Stibnite Road portion of McCall-Stibnite Road (Stibnite Road). Johnson Creek Road and the Stibnite Road portion of McCall-Stibnite Road is currently used to access the Operations Area Boundary during the summer.

The Johnson Creek Road is a county maintained, native surface road that is open to vehicles with seasonal restrictions due to snow. During the winter, Valley County plows approximately 10 miles of Johnson Creek Road from Yellow Pine to Wapiti Meadow Ranch and Perpetua (under agreement with Valley County) plows along Stibnite Road. Valley County grooms the remaining 17 miles of Johnson Creek Road from Wapiti Meadow Ranch to Warm Lake Road at Landmark for OSV use. Valley County does not plow Warm Lake Road from Warm Lake to Landmark. This section is a designated groomed OSV route.

McCall-Stibnite Road

The Stibnite Road from the intersection with Johnson Creek Road then east to the mine is also a county-maintained native surface road, open to all vehicles with seasonal restrictions due to snow. This road is plowed in the winter by Perpetua through an agreement with Valley County. Stibnite Road connects to Thunder Mountain Road on the southeastern portion of the Stibnite mine site and currently provides public access through the mine area.

The analysis area can be accessed from McCall during non-winter conditions by traveling east on the Lick Creek Road portion of McCall-Stibnite Road for approximately 37 miles to the East Fork Road portion of McCall-Stibnite Road, then approximately 16 miles to the village of Yellow Pine, and approximately 14 miles east on Stibnite Road. Lick Creek Road is not maintained during the winter; however, East Fork Road and Stibnite Road are plowed from the intersection with SFSR Road to Yellow Pine by Valley County and from Yellow Pine to the Operations Area Boundary by Perpetua to access their private land inholdings in the area. Although the Lick Creek and East Fork roads are not proposed to be used by the SGP, they provide access for other users of the analysis area.

South Fork Salmon River Road

The SFSR Road can be accessed year-round from Cascade by traveling approximately 24 miles northeast on Warm Lake Road to the intersection with SFSR Road. It then travels north for approximately 30 miles to intersect with the East Fork Road portion of the McCall-Stibnite Road. Some segments along SFSR Road have sharp curves which can be challenging for heavy vehicle travel. Although this route currently provides the only access to the Operations Area Boundary during winter months, it is not proposed to be used by the SGP.

3.16.4.3 Existing Stream Crossings

Existing stream crossings along the existing Johnson Creek, Stibnite, and Burnt Log roads are shown on **Figure 3.13-7**. There are 213 existing stream crossings along existing main access roads in the analysis

Table 5 Prominent Regulatory and Land and Resource Management Plan Requirements

Description	Type	Reference	Resources Affected
The proponent will prepare a dust mitigation plan with appropriate schedule or triggers for control deemed adequate by Idaho Department of Environmental Quality to achieve the level of control of 93.3 percent of dust (as required in conditions 2.1-2.8 of the Permit to Construct from Idaho Department of Environmental Quality). Additionally, the proponent will employ particulate matter or opacity monitors deemed adequate by the Forest Service and immediately apply water or chemical dust control when PM or opacity monitors reach levels within 10 percent of the threshold determined by Idaho Department of Environmental Quality.	Idaho Department of Environmental Quality Permit	Idaho Department of Environmental Quality Permit to Construct	Air Quality Visibility, Wildlife, Vegetation, Wilderness
During project planning, affected tribe(s) shall be consulted regarding opportunities for restoration, enhancement, and maintenance of native plant communities that are of interest to tribe(s) when proposed activities may affect those plant communities.	FP Component	BNF and PNF: TRST04	Cultural Resources, Vegetation
When taking water from fish-bearing waters for road and facility construction and maintenance activities, intake hoses shall be screened with the most appropriate mesh size (generally 3/32 of an inch), or as determined through coordination with National Oceanic and Atmospheric Administration Fisheries and/or U.S. Fish and Wildlife Service.	FP Component	BNF and PNF: FRST01 TEST32	Fish
Fish passage shall be provided at all proposed and reconstructed stream crossings of existing and potential fish-bearing streams.	FP Component	BNF and PNF: SWST08	Fish
Surface water withdrawal intake hoses will be situated so as to prevent generation of turbidity in bottom sediments during pumping.	Design Feature		Fish, Water Resources
Where settlement ponds, tailing dams, or impoundments are planned, each will be located, designed, constructed, and inspected under the supervision of a professional engineer.	FP Component	BNF and PNF: MIGU03	Geology and Geotechnical
Prohibit solid and sanitary waste facilities in Riparian Conservation Areas. If no alternative to locating mine waste (waste rock, spent ore, tailings) facilities in Riparian Conservation Areas exists, then: Analyze waste material using the best conventional methods and analytic techniques to determine its chemical and physical stability characteristics. Locate and design waste facilities using the best conventional geochemical and geotechnical predictive tools to ensure mass stability and prevent the release of acid or toxic materials. If the best conventional technology is not sufficient to prevent such releases and ensure stability over the long term, and such releases or instability would result in exceedance of established water quality standards or would degrade surface resources, prohibit such facilities in RCAs. Monitor waste and waste facilities to confirm predictions of chemical and physical stability and make adjustments to operations as needed to avoid degrading effects to beneficial uses and native and desired non-native fish and their habitats.	FP Component	BNF and PNF: MIST09	Geology and Geotechnical, Wetlands and Water Resources, Wildlife, Fish

Description	Type	Reference	Resources Affected
Reclaim and monitor waste facilities to ensure chemical and physical stability and revegetation to avoid degrading effects to beneficial uses and native and desired non-native fish and their habitats. Require reclamation bonds adequate to ensure long-term chemical and physical stability and successful revegetation of mine waste facilities.			
Transport hazardous materials on the Forest in accordance with 49 CFR 171 in order to reduce the risk of spills of toxic materials and fuels during transport through RCAs.	FP Component	BNF and PNF: SWGU11	Hazardous Materials, Fish, Health and Safety
A Spill Prevention, Control, and Countermeasure (SPCC) Plan shall be prepared in accordance with 49 CFR parts 171 through 180, including packaging, transportation, incident reporting, and incident response. Include the following items within the SPCC Plan: • During off-loading of fuel from fuel vehicles or during refueling operations have a standard marine-type fuel containment boom (which would be of sufficient length for a worst-case discharge), spill prevention kit, and fire kit readily available on site. • Store two or more spill containment and response caches along each of the fuel delivery routes. • Spill response team will carry sufficient containment equipment for one full fuel tanker. • Include the Forest Service as a party to be notified in the event of a hazardous materials spill. • Intake pumps, engines, fuel storage, fuel containment site, and other equipment with fuel or lubricants will be inspected at each refueling and periodically between refueling for leakage or spillage. • Pilot and emergency spill response vehicles will carry appropriate containment and first aid equipment. • All fuel containers will be marked with contents, owner's name and contact information. • Material Safety and Data Sheets for all products will be posted and available on site with the SPCC plan. • Intake pumps will not be situated within the active stream and ditch channel and will be placed within containment vessels capable of holding 120 percent of the pump engine's fuel, engine oil and hydraulic fluid. The smallest practical pump and intake hose will be used. • Following large storm events, the intake pumps will be inspected to determine if stream flow has encroached into the pump area and if the pump needs to be moved so it remains above flowing water. • A spill prevention and clean-up kit will be placed at the intake pump site and will consist of absorbent pads and/or boom (which will be sufficient length for a worst-case discharge), drip pan, a shovel, and a fire extinguisher. • Spare fuel for the water intake pump will be stored in approved [29 CFR 1926.152(a)(1)] fuel storage containers	Regulatory Requirement and Design Features	49 CFR 171	Hazardous Materials, Health and Safety, Water Resources, Wetlands, Fish, Wildlife, Soils,

Description	Type	Reference	Resources Affected
placed into a secondary containment vessel capable of holding at least 120 percent of the volume of the fuel in the fuel container. • A copy of the SPCC plan will be kept at an appropriate on-site facility.			
Unless otherwise authorized, all garbage or refuse should be removed from National Forest System lands. This includes, but is not limited to, empty fuel and lubricant containers. Food and garbage will be stored either indoors, in vehicles, or if outside, in wildlife-proof containers. No garbage will be burned.	FP Component and Design Features	Design Feature developed for compliance with BNF and PNF: MIGU04	Hazardous Materials, Water Resources, Fish, Health and Safety, Wildlife
The operator shall comply with all applicable Federal and State fire laws and regulations and shall take all reasonable measures to prevent and suppress fires on the area of operations and shall require their employees, contractors and subcontractors to do likewise.	Regulatory Requirement	36 CFR 228.11	
The operator shall comply with State of Idaho fire protection procedures (as outlined in IDAPA 20.04.01) and any local Valley County Fire District regulations and shall require their employees, contractors and subcontractors to do likewise.	Regulatory Requirement	IDAPA 20.04.01	Health and Safety, Vegetation
Several fire-response kits will be spaced strategically around the project area and be inspected annually.	Design Feature		Health and Safety, Vegetation
On-site staff will maintain contact with Krassel District Ranger to ensure appropriate procedures are followed in the event of implementation of fire restrictions or woodland use restrictions (e.g., “Red Flag Warnings”).	Design Feature		Health and Safety, Vegetation
Damage to or loss of Forest System trails from mining activities should be repaired or mitigated by the Project Operator.	FP Component	BNF: REGU22, REGU24 PNF: REGU23, REGU26	Recreation
When new recreation facilities and trails must be located in RCAs, they shall be developed such that degrading effects to Riparian Conservation Areas are mitigated. Where reasonable and practical location alternatives exist, new recreation facilities and trails should be located outside of RCAs.	FP Component	BNF: REST02 PNF: REST02	Recreation

Description	Type	Reference	Resources Affected
Architectural designs will follow principles and concepts outlined in the Built Environment Image Guide. Facilities identified as necessary should blend with the surrounding landscape character and the ROS setting. ROS descriptions in the Boise National Forest and Payette National Forest Land and Resource Management Plans Appendix F should be used to help guide facility development and recreation activity management within each ROS class. When a structure or facility is created for other than public use, the materials, color, and location should be chosen to reduce visual contrast of the structure. Natural or neutral colors should be used in to help structures blend with the landscape. The use of natural or neutral colors and non-reflective surfaces will be considered for structures. An exception to this will be when the function of the structure is to be seen.	FP Component	BNF and PNF: FRGU13, SCGU13, SCGU14, SCGU15 BNF: REGU12, REGU15 PNF: REGU13, REGU16	Scenic Resources, Tribal Resources
Reclamation cover material (e.g., growth media) used in places including but not limited to the tailings storage facility and tailings storage facility buttress will be evaluated for contaminants prior to use during reclamation. Acceptable metal and contaminant concentrations and sampling and testing methodology will be documented in a sampling and analysis plan developed prior to reclamation.	Design Feature		Soil, Water, Public Safety
Topsoil and any brush removed will be stockpiled separate from fill material and used in reclamation.	Design Feature		Soils
Measures such as, but not limited to, segregating and stockpiling topsoil, implementing stormwater and sediment best management practices (BMPs), backfilling, revegetation, and concurrent reclamation will be conducted, where possible and practical, for areas where the soil has been exposed by ground-disturbing activities. These areas and sites include but are not limited to borrow sites, utility corridors, skid trails, firebreaks, temporary roads, cut and fill slopes, and areas where construction activities have occurred.	Design Feature	Design Feature developed to lessen impacts under BNF and PNF: SWST03, SWGU05	Soils, Vegetation, Timber, Transportation and Access, Water, Wetlands, Fish
Applicable road obliteration for all roads proposed for obliteration including temporary roads and applicable sections of the Burntlog route (if selected) will be fully recontoured, including full bench constructed road segments. Road obliteration through recontouring is the reclamation of a road template through the following: • Deep decompaction (36”) of the inside half of the road surface; • excavate road fill down to the natural ground level and then place on top of the decompacted inside half of the road surface on the cut slope side of road; • Reestablish the natural slope profile; and • Vegetation clump planting. Decompaction**:** All compacted road surfaces that will be covered with excavated material, for example the inside half of the road surface, shall be decompacted to a depth of 36 inches or to a restrictive layer (bedrock). This is to promote water infiltration, breakup any potential landslide slip surface between	Design Feature		Soils, Vegetation, Transportation and Access

Description	Type	Reference	Resources Affected
the road surface and excavated and placed fill material and allow deep root vegetation establishment. Excavation: After decompaction of the roadway, the outside road fill material shall be excavated and placed on roadbed between the top of cut and natural ground, forming a slope approximating natural contours. No ditches, water traps, or berms shall remain. Finished product should blend in with the surrounding terrain. Soil-Vegetation Plug Transplanting: Excavate soil-vegetation plugs from adjacent natural and undisturbed ground having a minimum surface area of 9 square feet to a depth beyond the vegetation rooting zone (plug size is dictated by excavator bucket size). The plug transplant shall be of sufficient depth that will maintain the root system and contain adequate soil to enhance favorable growth. Soil-vegetation plug transplanting will be done at a minimum rate of 15 plantings per 100 lineal feet evenly distributed along the width and length of the recontoured surface. The plugs will be transplanted to a depth even with the surrounding recontoured ground level. This work will be accomplished with an excavator. Surface Ground Cover: Ground cover across the entire recontoured or disturbed surface (this will include all scarified ground, de-compacted roads and skid trials), by order of priority, shall be achieved using a combination of clump planting, native mulch, coarse woody debris and certified weed free agriculture straw to reach a minimum of 50 percent to the maximum 80 percent coverage of the recontoured surface or disturbed area. Apply native seed mix, hydromulch or organic fertilizer. This order or priority shall be given to vegetation plug planting, native mulch, coarse woody debris, and straw. When applying coarse woody debris, use various size classes at levels similar to surrounding undisturbed ground and placed at various orientations. The desired result of road obliteration through recontouring is to restore slope contours the natural slope profile, improve soil productivity, improve soil-water infiltration, and reestablish ground water flow paths and hydrologic function.			
Road rutting from operations, outside the mine site, will be minimized by construction and maintenance of surface drainage structures, application of surfacing material, and by restricting road use when conditions are unacceptable due to moisture that is leading to the onset of rutting and concentrated turbid flow. (Note typical guidance is 'no use' if ruts deeper than 4" are created.) This design feature does not apply to the mine site.	Design Feature	Design Feature developed to lessen impacts under BNF and PNF: SWST02 SWST03	Soils, Vegetation, Timber, Transportation and Access, Water, Wetlands, Fish

Description	Type	Reference	Resources Affected
Handling of road waste material (e.g., slough, rocks) will avoid or minimize delivery of waste material to streams that will result in degradation of soil, water, riparian, and aquatic resources.	Design Feature	Design Feature developed for compliance with BNF and PNF: FRST05	Transportation and Access, Fish, Soils, Water Resources, Wildlife,
Commercial transport vehicles will be inspected at Knox or Landmark by the driver prior to accessing the Johnson Creek area.	Design Feature		Transportation and Access, Health and Safety
Road clearing and maintenance activities for roads under Forest Roads and Trail Act easement agreements will be coordinated with Valley County, as necessary.	Design Feature		Transportation and Access, Health and Safety
Mitigate degrading effects from locatable mine operations situated within Riparian Conservation Areas by identifying reasonable locations for access, processing, and disposal facilities outside of RCAs, wherever possible.	FP Component	BNF and PNF: MIST04, LSST07, MIST08, FRGU06	Transportation and Access, Water Resources, Fish, Wetlands.
To minimize the degradation of watershed resource conditions, prior to expected water runoff, water management features will be constructed, installed, and/or maintained. Activities and features include, but are not limited to, water bars, rolling dips, seeding, grading, slump removal, barriers and berms, distribution of slash, and culvert and ditch cleaning in all applicable areas.	Design Feature	Design Feature developed for compliance with BNF and PNF: SWST01 and SWST04	Transportation and Access, Water Resources, Soils, Wetlands
To accommodate floods, including associated bedload and debris, new culverts, replacement culverts, and other stream crossings will be designed to accommodate a 100-year flood recurrence interval unless site-specific analysis using calculated risk tools or another method, determines a more appropriate recurrence interval.	FP Component	BNF and PNF: FRST02	Transportation and Access, Water Resources, Soils, Wetlands, Fish
To minimize sediment runoff from the temporary roads and roadbeds, water management features will be constructed, installed, and/or maintained on authorized temporary roads and roadbeds, on completion of use, before expected water runoff, or before seasonal shutdown. Activities and features could include, but will not be limited to, water bars, silt fencing, certified weed-free wattles, and/or weed-free straw bales, rolling dips, seeding, grading, slump removal, barriers and berms, distribution of slash, and culvert and ditch cleaning. These features will be installed in strategic downslope areas and in RCAs, where and when appropriate.	Design Feature	Design Feature developed for compliance with BNF and PNF: SWGU06	Transportation and Access, Water Resources, Wetlands, Soils

Description	Type	Reference	Resources Affected
Snow removal will be accomplished in accordance with the following standards of performance: • All debris, except snow and ice, that is removed from the road surface and ditches will be deposited away from stream channels at approved locations. • During snow removal operations, banks will not be undercut, and gravel or other surfacing material will not be bladed off the roadway surface. • Ditches and culverts will be kept functioning during and following plowing. Berms left on the shoulder of the road will be removed and/or drainage openings will be created and maintained. Drainage openings will be spaced to maintain satisfactory surface drainage without discharge on erodible fills. • Dozers will be used on an as-needed basis for plowing snow. The dozer operator will maintain an adequate snow floor over the gravel road surface. • Snow will not be totally removed to the gravel road surface. Appropriate snow floor depth will be maintained to protect the roadway. • Damage of roads from, or as a result of, snow removal will be repaired in a timely manner. • Culverts and stream crossings will be clearly marked before snow removal begins to avoid placing berm openings in locations that will allow runoff to enter drainages directly at the culverts or stream crossings. Excessive snow will not be plowed into locations that will impact operation of the culverts or prevent positive drainage from drainage areas. Some snow is necessary around culvert openings and in the bar ditches as this will insulate the ditch and culvert and will prevent the water in the ditch and culvert from freezing. • No ice and snow removal chemicals will be used on roads. • Traction material will be 3/8-inch diameter gravel or greater.	Design Feature		Transportation and Access, Water Resources, Wetlands, Fish
If sensitive plants or their propagules are required to be collected, collection methods and other information will be under the direction of the Forest or Regional Botanist.	Design Feature	Design Feature developed for compliance with BNF and PNF: BTST02	Vegetation
For projects or activities that include application of insecticides, herbicides, fungicides, or rodenticides, degrading effects on sensitive plant species will be mitigated.	FP Component	BNF and PNF: BTST04	Vegetation
In revegetation and seeding projects in occupied Threatened, Endangered, Proposed, or Candidate (TEPC) plant habitat, a Forest botanist shall be consulted to ensure appropriate species are used.	FP Component	BNF and PNF: TEST09	Vegetation

Description	Type	Reference	Resources Affected
When available and not cost-prohibitive, seeds and plants used for seedings and plantings in revegetation projects should originate from genetically local sources of native species. When project objectives justify the use of non-native plant materials, documentation explaining why non-natives are preferred should be part of the project planning process.	FP Component	BNF and PNF: BTGU03	Vegetation
Noxious weeds and undesirable non-native plants will be eradicated in the Operations Area boundary, within permitted use areas, and the cut and fill slopes of roads and trails used by mine and mine facility related traffic. Where it is not practical to eradicate existing infestations, infestations will be managed to prevent seed production and spread. In areas of existing extensive infestation, mitigation for noxious weed prevention will be incorporated into road layout, design, and project alternative evaluation.	Design Feature	Design Feature developed for compliance with BNF and PNF: FRGU02, TEST10	Vegetation
Clean borrow and gravel sources on Forest should be maintained as noxious weed free through an inspection and treatment program. Off-Forest inspections and treatments should be coordinated with county weed agents.	FP Component	BNF and PNF: NPGU02	Vegetation
All seed used on National Forest System lands will be certified to be free of seeds from noxious weeds listed on the current All States Noxious Weeds List.	FP Component	BNF and PNF: NPST02	Vegetation
Materials such as hay, straw, or mulch that are used for rehabilitation and reclamation activities shall be free of noxious weed seed and shall comply with the 1995 weed-free forage special order against use of non-certified hay, straw, or mulch. Materials that are not covered under a weed seed free certification, and that have the potential to contain noxious weed seed, shall be inspected and determined to be free of weed seed before purchase and use.	FP Component	BNF and PNF: NPST01 NPST06	Vegetation
Source sites for gravel and borrow materials shall be inspected for noxious weeds before materials are processed, used, or transported from the source site into the project area or onto the National Forest.	FP Component	BNF and PNF: NPST07	Vegetation
Gravel or borrow material source sites with noxious weed species present shall not be used unless effective treatment or other mitigation measures are implemented.	FP Component	BNF and PNF: NPST08	Vegetation
To prevent invasion and expansion of noxious weeds, the following provisions will be included in the plan of operating where land-disturbing activities are associated with the authorized land use): a) Re-vegetate areas, as designated by the Forest Service, where the soil has been exposed by ground-disturbing activity. Implement other measures, as designated by the Forest Service, to supplement the influence of re-vegetation in preventing the invasion or expansion of noxious weeds. Potential areas will include: construction and development sites, underground utility corridors, skid trails, landings, firebreaks, slides, slumps, temporary roads, cut and fill slopes, and travel ways of specified roads.	FP Component	BNF and PNF: NPST03	Vegetation

Description	Type	Reference	Resources Affected
b) Earth-disturbing equipment used on National Forest System lands--such as cats, graders, and front-loaders--shall be cleaned to remove all visible plant parts, soil, and material that may carry noxious weed seeds. Cleaning shall occur prior to entry onto the project area and again upon leaving the project area if the project area has noxious weed infestations. This also applies to fire suppression earth-disturbing equipment contracted after a Wildland Fire Situation Analysis and Wildland Fire Implementation Plan has been completed.			
Integrated weed management shall be used to maintain or restore habitats for sensitive plants and other native species of concern where they are threatened by noxious weeds or non-native invasive plants. Specific measures to reduce the potential for spread and establishment of noxious weed infestations could include, but are not limited to, determining the presence, location, and amount of noxious weed infestations in the Operations Area, developing management strategies such as, methods and frequency for treating infestations, treatment procedures and restrictions, reporting requirements, and follow-up or monitoring requirements. Herbicide applications will be by or under the direct supervision of licensed Idaho professional herbicide applicators with Aquatic Pest Control certifications and will be consistent with the Boise National Forest Invasive Species Management Plan and Payette National Forest guidance.	FP Component and Design Features	Design Feature developed for compliance with BNF and PNF: NPST11	Vegetation
New facilities for storage of fuels and other toxicants will be located outside of occupied Regional Forest Sensitive, Forest Watch, and TEPC plant habitat.	FP Component	BNF and PNF: TEST11	Hazardous Materials, Water Resources, Fish, Health and Safety, Vegetation
Public firewood cutting and gathering along the Burntlog route, if the route is open to the public, will not be allowed.	Design Feature		Vegetation
Mitigate, through avoidance or minimization, management actions within known winter roosting sites of TEPC species if those actions would adversely affect the survival of wintering or roosting populations. During project planning, determine sites, periods, and appropriate mitigation measures to avoid or minimize effects.	FP Component	BNF and PNF: TEST13 WIST03	Wildlife
Section 6 of Idaho Department of Land's Best Management Practices for Mining in Idaho (IDL 1992) will be observed, including if water is encountered in exploration holes, water zones will be sealed off during abandonment to prevent crossflow.	Regulatory Requirement	Section 6 of Idaho Department of Land's Best Management Practices for Mining in Idaho (IDL 1992)	Water Resources

Description	Type	Reference	Resources Affected
The proponent will implement surface water quality baseline turbidity monitoring, as defined in the Idaho Department of Environmental Quality permit clauses.	Design Feature		Water Resources, Fish
Do not authorize storage of fuels and other toxicants or refueling within Riparian Conservation Areas unless there are no other alternatives. Storage of fuels and other toxicants or refueling sites within Riparian Conservation Areas shall be approved by the responsible official and have an approved spill containment plan commensurate with the amount of fuel.	FP Component	BNF and PNF: SWST11	Water Resources, Fish, Wetlands, Hazardous Materials, Health and Safety
Dust abatement chemicals will be used in accordance with the applicable road maintenance Biological Assessment. Apply dust- abatement additives and stabilization chemicals (typically $MgCl_2$, $CaCl_2$, or lignin sulphonates) to avoid run-off of applied dust abatement solutions to streams. Spill containment equipment will be available during chemical dust abatement application. Where the road surface is within 25 feet (slope distance) of surface water, dust abatement will only be applied to a 10-foot swath down the centerline of the road. The rate and quantity of application will be regulated to insure all of the chemical is absorbed before leaving the road surface.	Design Feature		Water Resources, Fish, Wetlands, Air Quality, Transportation and Access
Drilling mud and hole plug products, if utilized, will conform to American Petroleum Institute guidelines for ensuring groundwater integrity.	Design Feature	American Petroleum Institute guidelines	Water Resources, Health and Safety, Hazardous Materials
Trees or snags that are felled in Riparian Conservation Areas will be left unless determined not to be necessary for achieving soil, water, riparian, and aquatic desired conditions. Felled trees or snags left in Riparian Conservation Areas will be left intact unless resource protection (e.g., the risk of insect infestation is unacceptable) or public safety requires bucking them into smaller pieces.	FP Component	BNF and PNF: SWST10	Water Resources, Soil, Fish, Vegetation
The proponent will monitor stormwater runoff and stormwater BMPs as per the Stormwater Pollution Prevention Plan (SWPPP). Stormwater monitoring, inspections, and reporting will be conducted in accordance with the Idaho Pollutant Discharge Elimination System Multi-Sector General Permit and the SWPPP.	Permitting Requirement	Idaho Pollutant Discharge Elimination System Multi-Sector General Permit and the SWPPP	Water Resources, Soils
All activities will be conducted in accordance with Idaho environmental anti-degradation policies, including Idaho Department of Environmental Quality water quality regulations at IDAPA 58.01.02 and applicable federal regulations.	IDAPA 58.01.02		Water Resources, Wetlands, Fish
If additional water rights are applied for, the Forest Service will be informed to determine if additional analysis or consultation is necessary prior to use.	Design Feature		Water Rights

Description	Type	Reference	Resources Affected
Road reconstruction and/or upgrades to NFR 51290 (Meadow Creek Lookout Road) on the ridgeline dividing Meadow Creek from the Indian Creek drainage will be restricted to 30 feet either side of the centerline of the existing alignment to prevent potential for direct impacts to the Frank Church River of No Return Wilderness.	Design Feature	Design Feature developed for compliance with BNF and PNF: LSST03, LSST05	Wilderness
Mitigate management actions within known winter roosting sites or hibernacula (bats) of Sensitive species if those actions would measurably reduce the survival of wintering or roosting populations. Sites, periods, and mitigation measures will be determined during project planning.	FP Component	BNF and PNF: WIST04	Wildlife
To mitigate impacts to known nesting or denning sites of Management Indicator Species or Sensitive species, land clearing activities in areas where complete vegetation removal is necessary greater than 0.5 acres will not occur, to the extent possible, until after the bird breeding season (April 1 through July 30th) for migratory and resident birds. This design feature does not apply to the mine site, road construction or maintenance, hazard tree felling, or the power line upgrades and construction.	Design Feature	Design Feature developed for compliance with BNF and PNF: WIST03	Wildlife
To the extent possible, trees and snags found to contain nesting cavities would not be disturbed or cut. No trees with active nests would be cut. Exceptions: Mine Site and New Road Construction: Land clearing activities in areas where complete vegetation removal (greater than 0.5 acres) is necessary; these activities will not occur until after the bird breeding season (March 1 through July 30th) for migratory and resident birds. Power line construction and upgrades: Land clearing activities in areas where complete vegetation removal is necessary will not occur until after the bird breeding season (March 1 through July 30th) for migratory and resident birds.	Design Feature	BNF and PNF: Developed in response to WIST03; EO 13186	Wildlife
Potential water sources will be surveyed by the proponent, in coordination with the Forest Service, for Columbia spotted frog egg masses and other amphibians after ice melt and avoid disturbing any water sources with identified egg masses or other species. Exceptions: If egg masses are found at a water source essential for proposed activities, the egg masses will be relocated in coordination with the Forest Service wildlife biologist.	Design Feature	Design Feature developed for compliance with BNF and PNF: WIST03, TEST12	Wildlife
The Forest Service wildlife biologist will be notified of any sightings of TEPC or Sensitive wildlife species, including, occupied sensitive species nests or dens encountered during implementation. If necessary to maintain key features of nesting and denning habitat or to avoid disruption of nesting and denning activities, prescribed activities will be modified in accordance with the Forest Service wildlife biologist.	Design Feature	Design Feature developed for compliance with BNF and PNF: WIST03, TEST12	Wildlife

Description	Type	Reference	Resources Affected
Where practicable, monitoring of high elevation habitats characteristic of wolverine denning habitat will be done in cooperation with State fish and game agencies.	Design Feature	Design Feature developed for compliance with BNF: WIGU17	Wildlife
To minimize adverse effects of lighting to TEPC, Management Indicator Species, or Sensitive species, where necessary and in accordance with Mine Safety and Health Administration and the Occupational Safety and Health Administration, the proponent could utilize actions in line with, but not limited to, the below: • To the extent practicable, limit construction activities to the time between dawn and dusk. • Utilize, where possible, use down shielding or directional lighting such as 'Cobra' style lights rather than an omnidirectional light system. • While allowing for public and worker safety, utilize low intensity energy saving lighting (e.g., low pressure sodium lamps). • If possible, minimize illumination of lighting on associated construction or operation structures by using motion sensors or heat sensors. • If possible, place light shields over outside lights, confining light to the immediate area. • Whisper Quiet light plants could be utilized used to mitigate visual impacts from night operations.	Design Feature	Design Feature developed for compliance with BNF and PNF: WIST03, WIST04 TEST29	Wildlife
Communication towers should not be sited in or near wetlands, or other known bird concentration or high use areas (e.g., riparian corridors), in known migratory or daily movement flyways. Towers should not be sited in areas with a high incidence of fog, mist, and low ceilings.	Design Feature		Wildlife
If fawning and calving activity is encountered during project activities, the activity will cease and/or be modified in coordination with the Forest Service.	FP Component	BNF: WIGU12 PNF: WIGU12	Wildlife
In goshawk territories with known active nest stands, identify alternate and replacement nest stands during project-level planning when it is determined that the proposed activity is likely to degrade nest stand habitat.	FP Component	BNF and PNF: WIST06	Wildlife
To minimize adverse effects of noise to TEPC, Management Indicator Species, or Sensitive species, where necessary and in accordance with Mine Safety and Health Administration and Occupational Safety and Health Administration, the proponent could utilize actions in line with, but not limited to, the below: • Construction equipment engines will be equipped with adequate mufflers, intake silencers, and engine enclosures when feasible. • When practicable, pumps, generators, and engines will be turned off when not in use.	Design Feature	Design Feature developed for compliance with BNF and PNF: WIST03, WIST04 TEST29	Wildlife, Scenic Resources, Noise, Wilderness

Description	Type	Reference	Resources Affected
• Temporary wooden structure could be erected around portions of the drill, pumps, and heaters, with acoustic absorbent panels. These temporary structures will not be put in place if they created safety issues related to exhaust vapor build-up. • When feasible, activities such as helicopter use and blasting, could be scheduled at the same time.			
In revegetation and seeding projects in occupied sensitive plant habitat, a Forest botanist shall be consulted to ensure appropriate species are used.	FP Component	BNF and PNF: BTST05	Vegetation
Design and implement projects within occupied habitats of Sensitive species to help prevent them from becoming listed. Use Forest Service-approved portions of Conservation Strategies and Agreements, as appropriate, in the management of Sensitive species habitat to keep management actions from contributing to a trend toward listing for these species.	FP Component	BNF and PNF: WIST02	Wildlife, Vegetation

Table 6 Proponent Proposed Environmental Design Features

Description	Resources Affected
Following crushing, the crushed ore will report via conveyor to a dome-shaped, covered stockpile.	Air Quality
Dust emission controls, such as water sprays and/or bag house dust collectors, will reduce dust from crushing, conveying, and stockpiling.	Air Quality
Dust will be controlled in a similar manner to the ore crushing and conveying process using water sprays and/or bag house dust collectors.	Air Quality
Air emissions from the leaching facility will be captured in a series of air pollution controls, and the material collected will be disposed of as a solid waste or a hazardous waste depending on characterization of the waste.	Air Quality
Air emissions from the induction furnace will be captured in a series of emission controls. Mercury from the induction furnace will be converted to a liquid metallic state, and then securely stored prior to shipment to a certified hazardous waste disposal facility.	Air Quality
Silos will be equipped with air emission controls except for Prill Silo.	Air Quality
All off-highway diesel engines will be Environmental Protection Agency Tier IV or better.	Air Quality, Climate Change
The Project Operator will encourage employees to use company provided shuttle buses as transport to the Stibnite Gold Logistics Facility from towns along SH 55.	Air Quality, Health and Safety, Transportation and Access
Busing and/or vanpooling will be provided for the Project Operator and contractor employees. The associated parking area will accommodate approximately 300 vehicles. To the degree practicable, the Project Operator will mandate the use of busing and vans for employee and contractor transportation to the Stibnite Gold Project and the worker housing facility.	Air Quality, Health and Safety, Transportation and Access
Proper dust control will be employed along transportation corridors and active mining areas using aquatic safe dust suppression chemicals and methods.	Air Quality, Water Resources, Fish, Wildlife

Description	Resources Affected
The Project Operator will utilize “smart grid” technology to reduce energy consumption, such as auto dimming lights in offices.	Climate Change
The Project Operator employees and contractors will be informed about relevant governmental regulations intended to protect cultural and historic resources.	Heritage
To protect fish residing in, using, or potentially using the Yellow Pine Pit lake (Chinook salmon, steelhead trout, bull trout, Westslope cutthroat trout, mountain whitefish), the Project Operator has developed a Fish Salvage and Release Plan to isolate the lake from upstream movement into the lake and salvage and release fish. The Fish Salvage and Release Plan will be refined in coordination with federal, state, and tribal agencies. The Project Operator will, in consultation with the U.S. Fish and Wildlife Service and the National Marine Fisheries Service, design, install, and operate a fish trap and one or two weirs designed to allow fish to leave the Yellow Pine pit lake but not allow fish to migrate upstream past the trap to ensure that the fewest number of individual Endangered Species Act -listed fish species are present in the pit lake when the draining process begins. The timing for providing the upstream barrier to fish movement will be designed to minimize the number of fish in the Yellow Pine pit lake, particularly larger bull trout. Fish captured in the Yellow Pine pit lake will be immediately released downstream of the upstream fish movement barrier or in another location determined by the appropriate regulatory agencies. The Yellow Pine pit lake will be partially drained to recover the remaining fish and relocate them prior to final draining of the pit lake.	Fish
A fishway has been designed and will be operated within the East Fork South Fork Salmon River diversion tunnel to provide upstream and downstream volitional fish passage throughout mine operations. The East Fork South Fork Salmon River diversion tunnel will be approximately 0.9 miles long and 15 feet high by 15 feet wide. The tunnel will include a parallel accessway to allow equipment and personnel access for monitoring, inspection, and maintenance. The accessway will function as a floodway for high flows, limiting the operating flow range within the fishway while river and thus total tunnel flows vary more widely.	Fish
As an alternative to the fishway in the East Fork South Fork Salmon River diversion tunnel the Project Operator will provide adult passage by trap and haul if needed. Criteria may be put in place so that if any unusual or unexpected events occur that result in adverse impacts to fish during operations, fish passage through the fishway will be switched to trap and haul operations.	Fish
Low-energy lighting will be provided in the fishway to determine if it aids in fish passage and to provide light for tunnel and fishway inspections. The system will be configured so that it mimics the photoperiod of the region, run manually on a dimming system, or be completely turned off at the option of the operator.	Fish
Fish salvage and relocation operations will be conducted any time the facility needs repair within the fishway, potentially during sediment removal, and potentially when streamflows recede from the accessway.	Fish
Post mining, the East Fork South Fork Salmon River stream channel will be reestablished across the backfilled Yellow Pine pit with a channel design that will provide for upstream and downstream fish passage.	Fish
the Project Operator will reestablish fish passage at the location of the existing box culvert on the East Fork South Fork Salmon River just downstream of the confluence with Meadow Creek at the McCall-Stibnite Road (CR 50-412) crossing.	Fish
The Project Operator will improve fish passage along the Burntlog Route within the Stibnite Gold Project area by identifying and replacing existing collapsed, undersized, or otherwise degraded or poorly designed culverts at road crossings and committing appropriate resources to fix and improve these structures.	Fish

Description	Resources Affected
The Project Operator will install side-ditching, culverts, guardrails, and bridges, where necessary along the Burntlog Route, with design features to provide fish passage and limit potential sediment delivery to streams.	Fish
The Project Operator will employ blasting setback distances and other controlled blasting techniques following industry best management practices (modifying blasting variables including charge size, and vibration and overpressure monitoring) to minimize impacts to fish from blasting. the Project Operator will follow up with monitoring in early stages of operation to evaluate effectiveness and refine blasting protocols in coordination with federal, state, and tribal agencies, if needed.	Fish
Dewatering of the Yellow Pine pit lake or stream segments will generally be conducted during low-flow periods to facilitate stream segment isolation and fish salvage. When practicable, dewatering also will be timed to avoid or minimize impacts during known spawning periods for Chinook salmon, steelhead, and bull trout.	Fish
To protect fish, the Project Operator will develop a standard procedure for channel segment isolation, dewatering, fish salvage, and fish relocation to appropriate receiving streams during dewatering or maintenance of natural stream and diversion channels, based on the U.S. Fish and Wildlife Service Recommended Fish Exclusion, Capture, Handling, and Electroshocking Protocols and Standards (U.S. Fish and Wildlife Service 2012) and refined in coordination with federal, state, and tribal agencies.	Fish
The fishway operations and management plan defines the monitoring and evaluation plan elements and describes how the hydraulic conditions, fish use, and performance of the tunnel fishway will be measured and evaluated, and the design of the adaptive management component of the plan including the option of using trap and haul.	Fish
Access and Stibnite Gold Project haul road crossings of fish bearing streams will be designed such that structures installed or constructed allow fish passage.	Fish and Wildlife
The Project Operator will implement measures to limit stream baseflow effects during active operations, including a combination of lining key reaches of streams potentially impacted by pit dewatering, and treating and discharging pit dewatering water that is not used for ore processing or other industrial uses. Maintain instream flows for fish species and other aquatic resources: flows within natural stream channels affected by Stibnite Gold Project operations will be maintained to meet seasonally appropriate and stream-specific low-flow needs to the maximum extent practicable. the Project Operator will continue to evaluate options and measures to further avoid and minimize the magnitude and duration of effects of the Stibnite Gold Project through other measures in consultation with federal, state, and tribal agencies.	Fish, Water Resources
Following permanent cessation of mining activities at the Yellow Pine pit, the Project Operator will backfill the pit and route the East Fork South Fork Salmon River over the backfilled pit with a longer, lower-gradient channel with higher intrinsic potential for Chinook salmon and steelhead spawning and rearing than the channel that exists presently. The floodplain area along the constructed channel will include side-channels and other off-channel features and will be revegetated to restore wetland and riparian habitat providing long-term shade and cover favorable to fish.	Fish, Wetlands
The Meadow Creek channel will be routed over the final tailings storage facility and tailings storage facility embankment and buttress, resulting in a long, relatively flat surface and a short, steep face. On top of the tailings storage facility surface, Meadow Creek will be contained within a broad floodplain corridor bound laterally by erosion-resistant terraces and vertically by a subsurface armor layer over a low-permeability geosynthetic stream liner. Design thicknesses of the reclamation material and armor layer were selected to be protective of the geosynthetic stream liner under post-closure weather, vegetation, and flow conditions.	Fish, Wetlands

Description	Resources Affected
The Project Operator will stabilize and restore Blowout Creek. Blowout Creek wetland restoration will consist of restoring and enhancing palustrine aquatic bed (PAB), palustrine emergent (PEM), Palustrine scrub-scrub (PSS) wetlands that were impacted when a historical dam failed on Blowout Creek. Headcutting and shallow aquifer dewatering have impaired and reduced functions of the wetland vegetation classes. A grade control and groundwater cutoff structure is proposed to raise the water level in Blowout Creek as well as recharge the shallow groundwater system and reduce stream headcutting. A coarse rock drain will be constructed within the chute downstream of the failed dam to isolate the flow of Blowout Creek from the actively eroding chute side slopes and to prevent further erosion of the gully bottom, facilitating subsequent restoration of a surface channel on top of the drain. The Project Operator will stabilize the steep, confined, erosive middle reach to address the significant fine sediment load currently produced from this reach and restore the downstream, relatively low-gradient reach.	Fish, Wetlands, Water Resources
The Project Operator will lead annual site visits for U.S. Army Corps of Engineers, Environmental Protection Agency, Idaho Department of Fish and Game, and other interested agency personnel as needed to facilitate agency review of mitigation areas if desired. Final reporting and data archival requirements will be subject to permit conditions; however, it is anticipated that until the U.S. Army Corps of Engineers concurs that mitigation sites meet success criteria, monitoring reports will be prepared by the Project Operator annually and submitted to U.S. Army Corps of Engineers Walla Walla District, Environmental Protection Agency, Idaho Department of Fish and Game, IDL, National Oceanic and Atmospheric Administration Fisheries, U.S. Fish and Wildlife Service, the Forest Service, affected Tribes, and other interested agencies, Stibnite Gold Project partners, and stakeholders. After success criteria are met, permit conditions will set the frequency for long-term monitoring and reporting.	Fish, Wetlands, Water Resources
The Project Operator will repair and rehabilitate habitats adversely affected by historical mining impacts in the Stibnite Gold Project area within the disturbance footprint of the modified mine plan.	Fish, Wetlands, Water Resources
Minor surface improvements (e.g., ditch and culvert repair, adding gravel, winter snow removal, and summer dust suppression) will occur on the Yellow Pine Route to reduce sediment runoff and dust generation.	Fish, Wildlife, Water Resources
Implementation of an avalanche hazard management program that "could" include avalanche control and/or road closure. Also proposed are daily region-scale assessments; daily weather observations including snowpack and avalanches; notifying Stibnite Gold Project staff of highly unstable conditions; closing roads during periods of elevated hazard or blocked roads; and mitigating the avalanche hazard with explosives. Section 7.2 of Dynamic Avalanche Consulting (2021) provides a description of an active avalanche monitoring and mitigation program that has more specific descriptions of the components that could be included in a Stibnite Gold Project -specific plan. Section 8.0 of Dynamic Avalanche Consulting (2021) includes a discussion of avalanche mitigation likely to be necessary for the avalanche paths identified and this should be included in the program discussed above. the Project Operator will provide for Forest Service review of a written avalanche monitoring and mitigation program that could be implemented for the Stibnite Gold Project.	Geotechnical Hazards
Construction and operation of snow catchment areas for smaller avalanche paths. Section 7.3 of Dynamic Avalanche Consulting (2021) includes a more detailed discussion of specific locations and design characteristics for ditches and catchment areas to reduce avalanche impacts to roads. the Project Operator will review this information and current road designs to provide for Forest Service review of specific designs and maintenance and operating plans for said ditches and catchment areas along the selected access route.	Geotechnical Hazards

Description	Resources Affected
Avalanche structural defense options that could be beneficial in the Stibnite Gold Project mine site to protect high-value, stationary facilities from avalanche hazards. The Project Operator will review this information and provide the Forest Service with any recommendations for implementing structural avalanche defenses in at the Stibnite Gold Project mine site.	Geotechnical Hazards
The Project Operator will increase the ground limestone dosage to the pre-oxidized concentrate as it is fed into the autoclave to address the potential for creation of soluble arsenic. By decreasing the free acid levels (increasing the pH) in the autoclave by increasing the ground limestone dosage in the autoclave feed increases the quantity of crystalline (stable) arsenic compounds in the resultant slurry with a proportional decrease in the quantity of amorphous (unstable) arsenic compounds.	Hazardous Materials
The Project Operator will monitor levels of soluble arsenic in the tailings. If soluble arsenic levels are higher than anticipated, the Project Operator will treat the oxidized concentrate with hot arsenic cure prior to neutralization.	Hazardous Materials
The ore processing area will be designed to provide for containment of ore processing materials, chemicals, wastes, and surface runoff. Potentially hazardous chemicals and wastes will be stored within buildings or areas with both primary and secondary containment. Surface runoff within the ore processing area will be directed to a contact water pond for collection. Leaks or spills escaping primary and secondary containment will flow to the contact water pond for collection and will not discharge off site.	Hazardous Materials
The processing circuit will be housed in a steel frame building set on concrete foundations with interior curbing to provide secondary containment; the interior curbing will be high enough to contain 110 percent of the volume of the largest tank.	Hazardous Materials
The gold and silver leaching circuit will be designed and operated consistent with the International Cyanide Management Institute Code (https://www.cyanidecode.org) and the Initiative for Responsible Mining Assurance Standard for Responsible Mining (https://responsiblemining.net/resources/). Accordingly, impermeable secondary containment for cyanide unloading, storage, mixing and process tanks shall be sized to hold a volume at least 110 percent of the largest tank within the containment and any piping draining back to the tank, with additional capacity for the design storm event, if applicable. Pipelines containing process water or process solution shall also use secondary containment in combination with audible alarms, interlock systems, and/or sumps as spill control measures.	Hazardous Materials
Cyanide-bearing solutions used in ore processing will be neutralized to approximately 10 milligrams per liter weak acid dissociable cyanide before the material is pumped to the tailings storage facility. Residual cyanide will be treated using a sodium metabisulfite and air system to detoxify the cyanide by oxidation to form cyanate.	Hazardous Materials
Cyanide will be neutralized to levels protective of wildlife, and the tailings storage facility will be surrounded by an 8-foot high, chain-link fence designed to keep wildlife, such as deer and elk, from entering the impoundment area, to prevent either liner damage or wildlife drowning.	Hazardous Materials
Oils, solvents, and lubricants will be stored in approved containers located within, or directly adjacent to, the maintenance shop and contained within secondary containments to prevent spills into the environment. All used petroleum products, waste antifreeze, and used solvents will be collected in approved containers, transported off site, and disposed or recycled.	Hazardous Materials
Nitric and sulfuric acid will be transported in tanks designed to prevent spills even in the event of rollovers.	Hazardous Materials
Nitric and sulfuric acids will be stored in specialized non-corrosive, polyethylene-lined tanks located within the ore processing facility and will have secondary containment.	Hazardous Materials
Liquids will be shipped to the Stibnite Gold Project in tank trucks designed for spill prevention and escorted to the Stibnite Gold Project by pilot cars manned and equipped to handle spills.	Hazardous Materials

Description	Resources Affected
Other legacy materials may be encountered during construction and operations. If encountered, these materials will be characterized to determine potential for reprocessing, reuse, or disposal.	Hazardous Materials
Small scale composting associated with organic materials generated at the worker housing facility may be incorporated within the centralized growth media stockpile in the Fiddle valley.	Hazardous Materials
An Explosives and Blasting Management Plan will be prepared for the Stibnite Gold Project. Explosives storage, transport, handling, and use will comply with applicable Department of Homeland Security, Bureau of Alcohol, Tobacco, Firearms and Explosives, and Mine Safety and Health Administration regulations.	Health and Safety
For safety and security reasons, no alcohol, firearms, or illegal drugs will be permitted on site.	Health and Safety
For safety and security reasons, public access into the mine area will be prevented by using fencing, gate locking, security personnel, and/or notice postings that prohibit unauthorized entry; no unauthorized vehicles or personnel will be permitted on the Stibnite Gold Project.	Health and Safety
Personnel transporting, handling, or using any hazardous chemicals (including sodium cyanide) will be trained to ensure the safe use of such materials. The Project Operator will design, construct, and manage facilities to conform to International Cyanide Management Code.	Health and Safety, Fish, Wildlife, Hazardous Materials
Fuel and other petroleum products at the site will be stored in above ground containment structures, with appropriate secondary containment measures.	Health and Safety, Fish, Wildlife, Hazardous Materials
Air emissions, groundwater, surface water, and aquatic parameters will be monitored during mine construction, operation, closure, and post-closure as specified in the final authorizations from the regulating agencies.	Monitoring
Monitoring will be conducted following the completion of closure and reclamation of all facilities and disturbance areas to demonstrate compliance with permit requirements and to measure the success of reclamation and mitigation.	Monitoring
The draft EMMP includes the following plans for monitoring aquatic resources: Stream and Wetlands Monitoring and Management Plan and Fisheries and Aquatic Habitat Monitoring and Management Plan.	Monitoring
The ore processing facility building will be enclosed.	Noise, Wildlife, Health and Safety
Appropriate sound dampening and muffling equipment will be utilized to minimize noise excursion from equipment and facilities. When possible, schedule high noise activities at the same time. Monitor and maintain equipment to reduce noise related impacts.	Noise, Wildlife, Health and Safety
When practicable, pumps, generators, and engines will be turned off when not in use to avoid unnecessary noise generation and reduce energy consumption.	Noise, Wildlife, Health and Safety
Electric line power will be utilized during operations to eliminate diesel generator noise, except in emergency situations when grid power is down or temporary use in remote areas where it is not practical to run power lines.	Noise, Wildlife, Health and Safety
An 8-mile temporary 16-foot-wide groomed over-snow vehicle trail will be created adjacent to Johnson Creek Road between Landmark and Trout Creek Campground during construction of the Burntlog Route.	Recreation

Description	Resources Affected
A 16-foot-wide groomed over-snow vehicle trail will be created south of Warm Lake Road to connect the southern end of Johnson Creek Road to the Landmark-Stanley Road. This 0.3-mile route will be used throughout construction and operations.	Recreation
During construction, approximately 11 miles of groomed over-snow vehicle trail will be maintained along Cabin Creek Road (FR 467).	Recreation
Suitable surface coatings or exterior design features will be used on Stibnite Gold Project buildings and other structures to reduce visual impacts.	Scenic Resources
Lighting will be managed within active mining areas to avoid unintended lighting of natural, wildlife usage areas. External lighting will be kept to the minimum required for safety and security purposes. Lights will be directed down toward the interior of the Stibnite Gold Project and shielded, where appropriate.	Scenic Resources, Wildlife
Approximately 37 percent of the reclamation will be done concurrent to mining and ore processing; the remaining 63 percent will be accomplished during closure.	Soils, Reclamation
The Yellow Pine pit will be backfilled with West End pit development rock during operations.	Soils, Reclamation
A sinuous channel will be constructed through the backfilled area for the reconstructed East Fork South Fork Salmon River with an average valley gradient approximating the historical, pre-disturbance river gradient.	Soils, Reclamation
The backfill will be placed to achieve a mounded final reclamation surface to promote drainage away from the West End pit and prevent formation of a pit lake within Midnight pit.	Soils, Reclamation
The floor of the sidehill pit southwest of the main West End pit will be graded to drain, covered with growth media, and revegetated.	Soils, Reclamation
The Project Operator will begin with placement of soil and rock cover material, then construct wetlands and restore Meadow Creek and its tributaries within appropriately sized lined floodplain corridors, place growth media, and revegetate the area.	Soils, Reclamation
Hangar Flats pit will be fully backfilled with development rock to the valley bottom elevation or slightly higher during mine operations. There will be no Hangar Flats pit lake.	Soils, Reclamation
Once all final mine closure and reclamation work has been completed, the Project Operator will reduce the 21-foot-wide travel way of 19.8 miles of Burntlog Road (FR 447), 1.3 mile of Meadow Creek Lookout Road (FR 51290), and 2.0 miles along Thunder Mountain Road (FR 375) of Burntlog Route to their approximate pre-mining width.	Soils, Reclamation
The approximately 15 miles of Burntlog Route connecting to Meadow Creek Lookout Road (FR 51290) and Thunder Mountain Road (FR 50375) will be decommissioned.	Soils, Reclamation
Following mining and ore processing operations, unless they are taken over by a third-party for ongoing use and maintenance, the Burntlog Maintenance Facility buildings will be removed. The sewer system and septic tanks for the facility will be decommissioned. Soil and rock beneath fuel storage areas and chemical storage buildings will be tested for contamination. All petroleum products, solvents, and other hazardous or toxic materials will be removed from the site and disposed of according to applicable state and federal regulations. After demolition of the buildings and facilities, the site will be graded, and drainage restored.	Soils, Reclamation
The Project Operator will manufacture growth media material using fines from glacial till sources mined from the Yellow Pine pit, available mulched vegetation, and off-site composted material.	Soils, Reclamation
Planting, seeding, and mulching will be conducted in the fall and early winter to take advantage of snowpack and springtime moisture. Where cover crops are used in lieu of mulch, seeding will occur in the spring or fall followed by seeding of the permanent mixture.	Soils, Reclamation
Reclamation monitoring will begin during concurrent reclamation at Stibnite Gold Project facilities. Quantitative and qualitative monitoring of reclamation success will begin the first growing season after final reclamation is completed and will continue until success criteria are satisfied.	Soils, Reclamation

Description	Resources Affected
Soil stability will be estimated for all reclaimed areas using qualitative descriptors.	Soils, Reclamation
Slope stability will be monitored during the erosion inspections.	Soils, Reclamation
If the performance of reclaimed areas is not satisfactory, appropriate maintenance activities will be implemented. Maintenance activities may include one or more of the following: • Sediment removal from sediment basins, stormwater drainage channels, and diversions as necessary to maintain their design capacity; • Diverting surface water away from reclaimed areas where erosion jeopardizes attainment of reclamation standards; • Stabilizing rills, gullies, and other erosion features or slope failures that have exposed development rock; • Noxious weed and invasive plant species control; and, • Re-seeding or re-applying reclamation treatments in areas where it is determined through monitoring and agency consultation that reclamation will not meet standards.	Soils, Reclamation
The Project Operator will submit an annual report to the Forest Service and the other federal and state agencies that are responsible for issuing authorizations applicable to reclamation for the preceding calendar year. The annual report will contain descriptions of the reclamation activities completed during the previous year, a summary of areas reclaimed, a discussion of the results of the reclamation monitoring conducted, and corrective actions implemented.	Soils, Reclamation
A new 12-foot-wide gravel road will be constructed to provide public access from Stibnite Road (FR 50412) to Thunder Mountain Road (FR 50375) through the Stibnite Gold Project. During operations, the public access road will be used to travel through the Stibnite Gold Project and will provide seasonal use, open to all vehicles. Vehicles passing through the Stibnite Gold Project will be required to check-in with mine personnel at the North or South Stibnite Gold Project entry points.	Transportation and Access, Health and Safety
Post reclamation, a road will be established over the backfilled Yellow Pine pit to allow public access through the reclaimed site and connect Stibnite Road (FR 50412) to Thunder Mountain Road (FR 50375). This will replace the operational phase public access route.	Transportation and Access
Prior to site preparation and construction of surface facilities, vegetation will be removed from operating areas. Trees and deadwood, shrubs, and slash not needed to construct windrows at the edge of Burntlog Route disturbance (to function as sediment barriers), will be chipped, and suitable soil will be separately salvaged and stockpiled (except for a small portion that will be 'live handled') for use as part of site reclamation and restoration. Portions of the salvaged soil will be blended with the chipped wood to create growth media. All growth media placed in stockpiles will be stabilized, seeded, and mulched to protect the stockpiles from wind and water erosion.	Vegetation
The Project Operator will inspect and remove vegetation material (including noxious weeds) from mechanical equipment and properly dispose to minimize the spread of unwanted vegetation.	Vegetation
Wood wastes and wood mulch are the two primary sources of compost. Food waste produced from on-site meal preparation and wastes may provide another source. Combined and properly managed during composting, these materials will provide a source of organic matter to be blended into substrate materials suitable for mitigation.	Vegetation
The Project Operator will be responsible for noxious weed control within areas disturbed by Stibnite Gold Project activities.	Vegetation, Wildlife
Develop and employ planting plans for wildlife benefits (cover, forage, etc.) using approved seed mixes.	Vegetation, Wildlife

Description	Resources Affected
The Project Operator will use aquatic safe herbicides during vegetation management activities and noxious weed control. Adhere to chemical label restrictions, Federal and State rules on usage. Use proper equipment for chemical application by trained personnel.	Vegetation, Fish
The Project Operator or its designated contractor(s) will perform long-term maintenance as necessary, including maintaining and monitoring the Mitigation Area (including stream and wetlands) in perpetuity once the final performance standards are met or until such responsibility is relinquished to an appropriate third party (Forest Service, etc.) as approved by the U.S. Army Corps of Engineers.	Vegetation, Wetlands
The Project Operator will plant stream reclamation reaches and wetland reclamation areas with native plant species that are present in PAB, PEM, PSS, and palustrine forested wetlands and riparian areas along streams throughout the Mitigation Area.	Vegetation, Wetlands
To address stream temperature, riparian planting widths along restored and enhanced stream reaches will be 18 feet wide on each stream bank where possible. Taller and denser vegetation such as spruce trees will be planted. Further, the creation of the lined Stibnite Lake, a feature similar in size to the present Yellow Pine pit lake, will replace the function of the existing Yellow Pine pit lake in buffering stream temperature extremes and reduce maximum stream temperatures in East Fork South Fork Salmon River in and downstream of the Stibnite Gold Project.	Vegetation, Wetlands, Surface Water, Reclamation
Pre-construction water management activities will include the installation of surface water management features and implementation of best management practices to reduce erosion and sediment delivery to streams. These water management features and best management practices could include sedimentation ponds; run-on water diversion ditches, trenches, and/or berms; runoff water collection ditches; silt fence; water bars; culverts; energy dissipation structures; terraces; and other features specified in construction permits.	Water Resources
Stormwater runoff from undisturbed areas upslope of mine features in the major drainages will be captured in the stream diversion channels described above or in other channels that will direct runoff away from disturbed areas. Smaller-scale diversion channels or earthen berms will be used, where necessary, to divert stormwater around other mine infrastructure.	Water Resources
Stormwater drains, ditches, and stream channels will be protected against erosion through a combination of adequate dimension, appropriate gradient, riprap, fabric- encapsulated soil lifts, or other stabilization materials. Diversions will be sized for a peak flow recurrence interval appropriate to the risk level of the facility, in recognition of other water management measures and fail-safes in place (excess flood storage and freeboard in the tailings storage facility, etc.), and in accordance with regulatory standards.	Water Resources
Existing streams that run through areas proposed for mining related disturbance will be diverted to prevent generation of contact water or commingling of contact and non-contact water, keeping clean water clean; and to prevent flooding of mine facilities by runoff generated off site.	Water Resources
Groundwater pumped from the dewatering wells will be considered to be contact water and will be managed through forced evaporation or active water treatment when the volume of pumped water exceeds the ore processing facility demand.	Water Resources
Channel segments constructed over fill or excavated in permeable materials will be constructed over a geosynthetic liner to reduce seepage. A transition layer of sand and gravel followed by riprap or similar will be placed over the liner for erosion protection.	Water Resources
Secondary containment for pipelines will consist of an open geosynthetic-lined trench, pipe-in-pipe, or backfilled geomembrane-wrapped trench, depending on location, and the pipeline corridor will drain to one of two pipeline maintenance ponds – one at the truck shop and one at the ore processing facility.	Water Resources

Description	Resources Affected
A lined tailings pipeline maintenance pond will be located at the ore processing facility, to which tailings and process water in the tailings distribution or water reclaim pipelines will drain by gravity during maintenance shutdowns or if there is a leak in either pipeline. The pond will typically be empty except during maintenance or unforeseen problems with the tailings pipeline, pumping system, or tailings storage facility. The pond is designed to contain the contents of the pipelines and the runoff from the pond and lined pipeline corridor from a 100-year, 24-hour storm event plus snowmelt.	Water Resources
Underdrain collection sumps and downgradient monitoring wells will be used for tailings storage facility leak detection.	Water Resources
Water treatment will continue until metal concentrations from each source have stabilized at levels that meet water quality standards for discharge.	Water Resources
A truck wash facility will include an oil-water separation system and water treatment facilities to enable reuse of the wash water.	Water Resources
During mine operations, summer low flows in perennial diversion channels around the tailings storage facility impoundment and buttress (Meadow Creek), Yellow Pine pit (Hennessy Creek and East Fork South Fork Salmon River diversion tunnel), and West End pit (West End Creek) will be piped underground as a mitigation measure to maintain cold stream temperatures.	Water Resources
Hennessy Creek flow will be disconnected from the current unlined ditch passing alongside the Northwest Bradley dumps.	Water Resources
A liner will be installed under the Meadow Creek stream and floodplain corridor to minimize water seepage into the Hangar Flats pit or the pit dewatering well system, and to avoid potential pit wall instability or loss of stream habitat as a result of stream dewatering.	Water Resources
The underdrain system will convey spring and seep flows beneath both facilities to a collection sump at the buttress toe where the flows will be monitored for water quality prior to release into the stream system or capture for use in the processing circuit or treatment prior to discharge, depending on water quality.	Water Resources
Crushed rock will be placed on Stibnite Gold Project access roads as needed to provide a durable surface and limit sediment transport.	Water Resources, Fish, Soils
Road surfaces throughout the Stibnite Gold Project will be stabilized and managed to minimize transport of sediment, dust, and other materials, especially near watercourses through appropriate road engineering, surface drainage, watering, and application of dust control binding agents (magnesium chloride, lignin sulfonate, etc.), roadside ditching, road-cut stabilization, road surface maintenance, appropriate speed limits, and by limiting traffic.	Water Resources, Fish, Soils
During operations, runoff generated from direct precipitation on the tailings storage facility will be retained in the tailings storage facility water pool for reclaim to the ore processing circuit.	Water Resources, Fish, Wildlife, Wetlands
Riparian fringe and floodplain wetlands will be established on the broad, gently sloping floodplains on both sides of the reclaimed stream channels.	Wetlands
Valley margin wetlands will only be established where there is an upgradient water source sufficient to produce enough saturation and near surface water tables for wetland conditions.	Wetlands
Wetland reclamation will begin after the end of mine construction, with the first reclaimed wetlands occurring in the Blowout Creek drainage. Additional reclamation will occur in and after operational year 3 and continue through operations to closure year 25.	Wetlands
Salvaged O and A horizon soils from wetland or hydric soils (seed bank materials over or in combination with mineral soils uplands and wetland subsoils (growth media) will be used to create wetland soil conditions.	Wetlands

Description	Resources Affected
During Burntlog Route and Stibnite Gold Project haul road construction and use, the Project Operator will install and maintain sediment control measures and devices, such as culverts, culvert inlet protection devices, ditching, silt fencing, straw wattles, straw bales, and sediment catch basins.	Wetlands, Fish, Wildlife
Erodible cut and fill slopes along roads will be mulched, hydro-seeded or have durable rock inlay material to minimize the potential for sediment generation.	Wetlands, Fish, Wildlife
During winter road maintenance, the Project Operator will remove snow from the Burntlog Route and haul roads at the Stibnite Gold Project and the temporary construction access Yellow Pine Route. The Project Operator will avoid disposal of snow in riparian areas, wetlands, or areas where snowmelt might cause road damage or erosion during spring melt. Care will also be taken to dispose of collected snow, which may contain sand or gravel, in a manner that avoids impacts to nearby streams and rivers.	Wetlands, Fish, Wildlife
The Project Operator will use coarse sand (with less than 20 percent fines) for winter sanding of the main access road and Stibnite Gold Project haul roads in combination with a fine to medium gravel as needed, (approximately 1/4 - 5/8-inch sizing).	Wetlands, Fish, Wildlife
The Project Operator will salvage and preserve the growth media and seedbank materials of wetlands and riparian areas that will be impacted by the Stibnite Gold Project. These salvaged soils, containing native seed banks, will be used to aid in establishment of wetland and riparian vegetation in the stream and wetland reclamation areas.	Wetlands, Vegetation
Soil will be amended with additional compost and other sources of organic matter necessary to successfully reclaim wetlands at the Stibnite Gold Project.	Wetlands, Vegetation
The Project Operator will maintain a recycling program at the Stibnite Gold Project.	Wildlife
In order to reduce attractants, during construction and operations, trash and other miscellaneous inert (non-hazardous) garbage will be contained in on-site wildlife-resistant containers and hauled to the Valley County waste transfer station for disposal. Used oils, solvents, grease, and antifreeze will be handled separately from normal trash and garbage. Good housekeeping practices will include minimizing loose trash, odors, and access for wildlife to trash storage or disposal areas and prompt removal of trash.	Wildlife
Implement an Avian Protection Plan at the Stibnite Gold Project for transmission lines, including designing power lines and poles to minimize potential bird mortalities due to electrocution. Develop procedures for managing nests of protected species on utility structures (if nests are built).	Wildlife
Construct and operate all overhead powerlines and transmission lines and related facilities in accordance with Avian Power Line Interaction Committee suggested practices (Avian Power Line Interaction Committee 2012) as described in Idaho Power's Avian Protection Plan.	Wildlife
Electric power structures to serve the Stibnite Gold Project facilities will be designed and constructed to avoid raptor perching on structures for predation purposes and minimize the risk of their being electrocuted.	Wildlife
The Project Operator will install a wildlife exclusion fence around the tailings storage facility, process facility areas, and related process ponds in order to reduce the potential for mortalities.	Wildlife
The Project Operator will plan routine inspections of tailings storage facility facilities for wildlife use. If needed, the Project Operator will implement measures to remove wildlife and install additional BMPs to reduce wildlife exposure to these areas.	Wildlife
If critical wildlife zones or corridors are identified, restricted or seasonal access will be established prior to construction or expansion activities to the extent practicable. Physical barriers and/or signage will be added identifying these areas and site-specific measures will be implemented to minimize impacts.	Wildlife

Description	Resources Affected
The Project Operator will implement an animal trapping and relocation plan, as necessary, for nuisance species for safety of staff, visitors, and animals.	Wildlife
The Project Operator will install fences along and around the ore processing facilities, tailings storage facility, explosive storage areas, and composting/landfill, excluding pit perimeters and high walls.	Wildlife
The Project Operator will install signs of known wildlife crossing and usage areas along access and Stibnite Gold Project haul road corridors and all active facility areas. Locations are yet to be determined but signs will be installed to state the road name and mile markers where these corridors are known to exist. These will also be referenced in the training materials.	Wildlife
The Project Operator will provide tiered training for awareness, sighting, operations and maintenance, and restoration. Cross training to include noxious weeds, maintenance needs, unsafe conditions, etc., as well as reporting mechanisms. All mine personnel and visitors will receive some level of training tiered appropriately based on where they are working, type of work activities, and reason for mine visit. Forms will be developed to document training and identify how often training needs to be refreshed. Fact sheets will be developed on known wildlife in the area including pictures, warnings, and what to do if encountered.	Wildlife
The Project Operator will design and manage the tailings storage facility and associated facilities to reduce wildlife attraction. These include the following: • Surface area of the supernatant pond will be minimized to the extent practical. • Install an 8-foot fence around the tailings storage facility to exclude wildlife from the facility. • Implement an avian mortality reporting system for the tailings storage facility and contact water ponds. • Use skirting to enclose open spaces as necessary beneath raised structures as practical. • Follow the International Cyanide Management Code to avoid features possibly attractive to wildlife, as feasible.	Wildlife
Erosion control techniques at the Stibnite Gold Project will include mulching, wetland sodding; planting of vegetation to stabilize slopes; and use of silt fences, biofilters, brush mats, erosion control fabric, and/or fiber rolls along temporary swales, perimeter dikes, and stream banks. In addition, to minimize human disturbance, permanent signage will be posted around the perimeter of individual project sites to prohibit unauthorized foot traffic and the use of all-terrain vehicles and motorbikes, dumping, draining, and cutting and/or removal of plant materials.	Wildlife
Sumps will be constructed with at least one side having a shallow grade for wildlife egress. Sumps will be backfilled and reclaimed when no longer needed for drilling.	Wildlife
Mine site facilities will be monitored in accordance with the draft EMMP for the presence and potential mortality of birds, mammals, reptiles, and amphibians. Sightings of rare or sensitive wildlife, along with any wildlife mortalities, will be recorded and provided in periodic reports to the Forest Service, U.S. Fish and Wildlife Service, and Idaho Department of Fish and Game.	Wildlife
The Project Operator will provide mine personnel with mobile deterrents to avoid conflicts with wildlife – sprays, air horns, etc.	Wildlife
The Project Operator will establish and post speed limits for the Burntlog Route, Stibnite Gold Project haul roads, and light vehicle access roads on the Stibnite Gold Project site. Slower speed limits will be posted at known wildlife crossings and along defined migratory corridors during migration season.	Wildlife, Health and Safety

Description	Resources Affected
There will be no hunting or discharge of firearms during construction and operations within the Stibnite Gold Project area. The Stibnite Gold Project site will be posted to prohibit hunting, and employees will be prohibited from carrying firearms on the Stibnite Gold Project.	Wildlife, Health and Safety
The Project Operator will employ vegetation maintenance for safety along roads, removal of hazard trees, and riparian conservation areas, etc. – coordinate such that wildlife protection and restoration are incorporated during maintenance.	Wildlife, Health and Safety

In addition to these project environmental design features and Forest Service requirements, the Project incorporates elements specifically designed to be protective of Endangered Species Act - listed species that are presented in Part 10.3 and made conditions of this decision.

BEFORE THE BOARD OF ENVIRONMENTAL QUALITY
STATE OF IDAHO

IN THE MATTER OF AIR QUALITY PERMIT TO CONSTRUCT P-2019.0047 NEZ PERCE TRIBE, IDAHO CONSERVATION LEAGUE, and SAVE THE SOUTH FORK SALMON, Petitioners, v. IDAHO DEPARTMENT OF ENVIRONMENTAL QUALITY, Respondent, and PERPETUA RESOURCES IDAHO, INC., Intervenor-Respondent.	Agency Case No. 0101-22-01 OAH Case No. 23-245-01 **CERTIFICATION AND TRANSMITTAL OF AGENCY RECORD AND TRANSCRIPTS**

I, Diane Cutler, certify and state as follows:

1. My name is Diane Cutler. I am the Rules and Planning Analyst with the Department of Environmental Quality (DEQ).

2. My duties include assisting DEQ with contested cases by organizing and managing the documents filed into the agency record.

3. In this capacity and for the purpose of contested cases, I am referred to as the hearing coordinator.

4. As hearing coordinator, I am custodian of the record compiled under Idaho Code § 67-5249.

5. A true and correct copy of the *Corrected Agency Record and Transcripts* for Agency Case No. 0101-22-01/OAH Case No. 23-245-01, In the Matter of Air Quality Permit to Construct P-2019.0047, is provided here via hyperlink and transmitted to the Idaho Board of Environmental Quality. This record is also available on DEQ's Petitions for Review website. This record is current as of January 27, 2025, and will be updated as documents are filed in this case.

I certify under penalty of perjury pursuant to the law of the State of Idaho that the foregoing is true and correct.

Dated this 27 day of January, 2025.

BEFORE THE BOARD OF ENVIRONMENTAL QUALITY
STATE OF IDAHO

IN THE MATTER OF AIR QUALITY PERMIT TO CONSTRUCT P-2019.0047 NEZ PERCE TRIBE, IDAHO CONSERVATION LEAGUE, and SAVE THE SOUTH FORK SALMON, Petitioners, v. IDAHO DEPARTMENT OF ENVIRONMENTAL QUALITY, Respondent, and PERPETUA RESOURCES IDAHO, INC., Intervenor-Respondent.	Agency Case No. 0101-22-01 OAH Case No. 23-245-01 **NOTICE OF SPECIAL MEETING OF THE BOARD OF ENVIRONMENTAL QUALITY | FEBRUARY 13, 2025**

NOTICE IS HEREBY GIVEN that the Board of Environmental Quality (DEQ Board) has scheduled a Special Meeting to take action in the above-captioned matter. The DEQ Board will hold an executive session pursuant to Idaho Code § 74-206(1)(f) to communicate with legal counsel to discuss the ramifications of and legal options regarding this pending contested case. The Board will also consider Petitioners' request that the Board hold a hearing on *Petitioners' Petition for Review of January 7, 2025 Preliminary Order, Memorandum in Support, and Request for Hearing* filed on January 21, 2025. The DEQ Board will further take action to consider the *Petitioner Save the South Fork Salmon's Motion for Reconsideration Based on New Evidence* filed January 24, 2025.

The Special Board Meeting will be held on February 13, 2025, at 10:30 a.m. Mountain Time in conference rooms C and D at the Department of Environmental Quality State Office, 1410 N. Hilton, Boise, Idaho. The public may attend the meeting in person or via Microsoft Teams. The Teams link will be available in the Meeting Notice posted at https://www.deq.idaho.gov/board-of-environmental-quality/ at least 24 hours prior to the meeting date.

Dated this 4th day of February, 2025.

ARGUMENT 12
I. The Hearing Officer Properly Concluded that DEQ Acted Reasonably and in Accordance with Law in Using the Project Specific 16/70 Adjustment 12
II. The Hearing Officer Properly Concluded that DEQ Acted Reasonably and in Accordance with Law in Using the Five-Year Rolling Average 21
III. The Hearing Officer Properly Concluded that DEQ Acted Reasonably and in Accordance with Law as there was Sufficient Evidence to Support the T-RACT Analysis Limiting the Non-West End Pit Production Limit 23
CONCLUSION 27

Respondent, the Idaho Department of Environmental Quality ("DEQ"), by and through the Office of the Attorney General, hereby submits this *Response to Petitioners' Petition for Review of January 7, 2025 Preliminary Order*.

INTRODUCTION

On June 17, 2022, DEQ issued an air quality permit, a Permit to Construct ("PTC"), to Perpetua Resources Idaho, Inc. ("Perpetua") for the Stibnite Gold Project ("SGP"). REC 1274. The PTC, which is the subject of this contested case, was issued after DEQ's nearly three-year permitting effort. *Id.* This effort included three extended public comment periods, two public informational meetings, frequent meetings with Perpetua, numerous requests for additional information, and four permit iterations. *Id*. Nez Perce Tribe, Idaho Conservation League, and Save the South Fork Salmon ("Petitioners") brought their challenge of the PTC on July 22, 2022. This matter has been in the contested case process since. Now, Petitioners bring their Second Petition to the Board of Environmental Quality (the "Board"), again challenging the permitted dust emissions covered by the PTC.

The contested case first came directly before the Board in April of 2024, when Petitioners first appealed the Hearing Officer's decision in DEQ's favor. After considering the matter and hearing oral argument, the Board remanded this case back to the Hearing Officer for further consideration of one discrete issue, the arsenic ambient air emissions. In particular, the Board remanded the matter to the Hearing Officer for further evidence because it found as follows:

> (1) DEQ did not act reasonably and in accordance with law when it applied the 16/70 calculation to the ambient arsenic air concentration analysis;
>
> (2) DEQ did not act reasonably in using a five-year rolling average for T-RACT that was not properly supported by permit conditions; and,
>
> (3) There was insufficient evidence to support the T-RACT analysis limiting the non-West End Pit production limit.

See REC 3712-15. The Board's remand asked DEQ to provide the necessary evidence on these three sub-issues (hereinafter the "Remaining Issues") to demonstrate that DEQ acted reasonably and in accordance with the law. *See* REC 3842. The Hearing Office carefully and thoroughly considered the Remaining Issues, hearing and considering testimony from several expert witnesses. Ultimately, as to this issue, the Hearing Officer determined that DEQ acted reasonably and lawfully, finding specifically:

> (a) DEQ acted reasonably in using a 5-year rolling average for T-RACT that was not supported by further permit conditions;
>
> (b) there was sufficient evidence to support DEQ's T-RACT analysis regarding non-West End Pit production; and
>
> (c) DEQ acted reasonably and in accordance with law when it applied the 16/70 adjustment to the AACC for arsenic.

REC 7111. DEQ now urges the Board to do the same and find that DEQ acted reasonably and in accordance with the law and to uphold the Hearing Officer's January 7, 2025 decision.

PROCEDURAL HISTORY

On July 22, 2022, Petitioners initiated a contested case, challenging DEQ's issuance of the PTC to Perpetua for the SGP. REC 0001-0028. Thereafter, the Board appointed a Hearing Officer to oversee and decide the contested case. REC 0031-0032. On August 12, 2022, DEQ responded to the Petition, denying it committed any error in issuing the PTC. REC 0033-0039. Perpetua then moved to intervene in the contested case, which the Hearing Officer granted. REC 0040-0045.

On September 6, 2022, Perpetua filed a Motion to Dismiss the Petition, which DEQ joined. REC 0052-0124. In ruling on the Motion to Dismiss, the Hearing Officer dismissed three of Petitioners' claims and partially dismissed a fourth. REC 0160-0186. Petitioners were given leave to amend their Petition, and an Amended Petition was filed in January 2023. REC 0263-0292.

Petitioners filed a Motion for Summary Judgment on April 14, 2023, and DEQ and Perpetua filed their own Motions for Summary Judgment on May 12, 2023. REC 0319-0363; REC 1204-1232; REC 1276-1336. After hearing oral argument, the Hearing Officer issued his *Memorandum Decision on Motions for Summary Judgment and Preliminary Order* on October 31, 2023, appearing to dismiss all of Petitioners' claims. REC 3280-3328. Seeking clarity on his decision, DEQ and Perpetua filed a *Joint Motion for Reconsideration and/or Clarification* on November 10, 2023. REC 3332-3341. On December 5, 2023, the Hearing Officer issued his *Amended Memorandum Decision on Motions for Summary Judgment and Preliminary Order*. REC 3372-3425. The Hearing Officer made it clear he dismissed all of Petitioners' claims. *Id*.

On December 15, 2023, Petitioners filed their *Amended Petition for Review of Preliminary Orders*, initiating its first appeal to the Board. REC 3426-3441. After briefing and oral argument, the Board issued its *Final Order* on May 9, 2024 ("Final Order"). In the Final Order, the Board found that DEQ acted reasonably and in accordance with the law on four of the five issues before the Board. As to the fifth issue, the Board concluded: "DEQ Did Not Act Reasonably or in Accordance with Law When it Analyzed the Ambient Arsenic Air Concentrations for the SGP." REC 3717. Therefore, the Board "remand[ed] this matter back for the development of further evidence regarding the ambient air concentrations of arsenic that will be produced by the SGP and whether those levels comply with the Air Rules." *Id*.

After the Board issued the Final Order, DEQ and Perpetua filed a *Joint Motion for Reconsideration and/or Clarification of Final Order.* REC 3721-3727. In the Joint Motion, DEQ and Perpetua asked the Board to either reconsider its decision, hold additional hearings on the arsenic emissions analysis, or provide clarification as to the Board's instructions to the Hearing

Officer. *Id.* The Board denied the request for reconsideration, and also denied the request to hold additional hearings or provide additional clarification for the Hearing Officer. REC 3838.

Thus, the matter was remanded to the Hearing Officer for the development of additional evidence. On remand, "the parties agreed expert witness testimony would be necessary to address the issues identified by the Board," and "from August to October 2024, the parties filed a total of six expert witness declarations." REC 7094. Then on October 17 and 18, 2024, the Hearing Officer held an evidentiary hearing wherein he heard from all six proffered witnesses. *Id.* On January 7, 2025, the Hearing Officer issued his *Findings of Fact, Conclusions of Law, and Preliminary Order* ("Second Preliminary Order"). REC 7091-7118. In the Second Preliminary Order, he found DEQ acted both reasonably and lawfully in its analysis of the ambient arsenic emissions. REC 7111.

On January 21, 2025, Petitioners filed their *Petition for Review of January 7, 2025 Preliminary Order, Memorandum In Support, and Request for Hearing* ("Second Petition"), once again asking the Board to review the Hearing Officer's decision. REC 7119-7145. Specifically, the Petitioners claim:

(1) The 16/70 adjustment for arsenic is unlawful, sets a dangerous new precedent, and is not supported by the evidence; and

(2) Using a five-year rolling average is not reasonable to assess compliance with arsenic limits; and the Permit's conditions are not sufficient to limit production from West End Pit and/or non-West End Pit sources to meet arsenic limits.

REC 7122. Thus, Petitioners continue to raise the same three issues addressed on remand.

STATEMENT OF FACTS

The Clean Air Act ("CAA") is the federal law that regulates air emissions from stationary and mobile sources. 42 U.S.C. § 7401, *et seq*. The Environmental Protection Agency ("EPA") has delegated the authority to implement the CAA in Idaho to DEQ. REC 1272. To implement the CAA, DEQ promulgated the Rules for the Control of Air Pollution in Idaho, IDAPA 58.01.01 (the

"Air Rules"). DEQ has received delegated authority from EPA for decades, and EPA has approved DEQ's program year after year. REC 1272. This delegation includes the authority to issue permits to qualifying facilities. *Id.* DEQ's air quality permit program issues more than 100 permits a year. REC 1258. In writing permits, DEQ staff use federal and state regulations and internal operating procedures. REC 1273. When DEQ receives a permit application for a "permit to construct," DEQ strives to issue the permit within 150 days, which includes time for a public comment period. *Id.*

Perpetua submitted an application for a permit to construct for the SGP on August 20, 2019. REC 0418. The SGP will consist of conventional open-pit mining, ore preparation, and gold extraction. REC 0415. DEQ expended extraordinary efforts to evaluate the application, consider public comments, and engage in highly technical decision-making to arrive at an environmentally and legally sound permit. *See* REC 1273-1274. DEQ held three extended public comment periods, two informational meetings, frequent meetings with Perpetua, and made many requests for additional information. REC 0418. DEQ found Perpetua's application incomplete three times. *Id.* DEQ's relentless pursuit for necessary information, and Perpetua's willingness to provide it, demonstrate the parties' desire to prepare only a defensible, environmentally protective permit.

On June 17, 2022, DEQ issued the 43-page PTC and accompanying 505-page Statement of Basis for the SGP. *See* REC 0367-0914. Petitioners then initiated the contested case on July 22, 2022, challenging DEQ's issuance of the PTC. REC 0001-0028.

LEGAL STANDARD

In a contested case proceeding, "the Board must determine whether DEQ has acted reasonably and in accordance with law." *In the Matter of Sunnyside Park Utilities' Application for Sewage Disposal Permit*, Final Order on Petition for Review of Preliminary Order, at 10 (BEQ

Dkt. 0103-07-02, Apr. 7, 2009).[1] A court will affirm the Board's decision, should it be appealed, unless the court finds that DEQ and the Board's decision is in violation of constitutional or statutory provisions, is in excess of statutory authority, is made on unlawful procedure, or is arbitrary, capricious, or an abuse of discretion. *See* I.C. § 67-5279(3).[2] Petitioners bear the burden of proof as the party challenging DEQ's issuance of the PTC. IDAPA 62.01.01.477 ("the burden of proof is on the party requesting or challenging an agency action or order"). The Petitioners' must meet their burden by a preponderance of the evidence. *Id*.

The Hearing Officer was tasked with determining whether Petitioners presented competent evidence establishing that DEQ was not reasonable and did not act in accordance with the law when it issued the PTC; and specifically, whether DEQ's analysis of the arsenic ambient air concentrations was unreasonable and unlawful. The Hearing Officer, and now the Board, must only consider whether DEQ was reasonable and acted in accordance with the law— not whether a person disagrees with DEQ's reasonable and lawful approach.

When reviewing the Second Preliminary Order, the Board has the authority to "exercise all of the decision-making power that [the Board] would have if [the Board] had presided over the hearing." I.C. § 67-5245(7). "This means that, in reviewing the Preliminary Order, the Board may review all of the evidence *de novo*…" *In the Matter of Sunnyside Park Utilities' Application for Sewage Disposal Permit*, at 2. "A de novo standard of review permits an appellate court to review all legal issues raised in the lower court, even if one of the issues was not addressed in the first

[1] Publicly available at https://www2.deq.idaho.gov/admin/LEIA/api/document/download/5566.

[2] The Hearing Officer recognized the helpfulness of using the judicial standard of review in I.C. § 67-5279, "[b]ecause those are the standards that ultimately govern the disposition of this matter…" REC 3377. Further, and importantly, Petitioners use the judicial standard of review set out in I.C. § 67-5279 in asking for relief. REC 3474.

instance, so long as there is a sufficient factual basis." *State v. Jay*, 167 Idaho 592, 598, 473 P.3d 861, 867 (Ct. App. 2020).

Throughout this contested case, it has been clear that expert opinions are necessary. *See* REC 3375 (in the December 5, 2023 *Amended Memorandum Decision on Motions for Summary Judgment and Preliminary Order*, the Hearing Officer discussed the technical nature of the air permit matters and determined DEQ staff were expert witnesses); REC 3716 (the Board seeks expert testimony from a toxicologist or other qualified expert). Because the PTC at issue, as well as the questions of cancer risk and arsenic concentrations, are technical and complex, expert testimony is essential. *See* REC 3375. Importantly, DEQ's "experience, technical competence, and specialized knowledge may be utilized in the evaluation of the evidence." I.C. § 67-5251(5).

When analysis "requires a high level of technical expertise," a court must defer to "the informed discretion of the responsible... agencies." *Kleppe v. Sierra Club*, 427 U.S. 390, 412 (1976). "When specialists express conflicting views, an agency must have discretion to rely on the reasonable opinions of its own qualified experts even if, as an original matter, a court might find contrary views more persuasive." *Marsh v. Oregon Nat. Res. Council*, 490 U.S. 360, 378 (1989). A court "will uphold a decision of less than ideal clarity if the agency's path may reasonably be discerned." *Bowman Transp., Inc.*, 419 U.S. at 286 (citing *Colorado Interstate Gas Co. v. FPC*, 324 U.S. 581, 595 (1945)).

"When examining this kind of scientific determination, as opposed to simple findings of fact, a reviewing court must generally be at its most deferential." *Baltimore Gas & Electric Co. v. Natural Resources Defense Council, Inc.*, 462 U.S. 87, 103 (1983). This is particularly true for statistical and modeling analysis. *See Appalachian Power Co. v. EPA*, 135 F.3d 791, 802 (D.C. Cir. 1998) (per curiam) (identifying statistics as "the prime example of those areas of technical

wilderness into which judicial expeditions are best limited to ascertaining the lay of the land"). The court "will examine each step of [the agency's] analysis to satisfy ourselves that the agency has not departed from a rational course, and only when the model bears no rational relationship to the characteristics of the data to which it is applied will we conclude the use of the model was arbitrary and capricious." *Huntsman Petrochemical LLC v. Env't Prot. Agency*, 114 F.4th 727, 735 (D.C. Cir. 2024) (emphasis added) (cleaned up).

REGULATORY SCHEME

For the Remaining Issues and issues subject to this Petition, the applicable sections of the Air Rules have been outlined several times, which include: Sections 203, 161, 210, 586, and the definition of "toxic air pollutant carcinogenic increments" in Section 006.125 of the Air Rules.[3] *See* REC 3416-17, 3707-10, 6894-96. In general terms, the parties appear to agree on the relevance and applicability of these specific rule sections listed above. However, Petitioners continue to question whether DEQ had authority to factor in the project duration for the SGP's arsenic emissions. Through its expert witnesses, DEQ explained why factoring in project duration was in fact supported by the Air Rules.

Section 203 of the Air Rules states that DEQ cannot issue a permit to construct unless the permit applicant can demonstrate to the satisfaction of the Department, "using the methods provided in Section 210," that "the emissions of toxic air pollutants from the stationary source… would not injure or unreasonably affect human health or animal life or vegetation as required by Section 161." IDAPA 58.01.01.203.03. An applicant has demonstrated compliance with Section 210 when the estimated ambient air impacts are less or equal to the applicable acceptable ambient concentration ("AACC") for carcinogens as provided in IDAPA 58.01.01.586. *See* IDAPA

[3] DEQ issued the PTC to Perpetua on June 17, 2022. Thus, the 2022 version of the Air Rules are relied upon.

58.01.01.210. The AACC in IDAPA 58.01.01.586 "is calculated by dividing the acceptable lifetime risk (1 in 1,000,000) by the [unit risk factor ("URF")]," which is "4.3E-3µg/m3 for arsenic." REC 4282. The URF, which is developed by the Environmental Protection Agency (EPA) is the risk probability from exposure to 1 µg/m3 of a substance continuously (24 hours/day and 365 days/year) over a lifetime of exposure (assumed to be 70 years). REC 3922.

Section 210.12 then allows a permit applicant to "use [Toxic Air Pollutant Reasonably Available Control Technology ("T-RACT")] to demonstrate preconstruction compliance for toxic air pollutants listed in Section 586." IDAPA 58.01.01.210.12. T-RACT "is an emission standard based on the lowest emission of toxic air pollutants that a particular source is capable of meeting by the application of control technology that is reasonably available, as determined by the Department…" IDAPA 58.01.01.210. When an applicant uses T-RACT, the allowable cancer risk changes from 1-in-1,000,000 to 1-in-100,000.

DEQ used the methods in Section 210 to determine the SGP's compliance with Section 161. Because Perpetua proposed to use T-RACT, the arsenic emissions from SGP could not create a lifetime cancer risk of greater than 1-in-100,000. TR 0244:16-21. Perpetua then modeled the emissions from the SGP, based on its "maximum design rate," as limited by the PTC. TR 0524:23-25. The modeling relied upon many conservative assumptions, using worst case scenarios. *See* TR 0527:23-272:3. Kevin Schilling, DEQ's Stationary Source Air Modeling Supervisor and one of DEQ's expert witnesses during the remand, explained the next steps in the process, stating:

> During development of final SGP permitting analyses, [Perpetua] expressed concern that compliance with AACCs could not be demonstrated with the conservative assumptions used in previous analyses, including the assumption that the SGP was a permanent source rather than one of 16-year duration. Rather than revise the analytical approach to provide a less conservative assessment of impacts, I proposed that compliance with carcinogenic [Toxic Air Pollutant] increments could be based on cumulative cancer risk of the limited-duration project rather than the worst-case annual impact for a project of limited duration. Since the AACC

> annual average is an expression of a 1- in-1,000,000 cancer risk limit for permitting projects, modeled impacts (annual contaminant concentration) must be adjusted to an exposure concentration that is appropriately comparable to the annual average AACC. Therefore, annual impacts for a project with a 16-year duration could be multiplied by a 16/70 factor to more appropriately compare to the AACC, which is based on a 70-year exposure duration.

REC 3924-25. "So, in Perpetua's case, in order to develop an appropriate factor to compare or an appropriate concentration to compare to the AACC, [DEQ] needed to account for the exposure duration." TR 0217:1-4.

DEQ's application of the project specific adjustment is consistent with the purpose and intent of the Toxic Air Pollutant ("TAP") Rules within the Air Rules. During the evidentiary hearing, Mr. Schilling stated that, in his experience based on personally participating in the development of the TAPs Rules, the "carcinogenic TAP AACCs were established to ensure that impacts of any carcinogenic TAPs from a project or facility would not cause a lifetime cancer risk over 1-in-1,000,000 or 1-in-100,000 when using T-RACT." REC 3926. He explained:

> Going all the way back to the toxics policy that was used in permitting, the cornerstone of that was focused on project risk. In other words, any particular project, whether it is a new facility or a modification, not causing a risk to exceed one in a million or one in 100,000, some things changed with T-RACT going from policy to regulation.

TR 0200:5-12. Thus, "DEQ continually asserted that carcinogenic TAPs resulting from a permitting project should be regulated to prevent an unacceptable excess cancer risk based on a 70-year lifetime." REC 3922. In simple terms, from the beginning of their development, the cornerstone of the TAPs Rules is that total increased pollutant-specific cancer risk from a project over the project's life cannot exceed the lifetime cancer risk limit imposed by the rules.

This approach, as described by Mr. Schilling, makes sense given the Air Rules' reference to and reliance upon EPA's URFs. Section 586 specifically lists the URF for each pollutant. Thus, "DEQ adopted EPA's cancer risk values and risk assessment methodology when it promulgated

the Air Rules for toxic air pollutants from stationary sources." REC 4282. Stated another way, "[c]ancer risks used to establish AACCs were based on EPA's cancer risk model (using established EPA URFs)." REC 3926. When asked during the evidentiary hearing if the Air Rules rely upon the URFs, Mr. Schilling responded by stating: "I believe it is really the cornerstone of the whole TAPs program for regulating carcinogenic compounds." TR 0202:8-10. According to Mr. Schilling, inclusion of the URF demonstrates that "it's a project cancer risk that is the focus rather than an annual strict increment." TR 0220:7-8. This is further supported by the definition of "Toxic Air Pollutant Carcinogenic Increments" in the Air Rules, which is as follows:

> Those ambient air quality increments based on the probability of developing excess cancers over a seventy (70) year lifetime exposure to one (1) microgram per cubic meter (1 ug/m3) of a given carcinogen and expressed in terms of a screening emission level or an acceptable ambient concentration for a carcinogenic toxic air pollutant. They are listed in Section 586.

IDAPA 58.01.01.006.125. And, as DEQ's Toxicologist and expert witness Dr. Norka Paden explained: "Under EPA's methodology for human health risk assessments, cancer risk calculations are done using a lifetime exposure set at 70 years," meaning the risk calculations use a lifetime of 70 years. REC 3877.

Thus, the TAPs Rules require that a project not exceed the lifetime allowable risk from a project. That is an increased risk of a 1-in-1,000,000, or 1-in-100,000 if T-RACT is used. Again, the AACCs are not annual limits, but an annual average "expression of a 1-in-1,000,000 cancer risk limit for permitting projects." See REC 3924-25. This requires DEQ to adjust exposure duration to "to an exposure concentration that is appropriately comparable to the annual average AACC." REC 3925. A permanently operating project is the underlying assumption for using a 70-year lifetime and exposure duration. Where a project will not operate permanently, however, a

specific adjustment for the actual life of the project is reasonable. Consequently, DEQ used a project specific adjustment factor, as supported by the regulations outlined above.

ARGUMENT

As stated above, the Board remanded this matter back to the Hearing Officer for further consideration of the three Remaining Issues. *See* REC 3712-3715. These are the same three issues Petitioners bring in their Second Petition. DEQ asked the Board to hear additional evidence on these issues when it filed its *Motion for Reconsideration and/or Clarification*, stating "DEQ and Perpetua ask the Board to reconsider its decision regarding DEQ's analysis of arsenic ambient concentrations and reopen the proceedings before the Board and hold an additional hearing on the analysis before issuing a final order." REC 3735. The Board denied the motion; instead, the Board entrusted the Hearing Officer to hear additional evidence and render a decision. REC 3835-3843.

During the remand, the parties spent several months working with their experts to provide written declarations. Subsequently, the Hearing Officer held a two-day evidentiary hearing. During the hearing, the Hearing Officer listened to expert witness testimony during examination and cross-examination, making his own credibility determinations. The Hearing Officer also asked his own questions of the witnesses. Thereafter, the Hearing Officer issued his decision, finding that, based on all the evidence presented, DEQ's analysis was reasonable and lawful.

I. The Hearing Officer Properly Concluded that DEQ Acted Reasonably and in Accordance with Law in Using the Project Specific 16/70 Adjustment

A. The project specific adjustment is supported by the Air Rules.

The Board remanded this matter to the Hearing Officer to determine whether DEQ acted reasonably and in accordance with law when it applied the 16/70 adjustment factor to the ambient arsenic emissions from the SGP. During the remand, DEQ and Perpetua's experts explained how

the Air Rules fully support using the project specific adjustment factor, and how it was protective of public health. Through the expert testimony, it became clear the cornerstone of the carcinogenic TAP Rules is limiting *project-caused* cancer risk to less than 1-in-1,000,000, or 1-in-100,000 when T-RACT is used. After careful consideration of the declarations and testimony, the Hearing Officer concurred the Air Rules support DEQ's approach. Still, Petitioners assert this was error. Petitioners claim the Hearing Officer ignored the Board's interpretation, REC 7127, but the Hearing Officer had the benefit of the expert witness testimony that was specifically requested by the Board.

Ignoring the Hearing Officer's thoughtful analysis, Petitioners instead state, "the Hearing Officer rationalized that adjusting the Stibnite Gold Project based on the 16 years it will operate is appropriate, because the 'Air Rules do not expressly preclude' it." REC 7127. As described above, it is not that the Air Rules simply do not "expressly preclude" the approach, but they expressly support it. First, the definition of "Toxic Air Pollutant Carcinogenic Increments" plainly supports DEQ's analysis. Again, the definition is as follows:

> Those ambient air quality increments based on the probability of developing excess cancers over a seventy (70) year lifetime exposure to one (1) microgram per cubic meter (1 ug/m3) of a given carcinogen and expressed in terms of a screening emission level or an acceptable ambient concentration for a carcinogenic toxic air pollutant. They are listed in Section 586.

IDAPA 58.01.01.006.125. Mr. Schilling highlighted that the definition "references the [one] in a million cancer risk being the criteria, and that the AACCs are an expression of that for a continuation exposure over the lifetime." TR 0202:15-18; *see* IDAPA 58.01.01.006.125. The definition is also "expressed in terms of the screening emission limit or the acceptable ambient concentration of a carcinogen," and the use of the word "expressed," in Mr. Schilling's opinion, "makes it clear that it focuses on a total project-imposed cancer risk rather than a specific year by year." TR 0214:9-14. The Hearing Officer also found the definition persuasive, stating the

definition "expressly reference the assumed 70-year lifetime for evaluating increased cancer risk from TAPs exposure." REC 7101.

Further, Section 586 of the Air Rules, which contains the AACCs, also provides the URFs, which were created by EPA. The URF[4] is "the toxicity value that you compare an exposure concentration to estimate risk from that exposure." TR 0364:24-0365:1. As Dr. Paden explained, "DEQ has in the rules that [A]ACC uses the inhalation unit risk which comes from EPA," and that Section 586 contains "a footnote there that indicates that value is taken from EPA." TR 0319:5-8. Thus, the inclusion of the URF in Section 586 demonstrates that "it's a project cancer risk that is the focus rather than an annual strict increment." TR 0220:7-8. When Mr. Schilling was asked what the impact would be to the TAP Rules if the URFs were not included in Section 586, he stated:

> It would be less clear that it's project risk we're concerned about. I wouldn't say it would be clear that the intent would be just an annual standard because through the rulemaking process and that entire thing and background, project risk was always sort of the cornerstone focus.

TR 0219:22-0220:3. In simple terms, the TAP Rules are focused on the overall risk of the project based on exposure over a lifetime. The Hearing Officer concurred stating: "Because Air Rule 586 incorporates the URFs/IURs adopted by EPA, its Acceptable Concentrations (i.e., AACCs) are inherently expressed as the annual average concentration over the course of an assumed 70-year lifetime." REC 7101.

The Hearing Officer did note that the "Air Rules do not expressly preclude adjusting exposure concentrations to account for projects with an operational life of more than 5 years and

[4] Perpetua's toxicologist and expert witness Theresa Lopez testified that the unit risk factors are the same as the inhalation unit risk. *See* TR 0364:9-13.

less than 70 years."[5] REC 7102. But he also stated that, "[t]o the contrary, as previously referenced, Air Rule 586 contains an express reference to the URFs/IURs adopted by EPA, which are based on an assumed 70-year lifetime exposure." *Id*. Understanding the AACCs necessarily requires a person to understand the impact of including the URFs. Once this is understood, it is clear that "it's a project cancer risk that is the focus rather than an annual strict increment." TR 0220:7-8.

Petitioners' expert witnesses, Dr. Ian von Lindern and William Tiedemann, offered a different reading of the Air Rules. However, the Hearing Officer found that "often, the Protestants' witnesses Mr. Tiedemann and Dr. von Lindern testified regarding what they wished the Air Rules said, rather than what they actually say." REC 7096 (emphasis added). For example, Dr. von Lindern testified the "annual compliance with [the AACC] is the cornerstone of the rule…" TR 0674:22-25. He also continually referred to the AACC as a maximum annual or maximum one year concentration. *See*, e.g., REC 6108, 6110, 6112. When asked where the term "maximum one-year annual average ambient air carcinogen concentration" came from, he responded by stating that it is "how you should interpret [section] 586, which says 'annual averages.'" TR 0742:24-25 (emphasis added). But he admitted the terminology was not from the Air Rules. TR 0743:2. Dr. von Lindern also continually discussed a "margin of safety" and the impacts to sensitive populations. *See* TR 0675:9-15; REC 6112. He also admitted that the margin of safety is not in the Air Rules, TR 0736:11-12 ("that's my term to help explain this"), and that the URFs already take into account susceptible groups, TR 0742:6. And even though EPA does not list arsenic as having a mutagenic mode of action, he continually stated it should be and instead noted it was "one of the

[5] Petitioners also claim that DEQ's approach renders the short-term adjustment for projects that last five years or less superfluous. REC 7129. The Hearing Officer specifically discusses the short-term source adjustment factor. Clearly, that provision in IDAPA 58.01.01.210.15 is still available and relevant for projects that will exist for less than five years. But that is not the case with the SGP.

most controversial things going on in EPA." TR 0741:2-3; *see also* TR 0737:25-0738:2. Petitioners continue to make these same arguments, only expressing what they *wish* the Air Rules said.

B. DEQ's approach is protective of public health.

In its Final Order, the Board stated it "has not found sufficient evidence in the record to convince it that the 16/70 analysis performed by DEQ was equally or more protective of human and animal life and vegetation as what is provided for by the Air Rules." REC 3717. During the remand, both DEQ and Perpetua's experts explained in great detail how DEQ was protective of public health. Still, Petitioners assert that DEQ's analysis is "allowing Idahoans to be exposed to higher cancer risk." REC 7130. As discussed herein, the expert witness testimony clearly provides sufficient evidence demonstrating that DEQ's analysis was equally or more protective and is in fact provided for by the Air Rules.

As has been discussed, the Air Rules, specifically the AACCs, rely upon and incorporate EPA's science and methodologies. *See* REC 3876, REC 4284. The URFs in Section 586 were developed by EPA and "reflect[] many years of research and evaluation…" REC 4282. Using EPA's methodology for calculating cancer risk, both Dr. Paden and Theresa Lopez, Perpetua's Toxicologist and expert witness, concluded that the use of the project specific adjustment factor did not unreasonably increase the risk and was in compliance with the T-RACT 1-in-100,000 project-allowable increased cancer risk increment. *See* TR 0316:23, 0383:2.

Shockingly, Petitioners assert that "Dr. Paden and Ms. Lopez[] failed to establish that application of the 16/70 Project-specific adjustment factor to arsenic emissions is a scientifically valid method for assessing excess cancer risk…" REC 7134. Although Petitioners did not provide their own toxicologist, they still attack the two toxicologists who clearly opined that including

project duration was done in accordance with human health risk assessments.[6] Both Dr. Paden and Ms. Lopez calculated the cancer risk from the SGP using EPA's formula for human health risk assessments where cancer risk calculations are done using a variable exposure duration and an assumed 70-year lifetime. REC 3877. That formula is as follows:

EC = (CA x ET x EF x ED)/AT

Where: EC (µg/m3) = exposure concentration;
CA (µg/m3) = contaminant concentration in air;
ET (hours/day) = exposure time;
EF (days/year) = exposure frequency;
ED (years) = exposure duration; and
AT (lifetime in years 70 x 365 days/year x 24 hours/day) = averaging time

Id. And Ms. Lopez testified:

> Using the highest modelled annual average arsenic concentration from the project of 0.00414 µg/m3 (REC 716) the calculation of the air concentration adjusted for exposure from the SGP is as follows:

$$\left[0.00414\,\frac{\mu g}{m3}\,x\,24\,\frac{hours}{day}\,x\,\frac{1\,day}{24\,hours}\,x\,365\,\frac{days}{year}\,x\,16\,years\right] / \left[365\,\frac{days}{year}\,x\,70\,years\right] = 0.00095\,\frac{\mu g}{m3}$$

REC 4284. As Ms. Lopez explained:

> This calculation took the exposure, the CA, contaminate concentration in air, which was the emissions from the mine, multiplied it by 24 hours a day, 365 days a year, for 16 years, and then divided by the averaging time in years to develop an exposure concentration that is equal to .00095.

TR 0379:13-19.

Simply put, the result of these calculations demonstrated that the arsenic emissions from the SGP resulted in a 0.00095 µg/m3 arsenic concentration averaged over a lifetime. Thus, Ms. Lopez concluded "[t]he actual risk is four in a million or approximately one in 240,000." TR 0382:18-19; *see also* TR 0318:1-5 (Dr. Paden similarly concluded: "But most importantly, the 16

[6] Petitioners also discuss at length the "health impact assessments" from the State of Washington. Once again, Petitioners are just discussing what they wish the Air Rules prescribe.

years that we are discussing in this hearing, and that four in 1 million cancer risk. So that is the below the T-RACT which is below our rule standard for cancer risk. This is less than the T-RACT adjusted risk increment of 1-in-100,000."). Clearly, the formulas above account for exposure duration. Dr. Paden testified it is common practice when performing a risk assessment to adjust the exposure duration. TR 0326:22. She explained, stating:

> In fact, usually when we are talking about residential exposures you can use different values from EPA, 26 [years]. Or when you are valuating a receptor that could be -- a receptor who is going to be exposed, a recreational person who is going to go to the site only for a short amount of time, you can use that exposure duration, that way you don't overestimate the risk. So if you have information that is provided to me as a risk assessor and they tell me I am going to look at the risk here, to be more accurate I can use that information and put the 26, the 16, 15, whatever number the person is going to get exposed to get an accurate calculation of the cancer risk.

TR 0325:24-0326:13. Ms. Lopez agreed, stating "[c]omparing unadjusted emissions to the AACC would result in an over-estimation of cancer risk because the dose will not continue for the 70-year lifetime exposure assumed in the development of the AACC." REC 4283 (emphasis added).

C. DEQ's arsenic analysis is not an "ad hoc" approach but is consistent with DEQ practice.

Lacking a true legal basis, Petitioners instead argue that DEQ has engaged in an "ad hoc approach" and is creating a new, dangerous precedent. REC 7130. Petitioners imply that only now, under the scrutiny of a contested case, has DEQ considered the impact of its analysis on public health and whether it complies with the Air Rules. Nothing could be further from the truth. As was discussed at length during the evidentiary hearing, DEQ did not break from any established agency precedent when it factored in the duration of the project, both in terms of a 16-year lifetime and having an overall production limit.

Mr. Schilling testified that, in his experience, "we have not encountered applications that were over five years, but less than 70." TR 0249:1-2. He also stated a permittee must only indicate

how long it will operate "if they want to take credit for a shorter than permanent duration in their permitting -- in their permit itself." TR 0250:8-10. This is not a situation where DEQ previously considered and rejected a project specific adjustment. And this is also not a situation where DEQ has an explicit mandate preventing it from doing so. In fact, the Air Rules support its decision.

Petitioners continue to claim DEQ departed from agency practice. REC 7130. But neither Petitioners nor their witnesses could describe a situation where DEQ was confronted with a project-specific duration adjustment but denied it based upon some agency position or practice. When asked, Mr. Tiedemann stated that, in his time at DEQ, no permit applicant asked for a project specific adjustment (of less than 70 years but greater than 5). *See* TR 0621:7-8. It is difficult to understand how DEQ could have been departing from a "long-standing, pre-Stibnite Gold Project Precedent," REC 7131, when it was encountering a situation for the first time. Mr. Schilling explained that when Perpetua did make this request, DEQ considered and vetted it, focusing on ultimate compliance with lifetime cancer risk, ensured it was a "reasonable approach to our interpretation," and then ultimately moved forward. TR 0306:20-0307:3. Thus, in reality, DEQ followed its typical permitting process where "you start with an application and the analysis gets refined over time." TR 0212:11-13.

The Hearing Officer concurred, stating that where a project has a "life of 70 years or more, direct comparison of the highest modeled annual average concentration to the Acceptable Concentration is appropriate for determining compliance with Section 586." REC 7102. But when a project has "a known project life of less than 70 years, EPA adjusts the highest modeled annual average concentration to account for the different exposure durations in order to accurately calculate cancer risk with an Approved Concentration that is capable of comparison to the Acceptable Concentrations in Section 586." *Id.* Thus, "for projects such as the SGP in which

exposure is known to be for less than 70 years, it is inappropriate to compare this concentration to the Acceptable Concentration in order to determine compliance with Section 586." REC 7100.

Petitioners then argue the TAP Rule rulemaking history supports their contention that DEQ's approach strays from agency practice. REC 7130. Again, DEQ's application of the project specific adjustment is consistent with the purpose and intent of the TAP Rules. Mr. Schilling stated that, in his experience based on personally participating in the development of the rules, the "carcinogenic TAP AACCs were established to ensure that impacts of any carcinogenic TAPs from a project or facility would not cause a lifetime cancer risk over 1-in-1,000,000 or 1-in-100,000 when using T-RACT." REC 3926. He explained:

> Going all the way back to the toxics policy that was used in permitting, the cornerstone of that was focused on project risk. In other words, any particular project, whether it is a new facility or a modification, not causing a risk to exceed one in a million or one in 100,000, some things changed with T-RACT going from policy to regulation.

TR 200:5-12. Thus, "DEQ continually asserted that carcinogenic TAPs resulting from a permitting project should be regulated to prevent an unacceptable excess cancer risk based on a 70-year lifetime." REC 3922. In simple terms, from the beginning, the cornerstone of the TAP Rules is that total increased pollutant-specific cancer risk from a project over the project's life cannot exceed the lifetime cancer risk limit imposed by the rules.

Petitioners discuss the "intent of the Air Rules," but continue to rely on the random assortment of unofficial rulemaking documents provided during the evidentiary hearing. REC 7130. In doing so, Petitioners ignore the Hearing Officer's Second Preliminary Order, wherein he "agrees that many of the exhibits offered by the Petitioners' witnesses consisted of isolated references from prior rulemakings that lacked explanation of their context or relevance to the interpretation of the plain language of the existing Air Rules." REC 7096-7097. Thus, the opinions

of witnesses who were not participants in the rulemaking and the assortment of unexplained documents should have no bearing.

Based on the above, the expert testimony demonstrates that the project specific adjustment was reasonable – calculating cancer risk naturally requires one to consider the exposure duration. REC 3877, REC 4286. The adjustment has also been shown to be lawful – the AACCs are based on EPA's methodologies and adjusting the exposure length is consistent with EPA methodologies. See REC 3876-77, 4286. Ultimately, the testimony of Dr. Paden and Ms. Lopez establish "the highest air concentration of arsenic from the project is below the acceptable lifetime risk established by the T-RACT AACC." REC 4285.

II. The Hearing Officer Properly Concluded that DEQ Acted Reasonably and in Accordance with Law in Using the Five-Year Rolling Average

Next, the Board asked the Hearing Officer to consider DEQ's use of a five-year rolling average for determining compliance. The testimony presented demonstrated that the five-year rolling average production limit for assessing compliance with the AACC is both reasonable and lawful. But since Petitioners continue to wrongly assert that the AACCs provide annual compliance limits, they also continue to assert that a five-year rolling average is insufficient. REC 7139. But "long-term exposure to a given concentration over the life of the project is the critical parameter for the risk-based AACCs." REC 3919. Mr. Schilling explained:

> It goes back to the same cornerstone of the rules being project-imposed risk. As long as project-imposed risk is the criteria and we have a duration of the project of 16 years, what really matters for demonstrating, whether it complies or not, is where are we at after 16 years.

TR 0221:14-19. Thus, the "[u]se of a 5-year averaging period for limiting processing rates easily accomplishes this requirement for a project with a 16-year duration, and it provides for reasonable periodic assurance of compliance with the long-term limit." REC 3926. Again, DEQ does not

simply determine if the SGP complied with the lifetime AACC at the end of the project. Instead, DEQ uses "something less than 16 years as a responsible vehicle to identify when things might… be going wrong at an earlier time." *Id*.

The PTC also contains "sideboards" on production. Mr. Schilling and Kevin Lewis, Perpetua's expert witness and air quality engineer, described these sideboards stating, "there are shorter-term processing limits in [the PTC]," TR 0225:20-21, and "[i]t's the 135,000 tons per day has sideboards and, you know, other short-term limits that you have to demonstrate compliance with…" TR 0549:12-14. But because Perpetua also has year to year operational variability given its operations, the five-year rolling average is actually more representative of emissions – not simply capturing one year that may be much different from any other year, operation-wise. *See* TR 0549:21-24. Dr. Paden confirmed that "if a five-year rolling average was actually more representative because of the variability of the project, [that] would… actually be the best number to use as the representative number." TR 0356:22-175:2. The Hearing Officer concurred, stating: "For projects like the SGP with highly variable emissions over time, a five-year rolling average of emissions is more representative of actual emissions from the project than evaluating emissions on an annual basis." REC 7108.

Because DEQ demonstrated the project adjustment factor was protective of public health, it follows that the five-year rolling average is also protective. When Perpetua's counsel asked Mr. Lewis, if "the five-year rolling average is a way to disguise whether or not this permit is going to allow Perpetua to exceed the T-RACT limits," Mr. Lewis stated: "That's just a complete mischaracterization of what's going on." TR 0550:5-12. And, in fact, Perpetua's counsel confirmed that, "even at its peak mining production, on any one given day, even if you strung it together every day for an entire year… [the SGP] still wouldn't exceed the T-RACT control limit."

TR 0550:19-22. If Perpetua can demonstrate that it will comply with the AACCs, understanding that it is a lifetime risk for the 16-year project, then a five-year rolling average is a reasonable method for measuring compliance. Again, the Hearing Officer agreed, finding:

> In fact, because Section 586 is focused on excess cancer risk posed by a project over the course of an assumed 70-year lifetime or the lifetime of a project that will last less than 70 years, the five-year rolling average approach in Condition 3.5 is stricter and more protective than Section 586 requires.

REC 7108. Again, for the reasons set forth herein, DEQ was both reasonable and lawful in using a five-year rolling average.

III. The Hearing Officer Properly Concluded that DEQ Acted Reasonably and in Accordance with Law as there was Sufficient Evidence to Support the T-RACT Analysis Limiting the Non-West End Pit Production Limit

Finally, the Board had concluded "there was insufficient evidence in the record to demonstrate exactly how or whether the non-West End Pit production was limited and, if it was, the Board of Environmental Quality could not find any PTC conditions able to enforce that reduction." REC 3714. Petitioners continue to assert that the PTC does not effectively limit production from the West End Pit or Non-West End Pit. REC 7141. According to the testimony of Mr. Schilling and Mr. Lewis, the PTC appropriately and effectively limited both West End Pit and non-West End Pit production. *See* REC 3927; REC 4139; TR 0227; TR 0539. Mr. Schilling explained: "There's sort of two main limits. There's a total mine limit in there of 788.4 million tons. And then there is a west end pit-specific limit of 50 percent of that, which is 394.2 million tons."[7] TR 0227:11-15. Thus, a "limit to the non-west end pit production sources was not needed because even if 100 percent of the production is from non-west end pit sources, we're still in

[7] Petitioners state: "100% West End Pit production is a realistic possibility." REC 7142. This is incorrect. As Mr. Schilling testified, PTC Condition 3.6 limits West End Pit production to 50% of the total ore. TR 0227:11-15.

compliance." TR 0227:18-21. This was important because, as Mr. Lewis explained, "pound for pound, the West End Pit resulted in higher ambient air impacts." TR 0565:14-16.

These limits are contained in the PTC as Condition 3.6, which "limits total hauling and excavation from the mine to 788.4 million tons" and it "limits hauling and excavation from the West End Pit to 394.2 million tons, which is equal to 50% of total allowable production." REC 3927; *see also* REC 4139. Thus, a limit to the non-West End Pit was not necessary based on the following relationship:

$$\text{Production}_{\text{Non-WEP}} = \text{Production}_{\text{total}} - \text{Production}_{\text{WEP}}$$

See REC 3928.

As the Hearing Officer explained, "Because Condition 3.6 limits [West End Pit] production to 394.2 million tons, and because 394.2 million equals 50% of 788.4 million tons, Condition 3.6 limits [West End Pit] production to 50% of total authorized production." REC 7110. Accordingly: "If 50% of total production from the SGP occurs from the West End Pit, then production from non-[West End Pit] sources is automatically limited to 50% of total production under the plain language of Condition 3.6." REC 7110. Again, this is important because, as the Hearing Officer explained: "As haulage from the WEP decreases and haulage from non-WEP sources increases, the modeled arsenic impacts decrease further and further below the Acceptable Concentration." REC 7110. Based on the relationship between West End Pit and Non-West End Pit production, and the overall limits in the permit, the Hearing Officer concluded that "it was reasonable for DEQ not to include a specific Permit condition limiting non-[West End Pit] haulage to 50% of total mine haulage for the life of the SGP." REC 7110-7111. Therefore, DEQ acted both reasonably and lawfully, as a limit on non-West End Pit sources is not required and would not make sense in the context of the existing limit on total production and West End Pit production.

Petitioners also discuss Dr. von Lindern's testimony "that the .00416 µg/m3 is calculated by averaging the average of seven non-West End Pit emissions scenarios with the one West End Pit emission scenario, and this averaging technique worked to reduce the apparent emissions by a factor of 1.7." REC 7142. This methodology—averaging across the different scenarios—is simply not the methodology used by Perpetua, is not the methodology presented and described in the SGP PTC application, and is not the methodology approved by DEQ and used for permit issuance. The Petitioners continue to use Dr. von Lindern's fabricated methodology to falsely claim DEQ inappropriately diluted maximum predicted impacts.

When Dr. von Lindern discussed this alleged averaging during the hearing, he claimed DEQ does "another dose-averaging exercise where they take the worst-case scenario and they dilute it by combining it with other scenarios…" TR 0715:6-8. The amounts referenced by Petitioners in their Second Petition, and used by Dr. von Lindern, come from "Table C. TAP Maximum Modeled Concentrations and Applicable AACs." TR, Exhibit 304. Mr. Lewis explained that "[t]his table represents, again, modeling at 135,000 tons per day, and in this case, it's -- it's the annual average concentration that the model spits out." TR 0569:9-10. Mr. Lewis also testified that the numbers used from Table C do not reflect DEQ's permit conditions, such as limits to the West End Pit, and, therefore, are not representative. TR 0569:12-14. Importantly, Perpetua did not propose and DEQ did not accept any averaging for the impacts. Instead, the methodology described in Section 5.8 of DEQ's TAPs Addendum Modeling Review Attachment of the Ambient Air Quality Impact Analysis Review Memorandum was used to evaluate maximum impacts on a receptor-by-receptor basis for all potential scenario combinations, as follows:

$$LifeExpose_{Wi,j,n} = \left[\left(WEPExpose_{Wi,n}\right)(50\%) + \left(nonWEPExpose_{Sj,n}\right)(50\%)\right]\left[\frac{16\ year\ LOM}{70\ year\ exposure}\right]$$

Where:

W*i*	=	West End Pit scenario, where *i* = 1 to 4.
S*j*	=	non West End Pit scenario, where *j* = B1, B2, H1, H2, H3, H4, Y1, Y2, and Y3.
n	=	specific receptor.
$LifeExpose_{Wi,j,n}$	=	lifetime exposure in µg/m^3 for West End Pit scenario *i*, non West End Pit scenario *j*, at receptor *n*.
$WEPExpose_{Wi,n}$	=	annual maximum impact in µg/m^3 for West End Pit scenario *i* at receptor *n*.
$nonWEPExpose_{Sj,n}$	=	annual maximum impact in µg/m^3 for non West End Pit scenario *j* at receptor *n*.
16 year LOM	=	maximum life-of-mine.
70 year exposure	=	Lifetime exposure used for development of AACCs in *Idaho Air Rules*.

See REC 3946-3947. From results calculated at specific receptors and for all scenarios (given by the above equation), the maximum impact at each receptor is determined by selecting the West End Pit/non-West End Pit scenario combination that provides the largest impact. *Id.* That is obtained by using the maximum impact of all West End Pit scenarios and the maximum impact of all non-West End Pit scenarios at that receptor. *Id.* From the population of maximum impacts at specific receptors, the overall maximum impact is selected as the value for comparison to the arsenic AACC. *Id.*

Considering the receptor that had the highest overall adjusted maximum impact of 0.00095 µg/m3, the unadjusted impacts from non-West End Pit scenarios ranged from 0.00010 µg/m3 to 0.00129 µg/m3 and West End Pit scenarios ranged from 0.00581 µg/m3 to 0.00698 µg/m3. *See* REC 3928; REC 3946-3947. By using the worst-case permit-allowable condition of 50% of production from the West End Pit sources and the remaining 50% from non-West End Pit sources, DEQ arrived at a combined maximum impact of 0.00414 µg/m3. *See* REC 3923. When this is adjusted using the 16/70 factor to account for limited exposure duration, DEQ arrived at 0.000945 µg/m3, which was rounded up to 0.00095 µg/m3. *Id.* There was no averaging among scenarios or

among receptors that could inappropriately dilute estimated impacts. The method calculated impacts from each scenario at each receptor, then selected the maximum potential impact at each receptor, and finally selected the receptor with the highest impact. *See* REC 3946-3947.

CONCLUSION

DEQ takes very seriously its mission to protect public health and the environment. After an enormous effort, which included much stakeholder involvement, DEQ issued a permit that is legally and technically defensible. REC 1273. Petitioners have failed to prove that DEQ committed any errors in its thorough and diligent PTC analysis, including in its analysis of the ambient arsenic air emissions. The expert witness testimony requested by the Board clearly demonstrates that DEQ acted reasonably and lawfully. The Hearing Officer agreed, after considering the testimony proffered by the parties. Thus, as to each of the Remaining Issues, Petitioners continue to fail to meet their burden, and the Board must uphold the Hearing Officer's Second Preliminary Order.

IN THE MATTER OF AIR QUALITY PERMIT TO CONSTRUCT P-2019.0047 _____ NEZ PERCE TRIBE, IDAHO CONSERVATION LEAGUE, and SAVE THE SOUTH FORK SALMON, Petitioners, v. IDAHO DEPARTMENT OF ENVIRONMENTAL QUALITY, Respondent, and PERPETUA RESOURCES IDAHO, INC., Intervenor-Respondent.	Case Docket No. 0101-22-01 OAH Case No. 23-245-01 PERPETUA'S OPPOSITION TO PETITION FOR REVIEW OF JANUARY 7, 2025 PRELIMINARY ORDER

TABLE OF CONTENTS

TABLE OF AUTHORITIES ii

KEY TO TERMS AND ABBREVIATIONS iii

I. INTRODUCTION AND BACKGROUND 1

II. STANDARD OF REVIEW 3

III. DEQ'S ASSESSMENT OF THE PROJECT'S IMPACT ON INCREMENTAL LIFETIME CANCER RISK UNDER THE TAPs RULES 5

A. DEQ's assessment of preconstruction compliance with the TAPs rules relies on cancer risk values and risk assessment methodology established by EPA. 5

B. The AACCs are derived from EPA's URFs/IURs, which represent continuous exposure over an assumed 70-year lifetime. 6

C. DEQ compared the Project's modeled arsenic exposure concentration to the T-RACT AACC accounting for maximum production limits. 7

IV. ARGUMENT 9

A. The evidence supports the Hearing Officer's conclusion that DEQ properly adjusted for exposure duration to derive the Project's modeled arsenic exposure concentration based on the PTC's production limits. 10

1. DEQ and Perpetua's expert evidence supports the Hearing Officer's conclusion that the T-RACT AACC is not an annual limit but represents an ambient concentration that aligns with the lifetime incremental cancer risk 10

2. DEQ and Perpetua's expert evidence supports the Hearing Officer's conclusion that adjusting the modeled exposure concentration to reflect exposure duration is consistent with the TAPs rules. 13

3. Petitioners present a range of irrelevant references and misinformation that fails to change the Hearing Officer's findings of fact and conclusions of law. 17

4. DEQ and Perpetua's expert evidence supports the Hearing Officer's conclusion that a limit on years of operation is not necessary. 18

B. The evidence supports the Hearing Officer's conclusion that DEQ reasonably used a five-year rolling average production limit as a T-RACT long-term limit. 20

C. The evidence supports the Hearing Officer's conclusion that PTC conditions were sufficient to limit production from the non-West End Pits. 22

1. DEQ and Perpetua's expert evidence showed how the PTC limits production from the non-West End Pits and that no separate limit is necessary. 22

2. Petitioners' contention that the maximum modeled annual average arsenic concentration was 0.00698 $\mu g/m^3$ is not supported by the evidence. 23

Perpetua opposes Petitioners' Petition for Review. The Board should affirm and accept the Hearing Officer's Preliminary Order and dismiss Petitioners' contested case challenging the PTC issued by DEQ for the Project.

I. INTRODUCTION AND BACKGROUND

The Board remanded this matter to seek the development of a "full factual record" regarding "the ambient air concentrations of arsenic that will be produced by the Stibnite Gold Project and whether those levels comply with the Air Rules." REC 3717; *see also* REC 3841-42. Specifically, the Board's remand was limited to three narrow issues:

(1) whether the "16/70 analysis performed by DEQ was equally or more protective of human and animal life and vegetation as what is provided for by the Air Rules" and whether ambient air concentrations of arsenic from the Project comply with the Idaho Air Rules, REC 3715-17;

(2) whether DEQ acted reasonably in using a five-year rolling average in analyzing arsenic ambient air concentrations, REC 3712-13; and

(3) whether non-West End Pit production was limited, and what effect non-West End Pit production has on arsenic emissions, REC 3713-14.

The Board observed that those issues involve cancer risk probability associated with arsenic emissions beyond the ordinary knowledge of a layperson. *See* REC 3716. An expert witness's scientific, technical, or other specialized knowledge was necessary to help the Board understand the complex relationship between arsenic exposure, incremental lifetime cancer risk, and the Idaho Air Rules. *See id.*; IDAPA 62.01.01.485.

On remand, the Hearing Officer took extensive evidence on the three issues. DEQ presented the expert testimony of Dr. Norka Paden (a DEQ Toxicological Risk Assessor) and Kevin Schilling (DEQ's Stationary Source Modeling Supervisor). Perpetua presented the expert

testimony of Theresa Lopez (a Principal Toxicologist with Tetra Tech, Inc.) and Kevin Lewis (an expert in air quality modeling and permitting for mining projects). Petitioners presented witnesses Dr. Ian von Lindern (a chemical engineer) and William Tiedemann (a regulatory conservation associate with the Idaho Conservation League).

After hearing the evidence, the Hearing Officer issued the Preliminary Order (*REC 7091-7118*) and concluded that DEQ assessed ambient concentrations of arsenic from the Project reasonably and in compliance with the Idaho Air Rules.[1] The Hearing Officer determined that:

- in the Idaho Air Rules, DEQ adopted incremental cancer risk values and assessment procedures established by EPA;
- EPA and DEQ methodologies are intended to evaluate incremental excess cancer risk from continuous exposure over a 70-year lifetime, not one year;
- according to standard EPA cancer risk assessment procedures, modeled arsenic exposure concentrations from the Project must be adjusted to reflect the PTC's maximum production limits and the Project's 16-year exposure duration;
- the incremental lifetime cancer risk associated with the Project's finite emissions is 1-in-240,000, which is below the applicable cancer risk probability of 1-in-100,000; and
- the Project's duration under the PTC's maximum production limits would be 16 years and a longer duration does not change arsenic emissions or the acceptable cancer risk.

The Hearing Officer's findings and conclusions are correct and fully supported by the record on remand. Petitioners had the opportunity to prove that DEQ and Perpetua were wrong on the science and the law, and they failed to meet their burden of proof.

Petitioners repeat the same arguments in the Petition for Review and criticize DEQ for

[1] All citations are to the 2022 version of the Idaho Air Rules.

not consulting a toxicologist until the Board's remand order. REC 7129, 7143. Petitioners claim DEQ and Perpetua "concocted" a "post-hoc excess cancer risk 'assessment'" and have used "mathematical tricks" to justify evaluating the Project's arsenic emissions and cancer risk over 70 years. REC 7129, 7143. The record shows that DEQ maintained the same reasonable approach all along. At the Board's direction, DEQ and Perpetua offered the toxicological framework and standard cancer risk assessment procedures that support and reinforce DEQ's review of the Project's arsenic emissions in compliance with the Idaho Air Rules.

The Hearing Officer concluded that the testimony of Dr. von Lindern and Mr. Tiedemann was unconvincing and only of "general relevance" on the complex areas of air quality modeling and cancer risk assessment of ambient concentrations of arsenic. *REC 7096*. "Often," as the Hearing Officer observed, "Mr. Tiedemann and Dr. von Lindern testified regarding what they wished the Air Rules said, rather than what they actually say." *Id*. The record confirms the Hearing Officer's statement. Petitioners' witnesses offered nothing more than "isolated references from prior rulemakings" and policy preferences that cannot overcome DEQ's reasonable and science-based decision making under the Idaho Air Rules. *See id*.

The Board must affirm and adopt the Hearing Officer's Preliminary Order and deny the Petition for Review. Petitioners' views cannot be substituted for DEQ's technical competence and specialized knowledge. Yet they ask the Board to accept their preferences and reject not only the choices made by DEQ, but the judgment of the Hearing Officer who carefully considered the evidence, including extensive toxicological evidence, requested by the Board.

II. STANDARD OF REVIEW

The Board "must determine whether DEQ 'has acted reasonably and in accordance with the law.'" REC 3697 (citations omitted). The Petitioners carry the burden to establish that DEQ acted unreasonably or inconsistent with the law and must prove their allegations by a

preponderance of the evidence. IDAPA 62.01.01.477. "A 'preponderance of the evidence' is evidence that, when weighed with that opposed to it, has more convincing force and from which results a greater probability of truth." *Harris v. Elec. Wholesale*, 141 Idaho 1, 3, 105 P.3d 267, 269 (2004); Idaho Civil Jury Instruction 1.20.1 (describing preponderance of the evidence as "the proposition is more probably true than not true").

Petitioners ignore the Board's standard of review and their burden of proof. *See* REC 7122-23. They also fail to acknowledge that the Board may consider DEQ's "experience, technical competence, and specialized knowledge" to evaluate evidence.[2] Idaho Code § 67-5251(5); *see also* Idaho Code § 67-5251(4)(b) (allowing official notice of "generally recognized technical or scientific facts within the agency's specialized knowledge"); Michael S. Gilmore & Dale D. Goble, *The Idaho Administrative Procedure Act: A Primer for the Practitioner*, 30 Idaho L. Rev. 273, 319 (1994) ("[T]he agency's repeated exposure to a specialized subject matter is a source of specialized knowledge that is useful in evaluating evidence.").

A decision rooted in an agency's technical competence and specialized knowledge is generally accorded great weight. *Earth Island Inst. v. U.S. Forest Serv.*, 351 F.3d 1291, 1301 (9th Cir. 2003). This is particularly persuasive when an agency is performing emissions assessments and modeling, including in the context of risk assessments. *See Huntsman*

[2] The Idaho Legislature recently amended the standard for judicial review under the Idaho Administrative Procedure Act to prohibit deference to agency interpretations, Idaho Code § 67-5279(5), but the standard for judicial review does not apply to the Board's review of the PTC, *see* REC 3377 (explaining that the statute's standards "are not directly applicable"). Nor does the amendment change the recognition of an agency's "experience, technical competence, and specialized knowledge" involving complex technical matters under Idaho Code § 67-5251(5). In a similar vein, while the United States Supreme Court recently eliminated judicial deference to agency interpretations of law under the federal Administrative Procedure Act, the Court explained that "although an agency's interpretation of a statute 'cannot bind a court,' it may be especially informative 'to the extent it rests on factual premises within [the agency's] expertise.'" *Loper Bright Enters. v. Raimondo*, 603 U.S. 369, 402 (2024) (citation omitted).

Petrochemical LLC v. EPA, 114 F.4th 727, 735 (D.C. Cir. 2024) (rejecting a challenge to EPA cancer risk assessment of ethylene oxide under Clean Air Act hazardous air pollutant standards).

III. DEQ'S ASSESSMENT OF THE PROJECT'S IMPACT ON INCREMENTAL LIFETIME CANCER RISK UNDER THE TAPS RULES

As the Preliminary Order outlines, DEQ evaluated the Project's arsenic emissions under Idaho's TAPs rules. The Hearing Officer's findings emphasize two key elements of the TAPs rules' risk-based approach to evaluate arsenic emissions: (1) the TAPs rules are project-specific and based on EPA cancer risk values and assessment methodologies that assume 70-year lifetime exposure; and (2) following EPA's standard cancer risk assessment procedures, DEQ compared the Project's modeled arsenic exposure concentration to the arsenic cancer risk increment established in the TAPs rules.

A. DEQ's assessment of preconstruction compliance with the TAPs rules relies on cancer risk values and risk assessment methodology established by EPA.

The TAPs rules are an Idaho specific program. *REC 7097 (¶ 7)*; Tr. 91:12-92:1 (Schilling). DEQ's evaluation of TAPs starts with Idaho Air Rule 161. *REC 7098 (¶ 11)*; Idaho Air Rule 203. Section 161 requires DEQ to determine that TAP emissions will not injure or unreasonably affect human, animal life, or vegetation. *REC 7098 (¶¶ 11-12)*. Preconstruction compliance with Section 161 can be shown using the methods provided in Idaho Air Rule 210. *See REC 7098 (¶ 13)*; Idaho Air Rule 203.03; Tr. 25:7-26:3 (Schilling). Under Section 210, compliance is determined on a project basis and based on project-specific conditions. *See REC 7097-98 (¶¶ 8-9)*; Tr. 17:7-22:9, 37:10-38:22, 84:4-22 (Schilling); REC 3921-24 (¶¶ 12-19).

Preconstruction compliance may be demonstrated by comparing emissions with the applicable TAP carcinogenic increment expressed as an "AACC" (or "acceptable ambient concentration for a carcinogen") in Idaho Air Rule 586. *See REC 7098 (¶ 14)*; Idaho Air Rules 006.125, 106.02, 203, 210, 586. TAP carcinogenic increments are different than standards, which

are emission limits. Tr. 35:10-36:21 (Schilling). As Mr. Schilling explained, "An increment is just a base-allowed impact for that project. So it doesn't concern itself with what goes on at the whole rest of the facility or what goes at the neighboring facility or what is already there for background. It says you can do this no matter what." Tr. 36:16-21 (Schilling).

B. The AACCs are derived from EPA's URFs/IURs, which represent continuous exposure over an assumed 70-year lifetime.

The table of AACCs in Section 586 contains a column labeled "URF." *REC 7100 (¶ 31)*; Idaho Air Rule 586. URF is a reference to a Unit Risk Factor developed and published by EPA. *See REC 7100 (¶ 32)*; Idaho Air Rule 106.19 ("URF. Unit Risk Factor from the US Environmental Protection Agency"). EPA refers to URFs as "IURs" or inhalation unit risk factors. *REC 7100 (¶ 33)*; Tr. 181:15-182:19, 188:10-22 (Lopez); REC 4282 (¶¶ 12-14). As explained below, the allowable increments provided in the AACCs are derived from URFs/IURs.

URFs/IURs represent a chemical-specific excess cancer risk based on exposure to 1 $\mu g/m^3$ of that substance continuously (24 hours/day and 365 days/year) over an assumed 70 year lifetime.[3] *REC 7101 (¶ 34)*; Tr. 19:11-20:18 (Schilling); REC 3922 (¶ 15); Tr. 135:2-13, 138:18-13 (Paden); REC 3876-77 (¶¶ 11-12); Tr. 181:15-182:1 (Lopez); REC 4282 (¶¶ 12-13); *see also* Ex. 210. EPA develops URFs/IURs based on years of scientific study, taking into account the exposure of sensitive subpopulations (e.g., children and pregnant women) and measuring excess cancer risk above the background risk. *REC 7101 (¶¶ 36-37)*; Tr. 138:6-139:5, 147:16-148:5, 153:13-154:12, 171:20-172:21 (Paden); Tr. 181:23-182:19, 188:2-22, 190:8-191:6 (Lopez).

The AACCs in Section 586 are derived from URFs/IURs. *REC 7101 (¶ 38)*; Tr. 20:6-21:10 (Schilling) (explaining that URFs are the "cornerstone of the whole TAPs program for

[3] A lifetime cancer risk of 1-in-1,000,000 means that if 1 million people are continuously exposed to a specific concentration of a substance (as established by the URF/IUR) for 70 years, one person may develop cancer.

regulating carcinogenic compounds"); Tr. 138:15-139:5 (Paden); Tr. 181:15-182:19 (Lopez); REC 4282 (¶ 16). Relevant here, the URF/IUR for arsenic is 0.0043/μg/m^3, which converts to an AACC of 0.00023 μg/m^3. *See* Idaho Air Rule 586. The calculation of the AACC is simply the incremental lifetime cancer risk of 1-in-1,000,000 divided by the URF/IUR.[4] *See* Tr. 136:6-137:10 (Paden); REC 3876-77 (¶ 11); Tr. 194:18-195:8 (Lopez); REC 4282-83 (¶¶ 16-17).

Derived from URFs/IURs, the AACCs represent the ambient concentration that a person could be exposed to continuously for a 70-year lifetime before the cancer risk exceeds 1-in-1,000,000. *REC 7101 (¶¶ 39, 82)*; Tr. 20:6-18, 30:21-32:3, 126:9-14 (Schilling); Tr. 135:2-13 (Paden); REC 3876-77 (¶¶ 11-12); Tr. 194:18-195:8 (Lopez); REC 4282-83 (¶¶ 16-18). This is made clear by Idaho Air Rule 006.125, the definition of "Toxic Air Pollutant Carcinogenic Increments." *See* REC 7101 (¶ 40). Section 006.125 reads:

> Those ambient air quality increments based on the probability of developing excess cancers over a seventy (70) year lifetime exposure to one (1) microgram per cubic meter (1 ug/m^3) of a given carcinogen and expressed in terms of a screening emission level or an acceptable ambient concentration for a carcinogenic toxic air pollutant. They are listed in Section 586.

See also Tr. 31:19-32:14 (Schilling) (explaining that the definition "makes it clear that it focuses on a total project-imposed cancer risk rather than a specific year by year").

C. DEQ compared the Project's modeled arsenic exposure concentration to the T-RACT AACC accounting for maximum production limits.

Section 210.12 allows a source to use "T-RACT" to demonstrate preconstruction compliance with Section 161. *REC 7098 (¶¶ 14-16)*. T-RACT is defined as an "emission standard based on the lowest emission of [TAPs] that a particular source is capable of meeting by the application of control technology that is reasonably available." *REC 7098-99 (¶ 15)* (quoting Idaho Air Rule 007.12). Where T-RACT operational limits are used to control emissions, the

[4] 0.000001 / 0.0043 per μg/m^3 = 0.00023 μg/m^3.

allowable incremental cancer risk probability over a 70-year lifetime of exposure is 1-in-100,000, or 10 times the AACC. *REC 7099 (¶ 19)*; Idaho Air Rule 210.12.b. This is called the T-RACT AACC, which for arsenic is 0.0023 μg/m^3. *REC 7099-7100 (¶¶ 22-24)*.

To show compliance with the T-RACT AACC, the plain language of Section 210.12.b requires DEQ to *compare* the source's "approved T-RACT ambient concentration" to the cancer risk probability reflected by the T-RACT AACC:

> *Compare* the source's or modification's approved T-RACT ambient concentration at the point of compliance for the toxic air pollutant to the amount of the toxic air pollutant that would contribute an ambient air cancer risk probability of less than one to one hundred thousand (1:100,000) (which amount is equivalent to ten (10) times the applicable acceptable ambient concentration listed in Section 586).

Idaho Air Rule 210.12.b (emphasis added). During the hearing, the "approved T-RACT ambient concentration" was referred to in various ways. DEQ and Perpetua's toxicologists referred to it as the "exposure concentration." *See*, *e.g.*, Tr. 141:17-143:1 (Paden); Tr. 191:12-193:2 (Lopez). In the Preliminary Order, the Hearing Officer refers to it as the "Approved Concentration." REC *7099 (¶¶ 18-19)*. For clarity, this brief refers to it as the "modeled exposure concentration," or in the case of arsenic, the "modeled arsenic exposure concentration."

The modeled exposure concentration is the source's modeled maximum annual average ambient concentration of the TAP based on the T-RACT operational limits. Operational limits for the Project are the maximum production limits under PTC Conditions 3.5 and 3.6. If Perpetua were to operate without interruption at those production limits, the Project's exposure duration would be 16 years. If under this worst-case scenario the modeled arsenic exposure concentration is less than or equal to the T-RACT AACC, then "no further procedures for demonstrating preconstruction compliance will be required for that toxic air pollutant as part of the application process." *See REC 7099 (¶ 21)* (quoting Idaho Air Rule 210.12.c); Tr. 65:4-18 (Schilling).

DEQ determined that the Project's modeled arsenic exposure concentration, adjusted to reflect the PTC's maximum production limits and related 16-year exposure duration, is 0.00095 µg/m^3, *which is less than the T-RACT AACC of 0.0023 µg/m^3*. REC 3877 (¶¶ 12-14); Tr. 197:9-19, 200:2-201:25 (Lopez); REC 4284-85 (¶¶ 24-25). DEQ used the following equation, based on standard EPA cancer risk assessment procedures:

EC = 0.00414 µg/m^3 x 16 years / 70 years = 0.00095 µg/m^3

See REC 7103 (¶ 59); REC 714. The modeled arsenic exposure concentration of 0.00095 µg/m^3 reflects an incremental lifetime cancer risk of 1-in-240,000, which is well below the acceptable cancer risk probability of 1-in-100,000 of the arsenic T-RACT AACC. *REC 7103 (¶¶ 60, 61)*; Tr. 136:1-5 (Paden); Tr. 200:2-201:25 (Lopez); REC 4284-85 (¶¶ 24-30).

IV. ARGUMENT

On remand, expert evidence from DEQ and Perpetua established the following to reinforce DEQ's evaluation of arsenic emissions and compliance with the TAPs rules:

(1) scientific principles and standard cancer risk assessment procedures require (a) the adjustment of the modeled arsenic exposure concentration for the Project's exposure duration for a true comparison to the T-RACT AACC, and (b) the adjustment for exposure duration does not increase cancer risk because cumulative exposure over the Project's life does not change;

(2) the 135,000 ton per day five-year rolling average for daily production established by the PTC does not increase cancer risk because the AACCs are based on 70 years of constant exposure, not exposure in any single year; and

(3) the PTC's total life-of-mine production limit and the 50% production limit on the West End Pit restrict production from the non-West End Pits and are designed to ensure the incremental lifetime cancer risk remains below the T-RACT AACC.

Petitioners' arguments that the AACCs are annual limits that cannot be adjusted for exposure duration are unavailing and contrary to standard cancer risk assessment and good science. Dr. von Lindern and Mr. Tiedemann's testimony in many instances articulated nothing more than their policy preferences and uninformed interpretation of the TAPs rules. *See REC 7096-97*. Petitioners failed to satisfy their burden to show DEQ acted unreasonably or unlawfully.

A. The evidence supports the Hearing Officer's conclusion that DEQ properly adjusted for the exposure duration to derive the Project's modeled arsenic exposure concentration based on the PTC's production limits.

Petitioners contend the Hearing Officer ignored the Board's interpretation that the TAPs rules do not allow adjustment of the Project's maximum arsenic concentration for exposure duration. REC 7126-27, 7133-34. Petitioners misconstrue the Board's remand order. The Board remanded on three issues to the Hearing Officer to develop a "full factual record," REC 3840-41, including evidence from toxicologists or other experts regarding "the ambient air concentrations of arsenic that will be produced by the Stibnite Gold Project and whether those levels comply with the Air Rules," REC 3716-17. On remand, the Hearing Officer concluded that DEQ and Perpetua's expert evidence demonstrated DEQ acted consistent with the scientific principles governing cancer risk assessment and the TAPs rules. *REC 7098-7105*.

1. DEQ and Perpetua's expert evidence supports the Hearing Officer's conclusion that the T-RACT AACC is not an annual limit but represents an ambient concentration that aligns with the lifetime incremental cancer risk.

Petitioners maintain the AACCs are "annual limits" and that the failure to treat the AACCs as "annual limits" allows greater cancer risk. *See* REC 7130-33, 7139. For this view, Petitioners largely rely on Dr. von Lindern's testimony that the AACCs are the "maximum one-year-annual average ambient air carcinogen concentration." *See*, *e.g.*, Tr. 436:14-15, 452:5-7 (von Lindern); REC 6108, 6110. Dr. von Lindern, however, conceded that his proffered terminology does not exist in the TAPs rules but is his own interpretation of "annual average" in

Section 586. Tr. 484:18-485:2 (von Lindern). Dr. von Lindern is not a toxicologist, Tr. 406:11-13 (von Lindern), and his testimony was scientifically inaccurate, *see* Tr. 499:2-509:19 (Lopez).[5]

The Hearing Officer correctly concluded that the AACCs are not annual limitations. *REC 7106-07 (¶¶ 84-85)*. The AACCs are ambient concentrations that align with incremental cancer risk assuming exposure over 70-years. *REC 7101 (¶ 39), 7102 (¶ 49), 7106 (¶¶ 82-83)*. While the AACCs are expressed as "annual averages," Section 586 does not use the term "annual limit" or specify compliance on an annual basis. *REC 7106 (¶¶ 81, 84)*. Nor does Section 210.12. Since the AACCs "are focused on calculating a cumulative cancer risk that accumulates over a continuous 70-year exposure period, it is not necessarily the case that monitoring emissions on an annual basis is necessary to achieve compliance with those standards." *REC 7106-07 (¶ 85)*.

As explained by DEQ and Perpetua's experts, to treat the AACCs as annual limits would ignore the plain language of Section 586 and conflict with the cumulative, long-term nature of the cancer risk that is the foundation of the TAPS rules. Tr. 509:2-19 (Lopez); 4286-4287 (¶¶ 37-41), 4302-4303; *see also* Tr. 48:18-21; 56:2-5 (Schilling); REC 3923 (¶ 17). Interpreting the AACCs as annual limits has *no toxicological basis* because that assumes a single annual exposure would result in incremental lifetime cancer risk. *See* Tr. 145:6-24 (Paden) ("We do not evaluate cancer risk for an acute exposure, but for chronic exposure."); Tr. 509:2-19 (Lopez); REC 4286-87 (¶¶ 37-42). Cancer risk assessment is an evaluation of chronic exposure, not acute or sub-chronic exposure. *REC 7104-7105 (¶¶ 68-72)*; Tr. 145:6-146:13 (Paden).

DEQ and Perpetua's toxicologists established that incremental cancer risk is based on cumulative exposure and that the AACC is an ambient concentration to which a person may be

[5] Mr. Tiedemann's testimony regarding the TAPs rules was not credible either. He revealed that his air quality permitting experience while employed at DEQ was very limited and that he had little to do with TAPs permitting or compliance. Tr. 352:2-363:8 (Tiedemann).

exposed for 24 hours per day, 365 days a year, for 70 years with an incremental cancer risk of 1-in-1,000,000 or 1-in-100,000 in the case of the T-RACT AACC. *REC 7106 (¶¶ 82-83)*; Tr. 135:2-137:10 (Paden); REC 3876-39 (¶¶ 11-15); Tr. 204:15-24 (Lopez); REC 4283 (¶ 17). The AACC values in Section 586 align with lifetime incremental cancer risk—not exposure in any single year—and compliance is assessed on a 70-year basis, not on an annual basis or following a single exposure. *REC 7106-07 (¶ 85)*; Tr. 237:18-238:6, 509:2-19 (Lopez); REC 4286-87 (¶¶ 38-42). This approach is consistent with the science of cancer risk assessment, which reflects the cumulative dose over a 70-year lifetime. Tr. 135:10-13 (Paden); Tr. 507:5-15 (Lopez). Indeed, using a "maximum one-year annual average ambient air carcinogen concentration" would ignore the assumed 70-year lifetime exposure that underpins the AACCs. Tr. 509:2-19 (Lopez).

Rather than establishing an "annual limit," the reference to an "annual average" is appropriately viewed in the context of the project-specific concentrations that are *modeled* as an "annual average." Tr. 52:5-17 (Schilling); Tr. 301:17-20 (Lewis). The model output from any single year cannot be compared against the AACC as an annual limit because the AACC is based on 70 years of exposure. Tr. 72:22-73:15 (Schilling) (comparing the AACC to an annual average concentration is "not appropriate . . . [b]ecause we still center on the fact that what matters is project-imposed cancer risk and not a year-by-year evaluation"); Tr. 237:16-25, 238:1-6, Tr. 311:7-14 (Lewis). For that reason, the modeled exposure concentration must be adjusted "to the same basis as the AACC lifetime exposure concentration" or 70 years. Tr. 304:22-25 (Lewis); *see also* Tr. 301:6-8, 305:1-2 (Lewis); Tr. 507:5-15 (Lopez).

While Petitioners want the TAPs rules to fit Dr. von Lindern's reading of Section 586, the rules do not. His commentary failed to refute the scientific testimony and judgment of DEQ and Perpetua's experts. *See Huntsman*, 114 F.4th at 735 (agency "evaluation of scientific data

within its area of expertise" should be afforded "an extreme degree" of reliance, and particularly so for "statistical and modeling analysis" (citation omitted)). Even Dr. von Lindern conceded the language in Section 586 does not match his interpretation. Convincing science-based evidence from DEQ and Perpetua's experts fully supports the Hearing Officer's holding that the AACCs are not annual limits because the concentrations reflect "cumulative cancer risk that accumulates over a continuous 70-year exposure period." *REC 7016-17 (¶¶ 81-85)*.

2. DEQ and Perpetua's expert evidence supports the Hearing Officer's conclusion that adjusting the modeled exposure concentration to reflect exposure duration is consistent with the TAPs rules.

Petitioners contend the TAPs rules do not allow adjustment of the maximum modeled annual average arsenic concentration for exposure duration. The Hearing Officer disagreed, stating: "[f]or projects with a known project life of less than 70 years, EPA adjusts the highest modeled annual average concentration to account for the different exposure durations in order to accurately calculate cancer risk with an Approved Concentration that is capable of comparison to the Acceptable Concentrations in Section 586." *REC 7102 (¶ 44)*. The "failure to account for the true exposure period results in overstating emissions from the project." *REC 7100 (¶ 30)*.

The expert evidence confirms the Hearing Officer's conclusions. DEQ and Perpetua's expert toxicologists provided extensive testimony showing that if a source operates less than the 70-year lifetime on which the AACCs are based, the exposure duration must be adjusted. REC 3923-25 (¶¶ 16-19, 22-23), 3929 (¶¶ 31-33); REC 3876-78 (¶¶ 8-9, 12-15); REC 4283-85 (¶¶ 20-30), 4292-4293, 4296, 4298-4300). Cancer risk cannot be evaluated without considering the length of time a potential receptor will be exposed to a carcinogen—referred to as "exposure duration." Tr. 140:1-145:15 (Paden); Tr. 189:15-190:5, 192:6-194:15, 197:9-198:5, 215:1-218:3, 229:11-232:19 (Lopez); Tr. 34:10-35:8, 56:18-57:19 (Schilling).

By adopting EPA's URFs/IURs, DEQ adopted EPA's cancer risk methodology for

analyzing TAP ambient concentrations. *See REC 7101 (¶¶ 39, 41)*; Tr. 135:2-137:10 (Paden); Tr. 213:11:3-214:14, 231:13-232:19 (Lopez). That includes EPA's recognition that inhalation risk assessments require the timeframe over which exposure occurs and that exposure duration is not always 70 years. *See REC 7102 (¶ 44)*; Tr. 135:2-137:10, 143:21-145:2 (Paden); Tr. 189:15-190:5, 192:6-194:15, 213:11-215:5, 231:13-232:19 (Lopez). EPA expresses this as an equation that explicitly adjusts the estimated concentration of the contaminant in the air based on project-specific information, including for exposure duration that could occur for less than 70 years:

EC = (CA x ET x EF x ED) / AT

Where: EC ($\mu g/m^3$) = exposure concentration;
CA ($\mu g/m^3$) = contaminant concentration in air;
ET (hours/day) = exposure time;
EF (days/year) = exposure frequency;
ED (years) = exposure duration; and
AT (lifetime in years 70 x 365 days/year x 24 hours/day) = averaging time.

REC 7102-7103 (¶¶ 50-56); REC 3923 (¶ 16); Tr. 136:19-137:13, 140:1-143:20 (Paden); REC 3876-77 (¶¶ 10-12); Tr. 191:12-194:15, 213:11-214:14 (Lopez); REC 4284 (¶ 22).

In the equation, the exposure concentration (EC) is calculated using the modeled maximum annual average ambient concentration, referred to as the "contaminant concentration in air" (CA), and temporal parameters. *REC 7103 (¶¶ 51-52)*; REC 3877 (¶ 12); 4284 (¶ 22). The temporal inputs in the equation are variable and include the exposure time (ET) in hours per day, the exposure frequency (EF) in days per year, and the exposure duration (ED) in years. The averaging time (AT) (the denominator) is the time over which exposure is averaged for chronic assessments and is the only constant. *REC 7103 (¶ 54-56, 58)*; REC 3877 (¶ 12); 4284 (¶ 22).

For the exposure concentration (EC) to be expressed in the same manner as EPA's URF/IUR and the AACCs in Section 586, with an assumed 70-year exposure, DEQ must adjust the numerator of the equation to reflect the project-specific exposure duration (ED). *REC 7101-*

02 (¶¶ 43-44); Tr. 140:1-145:15 (Paden); Tr. 189:15-190:5, 192:6-194:15, 197:20-198:5, 215:1-218:3, 229:11-232:19 (Lopez); REC 3924-25; Tr. 34:10-35:8, 56:18-57:19 (Schilling). Thus, when comparing the Project's highest modeled annual arsenic concentration to the arsenic T-RACT AACC pursuant to Section 210.12.b, DEQ properly adjusted the exposure concentration (EC) to account for a 16-year exposure duration (ED) of the Project. REC 3875-79 (¶¶ 4-17); REC 4280-81 (¶ 10), 4283-4287 (¶¶ 20-42). All other project-specific factors—such as exposure time (ET) and exposure frequency (EF)—remain the same.

DEQ calculated the Project's modeled arsenic exposure concentration using same approach, using the highest modeled annual arsenic concentration multiplied by the 16-year exposure duration to ensure the exposure concentration was comparable to the assumption of the 70-year exposure duration found in the AACC. REC 3926-27 (¶ 27), 3929 (¶ 32); REC 3876 (¶¶ 9-10). The adjustment is illustrated in the following formula utilized by DEQ:

$$Lifetime\ exposure\ \left(\frac{\mu g}{m^3}\right) = \frac{Highest\ annual\ concentration\ \left(\frac{\mu g}{m^3}\right) \times 16\ (mine\ operation\ years)}{70\ (years, lifetime\ exposure)}$$

REC 710; REC 3876 (¶ 10). The lifetime exposure in the formula is the exposure concentration. DEQ's formula matches EPA's formula and accounts for exposure duration. *See* Tr. 139:15-145:24 (Paden); Tr. 191:12-194:15, 197:9-198:5 (Lopez).

The highest modeled annual arsenic concentration from the Project, operating under the PTC's maximum production limits, was 0.00414 µg/m^3. *See REC 7100 (¶ 28), 7103 (¶ 53)*; Tr. 302:3-303:10 (Lewis). Using EPA's equation, DEQ adjusted the Project duration to reflect the highest allowable maximum production scenario and related exposure duration (16 years) to determine the modeled arsenic exposure concentration for the Project is 0.00095 µg/m^3:

EC = 0.00414 µg/m^3 x 16 years / 70 years = 0.00095 µg/m^3

See REC 7103 (¶ 59); REC 714; *see also* REC 3923 (¶ 18); REC 3877-78 (¶¶ 13-14); Tr. 197:9-

198:5 (Lopez); REC 4284-85 (¶¶ 22-25), 4300-01; Tr. 298:23-299:12 (Lewis).

Compared to the T-RACT AACC (0.0023 μg/m^3), the Project's modeled arsenic exposure concentration is far less, and thus the lifetime exposure of arsenic is less than a 1-in-100,000 cancer risk, which demonstrates the Project's arsenic emissions will not injure or unreasonably affect human health and the environment. *REC 7103 (¶ 60)*; REC 3877 (¶¶ 12-14); Tr. 197:9-19, 200:2-201:25 (Lopez); REC 4284-85 (¶¶ 24-25), 4300-4301. Based on the modeled arsenic exposure concentration of 0.00095 μg/m^3, the incremental increase in cancer risk from the Project's arsenic emissions over the life of the Project is 1-in-240,000, which is below the acceptable T-RACT incremental lifetime cancer risk of 1-in-100,000. *REC 7103 (¶¶ 60-61)*; Tr. 200:2-201:25 (Lopez); REC 4284-85 (¶¶ 24-30), 4300-01.

Thus, the expert testimony demonstrated that comparing the Project's modeled arsenic exposure concentration to the T-RACT AACC under Section 210.12 requires the exposure concentration to be adjusted to a lifetime exposure to compare to the T-RACT AACC. Idaho Air Rule 210.15, which addresses project durations shorter than five years, is an example of the toxicological principle that duration is relevant when evaluating project-specific cancer risk for a source with an operational life of less than 70 years. *See* REC 3923-24 (¶ 19); Tr. 229:11-230:8 (Lopez); REC 4286 (¶¶ 32-35), 4301-4302. The TAPs rules do not prohibit DEQ from following proper scientific method and "adjusting exposure concentrations to account for projects with an operational life of more than 5 years and less than 70 years."[6] *See REC 7102 (¶ 48)*.

On remand, DEQ and Perpetua's experts directly addressed the questions posed by the

[6] Nor does the rulemaking record support such a rule. Petitioners relied on a rulemaking record that was not the official rulemaking record, Tr. 365:9-366:4 (Tiedemann), and that "consisted of isolated references from prior rulemakings that lacked explanation of their context or relevance to the interpretation of the plain language of the existing Air Rules." REC 7096-97.

Board and unpacked the underlying rule-based mathematics that DEQ used to calculate the modeled arsenic exposure concentration from a 16-year exposure duration and to compare properly the exposure concentration to the T-RACT AACC. The Hearing Officer's conclusions are fully supported by the expert evidence presented and the TAPs rules; Petitioners did not satisfy their burden to show otherwise.

3. Petitioners present a range of irrelevant references and misinformation that fails to change the Hearing Officer's findings of fact and conclusions of law.

Petitioners raise several other arguments in support of their contention that adjusting the modeled arsenic exposure concentration to reflect the Project's exposure duration is not scientifically valid. *See* REC 7133-39. First, Petitioners argue that DEQ and Perpetua's reliance on EPA guidance, such as risk assessment at superfund sites, was inappropriate to assess cancer risk when the TAPs rules provide for TAP carcinogenic increments. REC 7135. Dr. Paden and Ms. Lopez, however, explained that the EPA guidance is not specific only to superfund sites and represents standard EPA cancer risk assessment methodology and procedures to calculate the concentration that corresponds to a risk level for a specified exposure duration over a 70-year lifetime. Tr. 159:25-62:17 (Paden); Tr. 233:23-234:6 (Lopez); REC 4306.

Second, Petitioners present the State of Washington's TAP program to argue DEQ should have assessed excess cancer risk as Washington does. Petitioners might prefer the approach taken by Washington, but Washington law and the state's distinct program does not control here. Following the Idaho TAPs rules, the expert evidence supports the Hearing Officer's conclusion that comparing the Project's modeled arsenic exposure concentration to the T-RACT AACC under Section 210.12 requires the adjustment of the exposure concentration for exposure duration to compare to the T-RACT AACC. *See Huntsman*, 114 F.4th at 737, 742 (holding while the petitioners' proposed alternative "approach to statistical modeling … may have advantages,"

EPA's action was "reasonable" because EPA "adequately explained its modeling approach and decisions" in light of the technical nature of the evidence before it).

Third, Petitioners claim that DEQ's analysis failed to consider mutagenic modes of action and sensitive populations. REC 7138-39. None of those claims are supported by the evidence. One reason is that EPA does not consider arsenic mutagenic, Tr. 499:8-508:4 (Lopez), as even Dr. von Lindern acknowledged, Tr. 439:14-16 (von Lindern). Another reason, as the Hearing Officer found, is that URFs/IURs are developed taking into account the exposure of sensitive subpopulations (e.g., children and pregnant women). *REC 7101 (¶¶ 36-37)*; Tr. 138:6-139:5, 146:15-24, 147:16-148:5, 153:13-154:12, 171:20-172:21 (Paden); Tr. 181:23-182:1, 185:6-12, 188:2-22, 190:6-191:6 (Lopez); REC 4293-95.

Fourth, Petitioners raise the irrelevant argument that DEQ only considered the impact of arsenic emissions and failed to account for the effects of other carcinogens under Section 161. REC 7137-38. Petitioners' argument is outside the scope of remand, and it is simply false. DEQ and Perpetua quantified the emissions of all TAPs from the Project and evaluated any TAP that exceeded the screening emission level in Section 586. REC 432-34, 699-701. Each carcinogenic TAP that exceeded the screening emission level was modeled and confirmed to be well below the T-RACT AACC. REC 697-716. The evidence does not support Petitioners' claim.

4. DEQ and Perpetua's expert evidence supports the Hearing Officer's conclusion that a limit on years of operation is not necessary.

The Hearing Officer also concluded that "[e]ven if the SGP operates for more than 16 years, the cancer risk from arsenic exposure calculated pursuant to EPA's IURs/URFs and Section 586 does not change as long as Perpetua complies with the production limits in Condition No. 3.6." *REC 7105 (¶ 76)*. And because incremental cancer risk from arsenic exposure "does not change with a project life longer than 16 years if compliance with Condition

No. 3.6 is achieved, DEQ's decision not to includ[e] a Permit condition specifically limiting the life of the SGP to 16 years was not error." *Id. (¶ 77)*. DEQ and Perpetua's expert evidence supports the Hearing Officer's conclusion that a permit limit on Project duration is not necessary.

A limit on the Project's years of operation is unnecessary because it is the production limits on emissions, not years of operation, that control the exposure. The largest source of arsenic emissions from the Project is haul road dust. REC 62, 226. Higher production and more activity on the haul roads generate more emissions, so PTC Conditions 3.5 and 3.6 impose production limits as T-RACT to ensure that emissions are controlled and do not exceed the T-RACT AACC. Tr. 117:24-119:6, 119:25-121:3 (Schilling); Tr. 202:1-203:17, Tr. 212:11-213:21 (Lopez); Tr. 315:16-19 (Lewis). As such, the Project's arsenic emissions, and cancer risk from those emissions, are directly tied to the PTC's production limits. *See* Tr. 314:12-317:2 (Lewis).

Condition 3.5 of the PTC includes two limits on daily production: 180,000 tons per day and 135,000 tons per day based on a five-year rolling average. *REC 7105-06 (¶ 78)*; REC 385. The 180,000 ton per day short-term limit addresses short-term 24-hour National Ambient Air Quality Standards. *REC 7107 at ¶ 87*; Tr. 284:4-22 (Lewis). Condition 3.6 establishes a total, life-of-mine production limit of 788.4 million tons, as well as a total production limit on the West End Pits of 394.2 million tons. *REC 7105 (¶ 75)*; REC 385. The PTC's total production limits, as restrained by the 135,000 ton per day five-year rolling average limit, are long-term T-RACT limits. These permit limits ensure that the Project's arsenic emissions are consistent with assumptions used to model the arsenic exposure concentrations against the T-RACT AACC. Tr. 114:17-115:6 (Schilling); Tr. 280:20-25, 283:15-19 (Lewis).

The Hearing Officer understood that arsenic emissions are a function of production, not years of operation, and that the modeled exposure concentration and incremental cancer risk do

not change if it takes longer than 16 years to exhaust the 788.4 million ton total production. *REC 7105 (¶ 76)*; Tr. 116:7-23, 117:24-118:6, 119:24-121:3 (Schilling); Tr. 169:10-170:5 (Paden); Tr. 202:1-203:17, 208:3-209:2 (Lopez); Tr. 314:12-317:2 (Lewis). Because "emissions are proportional on production and concentrations are proportional on emissions and risk is dependent upon the total exposure, you're going to arrive at the same risk whether it would be 16 years or 70 years." Tr. 120:19-24 (Schilling). Adding a 16-year permit limit is unnecessary; incremental lifetime cancer risk will not change and remains below the T-RACT AACC. *See REC 7105 (¶¶ 76-77)*; Tr. 202:11-22, 203:15-17 (Lopez); Tr. 314:12-317:2 (Lewis).

B. The evidence supports the Hearing Officer's conclusion that DEQ reasonably used a five-year rolling average production limit as a T-RACT long-term limit.

As noted, PTC Condition 3.5 limits mine production to 135,000 tons per day based on a five-year rolling average and ensures that arsenic emissions from the Project are consistent with assumptions used to model the exposure concentration against the T-RACT AACC. Petitioners' claim that a five-year rolling average is inappropriate is grounded on their belief that the AACCs are annual limits. *See* REC 7139-40. They contend the PTC improperly spreads out 16 years of emissions over 70 years and the five-year operational period could result in a violation of the "annual average arsenic concentration." *Id*.

On remand, the Hearing Officer concluded that DEQ acted reasonably and did not err in using the 135,000 ton per day five-year rolling average limit. *REC 7107 (¶ 96)*. Again, he found that the AACCs "are expressed as annual 'averages,' not annual 'limitations.'" *REC 7106 (¶ 84)*. And: "because Section 586 is focused on excess cancer risk posed by a project over the course of an assumed 70-year lifetime or the lifetime of a project that will last less than 70 years, the five-year rolling average approach in Condition 3.5 is stricter and more protective than Section 586 requires." *REC 7108 (¶ 97)* (citing Tr. 40:12-18 (Schilling); Tr. 294:11-23 (Lewis)).

The evidence supports the Hearing Officer's conclusion. As explained earlier (at pp. 10-13), Petitioners did not prove the AACCs are annual limits. *See* REC 7139-41. The AACCs reflect incremental cancer risk over a 70-year lifetime, and not risk over one year, so there is no need to monitor emissions annually. REC 7106-07 (¶ 85). It follows that a five-year rolling average compliance period represents a shorter and more conservative compliance demonstration period than 70 years and ensures that cumulative exposure is below the T-RACT AACC. *REC 7108 (¶ 97)*; *see also* Tr. 39:11-40:25 (Schilling); Tr. 219:25-220:12 (Lopez); Tr. 293:16-294:23, 318:1-13 (Lewis); *see also* REC 3926 (¶ 26); REC 4288 (¶¶ 46-47), 4303; REC 4138 (¶ 43).

In addition, Petitioners misconstrue Mr. Schilling's testimony, claiming he "confirmed that using a five-year rolling average was inappropriate for calculating the annual average arsenic concentration." REC 7139-40 (quoting REC 3925 (¶ 24)). But in Mr. Schilling's words, he was explaining the "implication of the stated issue." Had Petitioners read on, they would have learned why the five-year rolling average is proper and his conclusion that "[s]ince the exposure concentration (a resulting project caused concentration averaged over a lifetime) is a measure of compliance with AACC, the five-year rolling average is consistent with limits in Idaho Air Rules for carcinogenic TAPs." REC 3926 (¶¶ 25-26).

Finally, the Hearing Officer recognized that even if annual production occurred at the 180,000 tons daily rate for any one year, the incremental cancer risk will not change because the PTC's life-of-mine production limit, combined with the 135,000 ton per day five-year rolling average limit, restricts total exposure from the Project. *REC 7107 (¶ 89)*; *see also* Tr. 118:3-6 (Schilling); REC 3926 (¶ 26); Tr. 208:14-209:2 (Lopez); REC 4287-88 (¶¶ 43-47). Even without the five-year rolling average limit, production up to 180,000 tons per day would still not exceed the T-RACT AACC. *REC 7107 (¶ 90)*. As Mr. Lewis explained, 180,000 tons per day is 33.3%

greater than 135,000 tons per day, and if the maximum arsenic concentration of 0.00095 μg/m^3 is correspondingly increased by 33.3%, the result is 0.001267 μg/m^3, still less than the arsenic T-RACT AACC of 0.0023 μg/m^3. *Id. (¶¶ 90- 91)*; Tr. 285:17-290:5, 292:2-293:1 (Lewis); Ex. 222.

Because the AACCs are not based on exposure in a single year, and because the highest modeled arsenic exposure concentration for the shortest possible exposure duration (16 years) demonstrated compliance with the T-RACT AACC, the Hearing Officer correctly held that DEQ acted reasonably in determining that a five-year rolling average production limit is protective and ensures the Project is operated to align with the T-RACT AACC under Section 586.

C. The evidence supports the Hearing Officer's conclusion that PTC conditions were sufficient to limit production from the non-West End Pits.

1. DEQ and Perpetua's expert evidence showed how the PTC limits production from the non-West End Pits and that no separate limit is necessary.

The final issue on remand concerns the relationship between the two life-of-mine production limits in Condition 3.6: (1) the total, life-of-mine limit of 788.4 million tons and (2) the West End Pit limit of 394.2 million tons or 50% of total production. *See* REC 385; REC 7109 (¶¶ 98-100). Condition 3.6 does not expressly limit non-West End Pit production, and the Board found "there was insufficient evidence in the record to demonstrate exactly how or whether the non-West End Pit production was limited." REC 3714.

DEQ and Perpetua's expert evidence directly addressed the Board's inquiry. Based on that evidence, the Hearing Officer correctly held that "it was reasonable for DEQ not to include a specific permit condition limiting non-WEP haulage to 50% of total mine haulage for the life of the SGP." *REC 7110-7111 (¶ 116)*. The greatest arsenic impacts from the Project originate from the West End Pit due to its location and the prevailing winds. *REC 7109 (¶¶ 101-104)*; Tr. 48:25-50:3 (Schilling); Tr. 270:3-23 (Lewis). That led DEQ to limit production from the West End Pit to 50% of total production.

The most conservative modeling scenarios based on 50% production from the West End Pit and the remaining 50% from the non-West End Pits demonstrated compliance with the T-RACT AACC. Tr. 116:13-23 (Schilling); Tr. 277:3-278:9 (Lewis). Modeling scenarios based on 100% production from the non-West End Pits (and 0% production from the West End Pit) were also below and demonstrated compliance with the T-RACT AACC. *REC 7109 (¶ 106)*; Tr. 45:9-21 (Schilling); REC 4140 (¶ 49). An additional production limit on the non-West End Pits offers no further protection to the public health or the environment. Tr. 45:23-48:21 (Schilling); REC 3927-28 (¶¶ 28-30); Tr. 281:1-282:7 (Lewis); REC 4140-41 (¶¶ 49-53).

That is because if 50% of the total production occurs from the West End Pit, then production from the non-West End Pits is "automatically limited" to the remaining 50% of the total production allowed. *REC 7110 (¶¶ 112-113)*; *see also* Tr. 47:22-48:18 (Schilling); Tr. 281:1-282:7 (Lewis). And if non-West End Pits account for more than 50% of the total production from the Project, then production from the West End Pit must be correspondingly reduced below 50%. *REC 7110 (¶¶ 114-115).* Thus, the non-West End Pits are already limited by the total production limit and demonstrate compliance with the T-RACT AACC. *REC 7110-11 (¶ 116)*. The evidence supports the Hearing Officer's conclusion that an additional production limit on the non-West End Pits is unnecessary.

2. Petitioners' contention that the maximum modeled annual average arsenic concentration was 0.00698 µg/m^3 is not supported by the evidence.

Petitioners do not directly take issue with the Hearing Officer's conclusion that a separate production limit on the non-West End Pits is not necessary. *See* REC 7141-43. Rather, relying on Dr. von Lindern's testimony, they argue the Hearing Officer erred in finding the highest modeled annual average arsenic concentration based on production of 135,000 tons per day was 0.00414 µg/m^3 and that it should have been 0.00698 µg/m^3. REC 7141 (citing REC 7100 (¶ 28). From

there, taking Mr. Lewis's observation that production of 180,000 tons per day is 33.3% higher than production of 135,000 tons per day, Petitioners extrapolate that the highest annual average arsenic concentration should be 0.0093 $\mu g/m^3$, which is above the arsenic T-RACT AACC of 0.0023 $\mu g/m^3$. REC 7143.

Petitioners mischaracterize the evidence, and their inferences are incorrect. Dr. von Lindern was not offered as an expert in emissions estimations or modeling, *see* Tr. 405:19-406:1 (von Lindern), as his testimony confirmed. Dr. von Lindern testified that the Project's maximum modeled arsenic concentration was 0.00698 $\mu g/m^3$ based on the results from the W2 modeling scenario identified in the bottom table of Exhibit 304. *See* Tr. 457:11-458:12 (von Lindern). He relied on the 0.00689 $\mu g/m^3$ concentration assuming it included the PTC's production limits, but he did not know what the concentration represented. *See* Tr. 457:11-458:12, 467:8-472:21 (von Lindern). In fact, the concentration does not include the PTC's production limits and is not the Project's maximum modeled arsenic concentration. Tr. 310:14-312:13, 314:3-11 (Lewis). Dr. von Lindern should have used, as DEQ and Perpetua did, the modeled arsenic exposure concentration of 0.00095 $\mu g/m^3$ from the W2 modeling scenario identified at the top of Exhibit 304. Dr. von Lindern's testimony was inaccurate, misleading, and is not reliable.[7]

Petitioners' misunderstandings of the technical aspects of DEQ's work and the relevant model outputs and their failure to account for the PTC's production limits in their calculations demonstrates why there is no basis for their allegations that DEQ used "mathematical tricks" and

[7] Dr. von Lindern also did not understand how DEQ and Perpetua derived the maximum modeled annual arsenic concentration of 0.00414 $\mu g/m^3$. He understood the value was "an average of the average of the average of the average," specifically the average of modeling scenarios Y1 through H4 on the bottom table of Ex. 304. Tr. 457:16-458:22 (von Lindern); REC 7142 n.6. Dr. von Lindern's calculation adds and averages modeling outputs from different receptor locations, which is as erroneous as assuming a single person can be in two places at the same time. His calculation does not represent any math performed by DEQ or Perpetua.

"post-hoc" assessments to "hide the true threat to public health." *See* REC 7143. In all cases where they claim the Project's modeled arsenic exposure concentration exceeds the T-RACT AACC of 0.0023 $\mu g/m^3$—stating a variety of numbers such as 0.0055 (*see* REC 7128) and 0.00689 and 0.0093 (*see* REC 7143)—Petitioners fail to account for the PTC's production limits.

V. CONCLUSION

After two years of administrative challenges by Petitioners and multiple reviews by the Hearing Officer and the Board, Petitioners attempt again to substitute their preferences for the science-based, technical work of DEQ. The evidentiary record on remand demonstrates that Petitioners failed to carry their burden to prove, by a preponderance of the evidence, that DEQ acted unreasonably and inconsistent with the TAPs rules. Their evidence and commentary were unconvincing and improbable when weighed against DEQ and Perpetua's extensive expert evidence. Supported by that evidence, the Hearing Officer correctly concluded that DEQ properly adjusted the Project's modeled arsenic exposure concentration based on an exposure duration tied to the PTC's production limits, that a five-year rolling average production limit is consistent with the T-RACT AACC, and that no additional production limit is necessary to limit emissions from the non-West End Pits. The Board can now issue a final order affirming and accepting the Hearing Officer's Preliminary Order and deny Petitioners' Petition for Review.

Case Docket No. 0101-22-01
OAH Case No. 23-245-01

RESPONDENT IDAHO DEPARTMENT OF ENVIRONMENTAL QUALITY'S RESPONSE TO PETITIONER SAVE THE SOUTH FORK SALMON'S MOTION FOR RECONSIDERATION BASED ON NEW EVIDENCE

Respondent, the Idaho Department of Environmental Quality ("DEQ"), by and through the Office of the Attorney General, hereby submits this Response to Petitioner Save the South Fork Salmon's ("SSFS") Motion for Reconsideration Based on New Evidence.

INTRODUCTION

On June 17, 2022, DEQ issued an air quality permit, a Permit to Construct ("PTC"), to Perpetua Resources Idaho, Inc. ("Perpetua") for the Stibnite Gold Project ("SGP"). REC 1274. In the PTC, DEQ determined that the Stibnite Access Route ("the Route"), an access road that runs through the SGP, was not accessible by the general public and was, therefore, not "ambient air," as that term is defined in the applicable rules. REC 3475. The Hearing Officer and then the Board of Environmental Quality ("the Board") ultimately agreed with DEQ's determination that the Route was not ambient air. *See* REC 3297, REC 3701. SSFS now appeals that decision due to "new evidence." REC 7147. Based on SSFS's Motion for Reconsideration and the supporting affidavit of counsel, there is no new evidence that should change the Board's decision. Thus, the Board should continue to find that DEQ acted both reasonably and lawfully.

PROCEDURAL HISTORY

On July 22, 2022, SSFS, the Nez Perce Tribe, and the Idaho Conservation League (collectively, "Petitioners") initiated a contested case, challenging DEQ's issuance of the PTC to Perpetua for the SGP. REC 0001-0028. Thereafter, the Board appointed a Hearing Officer to oversee and decide the contested case. REC 0031-0032. On August 12, 2022, DEQ responded to the Petition, denying it committed any error in issuing the PTC. REC 0033-0039. Perpetua then moved to intervene in the contested case, which the Hearing Officer granted. REC 0040-0045.

On September 6, 2022, Perpetua filed a Motion to Dismiss the Petition, which DEQ joined. REC 0052-0124. In ruling on the Motion to Dismiss, the Hearing Officer dismissed three of

Petitioners' claims and partially dismissed a fourth. REC 0160-0186. Petitioners were given leave to amend their Petition, and an Amended Petition was filed in January 2023. REC 0263-0292.

Petitioners filed a Motion for Summary Judgment on April 14, 2023, and DEQ and Perpetua filed their own Motions for Summary Judgment on May 12, 2023. REC 0319-0363; REC 1204-1232; REC 1276-1336. After hearing oral argument, the Hearing Officer issued his *Memorandum Decision on Motions for Summary Judgment and Preliminary Order* on October 31, 2023, appearing to dismiss all of Petitioners' claims. REC 3280-3328. Seeking clarity on his decision, DEQ and Perpetua filed a *Joint Motion for Reconsideration and/or Clarification* on November 10, 2023. REC 3332-3341. On December 5, 2023, the Hearing Officer issued his *Amended Memorandum Decision on Motions for Summary Judgment and Preliminary Order*. REC 3372-3425. The Hearing Officer made it clear he dismissed all of Petitioners' claims. *Id*.

On December 15, 2023, Petitioners filed their *Amended Petition for Review of Preliminary Orders*, initiating its first appeal to the Board. REC 3426-3441. After briefing and oral argument, the Board issued its *Final Order* on May 9, 2024 ("Final Order"). In the Final Order, the Board found that DEQ acted reasonably and in accordance with the law on four of the five issues before the Board.[1] Relevant to this Motion for Reconsideration, the Board found that DEQ acted reasonably and in accordance with law when it found that Perpetua has both legal and practical control of the Stibnite Access Route and properly excluded it from the ambient air boundary.

[1] As to the fifth issue, the Board found that DEQ did not act reasonably or in accordance with law when it analyzed the ambient arsenic air concentrations for the SGP and remanded the matter back to the Hearing Officer for the development of further evidence. REC 3717. The Hearing Officer issued his *Findings of Fact, Conclusions of Law, and Preliminary Order* on January 7, 2025. REC 7091-7118. The Hearing Officer found that DEQ acted both reasonably and lawfully in its analysis of the ambient air arsenic emissions. On January 21, 2025, Petitioners filed their *Petition for Review of January 7, 2025 Preliminary Order, Memorandum In Support, and Request for Hearing*, once again asking the Board to review the Hearing Officer's decision. REC 7119-7145. That appeal to the Board is progressing concurrently with this Motion for Reconsideration.

On January 24, 2025, SSFS filed its *Motion for Reconsideration Based on New Evidence* ("Motion for Reconsideration"). In its Motion for Reconsideration, SSFS claims "the U.S. Forest Service's January 3, 2025 Final Record of Decision for the Stibnite Gold Project, and supporting documents, provide relevant new information that address the issue of whether Perpetua has legal control to preclude public access from the Stibnite Road Access Route." REC 7147. Thus, SSFS asks the Board to "remand the Permit back to DEQ for reconsideration of the ambient air boundary analysis." REC 7151.

LEGAL STANDARD

In a contested case proceeding, "the Board must determine whether DEQ has acted reasonably and in accordance with law." *In the Matter of Sunnyside Park Utilities' Application for Sewage Disposal Permit*, Final Order on Petition for Review of Preliminary Order, at 10 (BEQ Dkt. 0103-07-02, Apr. 7, 2009).[2] A court will affirm the Board's decision, should it be appealed, unless the court finds that DEQ and the Board's decision is in violation of constitutional or statutory provisions, is in excess of statutory authority, is made on unlawful procedure, or is arbitrary, capricious, or an abuse of discretion. *See* I.C. § 67-5279(3).[3] But, it is the Petitioners who have "the burden of proving by a preponderance of the evidence, the allegations in the petition." IDAPA 58.01.23.062. Thus, the Board must uphold DEQ's decision to issue the PTC unless it determines that Petitioners have in fact proven, by a preponderance of the evidence, that DEQ's decision was (1) unreasonable, (2) not in accordance with law, (3) issued upon unlawful procedure, and (4) was arbitrary, capricious, or an abuse of discretion.

[2] Publicly available at https://www2.deq.idaho.gov/admin/LEIA/api/document/download/5566.

[3] The Hearing Officer recognized the helpfulness of using the judicial standard of review in I.C. § 67-5279, "[b]ecause those are the standards that ultimately govern the disposition of this matter…" REC 3377. Further, and importantly, Petitioners use the judicial standard of review set out in I.C. § 67-5279 in asking for relief. REC 3474.

ARGUMENT

In its Final Order, the Board found "that there is sufficient evidence in the record to support DEQ's conclusion that Perpetua has practical and legal control over the Stibnite Road Access Route such that it may be excluded from consideration as ambient air." REC 3703. The evidence has not changed. The Board's analysis should also remain unchanged. For the reasons discussed below, DEQ's decision to exclude the Route from ambient air remains reasonable and lawful.

I. The PTC Still Requires Perpetua to Have the Ability to Restrict the General Public from the Route.

SSFS does not assert that any condition of the PTC has changed or that Perpetua will be unable to comply with the terms of the PTC. The PTC requires that the "general public" be precluded from accessing the Route and requires that access for all guests be carefully managed. REC 0376. For example, Permit Condition 2.7 requires a combination of security escort vehicles, manned guardhouses, locked gates, barriers, warning signs, and registration of all guests to the mine site. *Id*. Condition 2.7 also requires Perpetua to submit an Access Management Plan, which must include the specific measures Perpetua will use to discourage public access, including those included in Condition 2.7. *Id.* These conditions will be more than sufficient to notify a reasonable person that his or her presence is not permitted unless specifically granted by Perpetua and therefore punishable under I.C. § 18-7008 for criminal trespass and actionable under I.C. § 6-202 for civil trespass.

In its initial review, the Board agreed, finding "there are substantial conditions in the PTC that require Perpetua to implement practical and physical restrictions on access to the SGP by the general public." REC 3701. None of the language cited by SSFS from the Forest Service's Final Environmental Impact Statement ("FEIS") prevents Perpetua from complying with the

conditions of the PTC. For example, SSFS points to the following language:

> A new 12-foot-wide gravel road will be constructed to provide public access from Stibnite Road (FR50412) to Thunder Mountain Road (FR 50375) through the Stibnite Gold Project. During operations, the public access road will be used to travel through the Stibnite Gold Project and will provide seasonal use, open to all vehicles.

REC 7149. The Forest Service has always referred to this as a public access road – Perpetua agreed to include the road to benefit the public and to provide members of the public with access. *See* REC 3295. However, that does not change the fact that Perpetua must be able to preclude the public from using the road at any time, for any reason, or discontinue access at its discretion. REC 1238. That also does not change the fact that the members of the public become "invitees" of Perpetua once they enter the mine boundary, for purposes of an ambient air analysis. *See* REC 1145 (EPA's Revised Policy on Exclusions from "Ambient Air"). Nothing in the FEIS or other related documents prevents Perpetua having or asserting this level of control. And SSFS does not allege that the Forest Service's interpretation or assessment of the road has changed throughout its review. Thus, there is no new evidence demonstrating that Perpetua will now be unable to meet the PTC requirements.

II. DEQ Reasonably Relies on Perpetua's Assertions Regarding Control of the Stibnite Access Route.

DEQ excluded the Route from ambient air because, in part, Perpetua represented during the permitting process that it would have legal authority to prohibit access by the "general public" and the practical ability to do so. REC 1260; REC 1236-1240. Under the Rules for the Control of Air Pollution in Idaho, IDAPA 58.01.01 ("Air Rules"), a permit applicant is required to certify that the information and statements provided in a permit application are "true, accurate, and complete." IDAPA 58.01.01.123. In its permit application, Perpetua (then Midas Gold)

stated that it "will legally control the SGP, an active industrial site where mining activities will occur, such as heavy equipment operation," and that it "has established an operations boundary to identify the area where public access will be excluded." REC 1807. DEQ's reliance on these assertions was completely reasonable and supported by the Air Rules. The Board agreed, finding: "It was reasonable for DEQ to rely on Perpetua's representations in its application form that it would have legal control over access to the Stibnite Road Access Route." REC 3700.

The Board went on to state that "DEQ recognized at oral argument that, should the [Forest Service] ultimately require public access through the SGP, the ambient air boundary analysis will have to be reevaluated." REC 3700, TR 0080. According to the information provided by SSFS, the Forest Service is not *requiring* public access through the SGP. The information presented by SSFS does not conflict with the information provided to DEQ, and SSFS does not allege that Perpetua has in any way changed the assertions made to DEQ. Therefore, there is no evidence in the record that would make DEQ's reliance on Perpetua's statements related to the Route unreasonable or unlawful.

III. DEQ and EPA Guidance Continue to Support DEQ's Determination.

Finally, DEQ's determination that the Route is not ambient air is still supported by both DEQ and EPA guidance. The Hearing Officer summarized the Environmental Protection Agency ("EPA") guidance well when he stated:

> According to EPA's 2019 ambient air policy: (1) it is appropriate to exclude areas from ambient air where measures are employed that are "effective in precluding access to the land by the general public;" (2) such measures can include physical barriers, but physical barriers are not required; (3) determinations by the agency are discretionary on a case-by-case basis; (4) the permit applicant must have the legal ability to preclude access by the general public and must employ measures that actually preclude the general public as a practical matter; (5) in evaluating the adequacy of the preclusion measures, the agency applies a "rule of reason" as to whether the general public will have access "under reasonably anticipated circumstances.

REC 3392. Similarly, DEQ's guidance focuses on the ways in which the permittee will discourage public access. REC 3392. The nature or remote location of the facility may discourage public access, or the permittee may take steps to prevent access. *Id.* If the general public is sufficiently precluded, it is reasonable to consider that the facility or specific area would not qualify as ambient air. *Id.* This is different from a "right-of-way easement" or "common service road." As one example, PTC condition 2.7 requires registration of all guests of a mine—surely no easement or common service road requires such registration.[4]

The Board has already reviewed both EPA and DEQ guidance and determined that the Route was properly excluded from ambient air. REC 3698. Again, the guidance continues to support DEQ's decision. The general public will be sufficiently excluded due to the measures Perpetua must take to comply with the PTC. And while the general public *may* be given access on Perpetua's terms, that is not the same as Perpetua relinquishing legal or practical control. Accordingly, nothing in the FEIS or related documents changes the analysis.

CONCLUSION

The PTC requires Perpetua to have legal and practical control of the Stibnite Access Route. Perpetua continues to assert, and the evidence continues to demonstrate, that Petitioners have the necessary control over the Stibnite Access Route. Thus, DEQ's decision to exclude the Route from ambient air is reasonable and lawful. The Board should confirm its Final Order and deny SSFS's Motion to Reconsider.

[4] The FEIS discusses the need for users of the Route to check-in with Perpetua. The language from the FEIS, and quoted by SSFS, states: "Public vehicles passing through would be required to check-in with mine personnel at the North or South SGP entry points and would receive a safety briefing and would also be required to check-out with the SGP personnel upon exhibiting the SGP." REC 7149.

Attorneys for Perpetua Resources Idaho, Inc.

BEFORE THE BOARD OF ENVIRONMENTAL QUALITY
STATE OF IDAHO

IN THE MATTER OF AIR QUALITY PERMIT TO CONSTRUCT P-2019.0047 NEZ PERCE TRIBE, IDAHO CONSERVATION LEAGUE, and SAVE THE SOUTH FORK SALMON, Petitioners, v. IDAHO DEPARTMENT OF ENVIRONMENTAL QUALITY, Respondent, and PERPETUA RESOURCES IDAHO, INC., Intervenor-Respondent.	Case Docket No. 0101-22-01 OAH Case No. 23-245-01 PERPETUA'S BRIEF IN OPPOSITION TO PETITIONER'S MOTION FOR RECONSIDERATION BASED ON NEW EVIDENCE

Intervenor-Respondent Perpetua Resources Idaho, Inc. ("Perpetua") submits this opposition to the Motion for Reconsideration Based on New Evidence submitted by Petitioner Save the South Fork Salmon ("Petitioner"). Petitioner claims that the Final Environmental Impact Statement ("FEIS") and Record of Decision ("ROD") issued by the United States Forest Service ("Forest Service") for the Stibnite Gold Project (the "Project") constitute new evidence that Perpetua does not have legal control over the Stibnite Access Route. Petitioner's claim fails on its face—Perpetua maintains the same control over public access to the Stibnite Access Route as has been described by the Forest Service throughout the National Environmental Policy Act ("NEPA") process and the Idaho Department of Environmental Quality ("DEQ") in development of the Permit to Construct ("PTC"). The Board should reject Petitioner's claims and dismiss the Motion.

INTRODUCTION

I. Procedural History

The Project is a mining and mineral processing operation that will be constructed and operated on state, private, and federal land in Valley County, Idaho. In addition to gold and silver, Perpetua will produce antimony essential to military applications critical for national security.

Before commencing construction on the Project, Perpetua must obtain various regulatory approvals, including a PTC from DEQ, as well as a separate NEPA authorization that provides Perpetua with the legal right to conduct operations on Forest Service lands. This comprehensive NEPA review required the Forest Service to develop an Environmental Impact Statement

("EIS") prior to issuing a ROD to authorize Perpetua's Mine Plan.[1] 42 U.S.C. § 4332(2)(C); 40 C.F.R. § 1502.1. The Forest Service issued a Draft EIS ("DEIS") on August 14, 2020, and a Supplemental DEIS on October 28, 2022.

In 2017, during the initial scoping phase of the NEPA process, Perpetua modified its original Mine Plan to include the Stibnite Access Route after receiving feedback that the Project would lengthen travel time for those who use the existing Stibnite Road to access Thunder Mountain Road. *See* REC 676, 893–895, 1758. Under the Mine Plan, Perpetua will control the Stibnite Access Route and will allow registered visitors restricted and limited use for the sole purpose of accessing other National Forest areas on the north side of the Project. This has not changed throughout the PTC and NEPA processes. *See* Pooser Decl., Exh. 1 at REC 376, Exh. 2 at REC 415, 676–677, 893–897, Exh. 3, Exh. 4, Exh. 5, Exh. 6, Exh. 7. The PTC, issued by DEQ on June 17, 2022, reflects the same ambient air boundary as set forth in the DEIS, including Perpetua's plan to control public access to the Stibnite Access Route. *See id.*, Exh. 1 at REC 376, Exh. 2 at REC 676–677.

On May 9, 2024, the Idaho Board of Environmental Quality (the "Board") issued a Final Order finding that "DEQ acted reasonably and in accordance with law when it found Perpetua has legal and practical control of the Stibnite Access Route such that it could be excluded from the ambient air boundary." REC 3698–3703. The Board found that (1) there was sufficient evidence to demonstrate that Perpetua will have legal control over access to the ambient air

[1] An EIS includes a comprehensive environmental analysis of the proposed activity and its potential impacts, as well as possible alternatives. 40 C.F.R. § 1502.1. The ROD completes the NEPA process by documenting the responsible federal agency's decision on the proposed activity—or an alternative—subject to mitigation measures. 40 C.F.R. § 1505.2.

boundary and (2) the PTC contains enforceable conditions that will preclude practical access by the general public. *Id.*

However, at the time of the issuance of the PTC and the Board's Final Order, the Forest Service had not issued the FEIS and ROD. The Board stated that it would not speculate as to the outcome of the NEPA process but found that there was sufficient evidence in the record to support DEQ's conclusion that Perpetua will have legal authority to control access. *Id.* The Board acknowledged DEQ's statement during oral argument that "should the [Forest Service] ultimately require public access through the [Project], the ambient air boundary analysis will have to be reevaluated." REC 3700.

On September 6, 2024, the Forest Service issued the FEIS. On January 3, 2025, the Forest Service issued the ROD. The ROD gives Perpetua legal authority to control the Project's boundary, including access to the Stibnite Access Route. Along with the ROD, the Forest Service also issued an Errata to the FEIS to provide clarifications in response to objections. The Errata states that the Stibnite Access Route is not a public road. Pooser Decl., Exh. 6 at PRI 1012. The FEIS, Errata, and ROD are all consistent with the DEIS and Supplemental DEIS—each of these documents reflect Perpetua's legal control over the Stibnite Access Route, and the conditions for practical control over the Route mirror the conditions originally set forth in the DEIS and the Supplemental DEIS. *Compare id.*, Exh. 5, 6, 7 *with* Exh. 3, 4.

Petitioner now seeks reconsideration of the Board's Final Order based on their assertion of "new evidence" in the FEIS and the ROD—there is none—and requests remand of the PTC to DEQ for reconsideration of the ambient air boundary analysis. Pet. Mot. at 5.

II. EPA Guidance on Ambient Air and the Board's Conclusion that the Stibnite Access Route is Not Ambient Air

Idaho regulations define "ambient air" consistent with EPA regulations as "that portion of the atmosphere, external to buildings, to which the general public has access." IDAPA 58.01.01.006.05. *See also* 40 C.F.R. § 50.1(e) (same definition). EPA and DEQ have long recognized that an applicant need not demonstrate the impact of a source's emissions on air within areas where general public access is restricted. *See* REC 1138, 1341, 1805.

EPA has consistently exempted from "ambient air" "the atmosphere over land [1] owned *or controlled* by the source and [2] to which the public access is precluded by a fence or other physical barriers." REC 1138 (emphasis added). In 2019, EPA broadened the "fence or other physical barriers" element and recognized that physical boundaries are not the only way in which to preclude public access. REC 1146. Specifically, EPA recognized that other measures (such as video surveillance, monitoring, clear signage, and routine security patrols) may be effective in deterring or precluding general public access to the land. *Id*. EPA gives the example that clearly visible "No Trespassing" signs in conjunction with some degree of fencing or other physical and/or non-physical barriers may be effective to preclude access by the general public. REC 1147.

Also important, EPA recognizes a source's "ambient air" is reviewed based on an individual, case-by-case basis. REC 1147–1148. As EPA explains in the 2019 guidance:

> The EPA will apply a rule of reason in evaluating the effectiveness of any measure proposed by a source … this evaluation should address relevant factors, such as the nature of the measure used (e.g., physical or non-physical), source location, type and size of source and property to be excluded, surrounding area (including the proximity, nature, and size of the population in the area), and other factors affecting whether members of the general public would readily be able to trespass upon or otherwise have access to the source's properties.

REC 1147. Air agencies "should consider all relevant information provided by the source or other interested parties, or otherwise available regarding the effectiveness of the measures to prevent public access." *Id*. Thus, air agencies exercise discretion in determining whether a permit condition is appropriate to ensure that the source administers selected measures in a manner that maintains continued public health protection. *Id*.

Only the first element—legal control—is raised by Petitioner's Motion. Petitioner did not request reconsideration of the Board's determination in the Final Order that Perpetua will preclude practical access by the general public.

ARGUMENT

The Forest Service's FEIS and ROD do not warrant remand of the PTC to DEQ for reconsideration of its ambient air boundary analysis because (I) the FEIS and ROD provide no new evidence; (II) the FEIS and ROD support the Board's conclusion that Perpetua will have legal (and practical) control over the Stibnite Access Route; and (III) the Errata expressly confirms that the Stibnite Access Route is not a public road.

I. The FEIS and ROD Provide No New Evidence

Petitioner's argument hinges on the claim that the FEIS and ROD provide new evidence demonstrating that Perpetua will not have legal control over access to the Project site. Petitioner argues that these documents "unequivocally establish that the Stibnite Road Access Route is for public use and that Perpetua does not have *absolute legal authority* to preclude such use."[2] Pet.

[2] As established in the EPA guidance discussed above, the applicable legal standard is not "absolute" control; it is whether Perpetua will (1) exercise "legal control" of the Project site and (2) preclude "practical access" by the general public, as DEQ and Forest Service have properly recognized.

Mot. at 3 (emphasis added). Petitioner's claim of alleged "new" evidence is simply wrong as a factual matter. Petitioner's Motion should be denied for this reason alone.

The FEIS and ROD clearly provide descriptions of Perpetua's control of access and nothing in the FEIS or ROD changes either the Forest Service's analysis of the control question in the DEIS and the Supplemental DEIS, or the DEQ's analysis of the question when it first issued the PTC in June 2022. To be crystal clear, the characterization of Perpetua's legal control over the Stibnite Access Route has not changed throughout DEQ's development of the PTC, the Board's review of Petitioner's challenge, or the Forest Service's NEPA review.

DEQ's June 2022 Statement of Basis for the PTC recognized that Perpetua "will legally control the [Project site]" and provide limited public access through the Stibnite Access Route, subject to restrictions in Perpetua's Access Management Plan:

> [Perpetua] has the legal authority to control access to the Stibnite Road access route and would provide seasonal (non-winter conditions) access only. At the discretion of [Perpetua], additional access controls may occur during various phases of construction, during mine operations that present potential safely hazards such as blasting, due to inclement weather, or under any other circumstances that may present a threat to the protection of public or employee health and safety. [Perpetua] has the legal and practical ability to enforce its control over roadway access and to monitor traffic passing through the [Project] site.

Pooser Decl., Exh. 2 at REC 676–677.

The PTC then provides the following minimum control measures that Perpetua will implement in its Access Management Plan relative to the Stibnite Access Route:

- Preclude unauthorized access at primary access points through the use of security escort vehicles, manned guardhouses, locked gates, barriers, or equivalent measures;
- Post warning signs and place boulders at secondary access points;
- Use trained security personnel to patrol the Project site and escort trespassers off the site;

- Provide access only to "registered guests" for the sole purpose of passing through the Project site to another destination; and

- Require guests to complete a registration sheet that explains Perpetua's requirements for accessing the site and identifies potential hazards.

See id., Exh. 1 at REC 376.

The relevant analysis and conditions have not changed since DEQ made its initial decisions. Nonetheless, Petitioner erroneously claims that the following excerpts from the FEIS and ROD now establish that Perpetua will not legally control the Stibnite Access Route:

- Stibnite Road connects to Thunder Mountain Road on the southeastern portion of the Stibnite mine site and currently provides public access through the mine area.

- A new 12-foot-wide gravel road will be constructed to provide public access from Stibnite Road (FR 50412) to Thunder Mountain Road (FR 50375) through the Stibnite Gold Project. During operations, the public access road will be used to travel through the Stibnite Gold Project and will provide seasonal use, open to all vehicles.

- During operations, the public access road through the Operations Area Boundary would provide seasonal use, open to all vehicles; access would not be provided in winter when impassable (current county maintenance standards) and signs would inform the public of seasonal and temporary closures. Public vehicles passing through would be required to check-in with mine personnel at the North or South SGP entry points and would receive a safety briefing and would also be required to check-out with the SGP personnel upon exhibiting the SGP. For safety purposes, public access would be separated from other SGP roads by berms, security fencing, and the underpass to allow the public road to pass beneath the mine haul road.

Pet. Mot. at 3.

But these excerpts are also found in the DEIS and Supplemental DEIS. Indeed, the Forest Service used *nearly the exact same language* in the Supplemental DEIS, which was available at the time of DEQ's decision, with only a few grammatical differences:

- Stibnite Road connects to Thunder Mountain Road on the southeastern portion of the Stibnite site and currently provides public access through the site. Pooser Decl., Exh. 4, Excerpts from Supplemental DEIS at PRI 993.

- A new 12-foot-wide gravel road would be constructed to provide public access from Stibnite Road (FR 50412) to Thunder Mountain Road (FR 50375) through the SGP. During operations, the public access road would be used to travel through the SGP and would provide seasonal use, open to all vehicles. *Id.*, Exh. 4, Excerpts from Supplemental DEIS at PRI 991. *See also id.*, Exh. 3, Excerpts from DEIS at PRI 979–980.

- During operations, the public access road through the SGP would provide seasonal use, open to all vehicles; access would not be provided in winter when impassable (current county maintenance standards) and signs would inform the public of seasonal and temporary closures. Vehicles passing through the SGP would be required to check-in with mine personnel at the North or South SGP entry points and would receive a safety briefing and would also be required to check-out with SGP personnel upon exiting the SGP. For safety purposes, public access would be separated from other SGP roads by berms, security fencing, and the underpass to allow the public road to pass beneath the mine haul road. *Id.,* Exh. 4, Excerpts from Supplemental DEIS at PRI 989. *See also id.*, Exh. 3, Excerpts from DEIS at PRI 979–980.

The attached Exhibits—which include Forest Service determinations that Perpetua requests be administratively noticed by the Board[3]—include portions of the DEQ permitting record and additional NEPA documents that further demonstrate this consistency. *See id.*, Exh. 1, Excerpts from Permit to Construct, Exh. 2, Excerpts from Statement of Basis, Exh. 3, Excerpts from DEIS, Exh. 4, Excerpts from Supplemental DEIS, Exh. 5, Excerpts from FEIS, Exh. 6, Excerpts from Errata, Exh. 7, Excerpts from ROD.

Nor do the FEIS and ROD require public access (in fact the agency explicitly stated the opposite). The Stibnite Access Route is an element of the approved Mine Plan for the Project that is in the ultimate control of Perpetua—as illustrated by the measures Perpetua will

[3] Pursuant to IDAPA § 62.01.01.479, Idaho Code § 67-5251(4)(a), Idaho Code § 9-101(3), and I.R.E. Rule 201(b)(2), Perpetua requests that the Board take judicial notice that the Forest Service made the determinations in the highlighted portions of the NEPA documents. These highlighted portions provide adjudicative facts that are "not subject to reasonable dispute because" they are part of "official acts" of the Forest Service. *See Hastings v. Idaho Dep't of Water Res.*, 173 Idaho 630, 547 P.3d 1190, 1200-01 (2024) (affirming the district court's decision to take judicial notice of a conditional permit issued by the Idaho Department of Water Resources under Idaho Code § 9-101(3) and I.R.E. Rule 201(b)(2)).

implement to limit access and to manage use. The DEIS, Supplemental EIS, and FEIS analyzed the environmental impacts of Perpetua's Mine Plan, including the restricted public access (controlled and limited by Perpetua) through the Stibnite Access Route. *See* Pooser Decl., Exh. 3, Exh. 4, Exh. 5. In the ROD, the Forest Service then approved Perpetua's Mine Plan and authorizes Perpetua to control use of the Route and preclude public access pursuant to the Access Management Plan. Therefore, nothing has changed from the DEIS or SDEIS, and there is nothing for DEQ to reevaluate**.**

II. The FEIS and ROD Support the Board's Conclusion that Perpetua Will Have Legal Control Over the Stibnite Access Route

In its May 2024 Final Order, the Board concluded that there was sufficient evidence to demonstrate that Perpetua will have legal control over the Stibnite Access Route. REC 3698–3703. Additionally, the Board explained that Perpetua's measures to control practical access "make[] clear that access. . . will only be available under a very limited basis and not to the 'general public.'" REC 3702. Because the characterization of Perpetua's legal control over the Stibnite Access Route in the FEIS and ROD are consistent with the PTC, Statement of Basis, DEIS, and Supplemental DEIS, nothing in these final NEPA documents alters the Board's conclusions. The FEIS and ROD authorize Perpetua to restrict and control when and under what conditions vehicles use the Stibnite Access Route as DEQ authorized in the PTC. *See* Pooser Decl., Exh. 5 at PRI 1001–1002, Exh. 7 at PRI 1018–1019. Accordingly, the FEIS and ROD support the Board's Final Order.

III. The Forest Service's Errata Expressly Confirms that the Stibnite Access Route is Not a Public Road

Petitioner ignores the Forest Service's Errata to the FEIS, which flatly contradicts Petitioner's argument and further confirms that Perpetua has legal control over the Stibnite

Access Route. *See* Pooser Decl., Exhibit 6 at PRI 1012. The Errata added the following statement to the end of a paragraph in the FEIS reviewing the many measures that Perpetua will take to restrict access to the Project site:

> Because public use of the road would be subject to Perpetua's control measures on general use, *the public access road is not considered a public road*.

Id. (emphasis added). The Forest Service explained that "[t]he addition clarifies the status of the access road through the site with regard to whether it will be operated as a public road." *Id.*

The characterization of the Stibnite Access Route is consistent with Forest Service guidance, which limits a "public road" to one that is "(1) Available, except during scheduled periods, extreme weather, or emergency conditions; (2) Passable by four-wheel standard passenger cars; and open to the general public for use without restrictive gates, prohibitive signs or regulation other than restrictions based on size, weight, or class of registration." *See Pub. Lands for the People, Inc. v. United States Dep't of Agric.*, 2010 U.S. Dist. LEXIS 132748, at *34–35 (E.D. Cal. Dec. 14, 2010). Indeed, the Stibnite Access Route will be controlled by restrictive gates, prohibitive signs, and other control measures set out in the PTC, FEIS, and ROD. Pooser Decl., Exh. 1 at REC 376, Exh. 5 at PRI 1001–1002, Exh. 7 at PRI 1018–1019.

The Forest Service's Errata explicitly contradicts Petitioner's claim that the FEIS and ROD "unequivocally establish" that the Stibnite Access Route is for public use. Instead, the Errata further reconfirms what the PTC, Statement of Basis, DEIS, Supplemental EIS, FEIS, and ROD consistently establish—Perpetua will have legal control over access through the Stibnite Access Route.

CONCLUSION

As the FEIS and the ROD fail to provide any new information that would change DEQ's conclusion, remand to DEQ is neither appropriate nor necessary. Remand would be a waste of agency resources and time, particularly in light of the years of review that DEQ has already spent scrutinizing the PTC.

BEFORE THE BOARD OF ENVIRONMENTAL QUALITY
STATE OF IDAHO

IN THE MATTER OF AIR QUALITY PERMIT TO CONSTRUCT P-2019.0047 NEZ PERCE TRIBE, IDAHO CONSERVATION LEAGUE, and SAVE THE SOUTH FORK SALMON, Petitioners, v. IDAHO DEPARTMENT OF ENVIRONMENTAL QUALITY, Respondent, and PERPETUA RESOURCES IDAHO, INC., Intervenor-Respondent.	Case Docket No. 0101-22-01 OAH Case No. 23-245-01 DECLARATION OF W. CHRISTOPHER POOSER IN SUPPORT OF PERPETUA'S OPPOSITION TO RECONSIDERATION

I, W. CHRISTOPHER POOSER, declare as follows:

1. I am a partner at Stoel Rives LLP and an attorney of record for Intervenor-Respondent Perpetua Resources Idaho, Inc. ("Perpetua") in the above-entitled matter. As such, I

have personal knowledge of the facts and statements contained in this Declaration. I submit this Declaration in support of Perpetua's Opposition to Petitioner's Motion for Reconsideration Based on New Evidence.

2. Exhibits 1 through 2 are true and correct excerpts from Idaho Department of Environmental Quality permitting documents regarding the Stibnite Gold Project that are currently in the record and labeled with REC numbers. Portions of the documents relevant to Perpetua's Opposition have been highlighted for ease of reading.

3. Exhibits 3 through 7 are true and correct excerpts from the United States Forest Service's review of the Stibnite Gold Project under the National Environmental Policy Act, obtained online from the Payette National Forest Stibnite Gold Project EIS website: https://www.fs.usda.gov/project/?project=50516. These documents are not yet part of the administrative record. For purposes of the record, these documents have been Bates-stamped with "PRI" numbers consistent with previous declarations. Portions of the documents relevant to Perpetua's Opposition have been highlighted for ease of reading.

Ex. No.	REC or Bates No.	Document Description
1	REC 367, 376	Excerpts from Permit to Construct (June 17, 2022)
2	REC 410, 415, 676–677, 893–897	Excerpts from Statement of Basis (June 17, 2022)
3	PRI 977–985	Excerpts from Draft Environmental Impact Statement (August 2020)
4	PRI 986–997	Excerpts from Supplemental Draft Environmental Impact Statement (October 28, 2022)
5	PRI 998–1010	Excerpts from Final Environmental Impact Statement (September 6, 2024)

EXHIBIT 1
Excerpts from Permit to Construct

Air Quality

PERMIT TO CONSTRUCT

Permittee	Perpetua Resources Idaho, Inc.
Permit Number	P-2019.0047
Project ID	62288
Facility ID	085-00011
Facility Location	Forest Service Roads NF-374 and NF-412 Stibnite, Idaho 83611

Permit Authority

This permit (a) is issued according to the "Rules for the Control of Air Pollution in Idaho" (Rules), IDAPA 58.01.01.200–228; (b) pertains only to emissions of air contaminants regulated by the State of Idaho and to the sources specifically allowed to be constructed or modified by this permit; (c) has been granted on the basis of design information presented with the application; (d) does not affect the title of the premises upon which the equipment is to be located; (e) does not release the permittee from any liability for any loss due to damage to person or property caused by, resulting from, or arising out of the design, installation, maintenance, or operation of the proposed equipment; (f) does not release the permittee from compliance with other applicable federal, state, tribal, or local laws, regulations, or ordinances; and (g) in no manner implies or suggests that the Idaho Department of Environmental Quality (DEQ) or its officers, agents, or employees assume any liability, directly or indirectly, for any loss due to damage to person or property caused by, resulting from, or arising out of design, installation, maintenance, or operation of the proposed equipment. Changes in design, equipment, or operations may be considered a modification subject to DEQ review in accordance with IDAPA 58.01.01.200–228.

the Stockpile Transfer to Reclaim Conveyors (OC9), Reclaim Conveyors to SAG Mill Feed Conveyor (OC10), and SAG Mill Feed Transfer to SAG Mill conveyor (OC11).

- Develop specific criteria to determine what frequency and type (water and/or chemical) of dust suppressant must be applied, and appropriate suppressant application rates. Chemical dust suppressants shall be applied consistent with manufacturer's instructions and recommendations.
- Develop and implement precautionary measures to address high-wind events, such as when average (sustained) wind speed is forecast to exceed 25 miles per hour.
- Provide training/orientation to all relevant employees regarding FDCP requirements, including the necessity of restricting public access as specified in the Access Management Plan (AMP). Visible emissions evaluations shall be conducted by the permittee's employees who are certified visible emission observers.
- At least once each year, evaluate FDCP requirements to identify additional requirements and evaluate effectiveness of practices, including dust suppressant application rates, as appropriate.

2.7 The permittee shall develop and maintain an AMP that identifies the facility boundary and all primary and secondary access points, and clearly specifies measures used to discourage public access to the facility. The permittee shall comply with the measures identified in the AMP at all times. The measures specified in the AMP shall be incorporated by reference to this permit and shall be enforceable permit conditions. At a minimum, the AMP shall include requirements to:

- Observe all primary access points to preclude unauthorized public access. Onsite personnel shall be available for this purpose during active mining and mineral processing operations. Public access to the facility may be monitored by the use of security escort vehicles or manned guardhouses, or sufficiently precluded by the use of locked gates, barriers, or equivalent measures. Primary access points include the North and South Security Gates.
- Post warning signs and periodically patrol secondary access points to the facility to preclude public access. Onsite personnel shall be available for this purpose. Plans shall be described in the AMP, including identifying the access points monitored, the frequency of patrol, and measures employed to discourage access (e.g., locked gates, barriers, natural features, etc.). Secondary access points include secondary roadways and trails traversing the facility.
- Only registered guests of the facility will be allowed access to or through the facility. Those seeking to be a guest for the sole purpose of passing through the facility to another destination shall be provided a registration sheet that explains Perpetua's requirements for accessing the site and identifies potential hazards of the site.

2.8 Copies of the FDCP and AMP shall be submitted to DEQ for approval 30 days prior to startup at the address provided (Permit Condition 2.26), and shall remain onsite at all times. Any changes to the FDCP or the AMP shall be submitted to DEQ for review, comment, and approval 30 days prior to the change.

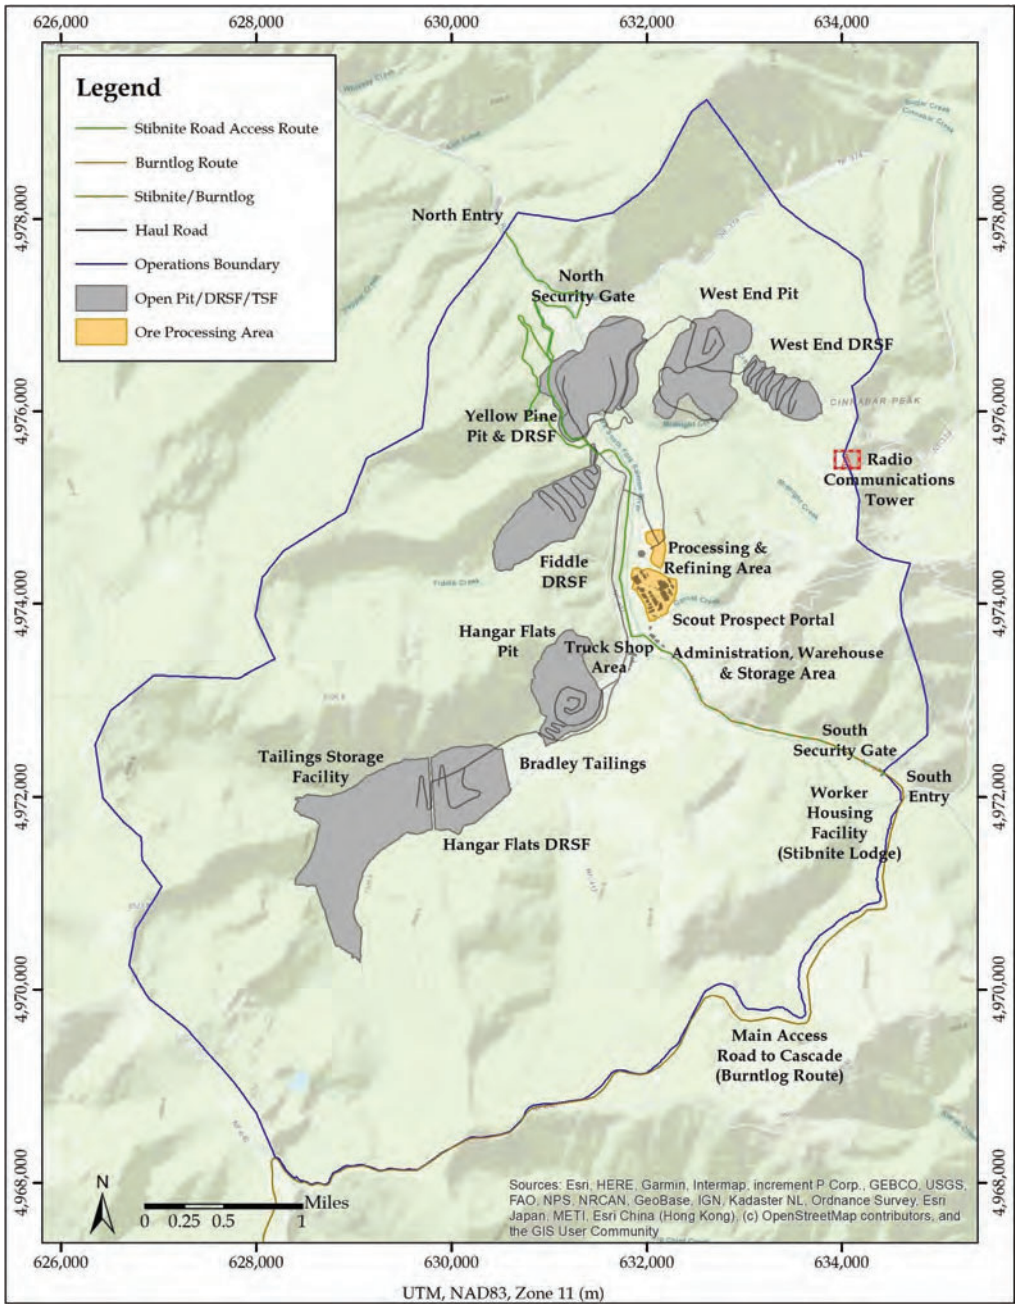
The purpose of this Statement of Basis is to satisfy the requirements of IDAPA 58.01.01.et seq, Rules for the Control of Air Pollution in Idaho, for issuing air permits.



FACILITY INFORMATION

Description

Perpetua Resources Idaho, Inc. (PRI) proposes to construct and operate the Stibnite Gold Project (SGP), consisting of conventional open-pit mining, ore preparation, and gold extraction operations.

SGP is to be located in Valley County at the intersection Forest Service roads NF-374 and NF-412 (Stibnite Road), approximately 10 miles east of Yellow Pine. The proposed Burntlog Route access road will provide year-round access to the site. The project comprises a combination of public national forest and private lands. The mining operations boundary within which public access will be excluded is defined in Figure 1. This operations boundary also defines the ambient air boundary used in all ambient air quality impact analyses.

Fi ure 1 PRO ECT RE OF OPER TIO S

3.3.10 Ambient Air Boundary

Ambient air is defined in Section 006 of the Idaho Air Rules as "that portion of the atmosphere, external to buildings, to which the general public has access."

PRI will legally control the SGP, an active industrial site where mining activities will occur, such as heavy equipment operation. Most areas of the mine will require strict safety protocols and controlled access. PRI has established an operations boundary to identify the area where public access will be excluded. Public access inside the operations boundary will be restricted for the life of the mine by physical barriers at points of potential access, including the current Stibnite Road point of entry and proposed site access via the Burntlog Route, as well as natural features of the landscape that prevent access. Consistent with the guidance provided in the EPA's draft revised policy on ambient air (EPA 2018b), public access control will include the following measures:

- Primary Access Points: The Stibnite Road (north) and Burntlog Route (south) access points will include locked gates. Guard shacks will be located at each gate to monitor all vehicle ingress/egress. Each gate also will include appropriate adjacent barriers (i.e., fencing, bollards, boulders, or other barriers) to prevent any vehicle from circumventing the gate and gaining site access. These primary access points are also controlled by adjacent natural features, such as streams and creeks, steep topography, and areas of thick vegetation and undergrowth that serve as natural barriers or impediments to access.

- Secondary Access Points: Other potential access points, such as secondary roadways and trails, will include posted signs warning the public against entry into the site. At these locations, boulders will be placed across the trail and at an appropriate width adjacent to the trail to prevent any vehicle from circumventing the barrier. These secondary access points also incorporate adjacent natural features, such as streams and creeks, steep topography, and areas of thick vegetation and undergrowth that serve as natural barriers or impediments to access. Some mine features, such as the TSF and process plant areas, will include perimeter fencing.

- Surveillance: PRI security personnel will routinely patrol mine facilities and roadways for unauthorized individuals. In addition, all onsite personnel will be trained on the necessity of restricting public access to areas within the operations boundary. Any suspected trespassing by unauthorized individuals will be reported immediately to security, and trespassers will be escorted off the site.

In response to comments from local community citizens, PRI will manage an access route to provide the general public with limited access through the SGP site between Stibnite Road at Sugar Creek and Thunder Mountain Road at Meadow Creek (shown in Figure 2). This route will be managed in accordance with the Stibnite Road Access Management Plan which is summarized as follows:

The proposed Stibnite Road access route through the SGP site is meant to provide controlled through-site access that is safe, provides travel-time comparable to current conditions and is consistent with the United States Forest Service travel management plan. The Stibnite Road access route extends from the north entry point southward to the Administration, Warehouse and Storage Area. Continuing southward, the Stibnite Road access route incorporates the Burntlog access road segment that occurs within the operations area and extends to the south entry point as shown on Figure 2. PRI has the legal authority to control access to the Stibnite Road access route and would provide seasonal (non-winter conditions) access only. At the discretion of PRI, additional access controls may occur during various phases of construction, during mine operations that present potential safely hazards such as blasting, due to

REC 7287
0676
PET 310

inclement weather, or under any other circumstances that may present a threat to the protection of public or employee health and safety. PRI has the legal and practical ability to enforce its control over roadway access and to monitor traffic passing through the SGP site. Signage will be placed at the North Security Gate (near the bridge over Sugar Creek) and the South Security Gate (near the Stibnite Lodge) to provide information to travelers, and guard shacks will be located at each gate to monitor all vehicle ingress/egress. Persons wishing to traverse the SGP site on the Stibnite Road access route will be required to check in at the security gate to receive a safety briefing and to alert mine staff of their presence. Travelers will be required to check out upon exiting the site to ensure passage through the site in a safe and timely manner. Travelers will not be allowed to stop or loiter while traveling though the operations area. Along its full length, the Stibnite Road access route would have appropriate signage to direct travelers and would be separated from mine haul roads and areas of mine operations by fencing, berms, or gates to prevent travelers from straying from the route. When possible and to the degree practicable, anticipated public access restrictions will be communicated to the public in a timely manner so that they may plan appropriately. Receptors on the Stibnite Road access route were not included in the SGP air quality analyses as this road is not considered ambient air.

The worker housing facility will be located within the project operations boundary, near the south access security gate. This housing facility will be used strictly for accommodating employees, contractors, and official visitors, and it will not be accessible to the general public. Therefore, the atmosphere over the land occupied by the worker housing facility is not considered ambient air, and receptors were not placed at this location for the air quality analyses.

The operations boundary, shown in Figure 2 above and Figure 9 below, was used to define the ambient air boundary for air dispersion modeling purposes.

3.3.11 Nearby Co-Contributing Sources

If impacts of neighboring emission sources on receptors showing a significant impact from the sources subject to the permitting action are not adequately accounted for by the background concentration used, then emissions from those sources must be modeled. The nearest significant permitted facility to SGP is Tamarack Mill, located more than 75 kilometers (km) west. This facility is located too far away to cause a significant concentration gradient along the periphery of the SGP and was therefore not included in the cumulative impact analyses for SGP.

3.3.12 Receptor Network

DEQ determined that the receptor grid used in the submitted modeling analyses was adequate to resolve maximum modeled impacts.

The SGP air quality analyses were performed using the following receptor spacing and extents (Table 18):

- 25-m-spaced receptors placed along the ambient air boundary;
- 50-m-spaced receptors extending 250 m beyond the ambient air boundary;
- 100-m-spaced receptors extending 1 km beyond the 50-m-spaced receptors;
- 500-m-spaced receptors extending 5 km beyond the ambient air boundary; and
- 1-km-spaced receptors extending 10 km beyond the ambient air boundary.

In addition, each highest modeled impact was evaluated further by performing a hot-spot analysis using a finer 25-m-spacing receptor grid. The modeling receptor grid is shown below in Figure 9. The full grid,

Midas Gold Idaho, Inc. - Stibnite Gold Project
Stibnite Road Access Management Plan – Version 1

April 15, 2020

1 Purpose and Objectives

This Stibnite Road Access Management Plan (Plan) describes the methods whereby Midas Gold Idaho, Inc. (Midas Gold), an Idaho corporation, would manage access on designated roads that traverse the proposed Stibnite Gold Project (SGP) mine site. The SGP is described in Midas Gold's Plan of Restoration and Operations (PRO).

The SGP is a proposed open pit mine that will be located at Stibnite, in central Idaho (see inset, Figure 1). The United States Forest Service (USFS) Forest System Road (FR) that passes through Stibnite (Stibnite Road; FR 50412) extends from the village of Yellow Pine eastward along the East Fork of the South Fork of the Salmon River for approximately 14 miles. Stibnite Road then continues south through the historic Stibnite mine site and connects with Thunder Mountain Road (FR 50375) on the southeastern portion of the proposed SGP. This route also allows for access to Meadow Creek Lookout Road (FR 51290; see Figure 1). As initially proposed, construction and operations at the SGP would prohibit access through the mine site for the life of the mine (approximately 20 to 25 years). During this period, alternative access to Thunder Mountain Road and Meadow Creek Lookout Road would be provided via the newly constructed Burntlog Route; a proposed mine access route that would connect the existing Burnt Log Road to Thunder Mountain Road with a new section of roadway and an upgraded section of Meadow Creek Lookout Road. Additionally, as proposed in the PRO, an off-highway vehicle (OHV) Trail would be upgraded to connect Horse Heaven/Powerline Road to Meadow Creek Lookout Road. Public access routes proposed in the PRO are illustrated in Figure 1. As part of reclamation of the SGP and closure of the mine site, Stibnite Road would be re-established in an alignment similar to its current location and would become the primary access route to Thunder Mountain Road. The Burntlog Route would be reclaimed to its previous condition and would no longer be connected to Thunder Mountain Road.

Following the presentation of the proposed public access routes described above in Midas Gold's PRO, an alternative public access route has been proposed by Midas Gold and would pass through the SGP mine site (Stibnite Road access route). This alternative route is under evaluation as part of the USFS's obligation to review the SGP in accordance with the National Environmental Policy Act (NEPA). One of the alternatives currently being evaluated in the Draft environmental impact statement (EIS), Alternative 2, would provide continued access through the SGP site on a realigned Stibnite Road during mine operations. The implementation of this Plan is contingent upon the selection of the applicable alternative by the USFS as the preferred alternative for the SGP and inclusion of the proposed Stibnite Road access route as a component of the approved SGP.

The health and safety of the public and the employees of the SGP is Midas Gold's priority. The procedures included in this Plan would be implemented by Midas Gold over the course of the life of the mine to ensure that the use of the Stibnite Road access route is conducted safely and responsibly.

2 Project Information

2.1 Introduction

Midas Gold has proposed to redevelop portions of the Stibnite Mining District (District) as described in the SGP PRO, submitted to the United States Forest Service (USFS) in September 2016. The SGP will be located at Stibnite in Valley County, approximately 92 miles by air and 144 miles by road northeast of Boise, Idaho; 44 air miles northeast of Cascade, Idaho; and 10 air miles east of Yellow Pine, Idaho. Current access to the site is from State Highway 55 to the SGP area via Warm Lake, Johnson Creek, and Stibnite Roads as shown in Figure 1. The proposed layout of the SGP mine features is illustrated in Figure 2.

Mining operations in the District first began in the 1920s and continued episodically through 1996. Proposed SGP mine operations described in Section 9 of the PRO would include open-pit mining in the three previously mined areas:

- The Yellow Pine open pit will encompass the area of the former Yellow Pine pit, Homestake pit, and portions of the Bradley Mining Company rock dumps.
- The West End open pit will encompass the former Stibnite Mines, Inc., open pits.
- The Hangar Flats open pit will encompass the former underground Meadow Creek Mine area, Hecla heap, and adjacent former mill and smelter area.

Other features and facilities that would be part of SGP mine operations include development rock storage facilities (DRSF), a tailings storage facility (TSF) and tailings pipeline, surface water management features (diversions, collection ditches, stormwater collection ponds), an ore processing facility, a water treatment facility, equipment maintenance and storage buildings, a worker housing facility, and all associated haul roads and access roads. The north and south points of entry to the SGP would have security gates and guard shacks that would be occupied on a continual basis. Features related to SGP mine but located off-site are illustrated in Figure 1 and include the Landmark Road Maintenance Facility, Stibnite Gold Logistics Facility, and features associated with powerline upgrades and extension.

The general timeline for constructing, operating, restoring, and mitigating the SGP is approximately 20 to 25 years, including 3 years of site preparation, construction, and early restoration activities; 12 to 15 years of operations; and 5 to 7 years of final closure and reclamation work. The SGP will produce gold, silver, and antimony over the 12- to 15-year mining period.

2.2 The SGP and NEPA

The proposed SGP occurs on patented mining claims (private land) and land administered by the United States Forest Service (USFS) within both the Boise National Forest (BNF) and Payette National Forest (PNF). The Big Creek/Stibnite Management Area 13, which includes the District, is administered by the Krassel Ranger District of the PNF. Proposed actions that occur on Federally managed lands require environmental review and analysis in compliance with NEPA. The NEPA analysis for the SGP was initiated

in mid-2017 with the USFS as the lead agency. The USFS is preparing an EIS to evaluate the environmental effects of the proposed SGP as well as a range of alternatives to the proposed action.

Public comments received for the SGP indicated that the change in access through the SGP for 20 to 25 years was of significant concern, particularly for those in the Johnson Creek and Yellow Pine area who use Stibnite Road to access Thunder Mountain Road and points beyond. At the direction of the USFS, Midas Gold evaluated numerous additional access options for the SGP that provided access similar to existing conditions and travel times. Midas Gold identified a suitable access route through the SGP site that would provide through-site access during operations. The road was designed to be separated from mine operations and to provide access similar to that provided by the existing Stibnite Road. The alternative access route through the SGP was included for consideration in the Draft EIS document as a component of Alternative 2.

2.3 Proposed Stibnite Road Access Route Through the SGP

The proposed SGP Stibnite Road access route that is currently under evaluation in the SGP Draft EIS is illustrated in Figure 2 and would include one of the two optional routes described below. During mine site construction, a new 12-foot-wide gravel road would be constructed to provide public access from Stibnite Road on the northern end of the SGP to Thunder Mountain Road on the southeastern end of the site. Along its full length, the Stibnite Road access route would have appropriate signage to direct travelers and would be separated from mine haul roads and areas of mine operations by fencing, berms, or gates to prevent travelers from straying from the route.

Two optional routes were identified and include variations in alignment in the vicinity of the Yellow Pine pit:

- **Stibnite Road Access Route: Option 1** – The access road would begin at the North Security Gate and would be constructed along a widened bench of the western portion of Yellow Pine pit during an early operational phase of the mine. South of the Yellow Pine pit this road would pass beneath the mine haul leading to the Fiddle Creek DRSF and would then parallel a mine haul road along a partially revegetated portion of the former Bradley mine haul road. In the central portion of the SGP site near the Mine Administration Building, the road would connect with the Burntlog Route and continue southeast toward the Worker Housing Facility and the South (Main) Security Gate. From the north end (North Security Gate) of the SGP to the south end (South Security Gate), this road would be approximately 3 miles in length.

- **Stibnite Road Access Route: Option 2** – The access road would begin at the North Security Gate and would be constructed west of the Yellow Pine pit. South of the Yellow Pine pit this road would pass beneath the mine haul leading to the Fiddle Creek DRSF and would then parallel a mine haul road along a partially revegetated portion of the former Bradley mine haul road. In the central portion of the SGP site near the Mine Administration Building, the road would connect with the Burntlog Route and continue southeast toward the Worker Housing Facility and the South (Main) Security Gate. From the north end (North Security Gate) of the SGP to the south end (South Security Gate), this road would be approximately 4 miles in length.

Based on assessment of impacts and public and agency feedback, one of these two options would be selected if Alternative 2 is identified as the Preferred Alternative for the Midas Gold SGP.

2.4 Access Controls

The proposed Stibnite Road access route through the SGP site is meant to provide controlled, through-site access that is safe, and provides travel-time comparable to current conditions. Additionally, the Stibnite Road access route would provide access that is consistent with the USFS travel management plan. Whereas Stibnite Road between Yellow Pine and Stibnite is not plowed in winter, Midas Gold would operate the Stibnite Road access route on a seasonal basis, i.e. access would not be provided in winter. Public access to the road would begin when Stibnite Road becomes passable in the Spring.

For either of the two route options described above, the northern extent of the Stibnite Road access route would begin at the North Security Gate, would continue southward traversing the SGP mine site, would connect with the Burntlog Route and would continue southeastward out of the mine operations area. The access route would exit South Security Gate near the employee housing facility.

Midas Gold has the legal authority to control access to the Stibnite Road access route and would provide seasonal (non-winter conditions) access only. At the discretion of Midas Gold, additional access controls may occur during various phases of construction, during mine operations that present potential safety hazards such as blasting or pit expansion, due to inclement weather, or under any other circumstances that may present a threat to the protection of public health and safety. Midas Gold has the legal and practical ability to enforce its control over roadway access and to monitor traffic passing through the SGP site. Signage would be placed at the North Security Gate (near the bridge over Sugar Creek) and the Main (South) Security Gate (near the Stibnite Lodge) entry points to provide information to travelers, and guard shacks would be located at each SGP Site entry gate to monitor all vehicle ingress/egress. To ensure passage through the site in a safe and timely manner, persons wishing to traverse the SGP site on the Stibnite Road access route would be required to check in at the security gate upon entry to receive a safety briefing and to alert mine staff as to their presence. After passing through the SGP site, travelers would also be required to stop at the guard shack upon exiting to check out. Travelers would not be allowed to stop or loiter while traveling though the operations area. Along its full length, the Stibnite Road access route would have appropriate signage to direct travelers and would be separated from mine haul roads and areas of mine operations by fencing, berms, or gates to prevent travelers from straying from the route.

Midas Gold would have the ability to temporarily restrict travel along the Stibnite Road access route for the protection of public health and safety. When possible and to the degree practicable, anticipated public access restrictions would be communicated to the public in a timely manner so that they may plan appropriately.

3 Conclusion

Midas Gold's SGP is under evaluation by the USFS and is proceeding through environmental analysis under NEPA. Midas Gold's proposed action and several alternatives to the proposed action will be included in the forthcoming Draft EIS. Alternative 2 in the Draft EIS includes an access alternative that would route a roadway, the Stibnite Road access route, through the mine site.

Maintaining and protecting SGP mine employee and public health and safety is Midas Gold's priority. This Stibnite Road Access Management Plan has been prepared to demonstrate that appropriate best practices, roadway construction features, and Midas Gold SGP site security measures would be in place over the life of the SGP mine and would effectively control access to the Stibnite Road access route.

This Plan will be updated and revised as appropriate.

2.4.3 Timeline

Timelines for construction, operations, and closure and reclamation for Alternative 2 would be the same as for Alternative 1.

2.4.4 Construction Phase

Construction activities and timing under Alternative 2 would be essentially the same as under Alternative 1. However, the modifications described in **Table 2.4-1** above would eliminate, relocate or modify interrelated construction activities.

2.4.4.1 Access Roads

BURNTLOG ROUTE – RIORDAN CREEK SEGMENT

Under Alternative 2, a section of new road construction along Burntlog Route (**Figure 2.4-3**) would be located on the south side of the Riordan Creek drainage and cross Riordan Creek north of Black Lake. The approximately 5.3-mile road segment would have 12 stream crossings, 3 of which cross perennial streams. The elevation of this road segment is approximately 8,000 to 8,600 feet and the average grade of this road segment would be 5 to 6 percent. The new construction portion of Burntlog Route under Alternative 2 would be approximately 13.5 miles and under Alternative 1 would be approximately 15 miles.

2.4.4.2 Public Access

STIBNITE ROAD TO THUNDER MOUNTAIN ROAD LINK

During mine site construction, a new 12-foot-wide gravel road would be constructed to provide public access from Stibnite Road (CR 50-412) to Thunder Mountain Road (FR 50375). The public access road would be constructed prior to the removal of development rock from Yellow Pine pit.

There are two options for a public access road through the mine site:

- Option 1 (**Figure 2.4-4**) – Constructed along a widened bench of the western portion of Yellow Pine pit (**Figure 2.4-5**). South of Yellow Pine pit this road would parallel a mine haul road and use a partially revegetated portion of the former Bradley mine haul road (**Figure 2.4-6**). The public access road portion through Yellow Pine pit would include a rockfall catchment area. This road would be approximately 3 miles in length.
- Option 2 (**Figure 2.4-7**) – Constructed west of the Yellow Pine pit. South of Yellow Pine pit, this road would parallel a mine haul road and use a partially revegetated portion of the former Bradley mine haul road (**Figure 2.4-8**). This road would be approximately 4 miles in length.

Based on assessment of impacts and public and agency feedback, one of these two options would be selected.

When the volume of water needing treatment in the Centralized WTP exceeds 4,000 gpm, such as during spring runoff, contact water ponds would be used to equalize the flows through the Centralized WTP. For high water years, mine pits also could be temporarily used to hold water for treatment.

During mine operation, the Centralized WTP is expected to require the following chemicals and reagents on an annual basis.

Sodium Hypochlorite – 15,000 gallons

Ferric Sulfate – 125,000 gallons/year

Hydrated Lime – 250 tons

Organic Flocculant (polymer) – 1,900 gallons

Sulfuric Acid – 2,400 gallons

Sodium Bisulfite – 2,000 gallons

Organic sulfide precipitant, if needed

Transport of these chemicals and reagents would add approximately 40 round trips for delivery to the operational AADT presented in **Table 2.4-3**. An estimated 2 to 4 employees would be required to operate the Centralized WTP.

The resulting solids from the Centralized WTP are not expected to be classified as a hazardous waste, and would be disposed in the TSF. Treated water would be discharged through the RIBs and/or direct discharge to the EFSFSR through an IPDES permitted outfall.

2.4.5.7 Access Roads

Access during operations would be the same as described in Alternative 1, except that a portion of the Burntlog Route would be relocated as described in Section 2.4.3.1, Access Roads.

2.4.5.8 Public Access

STIBNITE ROAD TO THUNDER MOUNTAIN ROAD LINK

Public Access during operations would be the same as described in Alternative 1, except that a new 12-foot-wide gravel road would be constructed to provide public access from Stibnite Road (CR 50-412) to Thunder Mountain Road (FR 50375) as described in Section 2.4.4.2, Public Access. The public access road would be used to travel through the mine site and would provide seasonal use, open to all vehicles. Vehicles passing through the mine site would be required to check-in with mine personnel at the Main or North Gates guard shacks upon entering the mine site and would receive a safety briefing. Vehicles on the public access road would be required to pass through the mine site without stopping or deviating from the public access road and would be required to check-out with mine site personnel upon exiting the mine site, to ensure they are clear of the site for safety purposes. Midas Gold would have the option to restrict mine site access to any vehicles due to concerns related to public or employee health

REC 7297
PRI-00000979

and safety, such as during blasting, mining in the immediate area of the road and other similar operations.

Berms, security fencing, and two underpasses, to allow the public road to pass beneath the mine haul road, would separate the public access road from other mine site roads. One underpass would be located north of the Fiddle DRSF and a second underpass would be located near the ore processing facility area. The public access road would be temporarily closed during construction and maintenance, and during other mining activities that would be considered public safety hazards (e.g., highwall scaling, blasting). Signs would be placed to inform the public of temporary closures and the public access road would not be plowed in the winter.

2.4.5.9 Off-site Facilities

Under Alternative 2, a maintenance facility (Burntlog Maintenance Facility) would be constructed within a borrow source site 4.4 miles east of the junction of Johnson Creek Road and Warm Lake Road (**Figure 2.4-1**). The relocated maintenance facility would include the same components as described in Alternative 1.

2.4.5.10 Traffic

The production of lime on-site would reduce lime deliveries to the site by 2,032 trips per year and would require an average of 133 additional propane deliveries per year (Midas Gold 2018b).

Table 2.4-3 shows the expected operational supply and haulage traffic under Alternative 2. The AADT for Alternative 2 is 50 vehicles.

2.4.6 Closure and Reclamation

Closure and Reclamation activities under Alternative 2 would be the same as under Alternative 1, except as described below.

2.4.6.1 Hangar Flats DRSF

Upon completion of final grading of the Hangar Flats DRSF, a low permeability geosynthetic cover would be placed on the top of the DRSF, which would be designed to limit infiltration through the DRSF. The geosynthetic liner would be overlain by placement of an inert soil/rock layer and growth media and revegetated.

2.4.6.2 Fiddle DRSF

Upon completion of final grading of the Fiddle DRSF, a low permeability geosynthetic cover would be placed on the top and outslopes of the DRSF that is designed to limit infiltration through the DRSF. The geosynthetic liner would be overlain by placement of an inert soil/rock layer and growth media and revegetated.

REC-7298
PRI-00000980

4 ENVIRONMENTAL CONSEQUENCES

4.1 INTRODUCTION

Chapter 4 describes the potential environmental consequences of implementing each of the alternatives presented in Chapter 2. Pursuant to 40 Code of Federal Regulations (CFR) 1500.1(b) and 1500.4, this section summarizes the completed analysis and forms the scientific and analytical basis for the comparison of alternatives. The alternatives described in Chapter 2 may cause, either directly or indirectly, changes in the human and natural environment. This Environmental Impact Statement (EIS) analyzes these potential changes and discloses the effects to the decision-makers and the public. Disclosure is a fundamental goal of the National Environmental Policy Act (NEPA). In addition, cumulative effects along with applicable mitigation measures and irreversible and irretrievable effects also are discussed. Effects of each action can be neutral, beneficial, and/or adverse. Effects are quantified whenever possible, and/or are qualitatively discussed.

The individual resource discussions are generally presented by issue(s) and organized with the presentation of the effects analysis issues and indicators for the resource; a brief methodology for the analysis of impacts; an evaluation of the alternatives' impacts to the resource; a discussion of cumulative effects, irreversible and irretrievable commitments, and short-term uses versus long-term productivity; followed by a summary of impacts by issues and indicators. The final subsection provides a table summarizing and comparing quantitative and qualitative impacts to each resource by alternative.

Section 4.1, Introduction, provides a brief explanation of what each resource section will address, including a summary of incomplete and unavailable information relevant to evaluating significant adverse impacts; the presentation of past, present, and reasonably foreseeable future actions (RFFAs) used for the direct, indirect, and cumulative impact analyses; and a discussion of Forest Plan Consistency and Potential Forest Plan Amendments.

4.1.1 Effects Analysis Indicators and Methodology of Analysis

An issue is defined as a point of disagreement, debate, or dispute with a proposed activity based on some anticipated effect. Issues are described in terms of cause and effect; that is, if an action occurs, an impact could result. Issues are addressed by describing comparative factors that provide a way to define, compare, and contrast the effects of the alternatives, including No Action.

REC 7299

PRI-00000981

Table 4.3-21 Maximum Annual HAP and Air Toxics Emissions Summary – Alternative 2 NSR Inventory [1]

Source Category	HCN (tpy)	H_2SO_4 (tpy)	HAP (tpy)	Hg (lbs/yr)
Ore Processing and Refining	0.97	8.9	1.8	24.9
Mining Fugitive	0.0	0.0	.0004	7.1
Total	**0.97**	**8.9**	**5.3**	**32.0**

Table Source: Air Sciences 2020

Table Notes:

1 - The HAP and Air Toxics emissions conform to the accepted PTC application to IDEQ.

H_2SO_4 = sulfuric acid, mist form. HCN = hydrogen cyanide.

HAP = Hazardous Air Pollutants. Hg = mercury (all forms).

tpy. = Tons per year. VOCs = Volatile Organic Compounds.

4.3.2.2.3 OPERATIONS PHASE – CONTROLLED ACCESS ROADWAY

The controlled access road for Alternative 2 is shown in **Figure 4.3-2** as it was included in a supplemental dispersion modeling analysis for this alternative. Although the route would be hypothetically open to all vehicles year-round, the level of usage is expected to vary seasonally because the destination areas are generally inaccessible except to over-snow vehicles between December and March. Roadway dust emissions would be reduced or eliminated during the wet months and periods of snow cover. In consideration of this, the modeling of the roadway impacts was only performed for the period of April through November. In addition, the IDEQ determination that the road is not within the regulated ambient air means that NAAQS do not apply for protection of individuals using the road.

To assess possible risk due to use of the controlled access roadway, supplemental dispersion modeling for this alternative treated the path of the public access road as “ambient air.” This requires that model receptors be positioned along the route as illustrated in **Figure 4.3-2** to predict pollutant concentrations. Treatment of the access road as ambient air could be considered a conservative approach, because several measures would be in place, consistent with EPA policy regarding sufficient measures to restrict or control public access (EPA 2019a). All public traffic on the proposed road would be required to check in and out of the mine site, and therefore they could be considered guests of the mine. Public vehicles would need to be checked in at security checkpoints at either end of the route through the Operations Area Boundary. Because the roadway would be fenced off, and on a separate ROW, no public access to the mine site or other operational areas would be allowed. Taken together, these practices allowed IDEQ to determine that the controlled access roadway can be excluded from ambient air analyses.

4.16.2.2.2.2 Public Access

Under Alternative 2, public access would be the same as Alternative 1 (e.g., the newly constructed Burntlog Route connecting to Meadow Creek Lookout Road [FR 51290]), except public access also would be provided through the mine site from Stibnite Road to Thunder Mountain Road (FR 50375) during mining operations. The newly constructed Burntlog Route connecting to Meadow Creek Lookout Road and then Thunder Mountain Road would allow public access when other routes are not available (i.e., the public access route through the mine site). The newly constructed roadway portion of the Burntlog Route would be a temporary road that is necessary for mining purposes and would meet 36 CFR 228A requirements for environmental protection. Public motor vehicle use would be allowed on the newly constructed, private mining road when other public access roads are blocked by mine operations. Approximately 13.5 miles of new roads managed by Midas Gold, but open to public access when needed, would be created.

After mine construction is complete, a 12-foot-wide, approximately 3- to 4-mile gravel road connecting Stibnite Road to Thunder Mountain Road would be open to all vehicles year-round. Midas Gold would maintain the public access road under Valley County's FRTA easement; however, it would not be plowed. There are two options for public access through the mine site (refer to Section 2.4.4.2, Public Access). Under Option 1, an approximately 3-mile public access road through a widened portion of the western side of Yellow Pine pit and paralleling a mine haul road would be constructed. Under Option 2, an approximately 4-mile public access road west of the Yellow Pine pit and paralleling the same mine haul road as Option 1 would be constructed. The selected public access road option would be separated from the mine site roads by berms, security fencing, and underpasses. For added safety, the public access road would be temporarily closed during construction and maintenance activities of the public access road, and during other mining activities that would be considered public safety hazards (e.g., high wall scaling and blasting). Signs would be placed to inform the public of the closure. During closures on the road through the mine site, public use of the Burntlog Route would be allowed.

4.16.2.2.3 Closure and Reclamation

Impacts to traffic volume and public access under Alternative 2 would be similar to those described under Alternative 1 for closure and reclamation; however, Alternative 2 would require an additional 40 truck trips per year to deliver chemicals for water treatment in perpetuity. Like operations, 40 truck trips for water treatment would provide an increase of 0.1 AADT for closure and reclamation and post-closure traffic. Post-closure, traffic to the mine site (i.e., the additional 40 truck trips per year required to deliver chemicals for water treatment in perpetuity) would no longer utilize the Burntlog Route, but would use the Yellow Pine Route to access the mine site which would be plowed to provide year-round access for treatment plant workers. Water treatment-related deliveries would not occur during the winter; supplies and waste would be stockpiled on site. Public access to and through the mine site would remain post reclamation and would require revision to the existing FRTA easement with Valley County.

relates to noise is “low” and the possibility is rated as “low,” with an overall public health rating of “negligible.”

4.18.2.1.4.3 Nutrition

Activities in the SGP area related to nutrition include fishing, hunting, or gathering of berries (or other edible vegetation). Contaminants in surface water could potentially bioaccumulate in the edible tissues of fish in impacted surface water or in wildlife that drink impacted surface water. Likewise, contaminants in soil could potentially bioaccumulate in plants growing in impacted soils. As discussed above, implementation of controls and surface water management during mine operations and the closure and reclamation activities would likely decrease concentrations of contaminants in soil and surface water relative to existing conditions. In addition, recreational exposures are expected to be of limited frequency and short duration (the Payette National Forest camping stay limit for individual campground sites is 16 days). For these reasons, the magnitude of impact on public health as it relates to nutrition is “low” and the possibility is rated as “low,” with an overall public health rating of “negligible.” There are no differences in impact findings among the construction, operation, and closure and reclamation phases of Alternative 1.

4.18.2.2 Alternative 2

Alternative 2 is similar to Alternative 1 with the main differences consisting of re-routing of a segment of the Burntlog Route, allowing public access through the mine site during operations, change in the location of the maintenance facility, re-routing a portion of the transmission line to be upgraded around the Thunder Mountain Estates, generating lime at the mine site, and establishment of a Centralized Water Treatment Plant. These changes are intended to reduce potential effects on surface water quality, reduce potential traffic related issues by providing public access through the mine site and potentially decreasing incidental public use of Burntlog Route, reduce SGP-related annual average daily traffic to the mine site during operations (through on-site lime generation) and reduce overall disturbance in the SGP area. However, Alternative 2 also would include an on-site propane-fired lime kiln and has higher air emissions than Alternative 1.

As discussed in Section 4.3.2, Direct and Indirect Effects on Air Quality, the $PM_{2.5}$ “annual” average (computed as the mean values from April through November) and PM_{10} 24-hour average concentrations (12.8 µg/m^3 and 179.7 µg/m^3, respectively) are predicted to be slightly over the respective NAAQS criteria at receptors along the public access road through the mine site (12 µg/m^3 and 150 µg/m^3, respectively). NAAQS are set at a level expected to protect public health with an adequate margin of safety, taking into consideration effects on susceptible populations. Signage and security checkpoints would alert the public to requirements for driving through the mine site, including check in and out at the checkpoints, no stopping or loitering while traversing the operations area, and restrictions would be enforced by signage, fencing, berms and/or gates to restrict travel to the designated route. The amount of time spent within the mine site on the public access road would be of limited duration. In addition, it is anticipated that people would only occasionally use the route through the mine site, such that the frequency

of exposure would be limited. While air modeling results exceeded the NAAQS criteria during the operations phase along the public access road through the mine site, the limited duration and frequency of exposure to PM at modeled air concentrations would likely be minimal, which would significantly reduce the public health impact associated with air quality, even for sensitive subpopulations. The slight exceedances of the NAAQS criteria along the public access road are expected to have little to no effect on the health of the general population, however, sensitive susceptible populations are at greater risk of health effects associated with air quality conditions.

Overall, impacts to public health and safety under Alternative 2 would therefore be slightly improved compared to Alternative 1 for traffic-related issues and surface water quality impacts. However, on-site lime generation could lead to slightly greater air quality impacts along the public access route through the mine site, that could affect sensitive subpopulations.

4.18.2.3 Alternative 3

Alternative 3 is similar to Alternative 1 with the main differences being no construction of the Meadow Creek off-highway-vehicle Connector Trail, the tailings storage facility (TSF) constructed in the EFSFSR, and different access through the mine site after mine closure/reclamation. Impacts to public health and safety would be essentially the same as those described under Alternative 1.

4.18.2.4 Alternative 4

Alternative 4 is similar to Alternative 1 with the main differences being the use of the Yellow Pine Route for access to the mine for all phases, and public road access through the mine during operations (similar to Alternative 2). These changes would result in different impacts than Alternative 1, particularly the use of the Yellow Pine Route.

Under Alternative 4, the Yellow Pine Route would be used from construction through operations and closure and reclamation and the Burntlog Route would not be constructed. Use of Johnson Creek (CR 10-413) and Stibnite (CR 50-412) roads as the primary route to the mine site during construction, operations, and closure and reclamation would result in increased noise, traffic, and safety-related issues from mine-related traffic along the Yellow Pine Route. The Yellow Pine Route would route all mine-related traffic through the Village of Yellow Pine and public traffic and mine traffic would share the same road from Landmark to the mine site. Additionally, the Yellow Pine Route would result in one point of entry to the SGP, effectively combining public access with mining traffic for the life of the mine. This limited ingress/egress to the SGP site also will impact emergency vehicle access during periods of road blockage.

The steep terrain along the Yellow Pine Route would likely be a greater risk to public safety under Alternative 4, because it would be the only route used for the life of the SGP and would require safety considerations for geotechnical hazards, landslides, and avalanche zones (see Section 4.2, Geologic Resources and Geotechnical Hazards). Overall, Alternative 4 could lead to greater public health and safety impacts compared to Alternative 1 through use of the Yellow Pine Route (increase traffic-related issues and increased geotechnical, landslide, and

Stibnite Gold Project

Supplemental Draft Environmental Impact Statement

Forest Service, Region 4, Payette and Boise National Forests, Valley County, Idaho

REC 7305

PRI-00000986

During operations, mine-related traffic would include transport of employees to and from the SGP, delivery of supplies, and activities associated with road maintenance such as snowplowing and sanding. Under the 2021 MMP and the Johnson Creek Route Alternative, operational AADT would be 50 vehicles (33 heavy vehicles and 17 light vehicles), resulting in approximately four mine-related vehicles per hour traveling outside the SGP.

The upgraded Burnt Log Road and the newly constructed Burntlog Route would experience an increase in traffic of over 71 percent under the 2021 MMP, with 27.5 percent of the traffic comprised of heavy vehicles. Although heavy vehicles currently use Johnson Creek Route to access the SGP, the Johnson Creek Route Alternative traffic would result in a noticeable change in baseline driver experience and slower drive times due to the substantial increase in mine-related heavy vehicles along the Johnson Creek Route during the life of the SGP. Even though upgrades to Johnson Creek Road and Stibnite Road would be made, these roads would still have many curves and slopes.

During closure and reclamation, activities including slope recontouring, facility removal, seeding and planting, and post-closure environmental monitoring would require approximately 7 years. Closure and reclamation would generate a total estimated AADT of 27 vehicles (15 heavy vehicles and 12 light vehicles). Post-closure monitoring activities would generate a total estimated AADT of six light vehicles.

Local roads experience a seasonal effect which results in noticeable differences in traffic. Valley County has many summer recreational areas that attract visitors from May through October with peak AADT levels in June, July, and August. Mine access via the Johnson Creek Route would be more impactful on summer recreational traffic because it would utilize established roads rather than new road development. Winter driving conditions influence the amount of traffic and result in lower AADT levels during the winter months. Therefore, the effect of SGP traffic on these roads would show a noticeably greater increase in mine-related winter traffic during winter. Post-closure winter traffic would not be as noticeable as heavy vehicle deliveries would not occur and approximately six mine-related light vehicles per day would utilize the accessible roadways in the analysis area for monitoring and maintenance purposes.

Public Access

Under the 2021 MMP, public access to the SGP area would be enhanced by the development of a new access road (Burntlog Route) compliant with current road standards. Under both action alternatives, there would also be a controlled public access route through the SGP during the operations, and closure and reclamation phases; however, public access would be intermittently interrupted during the construction phase. Under the Johnson Creek Route Alternative, the Burntlog Route would not be constructed, and the Johnson Creek Route would be used for both public and SGP-related access. To continue providing OSV access to Landmark, a 10.4-mile groomed OSV route between Warm Lake and Trout Creek Campground on Cabin Creek Road would be created as part of the 2021 MMP along with a parking area, resulting in a new winter access facility that would be maintained by Valley County.

Safety and Emergency Access

For the duration of the SGP, the increase in total volume of mine-related vehicles, specifically heavy vehicles or trucks, on the Yellow Pine and Burntlog routes would result in an increased risk for accidents occurring between public and SGP-related traffic due to the one-lane constraints during construction, for

Development of the mineral resource would include construction of access and haul roads; construction of supporting infrastructure; open pit mining; ore processing; placement of tailings in a TSF; and placement of development rock. New access to the SGP would be provided by the proposed Burntlog Route, which would be a combination of widening the existing Burnt Log Road (FR 447), Thunder Mountain Road (FR 50375), and Meadow Creek Lookout Road (FR 51290) and constructing new connecting road segments of approximately 15 miles (**Figure 2.4-1**). Development of the Burntlog Route would entail 340.9 acres of new cut and fill activity (including borrow sources) along existing and newly constructed roadways.

To provide electric power for the SGP, an existing powerline would be upgraded and a new transmission line from a new Johnson Creek substation to the mine would be constructed. Additional off-site support facilities to be constructed along access corridors include the SGLF and the Burntlog Access Route Maintenance Facility. The SGLF would house administrative offices, the assay laboratory, and a warehouse while the maintenance facility would be the headquarters for road maintenance and snow removal (**Section 2.4.4.9**). The proposed facilities and access roads are shown on **Figure 2.4-1** and **Figure 2.4-2**. The Operations Area Boundary shown on **Figures 2.4-1** and **2.4-2** is the boundary within which Perpetua would control public access.

The components of the 2021 MMP are described in the following sections in terms of overall land management and affected areas, and project phases: construction; operations; exploration; and closure and reclamation, including post-closure monitoring.

2.4.2 Land Management and Affected Areas

Table 2.4-1 provides a summary of land management or ownership by estimated SGP component for the maximum affected area proposed and also includes acreages of new disturbance and re-disturbance by SGP component and ownership.

2.4.3 Phases and Timeline

The actions proposed under the 2021 MMP would take place over a period of approximately 20 to 25 years, not including the long-term, post-closure environmental monitoring or potential long-term water treatment. The phases of the SGP are described in subsequent sections and include: (1) Construction (approximately 3 years; Mine Years -3 through -1); (2) Mining and Ore Processing Operations (approximately 15 years; Mine Years 1 through 15)); (3) Surface and Underground Exploration (approximately 17 years, beginning during construction and continuing concurrent with operations; Mine Years -2 through 15); and (4) Closure and Reclamation (Mine Year 16+). Most activities in the Closure and Reclamation period would be completed within five years. However, closure water management and water treatment are expected to continue for as long as 25 years (Mine Years 16 through 40). The environmental monitoring phase would continue for as long as needed to demonstrate that the site has been fully reclaimed. **Figure 2.4-3** provides an illustration of the timing of construction and operations activities and the initiation of the closure phase.

REC 7307

PRI-00000988

2.4.4.4 Public Access

During construction of the SGP and completion of the Burntlog Route, to the degree practicable, the public would continue to have access on forest roads currently available to the public (**Figure 2.4-1**). However, current public access through the SGP on Stibnite Road would be restricted for a period of approximately one year while a new through-site public access road is constructed. A new 4-mile long, 12-foot-wide gravel road would be constructed to provide public access from Stibnite Road (FR 50412) to Thunder Mountain Road through the SGP (**Figure 2.4-2**). The road would be constructed on a widened bench on the west side within the Yellow Pine pit, then head south of the Yellow Pine pit, where this road would utilize an underpass to cross under a SGP haul road and continue southward, parallel to and on the east side of the mine haul road on a partially revegetated portion of a former haul road (**Figure 2.4-2**). Southwest of the ore processing area, the public access road would connect with Thunder Mountain Road and continue toward the worker housing facility, exiting the SGP to the southeast.

During operations, the public access road through the SGP would provide seasonal use, open to all vehicles; access would not be provided in winter when impassable (current county maintenance standards) and signs would inform the public of seasonal and temporary closures. Vehicles passing through the SGP would be required to check-in with mine personnel at the North or South SGP entry points and would receive a safety briefing and would also be required to check-out with SGP personnel upon exiting the SGP. For safety purposes, public access would be separated from other SGP roads by berms, security fencing, and the underpass to allow the public road to pass beneath the mine haul road. No stopping or deviating from the public access road would be allowed. Perpetua would restrict SGP access to any vehicles due to concerns related to public or employee health and safety, such as during road construction and maintenance, blasting, highwall scaling, mining in the immediate area of the road, and similar operations.

Public access would continue along Johnson Creek Road and Burnt Log Road. Total closures of half-day to multiple days could occur during construction work on Stibnite Road between the village of Yellow Pine and the SGP, part of Thunder Mountain Road, and Burnt Log Road.

Public use of the Burntlog Route would provide motorized access to Meadow Creek Lookout Road (FR 51290) and Monumental Summit. Other routes available for public use are shown on **Figure 2.4-1**.

Public access by foot via existing trails or on roads would be restricted within the Operations Area Boundary shown on **Figure 2.4-2**. Security personnel, fencing (including wildlife exclusion fencing), and signs would restrict public access to vehicular traffic on the designated public access roadway inside the Operations Area Boundary.

Warm Lake to Landmark Groomed OSV Trail

Due to year-round access to the SGP along the Burntlog Route, an existing, approximately 8.5-mile-long groomed OSV trail from Warm Lake to Landmark would be closed for the life of the SGP. To replace this recreational use, a dedicated alternative OSV route would be established from Warm Lake area to Landmark via the Cabin Creek/Trout Creek drainages and Johnson Creek Road (**Figure 2.4-4**).

REC 7308

PRI-00000989

Description	Resources Affected
Cyanide-bearing solutions used in ore processing would be neutralized to approximately 10 milligrams per liter weak acid dissociable (WAD) cyanide before the material is pumped to the TSF. Residual cyanide would be treated using a sodium metabisulfite and air system to detoxify the cyanide by oxidation to form cyanate.	Hazardous Materials
Cyanide would be neutralized to levels protective of wildlife, and the TSF would be surrounded by an 8-foot high, chain-link fence designed to keep wildlife, such as deer and elk, from entering the impoundment area, to prevent either liner damage or wildlife drowning.	Hazardous Materials
Oils, solvents, and lubricants would be stored in approved containers located within, or directly adjacent to, the maintenance shop and contained within secondary containments to prevent spills into the environment. All used petroleum products, waste antifreeze, and used solvents would be collected in approved containers, transported off site, and disposed or recycled.	Hazardous Materials
Nitric and sulfuric acid would be transported in tanks designed to prevent spills even in the event of rollovers.	Hazardous Materials
Nitric and sulfuric acids would be stored in specialized non-corrosive, polyethylene-lined tanks located within the ore processing facility and would have secondary containment.	Hazardous Materials
Liquids would be shipped to the SGP in tank trucks designed for spill prevention and escorted to the SGP by pilot cars manned and equipped to handle spills.	Hazardous Materials
Other legacy materials may be encountered during construction and operations. If encountered, these materials would be characterized to determine potential for reprocessing, reuse, or disposal.	Hazardous Materials
Small scale composting associated with organic materials generated at the worker housing facility may be incorporated within the centralized GMS in the Fiddle valley.	Hazardous Materials
An Explosives and Blasting Management Plan would be prepared for the SGP. Explosives storage, transport, handling, and use would comply with applicable Department of Homeland Security, Bureau of Alcohol, Tobacco, Firearms and Explosives, and MSHA regulations.	Health and Safety
For safety and security reasons, no alcohol, firearms, or illegal drugs would be permitted on site.	Health and Safety
For safety and security reasons, public access into the mine area would be prevented by using fencing, gate locking, security personnel, and/or notice postings that prohibit unauthorized entry; no unauthorized vehicles or personnel would be permitted on the SGP.	Health and Safety
Personnel transporting, handling, or using any hazardous chemicals (including sodium cyanide) would be trained to ensure the safe use of such materials. Perpetua would design, construct, and manage facilities to conform to ICMC.	Health and Safety, Fish, Wildlife, Hazardous Materials
Fuel and other petroleum products at the site would be stored in above ground containment structures, with appropriate secondary containment measures.	Health and Safety, Fish, Wildlife, Hazardous Materials
Air emissions, groundwater, surface water, and aquatic parameters would be monitored during mine construction, operation, closure, and post-closure as specified in the final authorizations from the regulating agencies.	Monitoring

REC 7309

PRI-00000990

Description	Resources Affected
A new 12-foot-wide gravel road would be constructed to provide public access from Stibnite Road (FR 50412) to Thunder Mountain Road (FR 50375) through the SGP. During operations, the public access road would be used to travel through the SGP and would provide seasonal use, open to all vehicles. Vehicles passing through the SGP would be required to check-in with mine personnel at the North or South SGP entry points.	Transportation and Access, Health and Safety
Post reclamation, a road would be established over the backfilled Yellow Pine pit to allow public access through the reclaimed site and connect Stibnite Road (FR 50412) to Thunder Mountain Road (FR 50375). This would replace the operational phase public access route.	Transportation and Access
Prior to site preparation and construction of surface facilities, vegetation would be removed from operating areas. Merchantable timber on NFS surface lands could be purchased from the USFS. Non-merchantable trees, deadwood, shrubs, and slash would be removed, and any remaining vegetation would be grubbed using a bulldozer. The resulting material would be saved for future use in reclamation activities. Specifically, the organic matter would be chipped and stockpiled for use as mulch or blended to create a growth media additive. After vegetation removal, growth media would be salvaged and stockpiled. Stockpiles would be stabilized, seeded, and mulched to protect the stockpiles from wind and water erosion.	Vegetation
Perpetua would inspect and remove vegetation material (including noxious weeds) from mechanical equipment and properly dispose to minimize the spread of unwanted vegetation.	Vegetation
Wood wastes and wood mulch are the two primary sources of compost. Food waste produced from on-site meal preparation and wastes may provide another source. Combined and properly managed during composting, these materials would provide a source of organic matter to be blended into substrate materials suitable for mitigation.	Vegetation
Perpetua would be responsible for noxious weed control within areas disturbed by SGP activities.	Vegetation, Wildlife
Develop and employ planting plans for wildlife benefits (cover, forage, etc.) using approved seed mixes.	Vegetation, Wildlife
Perpetua would use aquatic safe herbicides during vegetation management activities and noxious weed control. Adhere to chemical label restrictions, federal/state rules on usage. Use proper equipment for chemical application by trained personnel.	Vegetation, Fish
Perpetua or its designated contractor(s) would perform long-term maintenance as necessary, including maintaining and monitoring the Mitigation Area (including stream and wetlands) in perpetuity once the final performance standards are met or until such responsibility is relinquished to an appropriate third party (Forest Service, etc.) as approved by the USACE.	Vegetation, Wetlands
Perpetua would plant stream reclamation reaches and wetland reclamation areas with native plant species that are present in PAB, PEM, PSS, and palustrine forested wetlands and riparian areas along streams throughout the Mitigation Area.	Vegetation, Wetlands
To address stream temperature, riparian planting widths along restored and enhanced stream reaches would be 18 feet wide on each stream bank where possible. Taller and denser vegetation such as spruce trees would be planted. Further, the creation of the lined Stibnite Lake, a feature similar in size to the present Yellow Pine pit lake, would replace the function of the existing Yellow Pine pit lake in buffering stream temperature extremes and reduce maximum stream temperatures in East Fork SFSR in and downstream of the SGP.	Vegetation, Wetlands, Surface Water, Reclamation
Pre-construction water management activities would include the installation of surface water management features and implementation of best management practices to reduce erosion and sediment delivery to streams. These water management features and best management practices could include sedimentation ponds; run-on water diversion ditches, trenches, and/or berms; runoff water collection ditches; silt fence; water bars; culverts; energy dissipation structures; terraces; and other features specified in construction permits.	Water Resources

REC 7310

PRI-00000991

confirmed that the 10-km domain size was adequate to characterize near-field air quality impacts. Air quality effects would typically decrease at distances beyond the modeled 10 km range.

The refined model uses a "grid" of defined receptor points at which air pollutant concentrations are predicted by the model calculations. Receptor tiers were used starting at 25 m along the Operations Area Boundary and transitioning to 1 km spacing out to the 10-km extent of the modeled domain to follow accepted regulatory modeling practice. Tighter spaced receptors were used closer to the Operations Area Boundary to allow the model to map in more detail the predicted close-in concentrations that are generally the highest.

Second, a much larger "far-field" region was defined within an area up to 300 km-radius from the SGP that encompassed more-distant Class I areas, wilderness areas, Tribal reservations, and other areas requested by Tribes were considered in the analysis. For the SGP, this region is shown in **Figure 3.3-2**, with the Class I areas identified.

A key concept in air quality analysis is the definition of "ambient air" as a defined area in which air pollutant effects to air are to be compared to the national and state ambient air quality standards because that area is accessible to the general public (EPA 2019a). For purposes of the SGP, the area outside the area of Operations Boundary is defined as ambient air for modeling analyses is the Operations Area Boundary. This area is illustrated in **Figure 3.3-1** and is understood to be the limit of the operations area that would be closed to unrestricted public access. In this area, public access would be prohibited, or restricted through such measures that are accepted as means to control public access (EPA 2019a) such as security checkpoints, physical barriers at points of potential access road and trail entry, and security surveillance patrols.

A May 12, 2021, memorandum developed for the Forest Service by Stantec Consulting Services Inc. (Stantec) outlines the rationale to exclude a portion of the proposed seasonal through-site controlled public access road through the mine operations from the public as approved by both the IDEQ and the accepted by the EPA from ambient air for dispersion modeling purposes (Stantec 2021). This stretch of road is from Stibnite Road (FR 50412) to Thunder Mountain Road (FR 50375). The EPA Region X has indicated that the access road could possibly be excluded from ambient air if sufficient enforceable measures are taken to comply with the 2019 revised policy (EPA 2019a). To comply with this measure, Perpetua has developed an access and transportation management plan that is included as Appendix D in the Air Quality Specialist Report (Forest Service 2022a). The Stantec memorandum provides details that IDEQ, who is responsible for issuing air permits in the state, have excluded the road because of access restriction measures put in place consistent with their rules and requirements in the permit. Lastly, DEQ issued a final Permit to Construct (PTC) on June 17, 2022, that requires an Access Management Plan to be developed outing specific requirements relating to access control. Further information regarding IDEQ's ambient air interpretation is available in the PTC, condition 2.7, and the Response to Comments document, Comment 16.

REC 7311

PRI-00000992

The maintenance of certain NFS roads is coordinated between the Forest Service and Valley County through Schedule A agreements. Typically, NFS road maintenance activities (including dust control, removal of debris from roadway and rights-of-way, road repair, and snow removal) are coordinated with the Valley County Roads and Bridge Department. Most Valley County backcountry roads are closed through the winter and melt off in the spring (Valley County 2017). Similarly, NFS roads are closed by snow in the winter and re-open once the snow melts off in the spring. Therefore, roads do not open for through-traffic until at least mid-June and often close to public use as early as October 15.

3.16.4.2 Primary Routes

There are three existing primary routes within the analysis area to access the Operations Area Boundary from Cascade or McCall: Johnson Creek, Lick Creek, and SFSR routes as shown on **Figure 3.16-1**. All of the routes require the use of Idaho SH 55.

Johnson Creek Route

During non-winter conditions (roads clear of snow), the Operations Area Boundary can be accessed from the City of Cascade by traveling northeast on Warm Lake Road for about 34 miles to Landmark, then north on Johnson Creek Road for approximately 25 miles to the village of Yellow Pine, and approximately 14 miles east on the Stibnite Road portion of McCall-Stibnite Road (Stibnite Road). The Johnson Creek Route, which only includes Johnson Creek Road and the Stibnite Road portion of McCall-Stibnite Road, is currently used to access the Operations Area Boundary during the summer.

The Johnson Creek Road is a county maintained, native surface road that is open to vehicles with seasonal restrictions due to snow. During the winter, Valley County plows approximately 10 miles of Johnson Creek Road from Yellow Pine to Wapiti Meadow Ranch and Perpetua (under agreement with Valley County) plows along Stibnite Road. Valley County grooms the remaining 17 miles of Johnson Creek Road from Wapiti Meadow Ranch to Warm Lake Road at Landmark for OSV use. Valley County does not plow Warm Lake Road from Warm Lake to Landmark. This section is a designated groomed OSV route.

The Stibnite Road portion of the route is also a county-maintained native surface road, open to all vehicles with seasonal restrictions due to snow. This road is plowed in the winter by Perpetua through an agreement with Valley County. Stibnite Road connects to Thunder Mountain Road on the southeastern portion of the Stibnite site and currently provides public access through the site.

Lick Creek Route

The SGP also can be accessed from McCall during non-winter conditions by traveling east on the Lick Creek portion of McCall-Stibnite Road (Lick Creek Road) for approximately 37 miles to the East Fork South Fork portion of McCall-Stibnite Road (East Fork Road), then approximately 16 miles to the village of Yellow Pine, and approximately 14 miles east on Stibnite Road. Lick Creek Road is not maintained during the winter; however, East Fork Road and Stibnite Road are plowed from SFSR Road to Yellow Pine by Valley County and from Yellow Pine to the Operations Area Boundary by Perpetua to access their private land inholdings in the area.

REC 7312

PRI-00000993

existing conditions. If the results from this computation are below the NAAQS, then impacts at other locations in the domain would be below the NAAQS as well.

For NAAQS modeling inputs, the highest emissions of each pollutant during any LOM year were determined and provided in **Table 4.3-6**. For the 2021 MMP, the highest criteria pollutant emissions occur during two different years, LOM 6 (CO, NO_X, and SO_2) and LOM 10 ($PM_{2.5}$ and PM_{10}). Therefore, to capture the highest modeled concentration for each pollutant, separate modeling was performed for LOM 6 and 10 (i.e., two models). Note that VOC emission maximums from LOM 3 were not modeled because there is no specific NAAQS for these emissions, however VOCs are addressed as part of the secondary $PM_{2.5}$ analysis.

Table 4.3-6 LOM Years for Pollutant-Specific Maximum Annual Emissions

Pollutant	LOM Year	SGP Total Annual Emissions (tpy)
CO	6	535.5
NO_2	6	335.2
PM_{10}	10	320.1
$PM_{2.5}$	10	69.2
SO_2	6	7.3
VOC	3	27.4
HAPs	10	8.5
Hg	10	13.3 (lb/yr)

The 2021 MMP would include a 12-foot wide gravel road to provide public access from Stibnite Road (FR 50412) to Thunder Mountain Road (FR 50375) through the SGP. Perpetua received a final PTC from IDEQ on June 17, 2022. This application proposed to exclude the public road on the basis of restricted access and maintaining full control, and that people traveling on the road would be considered "guests of the mine." IDEQ accepted the private road concept proposed by Perpetua (see PTC Condition 2.7, Response to Comments #16 and Statement of Basis on the IDEQ website) and in response to comments on February 18, 2021, also states that the roadway between Stibnite Road at Sugar Creek and Thunder Mountain Road at Meadow Creek was appropriately excluded from ambient air. Additionally, the EPA Region X has indicated that the access road could possibly be excluded from ambient air if sufficient enforceable measures are taken to comply with the 2019 revised policy (EPA 2019a). To comply with this measure, Perpetua has developed a transportation management plan and is included as Appendix D of the Air Quality Specialist Report (Forest Service 2022a).

The AERMOD dispersion modeling results for the 2021 MMP analysis emissions and comparison with the applicable NAAQS are provided in **Table 4.3-7**. The geographic location of the maximum impacts amongst the criteria pollutants and averaging periods between LOM 6 and 10 are provided in Figure 4 of the Air Quality Analysis Addendum ModPro2 (Air Sciences 2021a). The results demonstrate compliance with all NAAQS and would be considered to have a moderate impact locally and minor impact regionally. Additionally, **Table 4.3-8** provides geographic locations of the NAAQS maximums.

REC 7313

PRI-00000994

portion of the Johnson Creek Route. The Stibnite Road portion of the Johnson Creek Route would be improved by straightening curves, retaining walls, and installing culverts. The Johnson Creek Route would require 183 acres of cut and fill in addition to the existing roadways to address traffic safety, geotechnical hazards, landslides, and avalanche zones and may result in periods of road closure, while the Burntlog Route would require 246 acres of cut and fill primarily along a new route. While more acreage would be required for the Burntlog Route in comparison with the Johnson Creek Route, the activity along the Johnson Creek Route would be in proximity to Johnson Creek and the East Fork SFSR, whereas the Burntlog Route location avoids these surface flows. In addition to cut and fill in proximity to these surface flows, any traffic-related spills along the Johnson Creek Route would also occur closer to the streams compared to the Burntlog Route.

The public access route through the Operations Area Boundary would separate public traffic from mine traffic on the road through the Operations Area Boundary thereby reducing potential safety issues. Safety and emergency access impacts from the SGP would be localized, long-term, and minor to major.

4.16.3 Mitigation Measures

Mitigation measures required by the Forest Service would represent reasonable and effective means to reduce the impacts identified in the previous section or to reduce uncertainty regarding the forecasting of impacts into the future. These mitigation measures would be in addition to the Forest Service requirements and EDFs (**Section 2.4.9**) accounted for in the preceding impact analysis. At this time, no mitigation measures have been identified for Access and Transportation.

4.16.4 Irreversible and Irretrievable Commitments of Public Resources

4.16.4.1 No Action Alternative

Under the No Action Alternative, there would be no irreversible and irretrievable commitment of public resources as it relates to access and transportation.

4.16.4.2 Action Alternatives

The SGP would alter the roadway system, transportation and public access within the analysis area under both the 2021 MMP and the Johnson Creek Route Alternative. This would constitute an irretrievable commitment of the public resource as the baseline transportation and public access conditions would be restored when the SGP reclamation is completed.

Consumption of renewable and non-renewable resources would be required for infrastructure development, including metals, aggregate, cement, wood, fuel and other materials, which would be an irreversible commitment of these resources. Funds and labor would be irretrievably committed for project permitting and development.

4.16.5 Short-term Uses versus Long-term Productivity

4.16.5.1 No Action Alternative

Under the No Action Alternative, the public access roads developed for the action alternatives would not create any short-term uses that would affect long-term access and transportation productivity.

REC 7314

PRI-00000995

Soil Quality

Legacy soil impacts from historical mining plus significant soil disturbance is expected under the 2021 MMP (Soils Specialist Report, Forest Service 2022c). Thus, additional soil contaminants may be exposed during the construction and operation phases of the SGP. However, these soil impacts would be limited to the active mining areas, with restricted public access.

Releases of hazardous materials could range from a minor to large spills within the Operations Area Boundary or the off-site facilities, or along access routes. Depending on the nature of the spill and the effectiveness of spill responses, a release could potentially lead to exposures to contaminants in soil. The direct and indirect effects of a spill may range from negligible to major depending on the spill incident but based on the planned infrastructure specifically designed for the storage and management of hazardous materials, a large release to the environment within the Operations Area Boundary or off-site facilities would not likely occur. In the event a release was to occur, it would likely be relatively small in volume based on estimated container volumes and would be addressed promptly as per the SPCC Plan and Spill Response Plan. The SPCC Plan would address site-specific spill prevention measures, fuel haul guidelines, fuel unloading procedures, inspections, secondary containment of all on-site fuel storage tanks, and staff training. The Solid and Hazardous Materials Handling and Emergency Response Plan would address response and cleanup for any spill of hazardous materials, including concentrate, on all transport routes. The plan would include a sampling plan to assure that all spilled material is cleaned up and would include contingency plans for remediation of potential impacts to soil, wetlands/riparian, and water resources.

In the event that large quantities of hazardous materials are spilled into the environment from a transportation incident, or in the event that a spill is not immediately discovered or addressed, the impact could be more substantial. For these reasons, the magnitude of the health impact related to soil quality is rated as "medium" on **Table 4.18-3**, because some exposure of legacy contamination and/or a release of hazardous materials (ranging from small to large quantities) is possible. However, the possibility of the impacts on public health is rated as "low," because the public access is restricted in the active mining area, public access would be limited during response actions along access routes, and the probability of a large spill is low.

During closure and reclamation, RCM would be used as surface material to support vegetation growth and slope stability. The Reclamation and Closure Plan includes appropriate types and concentrations of material that would be protective of human receptors when identifying suitable RCM. The reclamation process is expected to lead to an overall reduction in chemical impacts to surface soil by removing potential sources of metals leaching into the soils, removing sources of erosion and sedimentation, reducing erosion of soils and sedimentation, and reducing downstream sediment transport. Thus, potential negative impacts to soil due to mining disturbance would be largely offset by positive impacts from reclamation of legacy contamination. Therefore, the evaluation of the potential public health and safety impacts associated with exposure to contaminants in soil during the closure and reclamation phase would be negligible (**Table 4.18-3**).

Idaho Department of Health and Welfare (IDHW) reviewed available information from the proposed Reclamation and Closure Plan for the SGP to consider whether potential health risks from metals in soils

REC 7315

PRI-00000996

along Thunder Mountain Road would begin during construction and continue until a new public access road through the SGP was constructed.

Secure areas within the Operations Area Boundary would be restricted from general public access and would be off limits to hunting by employees, thereby closing some areas to hunting and recreational shooting; however, the area is currently rarely used by hunters and recreational shooters. Impacts would be negligible, long term, and localized within the Operations Area Boundary.

After construction of the Burntlog Route and as part of public access control within and in the vicinity of the Operations Area Boundary, about 4.7 miles of Stibnite Road and 5.4 miles of Thunder Mountain Road would be closed to public use, but a new public access road through the Operations Area Boundary would be constructed. However, the public would not be able to reach the Stibnite Mining District Interpretive Site within the Operations Area Boundary, effectively closing this site to the public throughout operations. Impacts would be localized to just the interpretive site and would begin with the completion of Burntlog Route and conclude after closure and reclamation. These impacts are anticipated to be minor, long term, and localized.

During periodic closures of the road through the Operations Area Boundary, recreation areas and sites beyond the Operations Area Boundary accessed from Stibnite and Thunder Mountain roads would be available via the new Burntlog Route. Using the Burntlog Route would result in a long detour for recreationists traveling from Yellow Pine to Monumental Summit, Thunder Mountain Road, and Meadow Creek lookout. There could be a decrease in summer and winter use of the impacted sites/areas, even with the Burntlog Route, if displaced recreationists decide to forego visiting these destinations due to added travel time. Impacts are anticipated to be moderate, long term, and localized.

During mine operations, public access would be allowed through the Operations Area Boundary via a 12-foot gravel road that connects Stibnite Road to Thunder Mountain Road. This road would be open to all vehicles year-round but would not be plowed during the winter. Because the road would be within the Operations Area Boundary, there would be no public use allowed off the road; the road would be for public access to the recreation sites/areas accessed via Thunder Mountain Road. The public access road through the Operations Area Boundary would return access to these recreation sites/areas after Stibnite Road is no longer available. In addition, the public access road would allow visitors from Yellow Pine to reach the Thunder Mountain Road sites/areas substantially faster than taking the Burntlog Route, which may result in less displacement of use at these sites/areas during operations. For visitors that pass through the Operations Area Boundary on the public access road, the recreation setting would be very developed and substantially modified; however, this would likely be expected, because the road would be passing through the active Operations Area Boundary. Although the public access road would return access to recreation sites/areas accessed via Thunder Mountain Road, there would be temporary closures of this route during some mining activities that would be considered public safety hazards (e.g., highwall scaling, blasting). When such road closures would occur, the closures would result in reduced access to recreation sites/areas off Thunder Mountain Road; reduced recreation opportunities and use due to a lack of access; and impacts to recreation experiences due to visitor expectations regarding site/area availability. Impacts from road closures would affect recreation sites/areas off Thunder Mountain Road and may ultimately lead to continued displacement of visitors from the Thunder Mountain Road sites/areas. Impacts would persist throughout operations and closure and reclamation until a relocated Stibnite Road was available to

PRI-00000998

in slower travel times for non-mine-related traffic and may deter other travelers from using these roadways. Travelers may use alternative roadways including McCall-Stibnite Road to South Fork Salmon River Road.

During operations, mine-related traffic would include transport of employees to and from the SGP, delivery of supplies, and activities associated with road maintenance such as snowplowing and sanding. Under the 2021 MMP and the Johnson Creek Route Alternative, operational AADT would be 50 vehicles (33 heavy vehicles and 17 light vehicles), resulting in approximately four mine-related vehicles per hour traveling outside the SGP.

The upgraded Burnt Log Road and the newly constructed Burntlog Route would experience an increase in traffic of over 71 percent under the 2021 MMP, with 27.5 percent of the traffic comprised of heavy vehicles. Under the Johnson Creek Route Alternative, traffic on Johnson Creek Road and Stibnite Road would increase approximately 71 percent as well, also with 27.5 percent of the traffic comprised of heavy vehicles. Although heavy vehicles currently use Johnson Creek Route to access the SGP, the Johnson Creek Route Alternative traffic would result in a noticeable change in baseline driver experience and slower drive times due to the substantial increase in mine-related heavy vehicles along the Johnson Creek Route during the life of the SGP. Even though upgrades to Johnson Creek Road and Stibnite Road would be made, these roads would still have many curves and slopes.

During closure and reclamation, activities including slope recontouring, facility removal, seeding and planting, and post-closure environmental monitoring would require approximately 7 years. Closure and reclamation would generate a total estimated AADT of 27 vehicles (15 heavy vehicles and 12 light vehicles). Post-closure monitoring activities would generate a total estimated AADT of six light vehicles.

Local roads experience a seasonal effect which results in noticeable differences in traffic. Valley County has many summer recreational areas that attract visitors from May through October with peak AADT levels in June, July, and August. Mine access via the Johnson Creek Route would be more impactful on summer recreational traffic because it would utilize established roads rather than new road development. Winter driving conditions influence the amount of traffic and result in lower AADT levels during the winter months. Therefore, the effect of SGP traffic on these roads would show a noticeably greater increase in mine-related winter traffic during winter. Post-closure winter traffic would not be as noticeable as heavy vehicle deliveries would not occur and approximately six mine-related light vehicles per day would utilize the accessible roadways in the analysis area for monitoring and maintenance purposes.

Public Access

Under the 2021 MMP, public access to the SGP area would be enhanced by the development of a new access road (Burntlog Route) compliant with current road standards. Under both action alternatives, there would also be a controlled public access route through the SGP during the operations, and closure and reclamation phases; however, public access would be intermittently interrupted during the construction phase. Under the Johnson Creek Route Alternative, the Burntlog Route would not be constructed, and the Johnson Creek Route would be used for both public and SGP-related access. To continue providing OSV access to Landmark, a groomed OSV route between Warm Lake and Trout Creek Campground on Cabin Creek Road would be established as part of the 2021 MMP to connect to Landmark from Trout Creek

REC 7319

PRI-00000999

2.4.4.4 Public Access

During construction of the SGP and completion of the Burntlog Route, to the degree practicable, the public would continue to have access on forest roads currently available to the public (**Figure 2.4-1**). However, public access through the Operations Area Boundary on Stibnite Road would be restricted for a period of approximately one year while a new through-site public access road is constructed. A new 4-mile long, 12-foot-wide gravel road would be constructed to provide public access from Stibnite Road (FR 50412) to Thunder Mountain Road through the SGP (**Figure 2.4-2**). The road would be constructed on a widened bench on the west side within the Yellow Pine pit, then head south of the Yellow Pine pit, where this road would utilize an underpass to cross under a SGP haul road and continue southward, parallel to and on the east side of the mine haul road on a partially revegetated portion of a former haul road (**Figure 2.4-2**). Southwest of the ore processing area, the public access road would connect with Thunder Mountain Road and continue toward the worker housing facility, exiting the SGP to the southeast.

During operations, the public access road through the Operations Area Boundary would provide seasonal use, open to all vehicles; access would not be provided in winter when impassable (current county maintenance standards) and signs would inform the public of seasonal and temporary closures. Public vehicles passing through would be required to check-in with mine personnel at the North or South SGP entry points and would receive a safety briefing and would also be required to check-out with SGP personnel upon exiting the SGP. For safety purposes, public access would be separated from other SGP roads by berms, security fencing, and the underpass to allow the public road to pass beneath the mine haul road. No stopping or deviating from the public access road would be allowed. Perpetua could restrict access to any vehicles due to concerns related to public or employee health and safety, such as during road construction and maintenance, blasting, highwall scaling, mining in the immediate area of the road, and similar operations.

Public access along Johnson Creek Road during the life of the SGP would be unchanged; however, closures spanning from a half-day to multiple days could occur due to construction activities. Total closures of half-day to multiple days could occur during construction work on Stibnite Road between the village of Yellow Pine and the SGP, part of Thunder Mountain Road, and Burnt Log Road.

Public access on existing segments of the Burnt Log Road would be restricted for limited periods of time to upgrade road segments during construction of the Burntlog Route. Other routes available for public use are shown on **Figure 2.4-1**.

Public access by foot via existing trails or on roads would be restricted within the Operations Area Boundary shown on **Figure 2.4-2**. Security personnel, fencing (including wildlife exclusion fencing), and signs would restrict public access to vehicular traffic on the designated public access roadway inside the Operations Area Boundary.

REC 7320

PRI-00001000

Description	Resources Affected
The gold and silver leaching circuit would be designed and operated consistent with the International Cyanide Management Institute Code (ICMC) (https://www.cyanidecode.org) and the Initiative for Responsible Mining Assurance (IRMA) Standard for Responsible Mining (https://responsiblemining.net/resources/). Accordingly, impermeable secondary containment for cyanide unloading, storage, mixing and process tanks shall be sized to hold a volume at least 110 percent of the largest tank within the containment and any piping draining back to the tank, with additional capacity for the design storm event, if applicable. Pipelines containing process water or process solution shall also use secondary containment in combination with audible alarms, interlock systems, and/or sumps as spill control measures.	Hazardous Materials
Cyanide-bearing solutions used in ore processing would be neutralized to approximately 10 milligrams per liter weak acid dissociable (WAD) cyanide before the material is pumped to the TSF. Residual cyanide would be treated using a sodium metabisulfite and air system to detoxify the cyanide by oxidation to form cyanate.	Hazardous Materials
Cyanide would be neutralized to levels protective of wildlife, and the TSF would be surrounded by an 8-foot high, chain-link fence designed to keep wildlife, such as deer and elk, from entering the impoundment area, to prevent either liner damage or wildlife drowning.	Hazardous Materials
Oils, solvents, and lubricants would be stored in approved containers located within, or directly adjacent to, the maintenance shop and contained within secondary containments to prevent spills into the environment. All used petroleum products, waste antifreeze, and used solvents would be collected in approved containers, transported off site, and disposed or recycled.	Hazardous Materials
Nitric and sulfuric acid would be transported in tanks designed to prevent spills even in the event of rollovers.	Hazardous Materials
Nitric and sulfuric acids would be stored in specialized non-corrosive, polyethylene-lined tanks located within the ore processing facility and would have secondary containment.	Hazardous Materials
Liquids would be shipped to the SGP in tank trucks designed for spill prevention and escorted to the SGP by pilot cars manned and equipped to handle spills.	Hazardous Materials
Other legacy materials may be encountered during construction and operations. If encountered, these materials would be characterized to determine potential for reprocessing, reuse, or disposal.	Hazardous Materials
Small scale composting associated with organic materials generated at the worker housing facility may be incorporated within the centralized GMS in the Fiddle valley.	Hazardous Materials
An Explosives and Blasting Management Plan would be prepared for the SGP. Explosives storage, transport, handling, and use would comply with applicable Department of Homeland Security, Bureau of Alcohol, Tobacco, Firearms and Explosives, and MSHA regulations.	Health and Safety
For safety and security reasons, no alcohol, firearms, or illegal drugs would be permitted on site.	Health and Safety
For safety and security reasons, public access into the mine area would be prevented by using fencing, gate locking, security personnel, and/or notice postings that prohibit unauthorized entry; no unauthorized vehicles or personnel would be permitted on the SGP.	Health and Safety
Personnel transporting, handling, or using any hazardous chemicals (including sodium cyanide) would be trained to ensure the safe use of such materials. Perpetua would design, construct, and manage facilities to conform to ICMC.	Health and Safety, Fish, Wildlife, Hazardous Materials

REC 7321
PRI-00001001

Description	Resources Affected
Perpetua would submit an annual report to the USFS and the other federal and state agencies that are responsible for issuing authorizations applicable to reclamation for the preceding calendar year. The annual report would contain descriptions of the reclamation activities completed during the previous year, a summary of areas reclaimed, a discussion of the results of the reclamation monitoring conducted, and corrective actions implemented.	Soils, Reclamation
A new 12-foot-wide gravel road would be constructed to provide public access from Stibnite Road (FR 50412) to Thunder Mountain Road (FR 50375) through the SGP. During operations, the public access road would be used to travel through the SGP and would provide seasonal use, open to all vehicles. Vehicles passing through the SGP would be required to check-in with mine personnel at the North or South SGP entry points.	Transportation and Access, Health and Safety
Post reclamation, a road would be established over the backfilled Yellow Pine pit to allow public access through the reclaimed site and connect Stibnite Road (FR 50412) to Thunder Mountain Road (FR 50375). This would replace the operational phase public access route.	Transportation and Access
Prior to site preparation and construction of surface facilities, vegetation would be removed from operating areas. Trees and deadwood, shrubs, and slash not needed to construct windrows at the edge of Burntlog Route disturbance (to function as sediment barriers), would be chipped, and suitable soil would be separately salvaged and stockpiled (except for a small portion that would be 'live handled') for use as part of site reclamation and restoration. Portions of the salvaged soil would be blended with the chipped wood to create growth media. All growth media placed in stockpiles would be stabilized, seeded, and mulched to protect the stockpiles from wind and water erosion.	Vegetation
Perpetua would inspect and remove vegetation material (including noxious weeds) from mechanical equipment and properly dispose to minimize the spread of unwanted vegetation.	Vegetation
Wood wastes and wood mulch are the two primary sources of compost. Food waste produced from on-site meal preparation and wastes may provide another source. Combined and properly managed during composting, these materials would provide a source of organic matter to be blended into substrate materials suitable for mitigation.	Vegetation
Perpetua would be responsible for noxious weed control within areas disturbed by SGP activities.	Vegetation, Wildlife
Develop and employ planting plans for wildlife benefits (cover, forage, etc.) using approved seed mixes.	Vegetation, Wildlife
Perpetua would use aquatic safe herbicides during vegetation management activities and noxious weed control. Adhere to chemical label restrictions, Federal and State rules on usage. Use proper equipment for chemical application by trained personnel.	Vegetation, Fish
Perpetua or its designated contractor(s) would perform long-term maintenance as necessary, including maintaining and monitoring the Mitigation Area (including stream and wetlands) in perpetuity once the final performance standards are met or until such responsibility is relinquished to an appropriate third party (Forest Service, etc.) as approved by the USACE.	Vegetation, Wetlands
Perpetua would plant stream reclamation reaches and wetland reclamation areas with native plant species that are present in PAB, PEM, PSS, and palustrine forested wetlands and riparian areas along streams throughout the Mitigation Area.	Vegetation, Wetlands
To address stream temperature, riparian planting widths along restored and enhanced stream reaches would be 18 feet wide on each stream bank where possible. Taller and denser vegetation such as spruce trees would be planted. Further, the creation of the lined Stibnite Lake, a feature similar in size to the present Yellow Pine pit lake, would replace the function of the existing Yellow Pine pit lake in buffering stream temperature extremes and reduce maximum stream temperatures in East Fork SFSR in and downstream of the SGP.	Vegetation, Wetlands, Surface Water, Reclamation

REC 7322
PRI-00001002

3.0 AFFECTED ENVIRONMENT

3.1 Introduction

Chapter 3 describes the existing natural and human environment that would potentially be affected by the SGP. The natural and human environment is further divided into resources or resource uses - physical environment, biological resources, and social resources/environment. Each resource section is organized as follows: a brief introduction and scope of analysis including a definition of the analysis area specific to the resource; relevant laws, regulations and policies; and existing conditions of the resource in the analysis area.

This EIS is purposely designed to efficiently detail what is necessary in order to understand the affected environment and environmental effects related to the alternatives that are evaluated. Many of the subsections of this EIS summarize more detailed information that is discussed in specialist reports which are cited in the subsections. These reports include any information that has become available since the DEIS was released in August 2020. Readers who are interested in reviewing the more detailed information may download the specialist reports of interest from the same website hosting this EIS. The specialist reports that are available include:

- Air Quality Specialist Report (Forest Service 2023a)
- Climate Change Specialist Report (Forest Service 2023b)
- Soils and Reclamation Cover Materials Specialist Report (Forest Service 2023c)
- Noise Specialist Report (Forest Service 2023d)
- Surface Water and Groundwater Quantity Specialist Report (Forest Service 2023e)
- Surface Water and Groundwater Quality Specialist Report (Forest Service 2023f)
- Vegetation: General Vegetation Communities, Botanical Resources, and Non-Native Plants Specialist Report (Forest Service 2023g)
- Wetland and Riparian Resources Specialist Report (Forest Service 2023h)
- Fisheries and Aquatic Habitat Including Threatened, Endangered, Proposed, and Sensitive Species Specialist Report (Forest Service 2023i)
- Wildlife and Wildlife Habitat Including Threatened, Endangered, Candidate, and Sensitive Species Specialist Report (Forest Service 2023j)
- Access and Transportation Specialist Report (Forest Service 2023k)
- Heritage Resources Specialist Report (Forest Service 2023l)
- Recreation Specialist Report (Forest Service 2023m)
- Scenic Resources Specialist Report (Forest Service 2023n)
- Social and Economic Conditions Specialist Report (Forest Service 2023o)
- Special Designations Specialist Report (Forest Service 2023p)
- Tribal Rights and Interests Specialist Report (Forest Service 2023q)

Certain of the environmental resources evaluated in this EIS are essentially unchanged from 2020 so specialist reports were not prepared for these resources, which include: geology, hazardous materials, environmental justice, timber, land use, and public health and safety.

REC 7323
PRI-00001003

A key concept in air quality analysis is the definition of "ambient air" as a defined area in which air pollutant effects to air are to be compared to the national and state ambient air quality standards because that area is accessible to the general public (EPA 2019a). For purposes of the SGP, the area outside the area of Operations Boundary is defined as ambient air for modeling analyses is the Operations Area Boundary. This area is illustrated in **Figure 3.3-1** and is understood to be the limit of the operations area that would be closed to unrestricted public access. In this area, public access would be prohibited, or restricted through such measures that are accepted as means to control public access (EPA 2019a) such as security checkpoints, physical barriers at points of potential access road and trail entry, and security surveillance patrols.

A May 12, 2021, memorandum developed for the Forest Service by Stantec Consulting Services Inc. (Stantec) outlines the rationale to exclude a portion of the proposed seasonal through-site controlled public access road through the mine operations from the public as approved by both the IDEQ and the accepted by the EPA from ambient air for dispersion modeling purposes (Stantec 2021). This stretch of road is from Stibnite Road (FR 50412) to Thunder Mountain Road (FR 50375). The EPA Region X has indicated that the access road could possibly be excluded from ambient air if sufficient enforceable measures are taken to comply with the 2019 revised policy (EPA 2019a). Exclusion of the public access road from ambient air protections is a unique case that relies on measures assumed to meet the standards inferred in the 2019 revised ambient air policy. However, a formal EPA policy review of the ambient air boundary for the SGP has not been conducted nor requested. A formal review is not necessarily required. The EPA did provide formal comment on IDEQ's air quality Permit to Construct (PTC) recommending a review be requested by the state and that initial measures in the PTC were too ambiguous to determine compliance with the revised ambient air policy. To comply with this measure, Perpetua has developed an access and transportation management plan that is included as Appendix D in the Air Quality Specialist Report (Forest Service 2023a). The Stantec memorandum provides details that IDEQ, who is responsible for issuing air permits in the state, have excluded the road because of access restriction measures put in place consistent with their rules and requirements in the permit. IDEQ has accessed the access road restriction and stated that only registered guests would have access to or through the mine as stated in the final PTC issued on June 17, 2022. IDEQ is confident of its interpretation of ambient air and asserts that methods applied to exclude areas is appropriate. The PTC also requires an Access Management Plan to be developed outlining specific requirements relating to access control. Further information regarding IDEQ's ambient air interpretation is available in the PTC, condition 2.7, and the Response to Comments document, Comment 16.

3.3.3 Relevant Laws, Regulations, Policies, and Plans

The Clean Air Act (CAA) of 1970 (42 USC 7401 et seq.), as amended in 1977 and 1990, regulates air emissions and protects air quality and air quality related values across the U.S. Provisions of the CAA that are relevant to the analysis of SGP air quality effects are listed below:

- National Ambient Air Quality Standards (NAAQS)
- Attainment and Non-Attainment Area Designations
- New Source Review Permitting
- New Source Performance Standards (NSPS)

REC 7324
PRI-00001004

4.0 ENVIRONMENTAL CONSEQUENCES

4.1 Introduction

Chapter 4 describes the potential environmental consequences of implementing each of the alternatives presented in Chapter 2. Pursuant to 40 CFR 1500.1(b) and 1500.4, this section summarizes the completed analysis and forms the scientific and analytical basis for the comparison of alternatives. The alternatives described in Chapter 2 may cause, either directly or indirectly, changes in the human and natural environment. This EIS analyzes these potential changes and discloses the effects to the decision-makers and the public. Disclosure is a fundamental goal of NEPA. In addition, applicable mitigation measures and irreversible and irretrievable effects also are discussed. Effects of each action can be neutral, beneficial, and/or adverse. Effects are quantified whenever possible, and/or are qualitatively discussed.

The individual resource discussions are generally presented by issue(s) and organized with the presentation of the effects analysis issues and indicators for the resource; a brief methodology for the analysis of impacts; an evaluation of the alternatives' impacts to the resource; irreversible and irretrievable commitments, and short-term uses versus long-term productivity. A table summarizing and comparing these quantitative and qualitative impacts to each resource by alternative is located in **Section 2.8**.

4.1.1 Effects Analysis Indicators and Methodology of Analysis

An issue is defined as a point of concern, disagreement, debate, or dispute with a proposed activity based on some anticipated effect. Issues are described in terms of cause and effect; that is, if an action occurs, an impact could result. Issues are addressed by describing comparative factors that provide a way to define, compare, and contrast the effects of the alternatives, including the No Action.

An indicator is an element or parameter used to determine change (and the intensity of change) in a resource (e.g., acres of wetlands disturbed). These issues and indicators are used to predict or detect change in a resource related to causal effects of the alternatives in Chapter 4 (i.e., environmental consequences).

In addition, the analysis procedures and assumptions used to develop the current conditions and environmental consequences are summarized in this section. Unless specifically stated otherwise, additional supporting information, including detailed analysis procedures and assumptions for each resource area, can be found in the SGP record.

The modeling, analysis, and unit amounts for indicators such as acreage and road miles are all best estimates based on the latest available information. The modeling and analysis conducted for this SDEIS are intended to indicate relative differences among the alternatives, rather than to predict absolute amounts of activities, outputs, or effects.

REC 7325
PRI-00001005

emissions. These process exhaust control technologies are accounted for in the maximum emissions estimates in **Table 4.3-5**:

- Activated carbon regeneration kiln – wet scrubber and activated carbon filter;
- Retort – activated carbon canisters and filter pack; and
- Induction furnaces – baghouse filter and activated carbon filter pack.

Near-Field Analysis NAAQS

Assessment of conformance to the NAAQS is based on the highest receptor concentration in the modeling domain for the pollutants and averaging times corresponding to the standards. The modeled maximum concentration at each receptor is added to the selected background concentrations that represent current existing conditions. If the results from this computation are below the NAAQS, then impacts at other locations in the domain would be below the NAAQS as well.

For NAAQS modeling inputs, the highest emissions of each pollutant during any LOM year were determined and provided in **Table 4.3-6**. For the 2021 MMP, the highest criteria pollutant emissions occur during two different years, LOM 6 (CO, NO_X, and SO_2) and LOM 10 ($PM_{2.5}$ and PM_{10}). Therefore, to capture the highest modeled concentration for each pollutant, separate modeling was performed for LOM 6 and 10 (i.e., two models). Note that VOC emission maximums from LOM 3 were not modeled because there is no specific NAAQS for these emissions, however VOCs are addressed as part of the secondary $PM_{2.5}$ analysis.

Table 4.3-6 LOM Years for Pollutant-Specific Maximum Annual Emissions

Pollutant	LOM Year	SGP Total Annual Emissions (tpy)
CO	6	535.5
NO_2	6	335.2
PM_{10}	10	320.1
$PM_{2.5}$	10	69.2
SO_2	6	7.3
VOC	3	27.4
HAPs	10	8.5
Hg	10	13.3 (lb/yr)

The 2021 MMP would include a 12-foot-wide gravel road to provide public access from Stibnite Road (FR 50412) to Thunder Mountain Road (FR 50375) through the SGP. Perpetua received a final PTC from IDEQ on June 17, 2022. This application proposed to exclude the public road on the basis of restricted access and maintaining full control, and that people traveling on the road would be considered "guests of the mine." IDEQ accepted the private road concept proposed by Perpetua (see PTC Condition 2.7, Response to Comments #16 and Statement of Basis on the IDEQ website) and in response to comments on February 18, 2021, also states that the roadway between Stibnite Road at Sugar Creek and Thunder Mountain Road at Meadow Creek was appropriately excluded from ambient air. Additionally, the EPA

REC 7320
PRI-00001006

Region X has indicated that the access road could possibly be excluded from ambient air if sufficient enforceable measures are taken to comply with the 2019 revised policy (EPA 2019a). Exclusion of the public access road from ambient air protections is a unique case that relies on measures assumed to meet the standards inferred in the 2019 revised ambient air policy. However, a formal EPA policy review of the ambient air boundary for the SGP has not been conducted nor requested. A formal review is not necessarily required. The EPA did provide formal comment on IDEQ's air quality PTC recommending a review be requested by the State and that initial measures in the PTC were too ambiguous to determine compliance with the revised ambient air policy. To comply with this measure, Perpetua has developed a transportation management plan that is included as Appendix D of the Air Quality Specialist Report (Forest Service 2023a).

The AERMOD dispersion modeling results for the 2021 MMP analysis emissions and comparison with the applicable NAAQS are provided in **Table 4.3-7**. The geographic location of the maximum impacts amongst the criteria pollutants and averaging periods between LOM 6 and 10 are provided in Figure 4 of the Air Quality Analysis Addendum ModPro2 (Air Sciences 2021a). The results demonstrate compliance with all NAAQS and would be considered to have a moderate impact locally and minor impact regionally. Additionally, **Table 4.3-8** provides geographic locations of the NAAQS maximums.

Table 4.3-7 Near-Field NAAQS Compliance Demonstration

Pollutant	Averaging Time	Maximum Modeled Conc. (µg/m^3)	Background Conc.[3] (µg/m^3)	Total Impact Conc. (µg/m^3)	NAAQS (µg/m^3)	NAAQS Compliance
CO	8 hours	404.6	1,110	1,515	10,000	Yes
CO	1 hour	495.5	1,740	2,236	40,000	Yes
Lead	3-month rolling	Not Required[1]	Not Required[1]	Not Required[1]	Not Required[1]	Not Required[1]
NO_2	Annual	19.8	0.9	20.7	100	Yes
NO_2	1 hour	129.8	4.3	134.1	188	Yes
O_3	8 hours	3.0	117.7	120.7	137	Yes
PM_{10}	24 hours	15	37.0	51.9	150	Yes
$PM_{2.5}$ [2]	Annual	1.1	3.5	4.6	12	Yes
$PM_{2.5}$ [2]	24 hours	2.7	15.0	17.7	35	Yes
SO_2	1 hour	3.0	12.3	15.3	196	Yes
SO_2	3 hours	1.8	16.8	18.6	1,300	Yes

[1] Lead modeling is not required per IDEQ as the facility-wide emissions are less than 10 percent of the lead significant emission rate of 0.6 tpy and considered "Below Regulatory Concern".
[2] Includes the secondary impacts.
[3] All background concentrations are derived from the NW Airquest data (WSU 2018).

REC 7327
PRI-00001007

During construction, public access through the Operations Area Boundary on Stibnite Road would be restricted for 1 year or more while a new 4-mile-long, 12-foot-wide gravel road is constructed to provide public access from Stibnite Road (FR 50412) to Thunder Mountain Road (FR 50375).

The through-SGP public access road would provide seasonal access, similar to current conditions. During operations, restricted public access through the Operations Area Boundary would be provided during the snow-free season to all vehicle types. Vehicles passing through the Operations Area would be required to check-in with mine personnel at the North or South entry points to receive a safety briefing and would also be required to check-out with mine site personnel upon exiting. For safety purposes, no stopping or deviating from the public access road would be allowed. Operations Area Boundary access would be restricted during road construction and maintenance, blasting, highwall scaling, mining in the immediate area of the road, and similar operations.

Public access would be separated from other mine roads by berms, security fencing, and an underpass to allow the public road to pass beneath the mine haul road. The public access road would not be plowed in the winter (current county maintenance standards) and static and electronic signage and automated timed stoplights would be present at points of public access to inform the public of seasonal and temporary closures.

The newly constructed Burntlog Route connecting to Thunder Mountain Road would be a temporary road necessary for mining purposes and would meet 36 CFR 228A requirements for environmental protection to assume that mine operations are conducted to minimize adverse environmental impacts to the extent feasible for roads. Accordingly, the road would not be designated for public motor vehicle use under 36 CFR 212.50 on the Motor Vehicle Use Map. Therefore, for public motor vehicle use to be allowed on the road when other public access roads are blocked by mine operations, one of the other exceptions from the prohibitions on motor vehicle use on NFS land at 36 CFR 261.13 must be met. The approved plan of operations would meet the exception for written Forest Service authorization under 36 CFR 261.13(h) by including a provision in the mine plan for public use of the road when other public road access is blocked by mine operations.

Impacts to public access during construction would be localized, short-term, and minor to major. Major impacts would generally be associated with road construction and non-standard maintenance activities plus the mobilization of equipment resulting in over-sized loads.

Operations

Traffic Volumes

Upon completion of Burntlog Route, mine vehicles would travel approximately 71 miles from the intersection of Warm Lake Road and SH 55 to the Operation Area Boundary. Approximately 15 miles of new roads managed by Perpetua would be created during the life of the mine. No new NFS roads would be created during the life of the mine. **Table 4.16-4** shows the existing and 2021 MMP AADT for the main roadway segments in the access and transportation analysis area during operations.

REC 7328
PRI-00001008

Table 4.16-8 Access Impacts During Construction and Operations

Road	Mine Year -3	Mine Year -2	Mine Year -1	Mine Operations
Warm Lake Road (Cascade to Landmark)	Limited effects	Limited effects	Limited effects	Limited effects
Johnson Creek Road (Landmark to Yellow Pine)	Limited effects	Temporary closures	Seasonal access	Seasonal access
Stibnite Road (Yellow Pine to Stibnite)	Limited effects	Temporary closures	Closed in Operations Area	Seasonal access
Thunder Mountain Road (Stibnite to Thunder Mountain)	Limited effects	No access when Stibnite Road is temporarily closed	Access through new Burntlog Route only	Seasonal access via new public access road through site
Meadow Creek Lookout Road	Temporary closures for nearby Burntlog Route construction	Limited effects	1.8-mile shared segment with new Burntlog Route	1.8-mile shared segment with new Burntlog Route
New Burntlog Route (Landmark to Stibnite)	Under construction	Under construction	Site access plus public access	Site access with public access restriction

The Burntlog Route would be a mine access road operated by the SGP for the duration of the Project. As such, Project-related use of the route would be regulated per the Forest Service's decision on the Project and incorporate compliance with the Project's Transportation Management Plan. Public use of the Burntlog Route would be restricted. Seasonal use of the newly constructed portions of the Burntlog Route would be allowed only during the snow-free portion of Year -1 when there would be no other access to the Thunder Mountain Road.

Public use of existing segments of the Burntlog Route would not be modified by the SGP decision but would be subject to temporary closures for new Burntlog Route construction. During operations, public use of existing segments of the Burntlog Route (i.e., Burnt Log Road [FS447], Meadow Creek Lookout Road [FR51290], and Thunder Mountain Road [FR50375]) would be unrestricted. The main road segment where public access would continue would be a 1.8-mile section of the Meadow Creek Lookout Road, coincident with the Burntlog Route. Signage would be placed at all intersections with Forest Service roads and trails to identify road segments with public access restrictions.

The Forest Service would require Perpetua or any other Project owner, to develop and implement a Burntlog Route Access Plan to restrict public access per this mitigation measure and to provide notifications to the public when the newly constructed segments of the Burntlog Route would be open. The road would not be designated for public motor vehicle use under 36 CFR 212.50 on the Motor Vehicle Use Map. Therefore, for public motor vehicle use to be allowed on the road when other public access roads are blocked by mine operations, one of the other exceptions from the prohibitions on motor vehicle use on NFS land at 36 CFR 261.13 must be met. The 2021 MMP would meet the exception for

REC 7329
PRI-00001009

written Forest Service authorization under 36 CFR 261.13(h) by including a provision in the mine plan for public use of the road when access via other public road is blocked by mining operations.

Effectiveness: While public access restrictions would not completely eliminate potential impacts of mine traffic associated with traffic incidents, wildlife interactions, wilderness solitude, and tribal interests, the enforcement of the Transportation Management Plan, Burntlog Route Access Plan, and Project design features would be effective as a means to minimize these impacts via traffic controls and reduced road usage, resulting in reductions in traffic incidents and wildlife interactions as well as reducing dust emissions and sedimentation from the roadway. These restrictions would also mitigate potential impacts to public safety and emergency services by removing the public from the route for the majority of time it is in use. Public access restrictions would also reduce the potential for unauthorized route creation leading to possible wilderness intrusions and would reduce the potential for impacts to tribal traditional use areas.

Traffic Delay Notifications

Issue: Road improvement, repair, and maintenance activities plus the transportation of large loads to the Operations Area Boundary would result in road closures and traffic delays on site access roads (i.e., Warm Lake Road (e.g., Big Creek Summit), Johnson Creek Road, Stibnite Road, and Thunder Mountain Road). These delays would affect public use of the access roads for their non-Project-related usage.

Mitigation Measure – Traffic Delay Notifications: Perpetua would coordinate with the Forest Service, Valley County Road and Bridge Department, Valley County Sheriff Department, Valley County Recreation Department, Cascade Rural Fire Protection District, Warm Lake Campground, and Yellow Pine Town Council to provide information regarding planned roadwork, road usage, and traffic delays. This coordination would include publication and weekly updating of the planned schedule for SGP roadwork and large-load road usage that would be available on a project webpage on the internet, on a system accessible by phone dial-in, and at the coordinating entities' physical locations. Also, in coordination with the Forest Service and Valley County Road and Bridge Department, roadside signage indicating the current and planned traffic delays for the next week would be displayed near the intersection of SH 55 and Warm Lake Road, at the intersection of Warm Lake Road and Johnson Creek Road, and at the Yellow Pine rest area.

Effectiveness: Traffic delay notifications would allow public road users to make informed decisions about their routes and travel to minimize the effects of travel delays on their public road usage. However, travel delays would not be completely eliminated.

See also the Cabin Creek Road OSV mitigation measure (**Section 4.19.3**).

Stibnite Gold Project Final Environmental Impact Statement Errata Document

1. Introduction

The Stibnite Gold Project Draft Record of Decision and the Final Environmental Impact Statement (FEIS) were released on September 6, 2024. This errata sheet documents corrections to the text of the September 2024 published FEIS and should be reviewed along with the FEIS. These corrections reflect instructions provided by Kelly Orr, the Intermountain Region Deputy Regional Forester, in the response to objections dated October 21, 2024, and additional clarifications. These corrections are consistent with the direction given in Forest Service Handbook 1909.15, Chapter 10, Section 18. There are no changes to the project or significant new circumstances identified in this errata sheet that affect the analysis and conclusions in the Stibnite Gold Project FEIS, therefore, a supplement to or revision of the FEIS is not needed. These changes also apply to the Stibnite Gold Project specialist reports, as applicable.

Article II. Chapter 2

1. FEIS, Chapter 2, Section 2.4.4.4 Public Access (page 2-20)

The description regarding seasonal public access through the operating mine site to Thunder Mountain Road is modified per the italicized text:

During operations, the public access road through the Operations Area Boundary would provide seasonal use, open to all vehicles; access would not be provided in winter when impassable (current county maintenance standards) and signs would inform the public of seasonal and temporary closures. Public vehicles passing through would be required to check-in with mine personnel at the North or South SGP entry points and would receive a safety briefing and would also be required to check-out with SGP personnel upon exiting the SGP. For safety purposes, public access would be separated from other SGP roads by berms, security fencing, and the underpass to allow the public road to pass beneath the mine haul road. No stopping or deviating from the public access road would be allowed. Perpetua could restrict access to any vehicles due to concerns related to public or employee health and safety, such as during road construction and maintenance, blasting, highwall scaling, mining in the immediate area of the road, and similar operations. *Because public use of the road would be subject to Perpetua's control measures on general use, the public access road is not considered a public road.*

Significance: The addition clarifies the status of the access road through the site with regard to whether it will be operated as a public road.

2. FEIS, Chapter 2, Section 2.4.9 Environmental Design Features (Table 2.4-12 on page 2-106)

An environmental design feature used in the wildlife specialist report effects analysis unintentionally omitted from Table 2.4-12. The following row is added into Table 2.4-12 on page 2-106.

Final Record of Decision

Stibnite Gold Project

Valley County, Idaho

January 2025

REC 7335

PRI-00001013

preparation and early construction until the worker housing facility is constructed. Administrative offices, a transportation hub, warehouses, and assay laboratory facilities, all supporting mine-related activities, will be located offsite and outside of the operations area boundary.

Prior to site preparation and construction of surface facilities, vegetation will be removed from operating areas. Any merchantable timber on National Forest System lands will be purchased from the Forest Service through a timber sale. Access to the mine site during the construction period will be from Cascade, Idaho via the County Road 10-579 (Warm Lake Road), to County Road 10-413 (Johnson Creek Road), and then to County Road 50-412 (Stibnite Road). As part of the Stibnite Gold Project construction, a new access route, the Burntlog Route, will be constructed to connect the Warm Lake Road to the mine site. The new Burntlog Route will be used during the operating and closure periods and will be reclaimed as part of closure. The Burntlog Route will be used by Perpetua and its contractors for mine access, but public use of the route will be restricted as described in the Burnt Log Route Public Access Restriction mitigation measure in Part 2.3.10. The Johnson Creek Road and Stibnite Road will only be used for alternative site access in case of emergency or unplanned closure of the Burntlog Route.

Mining

The Selected Alternative includes a total of approximately 3,266 acres of new and re-disturbance of surface resources through the creation or expansion of three open-pits, an ore processing area, a tailings storage facility and buttress, an access roads, a transmission line, dewatering and industrial water supply wells, a worker housing facility, a road maintenance facility, an underground exploration decline, and other ancillary facilities (**Fi ure 1**). The acreages of disturbance for each mine feature are presented in Table 2.4-1 of the FEIS.

The proposed facilities and methods of mining are described in greater detail in Section 2.4 of the FEIS. The estimated operating mine life is approximately 15 years preceded by a three-year construction period, a five-year closure period, and an estimated 15-year post-closure period for water treatment of residual process solution. Perpetua will employ approximately 640 personnel during the construction period, 580 personnel during the operating period, 160 personnel during the closure period, and 40 personnel during the post-closure period.

General mine operations will include drilling, blasting, loading, and hauling using excavators, dozers, and a fleet of trucks. Ore will be hauled to the on-site mill facility, and overburden will be placed as a buttress to the tailings storage facility embankment or backfilled into the mined-out pits (**Fi ure 2**). Reclamation will take place concurrently with mining operations, as feasible, and will be completed during the closure and post-closure periods.

The Stibnite Gold Project will consist of mining three primary mineral deposits and the re-mining of historical tailings using conventional open pit mining methods. Ore from three open pits (Yellow Pine, Hangar Flats, and West End pits) will be sent to either the crusher, located near the processing plant, or one of several ore stockpiles in various locations within the operations area boundary (**Fi ure 2**). Ore will be stockpiled and processed at a future time during extended periods when the ore tonnage or ore type from the pits exceed the availability of the ore processing plant. Pre-stripping or removing the overlying soil and development rock (also known as waste rock) to access the mineral deposit, will commence during the construction phase in Mine Year 2. Ore removal and processing will begin in Mine Year 1 (operations phase) and continue year-round for approximately 15 years. Mine operations will occur in the area of two historical open pit mined areas (Yellow Pine and West End) and one new open pit (Hangar Flats) that includes the sites of former underground mining and mineral processing facilities. Development rock will be hauled to the tailings storage facility embankment or placed in one of four destinations: the tailings storage facility buttress or the Yellow Pine, Hangar Flats, or West End open pits once they are mined out.

iti ation easures ite ar Pine Impact Rectif in an Restorin

- VEG-11. If damage or removal of any live whitebark pine trees cannot be avoided, the Project Operator will make every reasonable effort to collect the cones, scion, pollen, or other genetic material from live mature trees (particularly "plus" trees) within the same seed zone for future restoration efforts before the live whitebark pine is damaged or killed. The Project Operator will coordinate with the Forest Service and U.S. Fish and Wildlife Service to identify potential restoration efforts for the species within or near the Stibnite Gold Project.
- VEG-12. If collection cannot occur, the Project Operator will contact the Forest Service and U.S. Fish and Wildlife Service to explore additional options, which may include replanting in accordance with current whitebark pine replanting guidelines or best practices, or suitable alternatives with whitebark pine seedlings or seed stock of known superior parentage ("plus" whitebark pine). Whitebark pine used for replanting will be of the same seed zone as the mature trees that were removed.

Clark's Nutcracker Habitat

Issue Impacts to whitebark pine seed dispersers, primarily the Clark's nutcracker and its habitat.

iti ation easure Clar s utcrac er

VEG-13. Where possible, the Project Operator will avoid or limit cutting of mature whitebark pine trees in stands that are of sufficient size to support Clark's nutcracker use of the area (30,888 to 61,776 acres of cone bearing whitebark pine habitat within a 20.3-mile radius).

2.3.9 Wildlife

Wolverine

Issue Impacts to wolverine habitat.

iti ation easure ol erine Impact inimi ation

- The Forest Service wildlife biologist will be notified of any occupied wolverine dens encountered during construction and operation.
- If a wolverine is observed within or near the Project, the Forest Service wildlife biologist and U.S. Fish and Wildlife Service will be notified immediately and coordination with Perpetua will occur regarding modifications to construction and operation activities to avoid potential disruption of wolverine denning activities.
- Off road use and the construction of new or temporary roads in wolverine habitat will be limited.
- New or temporary roads will be marked off limits to non-authorized motorized access to reduce traffic and increased access in wolverine habitat.
- For exploratory drilling activities, from December 1 to April 1, a 1-mile no-disturbance buffer will be implemented around denning habitat as modeled using the persistent snow cover layer.

2.3.10 Transportation

Burntlog Route Public Access Restriction

Issue Unrestricted public use of the Burntlog Route (consisting of the existing Forest Road [FR] 447 [Burnt Log Road] and new road segments connecting to FR 50375 [Thunder Mountain Road] and FR 51290 [Meadow Creek Lookout Road]) would have potential impacts associated with traffic incidents, public safety, emergency services, wildlife interactions, wilderness solitude, and tribal interests.

iti ation easure Burntlo Route pu lic access restriction Construction of the Stibnite Gold Project is expected to take three years (Mine Years -3 through -1). The Burntlog Route is anticipated to take two years to construct (i.e., Mine Year -3 and -2). The access to Meadow Creek Lookout Road will experience short-term closures during Year -3 when crossings of the new Burntlog Route are constructed.

The through-site public access to Thunder Mountain Road will be largely unaffected during Year -3 with more temporary closures in Year -2, then completely closed during Year -1 before re-opening on a new seasonal access route in Year 1 (Table 3).

Table 3 Access Impacts During Construction and Operations

Road	Mine Year -3	Mine Year -2	Mine Year -1	Mine Operations
Warm Lake Road (Cascade to Landmark)	Limited effects	Limited effects	Limited effects	Limited effects
Johnson Creek Road (Landmark to Yellow Pine)	Limited effects	Temporary closures	Seasonal access	Seasonal access
Stibnite Road (Yellow Pine to Stibnite)	Limited effects	Temporary closures	Closed in Operations Area	Seasonal access
Thunder Mountain Road (Stibnite to Thunder Mountain)	Limited effects	No access when Stibnite Road is temporarily closed	Access through new Burntlog Route only	Seasonal access via new public access road through site
Meadow Creek Lookout Road	Temporary closures for nearby Burntlog Route construction	Limited effects	1.8-mile shared segment with new Burntlog Route	1.8-mile shared segment with new Burntlog Route
New Burntlog Route (Landmark to Stibnite)	Under construction	Under construction	Site access plus public access	Site access with public access restriction

The Burntlog Route will be a mine access road operated by the Stibnite Gold Project for the duration of the project. As such, project-related use of the route will be regulated per the Forest Service's decision on the Stibnite Gold Project and incorporate compliance with the project's Transportation Management Plan. Public use of the Burntlog Route will be restricted. Seasonal use of the newly constructed portions of the Burntlog Route will be allowed only during the snow-free portion of Year -1 when there would be no other access to the Thunder Mountain Road.

Public use of existing segments of the Burntlog Route will not be modified by the Stibnite Gold Project decision but would be subject to temporary closures for new Burntlog Route construction. During operations, public use of existing segments of the Burntlog Route (i.e., Burnt Log Road [FS447], Meadow Creek Lookout Road [FR51290], and Thunder Mountain Road [FR50375]) will be unrestricted. The main road segment where public access would continue will be a 1.8-mile section of the Meadow Creek Lookout Road, coincident with the Burntlog Route. Signage would be placed at all intersections with Forest Service roads and trails to identify road segments with public access restrictions.

The Forest Service will require the Project Operator, to develop and implement a Burntlog Route Access Plan to restrict public access per this mitigation measure and to provide notifications to the public when the newly constructed segments of the Burntlog Route would be open.

Description	Type	Reference	Resources Affected
• Temporary wooden structure could be erected around portions of the drill, pumps, and heaters, with acoustic absorbent panels. These temporary structures will not be put in place if they created safety issues related to exhaust vapor build-up. • When feasible, activities such as helicopter use and blasting, could be scheduled at the same time.			
In revegetation and seeding projects in occupied sensitive plant habitat, a Forest botanist shall be consulted to ensure appropriate species are used.	FP Component	BNF and PNF: BTST05	Vegetation
Design and implement projects within occupied habitats of Sensitive species to help prevent them from becoming listed. Use Forest Service-approved portions of Conservation Strategies and Agreements, as appropriate, in the management of Sensitive species habitat to keep management actions from contributing to a trend toward listing for these species.	FP Component	BNF and PNF: WIST02	Wildlife, Vegetation

Table 6 Proponent Proposed Environmental Design Features

Description	Resources Affected
Following crushing, the crushed ore will report via conveyor to a dome-shaped, covered stockpile.	Air Quality
Dust emission controls, such as water sprays and/or bag house dust collectors, will reduce dust from crushing, conveying, and stockpiling.	Air Quality
Dust will be controlled in a similar manner to the ore crushing and conveying process using water sprays and/or bag house dust collectors.	Air Quality
Air emissions from the leaching facility will be captured in a series of air pollution controls, and the material collected will be disposed of as a solid waste or a hazardous waste depending on characterization of the waste.	Air Quality
Air emissions from the induction furnace will be captured in a series of emission controls. Mercury from the induction furnace will be converted to a liquid metallic state, and then securely stored prior to shipment to a certified hazardous waste disposal facility.	Air Quality
Silos will be equipped with air emission controls except for Prill Silo.	Air Quality
All off-highway diesel engines will be Environmental Protection Agency Tier IV or better.	Air Quality, Climate Change
The Project Operator will encourage employees to use company provided shuttle buses as transport to the Stibnite Gold Logistics Facility from towns along SH 55.	Air Quality, Health and Safety, Transportation and Access
Busing and/or vanpooling will be provided for the Project Operator and contractor employees. The associated parking area will accommodate approximately 300 vehicles. To the degree practicable, the Project Operator will mandate the use of busing and vans for employee and contractor transportation to the Stibnite Gold Project and the worker housing facility.	Air Quality, Health and Safety, Transportation and Access
Proper dust control will be employed along transportation corridors and active mining areas using aquatic safe dust suppression chemicals and methods.	Air Quality, Water Resources, Fish, Wildlife

Description	Resources Affected
Other legacy materials may be encountered during construction and operations. If encountered, these materials will be characterized to determine potential for reprocessing, reuse, or disposal.	Hazardous Materials
Small scale composting associated with organic materials generated at the worker housing facility may be incorporated within the centralized growth media stockpile in the Fiddle valley.	Hazardous Materials
An Explosives and Blasting Management Plan will be prepared for the Stibnite Gold Project. Explosives storage, transport, handling, and use will comply with applicable Department of Homeland Security, Bureau of Alcohol, Tobacco, Firearms and Explosives, and Mine Safety and Health Administration regulations.	Health and Safety
For safety and security reasons, no alcohol, firearms, or illegal drugs will be permitted on site.	Health and Safety
For safety and security reasons, public access into the mine area will be prevented by using fencing, gate locking, security personnel, and/or notice postings that prohibit unauthorized entry; no unauthorized vehicles or personnel will be permitted on the Stibnite Gold Project.	Health and Safety
Personnel transporting, handling, or using any hazardous chemicals (including sodium cyanide) will be trained to ensure the safe use of such materials. The Project Operator will design, construct, and manage facilities to conform to International Cyanide Management Code.	Health and Safety, Fish, Wildlife, Hazardous Materials
Fuel and other petroleum products at the site will be stored in above ground containment structures, with appropriate secondary containment measures.	Health and Safety, Fish, Wildlife, Hazardous Materials
Air emissions, groundwater, surface water, and aquatic parameters will be monitored during mine construction, operation, closure, and post-closure as specified in the final authorizations from the regulating agencies.	Monitoring
Monitoring will be conducted following the completion of closure and reclamation of all facilities and disturbance areas to demonstrate compliance with permit requirements and to measure the success of reclamation and mitigation.	Monitoring
The draft EMMP includes the following plans for monitoring aquatic resources: Stream and Wetlands Monitoring and Management Plan and Fisheries and Aquatic Habitat Monitoring and Management Plan.	Monitoring
The ore processing facility building will be enclosed.	Noise, Wildlife, Health and Safety
Appropriate sound dampening and muffling equipment will be utilized to minimize noise excursion from equipment and facilities. When possible, schedule high noise activities at the same time. Monitor and maintain equipment to reduce noise related impacts.	Noise, Wildlife, Health and Safety
When practicable, pumps, generators, and engines will be turned off when not in use to avoid unnecessary noise generation and reduce energy consumption.	Noise, Wildlife, Health and Safety
Electric line power will be utilized during operations to eliminate diesel generator noise, except in emergency situations when grid power is down or temporary use in remote areas where it is not practical to run power lines.	Noise, Wildlife, Health and Safety
An 8-mile temporary 16-foot-wide groomed over-snow vehicle trail will be created adjacent to Johnson Creek Road between Landmark and Trout Creek Campground during construction of the Burntlog Route.	Recreation

Description	Resources Affected
Soil stability will be estimated for all reclaimed areas using qualitative descriptors.	Soils, Reclamation
Slope stability will be monitored during the erosion inspections.	Soils, Reclamation
If the performance of reclaimed areas is not satisfactory, appropriate maintenance activities will be implemented. Maintenance activities may include one or more of the following: • Sediment removal from sediment basins, stormwater drainage channels, and diversions as necessary to maintain their design capacity; • Diverting surface water away from reclaimed areas where erosion jeopardizes attainment of reclamation standards; • Stabilizing rills, gullies, and other erosion features or slope failures that have exposed development rock; • Noxious weed and invasive plant species control; and, • Re-seeding or re-applying reclamation treatments in areas where it is determined through monitoring and agency consultation that reclamation will not meet standards.	Soils, Reclamation
The Project Operator will submit an annual report to the Forest Service and the other federal and state agencies that are responsible for issuing authorizations applicable to reclamation for the preceding calendar year. The annual report will contain descriptions of the reclamation activities completed during the previous year, a summary of areas reclaimed, a discussion of the results of the reclamation monitoring conducted, and corrective actions implemented.	Soils, Reclamation
A new 12-foot-wide gravel road will be constructed to provide public access from Stibnite Road (FR 50412) to Thunder Mountain Road (FR 50375) through the Stibnite Gold Project. During operations, the public access road will be used to travel through the Stibnite Gold Project and will provide seasonal use, open to all vehicles. Vehicles passing through the Stibnite Gold Project will be required to check-in with mine personnel at the North or South Stibnite Gold Project entry points.	Transportation and Access, Health and Safety
Post reclamation, a road will be established over the backfilled Yellow Pine pit to allow public access through the reclaimed site and connect Stibnite Road (FR 50412) to Thunder Mountain Road (FR 50375). This will replace the operational phase public access route.	Transportation and Access
Prior to site preparation and construction of surface facilities, vegetation will be removed from operating areas. Trees and deadwood, shrubs, and slash not needed to construct windrows at the edge of Burntlog Route disturbance (to function as sediment barriers), will be chipped, and suitable soil will be separately salvaged and stockpiled (except for a small portion that will be 'live handled') for use as part of site reclamation and restoration. Portions of the salvaged soil will be blended with the chipped wood to create growth media. All growth media placed in stockpiles will be stabilized, seeded, and mulched to protect the stockpiles from wind and water erosion.	Vegetation
The Project Operator will inspect and remove vegetation material (including noxious weeds) from mechanical equipment and properly dispose to minimize the spread of unwanted vegetation.	Vegetation
Wood wastes and wood mulch are the two primary sources of compost. Food waste produced from on-site meal preparation and wastes may provide another source. Combined and properly managed during composting, these materials will provide a source of organic matter to be blended into substrate materials suitable for mitigation.	Vegetation
The Project Operator will be responsible for noxious weed control within areas disturbed by Stibnite Gold Project activities.	Vegetation, Wildlife
Develop and employ planting plans for wildlife benefits (cover, forage, etc.) using approved seed mixes.	Vegetation, Wildlife

10.3.10 Road Use and Maintenance

Description	Reference
Minor surface improvements (e.g., ditch and culvert repair, adding gravel, winter snow removal, and summer dust suppression) will occur on the Yellow Pine Route to reduce sediment runoff and dust generation.	2021 Modified Mine Plan
Once all final mine closure and reclamation work has been completed, the Project Operator will reduce the 21-foot-wide travel way of 19.8 miles of Burntlog Road (FR 447), 1.3 mile of Meadow Creek Lookout Road (FR 51290), and 2.0 miles along Thunder Mountain Road (FR 375) of Burntlog Route to their approximate pre-mining width.	2021 Modified Mine Plan
The approximately 15 miles of Burntlog Route connecting to Meadow Creek Lookout Road (FR 51290) and Thunder Mountain Road (FR 50375) will be decommissioned.	2021 Modified Mine Plan
Following mining and ore processing operations, unless they are taken over by a third-party for ongoing use and maintenance, the Burntlog Maintenance Facility buildings will be removed. The sewer system and septic tanks for the facility will be decommissioned. Soil and rock beneath fuel storage areas and chemical storage buildings will be tested for contamination. All reagents, petroleum products, solvents, and other hazardous or toxic materials will be removed from the site and disposed of according to applicable state and federal regulations. After demolition of the buildings and facilities, the site will be graded, and drainage restored.	2021 Modified Mine Plan
A new 12-foot-wide gravel road will be constructed to provide public access from Stibnite Road (FR 50412) to Thunder Mountain Road (FR 50375) through the Stibnite Gold Project. During operations, the public access road will be used to travel through the Stibnite Gold Project and will provide seasonal use, open to all vehicles. Vehicles passing through the Stibnite Gold Project will be required to check-in with mine personnel at the North or South Stibnite Gold Project entry points.	2021 Modified Mine Plan
Post reclamation, a road will be established over the backfilled Yellow Pine pit to allow public access through the reclaimed site and connect Stibnite Road (FR 50412) to Thunder Mountain Road (FR 50375). This will replace the operational phase public access route.	2021 Modified Mine Plan
New roads constructed for the Project on National Forest System lands will be closed and reclaimed, as required by Forest Service, once they are no longer needed to support Project construction, operations,	2021 Modified Mine Plan
Project-related traffic will be restricted to existing roadways and Project areas. Off-road travel in previously undisturbed areas will be forbidden.	2021 Modified Mine Plan

10.3.11 Reclamation and Restoration

Description	Reference
Facilities will be located on previously impacted lands when that location fits into mine operations.	2021 Modified Mine Plan
Productive lands that support wildlife and fisheries habitat and dispersed recreation will be established on Project-related surface disturbance.	2021 Modified Mine Plan
Approximately 37 percent of the reclamation will be done concurrent to mining and ore processing; the remaining 63 percent will be accomplished during closure. Annual reclamation activities are described in a schedule provided in Table 3-1 of the Reclamation Closure Plan. Concurrent reclamation areas will focus on construction period restoration efforts (e.g., East Fork Meadow Creek, aka Blowout Creek) and laydown yards, Yellow Pine Pit area facilities, and Hangar Flats Pit area facilities. Closure period activities are focused on the West End Pit area, tailings storage facility area, Fiddle growth media stockpile, and process plant area. This information is also presented graphically in Appendix C to the Compensatory Mitigation Plan.	2021 Modified Mine Plan
The Yellow Pine pit will be backfilled with West End pit development rock during operations.	2021 Modified Mine Plan
A sinuous channel will be constructed through the backfilled area for the reconstructed East Fork South Fork Salmon River with an average valley gradient approximating the historical, pre-disturbance river gradient.	2021 Modified Mine Plan
The backfill will be placed to achieve a mounded final reclamation surface to promote drainage away from the West End pit and prevent formation of a pit lake within Midnight pit.	2021 Modified Mine Plan
The floor of the sidehill pit southwest of the main West End pit will be graded to drain, covered with growth media, and revegetated.	2021 Modified Mine Plan

BEFORE THE BOARD OF ENVIRONMENTAL QUALITY

STATE OF IDAHO

IN THE MATTER OF AIR QUALITY PERMIT TO CONSTRUCT P-2019.0047	Case Docket No. 0101-22-01 OAH Case No. 23-245-01
NEZ PERCE TRIBE, IDAHO CONSERVATION LEAGUE, and SAVE THE SOURTH FORK SALMON, Petitioner, v. IDAHO DEPARTMENT OF ENVIRONMENTAL QUALITY, Respondents, and PERPETUA RESOURCES IDAHO, INC., Intervenor-Respondent.	ORDER ON SAVE THE SOUTH FORK SALMON'S MOTION FOR RECONSIDERATION BASED ON NEW EVIDENCE

I. INTRODUCTION

On January 24, 2025, Save the South Fork Salmon ("SSFS") filed *Petitioner Save the South Fork Salmon's Motion for Reconsideration Based on New Evidence* ("Motion for Reconsideration"). The Motion for Reconsideration seeks reconsideration of the Idaho Department of Environmental Quality Board's ("DEQ Board") *Final Order* issued in this matter on May 9, 2024. The Motion for Reconsideration asserts that the United States Forest Service's

January 2, 2025 Final Record of Decision ("USFS ROD") for the Stibnite Gold Project ("STP") provides relevant new information that addresses the issue of whether Perpetua Resources Idaho, Inc. ("Perpetua") has legal control to preclude public access to the Stibnite Road Access Route such that it was appropriate for the Department of Environmental Quality ("DEQ") to exclude the road from ambient air quality protections when it issued the Air Quality Permit to Construct ("PTC") at issue in this case.

BACKGROUND

The DEQ Board issued a *Final Order* in this matter on May 9, 2024. The Final Order found that 1) DEQ acted reasonably and in accordance with law when it determined that Perpetua will have legal control of the Stibnite Road Access Route such that it could properly be excluded from consideration as ambient air, 2) DEQ acted reasonably and in accordance with law when it determined that Perpetua will have physical and practical control of the Stibnite Road Access Route such that it could properly be excluded from consideration as ambient air, 3) DEQ acted reasonably and in accordance with law when it allowed Perpetua to submit some plans after the PTC was issued, 4) the PTC includes enforceable conditions that will achieve 93.3% dust control, and 5) DEQ did not act reasonably and in accordance with law when it analyzed the ambient arsenic air concentrations for the Stibnite Gold Project. The *Final Order* remanded the ambient arsenic air concentration issue back to the Hearing Officer for additional fact-finding.

On May 23, 2024, Petitioners the Nez Perce Tribe, Idaho Conservation League, and Save the South Fork Salmon filed a *Petitioners' Motion for Clarification and/or Reconsideration* of the *Final Order.* On May 23, 2024, Respondent/Intervenors DEQ and Perpetua filed a *Joint Motion for Reconsideration and/or Clarification of Final Order* and *Memorandum in Support of*

Joint Motion for Reconsideration and/or Clarification of Final Order. On June 3, 2024, Petitioners filed *Petitioners Response Opposing DEQ/Perpetua's Motion for Reconsideration*. On June 4, 2024, DEQ and Perpetua filed a *Joint Motion to Strike Petitioners Response.* The motions raised several issues including that the DEQ Board: 1) vacate the PTC while the matter was on remand or order an amended Application for Permit to Construction be filed, 2) reconsider the *Final Order* including clarification of its effective date, 3) reconsider its decision on the ambient arsenic concentrations, 4) hold additional hearings on the arsenic issues before issuing the *Final Order*, 5) reconsider or clarify the instructions on remand to the Hearing Officer.

On June 12, 2024, the DEQ Board issued an *Order on Petitions for Reconsideration and/or Clarification of Final Order* ("Order on Reconsideration"). The DEQ Board denied all the requests for reconsideration/clarification except the request for clarification of the effective date of the *Final Order*. The DEQ Board found:

> While the Board's decision is final as to the first four issues, it is not final as to the arsenic issue. Therefore, the Board will stay issuance of a final order on all five issues until the remand before the Hearing Officer is complete and all statutory deadlines for review of the Hearing Officer's Orders have run. The order will still be a "Final Order," but it will not be considered "effective" for purposes of I.C. §§ 67-5246(5), 67-5270, and 67-5273 until the Hearing Officer has issued an order on the arsenic issue and all statutorily allowed administrative review of that issue has been completed. At that point, all five issues will be considered "final" and appealable under I.C. §§ 67-5270 and 67-5273. This will allow a full factual record to be developed for the arsenic issue and will prevent the parties from having to simultaneously file for judicial review and engage in additional fact finding before the Hearing Officer.

Order on Reconsideration at 6. The case was remanded to the Hearing Officer and a hearing was held October 17–18, 2024. The Hearing Officer issued a *Findings of*

Fact, Conclusions of Law, and Preliminary Order on January 7, 2025. On January 21, 2025, Petitioners filed their *Petitioners' Petition for Review of January 7, 2025 Preliminary Order, Memorandum in Support, and Request for Hearing.* On January 24, 2025, Save the South Fork Salmon filed its Motion for Reconsideration of the *Final Order*.

ANALYSIS

The Motion for Reconsideration seeks to have the DEQ Board reconsider its *Final Order* based on new evidence in the form of the USFS Final ROD. The DEQ Board's Order on Reconsideration made clear, however, that the *Final Order* would be stayed "until the remand before the Hearing Officer is complete and all statutory deadlines for review of the Hearing Officer's Orders have run." Order on Reconsideration at 6. It also made clear that the *Final Order* "will not be considered "effective" for purposes of I.C. §§ 67-5246(5), 67-5270, and 67-5273 until the Hearing Officer has issued an order on the arsenic issue and all statutorily-allowed administrative review of that issue has been completed." *Id.* The DEQ Board is actively in the process of hearing a petition for administrative review of the Hearing Officer's order. Thus, the statutorily-allowed deadlines for administrative review have not yet run and the *Final Order* is not yet final for purposes of I.C. §§ 67-5246(5), 67-5270, and 67-5273. Because of this, the Motion for Reconsideration of the *Final Order* is premature. A Motion for Reconsideration of the *Final Order* will not be appropriate until after all the administrative deadlines have passed and the *Final Order* becomes effective.

CONCLUSION

Based on the foregoing it is hereby ordered the Motion for Reconsideration is denied, without prejudice.

Dated this 24th day of February, 2025

BEFORE THE BOARD OF ENVIRONMENTAL QUALITY
STATE OF IDAHO

IN THE MATTER OF AIR QUALITY PERMIT TO CONSTRUCT P-2019.0047 NEZ PERCE TRIBE, IDAHO CONSERVATION LEAGUE, and SAVE THE SOUTH FORK SALMON, Petitioners, v. IDAHO DEPARTMENT OF ENVIRONMENTAL QUALITY, Respondent, and PERPETUA RESOURCES IDAHO, INC., Intervenor-Respondent.	Agency Case No. 0101-22-01 OAH Case No. 23-245-01 **NOTICE OF ORAL ARGUMENT**

On January 7, 2025, the Hearing Officer issued the *Findings of Fact, Conclusions of Law, and Preliminary Order*, and on January 21, 2025, Petitioners filed *Petitioners' Petition for Review of January 7, 2025 Preliminary Order, Memorandum in Support, and Request for Hearing*.

Pursuant to Idaho Code § 67-5245(b)(5) and IDAPA 62.01.01.626.02.i, NOTICE IS HEREBY GIVEN that oral argument will take place on April 2 & 3, at 9:00 a.m. Mountain Time, or as soon thereafter as the matter may be heard, in conference rooms A and B at the Department of Environmental Quality State Office, 1410 N. Hilton, Boise, Idaho. The parties will each be allowed 30 minutes for argument. Petitioners will be allowed 10 minutes for rebuttal.

The oral argument in this matter will be heard by the Idaho Board of Environmental Quality at the Special Board Meeting scheduled to commence at 9:00 a.m. Mountain Time on

April 2, 2025. If additional time is needed, the Board will reconvene at 9 a.m. on April 3, 2025 to continue the meeting. The public may attend the meeting in person or via Microsoft Teams. The Teams link will be available in the Meeting Notice posted at https://www.deq.idaho.gov/board-of-environmental-quality/ at least 24 hours prior to the meeting date.

Dated this 26th day of February, 2025.

BEFORE THE BOARD OF ENVIRONMENTAL QUALITY

STATE OF IDAHO

IN THE MATTER OF AIR QUALITY PERMIT TO CONSTRUCT P-2019.0047	Case Docket No. 010-22-01 OAH Case No. 23-245-01
NEZ PERCE TRIBE, IDAHO CONSERVATION LEAGUE, and SAVE THE SOUTH FORK SALMON, Petitioners, v. IDAHO DEPARTMENT OF ENVIRONMENTAL QUALITY, Respondents, and PERPETUA RESOURCES IDAHO, INC., Intervenor-Respondent.	FINAL ORDER

I. INTRODUCTION

On July 22, 2022, the Nez Perce Tribe, the Idaho Conservation League, and Save the South Fork Salmon (collectively "Petitioners"), filed a *Petition to Initiate Contested Case: Air Quality Permit to Construct P-2019.0047 (Jun. 17, 2022)*, seeking review of the Idaho Department of Environmental Quality's ("DEQ") issuance on June 17, 2022, of Air Quality Permit to Construct P-2019.0047 ("PTC"), to mining company Perpetua Resources Idaho, Inc.

("Perpetua") for its proposed Stibnite Gold Project ("SGP"). REC 0001–0028. Perpetua filed a Petition to Intervene in the matter on August 12, 2022. REC 0040–0043. A Hearing Officer was appointed and the parties participated in discovery and ultimately filed cross-motions for summary judgement. REC 319–322, REC 1204–1206, REC 1276–1278. On October 31, 2023, the Hearing Officer issued a *Preliminary Order*. REC 3280–3328. On November 14, 2023, the Petitioners filed a *Petition for Review* of the *Preliminary Order.* REC 3342–3356. On December 5, 2023, the Hearing Officer issued an *Amended Preliminary Order*. REC 3372–3425. In response, the Petitioners filed an *Amended Petition for Review* that requested review by the Board of Environmental Quality of both the October 31, 2023 *Preliminary Order* and the December 5, 2023, *Amended Preliminary Order*. REC 3426–3441.

The *Amended Petition for Review*, claimed the following errors with the PTC:

1. That DEQ erred in finding Perpetua has legal control of the Stibnite Road Access Route such that the Route need not comply with ambient air quality standards.

2. That DEQ erred in finding Perpetua will be able to practically and physically preclude the general public from accessing locations within the ambient air boundary.

3. That DEQ violated the Air Rules[1] by allowing Perpetua to submit plans with project details after the PTC was issued and without allowing for public comment on the plans.

4. That the PTC does not include enforceable conditions that will achieve 93.3% dust control.

5. That DEQ violated the Air Rules when calculating the ambient arsenic concentrations attributable to the SGP by diluting them by 16/70.

REC 3427–3428. The DEQ Board received briefing and heard oral argument on the Petition. REC 3448–C, REC 3694.

[1] The "Air Rules" are found at IDAPA 58.01.01.

On May 9, 2024, the Board issued a *Final Order* in this matter. REC 3695–3720. The Final Order found that sufficient evidence existed to support DEQ's findings in four of the five issues brought for review and that DEQ acted reasonably in making those decisions. The Board found, however, with regard to the ambient arsenic air concentration analysis, that there was not sufficient evidence to support DEQ's analysis and that further factual development was needed on that issue. Consequently, the Board remanded that issue to the Hearing Officer.

On May 23, 2024, Petitioners filed their *Petitioners' Motion for Clarification and/or Reconsideration.* REC 3721–3727. On May 23, 2024, DEQ and Perpetua filed a *Joint Motion for Reconsideration and/or Clarification of Final Order* and *Memorandum in Support of Joint Motion for Reconsideration and/or Clarification of Final Order.* REC 3728–3751. On June 3, 2024, Petitioners filed *Petitioners Response Opposing DEQ/Perpetua's Motion for Reconsideration.* On June 4, 2024, DEQ and Perpetua filed a *Joint Motion to Strike Petitioners Response.* On June 12, 2024, the DEQ Board issued its *Order on Petitions for Reconsideration and/or Clarification of Final Order*. REC 3835–3843. The Order denied the Petitions for Reconsideration, but granted the motion for clarification holding that the *Final Order* was final as to the first four issues brought by the Petition for Review, but not final as to the final arsenic issue. REC 3840. The DEQ Board stayed issuance of the *Final Order* on all five issues until the remand before the Hearing Officer was complete and all statutory deadlines for review of the Hearing Officer's order have run. REC 3840.

The matter was remanded to the Hearing Officer for development of a factual record on the arsenic issue. A hearing was held October 17–18, 2024. TR 0183–0851. The Hearing Officer issued a *Findings of Fact, Conclusions of Law, and Preliminary Order* on January 7, 2025 ("*Preliminary Order"*). REC 7091–7118. The Hearing Officer found that "(a) DEQ acted

reasonably in using a 5-year rolling average for T-RACT that was not supported by further permit conditions; (b) there was sufficient evidence to support DEQ's T-RACT analysis regarding non-West End Pit production; and (c) DEQ acted reasonably and in accordance with law when it applied the 16/70 adjustment to the AACC for arsenic." REC 7111. On January 21, 2025, Petitioners filed *Petitioners' Petition for Review of January 7, 2025 Preliminary Order, Memorandum in Support, and Request for Hearing*. REC 7119–7145. Petitioners asserted the Hearing Officer erred based on the following:

1. The 16/70 adjustment for arsenic is unlawful, sets a dangerous new precedent, and is not supported by the evidence; and
2. Using a five-year rolling average is not reasonable to assess compliance with arsenic limits, and the Permit's conditions are not sufficient to limit production from West End Pit and/or non-West End Pit sources to meet arsenic limited.

REC 7122.

The Board of Environmental Quality has the authority to review Preliminary Orders pursuant to I.C. § 67-5245(2) and IDAPA 58.01.23.730. The Parties presented briefs on the issues in this matter and participated in oral argument on April 2, 2025.

II. STANDARD OF REVIEW

In making its decision on the *Amended Petition for Review* the Board of Environmental Quality "shall exercise all the decision-making power that [it] would have had if the agency head had presided over the hearing." I.C. § 67-5245(7). This means that the Board of Environmental Quality can take a "de novo" or completely new look at the facts and issues. The Board of Environmental Quality must determine whether DEQ "has acted reasonably and in accordance

with law" when issuing the Permit. *See* I.C. §§ 67-5248(a) and 67-5279; *In the Matter of Sunnyside Park Utilities' Application for Sewage Disposal Permit*, Final Order on Petition for Review of Preliminary Order, at p. 10 (BEQ Dkt. 0103-07-02, April 7, 2009).

III. ANALYSIS

1. There was Sufficient Evidence to Demonstrate that DEQ Acted Reasonably and in Accordance with Law in Using a Five-Year Rolling Average for T-RACT.

Petitioners assert that there was insufficient evidence presented to the Hearing Officer to support DEQ's use of the five-year rolling average for hauling ore. Condition 3.5 of the PTC states: "The permittee shall haul not more than 180,000 tons per day (T/day) of ore and DR" and "not more than 135,000 T/day of ore and DR, based on a 5-year rolling average." REC 385. The five-year rolling average was a T-RACT used by DEQ per Section 210 to ensure compliance with the cancer risk levels allowed by the Idaho Air Rules. IDAPA 58.01.01.210.02.d.ii. Evidence presented at the hearing demonstrated that the 5-year rolling average allowed under Condition 3.5, along with the complement of other T-RACT conditions, would not allow arsenic concentrations to exceed the amount that is equivalent to ten (10) times the applicable acceptable ambient concentration listed in Section 586. IDAPA 58.01.01.210.12.b, Transcript 10/18/2024, 283:10–276:7, REC 3925–3926, REC 3885, REC 4138–4139, REC 4287–4288. The DEQ Board has reviewed the evidence in the record and agrees with the analysis set forth in the *Preliminary Order*. REC 7105–7108. Section 210 of the Idaho Air Rules gives DEQ the authority to use T-RACT to demonstrate compliance with the cancer risk levels in the rules. The DEQ Board finds that there was sufficient evidence presented to the Hearing Officer to justify the use of the 5-year rolling average and that DEQ's use of the 5-year rolling average was reasonable and in accordance with law.

2. **There was Sufficient Evidence to Demonstrate that DEQ Acted Reasonably and in Accordance with Law in Not Including Additional Permit Conditions Limiting the Non-West End Pit Production Limit.**

Petitioners assert that the Hearing Officer erred in his conclusion that the permit conditions included in the PTC were sufficient to limit the non-West End Pit production. Permit Condition No. 3.6 states: "The permittee shall haul no more than 788.4 million tons (MT) of ore and DR from the West End deposit over the life of the mine." REC 385. The West End pit limit was a T-RACT used by DEQ per Section 210 to ensure compliance with the cancer risk levels allowed by the Idaho Air Rules. IDAPA 58.01.01.210. The DEQ Board has reviewed the evidence in the record and agrees with the analysis set forth in the *Preliminary Order*. REC 7108–7111, Transcript 10/18/2024, 270:12–23, Transcript 10/18/2024, 280:2–281:24, Transcript 10/17/2024, 45:2–48:22, Transcript 10/17/2024, 116:15–23, REC 4139–4141, REC 3919, REC 3926–3928. Section 210 of the Idaho Air Rules gives DEQ the authority to use T-RACT to demonstrate compliance with the cancer risk levels in the rules. The DEQ Board finds that there was sufficient evidence presented to the Hearing Officer to demonstrate that DEQ was reasonable and acted in accordance with law when it decided not to include a specific condition in the PTC limiting the non-West End Pit production to 50% of the total mine haulage for the SGP.

3. **There was Sufficient Evidence to Demonstrate that DEQ Acted Reasonably and in Accordance with Law When it Applied the 16/70 Calculation to the Ambient Air Concentration Analysis.**

Petitioners assert that DEQ acted unreasonably when it applied the 16/70 factor in its calculations. The parties presented voluminous evidence at the hearing on this topic and also provided additional information during oral arguments before the DEQ Board. In its previous Final Order, the DEQ Board expressed concern whether there was sufficient evidence to justify

the 16/70 adjustment, whether the adjustment was lawful under the Idaho Air Rules, and whether public health and environment would be protected. IDAPA 58.01.01. However, review of the evidence presented to the Hearing Officer and the briefing and oral arguments presented in the matter have convinced the DEQ Board that the 16/70 adjustment was reasonable and was not in violation of the Air Rules.

a. Overview of the Air Rules Requirement for Determining Ambient Arsenic Concentrations.

The Air Rule requirements for toxic pollutants begin with IDAPA 58.01.01.161. Section 161 is the over-arching policy or qualitative standard that should be applied to the emission of toxic contaminants such as arsenic. It provides: "Any contaminant that is by its nature toxic to human or animal life or vegetation ***must not be emitted in such quantities or concentrations as to alone, or in combination with other contaminants, injure or unreasonably affect human life or vegetation.***" (emphasis added). To obtain a permit to construct an applicant must demonstrate, to the satisfaction of the Department:

> ***Using the methods provided in Section 210***, the emissions of toxic air pollutants from the stationary source or modification would not injure or unreasonably affect human or animal life or vegetation ***as required by Section 161***. Compliance with all applicable toxic air pollutant carcinogenic increments and toxic air pollutant non-carcinogenic increments demonstrates preconstruction compliance with Section 161 ***with regard to the pollutants listed in Section 585 and 586.***

IDAPA 58.01.01.203.03 (emphasis added). Thus, if a toxic air pollutant is listed in IDAPA 58.01.01.585 or 586 ("Section 586") it must be evaluated under the methods provided in Section 210.

Arsenic is listed in Section 586 of the Air Rules which consists of a table that lists each carcinogenic[2] toxic air pollutant that is covered by the rules. Section 586 includes "the screening emissions levels (EL) and acceptable ambient concentrations (AACC)" for each toxic carcinogenic pollutant listed. The EL listed for arsenic is "1.5E-06 lb/hr" and the AACC for arsenic is "2.3E-04 µg/m^3." The AACC is the carcinogen concentration in air in which daily exposure would limit the risk of cancer to 1:1,000,000 over a lifetime, which is identified as 70 years. The AACCs listed in the table in Section 586 are based on "annual averages." IDAPA 58.01.01.586.

Section 210.01 provides that the applicant must first identify what toxic air pollutants will be emitted by the project. IDAPA 58.01.01.210.01. Then the applicant must use "standard scientific and engineering principles and practices to estimate the emission rate" of the pollutant. IDAPA 58.01.01.210.02.a.[3] If the EL exceeds the levels listed in Section 586, then the applicant must continue with further analysis under Section 210.

The Applicant must then use "the modeling methods provided in Subsection 202.02 to estimate the ambient concentrations at specific receptor sites for any toxic air pollutant emitted from the point(s) of emission." IDAPA 58.01.01.210.03.a.[4] The "point of compliance is the

---

[2] A carcinogen is an agent capable of inducing cancer. Cancer is a disease of heritable, somatic mutations affecting cell growth and differentiation, characterized by an abnormal, uncontrolled growth of cells.

[3] The "uncontrolled emissions rate" is "calculated using the maximum capacity of the source . . . without the effect of any physical or operational limitations." IDAPA 58.01.01.210.02.b.

The "controlled emissions rate" is "calculated using the maximum capacity of the source . . . with the effect of any physical or operational limitations that has been specifically described" by the applicant and submitted to DEQ. IDAPA 58.01.01.210.02.c.

The "T-RACT emissions rate" is "calculated using the maximum capacity of the source . . . with the effect of any physical or operational limitation other than control equipment that has been specifically described" by the applicant and "an emission standard that is T-RACT." IDAPA 58.01.01.210.02.d.

[4] Section 202.02 provides that modeling "must be based on the applicable air quality models, data bases, and other requirements specified in 40 CFR Part 51, Appendix W (Guideline on Air Quality Models). Where an air quality model specified in the 'Guideline on Air Quality Models' is inappropriate, the model may be modified or another

receptor site that is estimated to have the highest ambient concentration of the toxic air pollutant of all the receptor sites . . .." IDAPA 58.01.01.210.03.b. Preconstruction compliance for toxic pollutants can be demonstrated using any of the methods "described in Subsection 210.05 through 210.08 and may use any applicable specialized method described in Subsection 210.09 through 210.12." IDAPA 58.01.01.210.04.[5]

Most applicable here are the compliance methods described in Section 210.12, which provides for the use of T-RACT to demonstrate preconstruction compliance for toxic pollutants listed in Section 586. T-RACT stands for "Toxic Air Pollutant Reasonably Available Control Technology" and "is an emission standard based on the lowest emission of toxic air pollutants that a particular source is capable of meeting by the application of control technology that is reasonably available, *as determined by the Department*, considering technological and economic feasibility." IDAPA 58.01.01.210 (emphasis added). The applicant must comply with IDAPA 58.01.01.210.13 and 210.14 to first get the T-RACT approved by DEQ before it can be used in the modeling. If T-RACT is used it allows for a comparison of:

> [T]he source's . . . approved T-RACT ambient concentration at the point of compliance for the toxic air pollutant to the amount of the toxic air pollutant that would contribute an ambient air cancer risk probability of less than one to one hundred thousand (1:100,000) (which amount is equivalent to ten (10) times the applicable acceptable ambient concentration listed in Section 586).

IDAPA 58.01.01.210.12.b. Thus, if the source's approved T-RACT ambient concentration meets the AACC listed in Section 586 times 10, then "no further procedures for demonstrating

---

model substituted, subject to written approval of the EPA Administrator and public comment pursuant to Subsection 209.01.c; provided that modifications and substitutions or models used for toxic air pollutants will be reviewed by the Department."

[5] Section 210.05 Uncontrolled Emissions; Section 210.06 Uncontrolled Ambient Concentration; Section 210.07 Controlled Emissions, Section 210.08 Controlled Ambient Emissions; Section 210.09 Net Emissions; Section 210.10 Net Ambient Concentration; Section 210.11 Toxic Air Pollutant Offset Ambient Concentration; Section 210.12 T-RACT Ambient Concentration for Carcinogens.

preconstruction compliance will be required for that toxic air pollutant as part of the application process." IDAPA 58.01.01.210.12.c. DEQ must then include appropriate conditions in the permit to ensure that the T-RACT is implemented so that the 10-times ambient concentrations can be met. IDAPA 58.01.01.210.12.d. Thus, the Air Rules establish two acceptable cancer risk levels—1 in 1,000,000 (the AACC level) and 1 in 100,000 (the T-RACT level). As long as the estimated cancer risk of a project meets either acceptable cancer risk level, the health protection requirements of Section 161 are satisfied.

Section 210 provides one further analysis that has bearing in this case. Section 210.15 provides that "short term" projects "may utilize a short-term adjustment factor of ten (10). For a carcinogen, multiply either the applicable acceptable ambient concentration (AACC) or the screening emission rate, but not both, by ten (10), to demonstrate preconstruction compliance." IDAPA 58.01.01.210.15. "Short Term Source" is defined as any new stationary source "with an operational life no greater than five (5) years from the inception of any operations to the cessation of actual operations." IDAPA 58.01.01.007.08. Thus, short term sources are also allowed 10 times the AACC, which would represent a 1 in 100,000 cancer risk, as long as the operational source life is no greater than five (5) years.

b. There was Sufficient Evidence to Demonstrate that DEQ Acted Reasonably When it Applied the 16/70 Adjustment.

DEQ performed its analysis of ambient arsenic levels by first determining that the levels of arsenic that would be generated by the project exceeded the EL levels found in Section 586. REC 1760. DEQ then "undertook the task of evaluating whether a more refined approach could be used to demonstrate compliance with TAP rules of Section 210." REC 1242. The first step in the refinement was to apply the T-RACT analysis under Rule 210.12. It is permissible under Rule 210.12 to apply T-RACT limits in multiple iterations to demonstrate compliance with

IDAPA 58.01.01.203.03. REC 1242. DEQ developed a complement of T-RACT limits for the permit:

1. Permit Conditions 2.1–2.6: Requiring measures to prevent fugitive dust. REC 374–375.

2. Permit Condition 3.5: Limiting the mine production to 180,000 tons per day of ore and DR and no more than 135,000 tons per day, on a five-year rolling average. REC 385.

3. Permit Condition 3.6: Limiting the total lifetime, facility-wide production of the mine to 788.4 million tons. REC 385.

4. Permit Condition 3.6: Limiting the West-End Pit production to no more than 50% (394.2 million tons) of the total mine production over the life of the mine. REC 385.

5. Permit Condition 3.11: Requiring dust collection systems with a minimum control efficiency of 90% on all drilling rigs. REC 385.

6. Permit Condition 3.13: Requiring haul road capping. REC 385.

This complement of T-RACT conditions create enforceable limits on the operation of the mine that will ensure emissions fall within limits that are protective of human health and the environment. One of the numeric T-RACT limits placed on the mine was a 788.4 million tons lifetime facility-wide total mining limit. Permit Condition No. 3.6 states: "The permittee shall haul no more than 788.4 million tons (MT) of ore and DR [development rock] from all deposits over the life of the mine . . .." REC 385, Transcript 10/18/2024, 280:23–281:6, 282:19–21. Thus, under the PTC, no more than 788.4 million tons of ore may ever be extracted from the SGP. Taken in conjunction with the five-year rolling average stated in Condition 3.5,[6] the fastest the mine could reach the 788.4 million tons of ore extraction would be 16 years. As explained at the hearing:

[6] Condition 3.5 states: "The permittee shall haul not more than 180,000 tons per day (T/day) of ore and DR" and "not more than 135,000 T/day of ore and DR, based on a 5-year rolling average." REC 385.

> So in this case, the parameter is production, so there's —that production is split up between 135,000 tons per day and 788.4 million tons. The 16 years is calculated from those limits. So if we take —if you take, you know, 788.4 million tons and you divide into that 135,000 tons a day, you arrive at 16. So 16 years is calculated. 16 years would not make a good metric for putting in the permit. Years don't equal emissions. Production equals emissions. That's why it's permitted that way. This is how every agency does it.

Transcript 10/18/2024, 315:7–315:19; *see also* Transcript 10/17/2024, 197:23–198:5, 199:20–199:24. Thus, the T-RACT Condition limiting total life-of-mine production to 788.4 million tons limits the lifetime of the mine to, at a minimum, 16 years.[7] This 16-year timeframe meant that the project was neither a short-term source of 5-years or less as defined by IDAPA 58.01.01.007.08, nor was it a source that would operate for a full 70-year lifetime.

Given this shortened operational timeframe, and as explained in the *Expert Declaration of Norka E. Paden, Ph.D*, DEQ decided to use "EPA's methodology for adjusting exposure duration given the known exposure duration (lifetime of the mine.)." REC 3878, Transcript 10/17/2024, 166:24–167:4, 143:21–144:1; 144:17–145:2; 190:1–5; 191:1–193:5. The EPA methodology is consistent with the scientifically established relationship between dose and duration of dose. The Air Rules establish two acceptable cancer risk levels—1 in 1,000,000 (the AACC level) and 1 in 100,000 (the T-RACT level).[8] IDAPA 58.01.01.210.12.b, 586. The DEQ Board finds there was sufficient evidence presented at the hearing that adjusting for exposure duration by applying the 16/70 calculation demonstrated an acceptable exposure risk and was

[7] There was considerable testimony demonstrating that a PTC condition explicitly limiting the life of the mine to 16 years was not necessary because "the years don't make emissions. The production makes emissions." Transcript 10/18/024, 316:7–316:9. If the mine was to operate at a lower production limit for a longer period of time, such as 50% production for 32-years "that would have a concurrent drop in the concentration, the exposure concentration [for arsenic]. And then that would happen for 32 years, at which point you would still end up with a cumulative dose that is the same [as for 16 years]. . . .Because if you're 50 percent production for the emissions, it's going to take you twice as long. But the end result is that you still have the same cumulative dose for your lifetime." Transcript 10/17/2024, 206:5–206:18.

[8] The Air Rules also provide a further acceptable level for short-term sources operating for less than five-years. IDAPA 58.01.01.007.08. As noted above, this also allows up to a 1:100,000 cancer risk.

reasonable. Transcript 10/17/2024, 167:5–168:11; Transcript 10/17/2024, 138:15–139:13, Transcript 10/17/2024, 195:22–203:17, REC 3876–3881, REC 701–707. Using the 16/70 calculation resulted in a 1:240,000 (4:1,000,000) cancer risk, which is less than the 1:100,000 allowed for by the Air Rules. REC 3878 The DEQ Board finds that this calculation was reasonable and complied with the directive in Rule 161 that arsenic "not be emitted in such quantities or concentrations as to alone, or in combination with other contaminants, injure or unreasonably affect human or animal life or vegetation." IDAPA 58.01.01.161.

c. **DEQ Acted in Accordance with Law When it Applied the 16/70 Calculation.**

The DEQ Board further finds that the 16/70 calculation was not in violation of the Idaho Air Rules. The Air Rules clearly provide an AACC standard in Section 586. They then clearly provide an adjustment to that AACC standard when T-RACT can be used to control emissions. IDAPA 58.01.01.210.12.b. When using T-RACT, the AACC may be adjusted to allow an ambient concentration at the point of compliance for the toxic air pollutant that would contribute an ambient air cancer risk probability of less than one to one hundred thousand (1:100,000). IDAPA 58.01.01.210.12.b–c. As noted above, the daily limit of 135,000 tons (Condition 3.5) and the 788.4 million ton total limit for the life of the mine (Condition 3.6) were T-RACT conditions applied by DEQ under Rule 210. REC 385. As outlined above, the 16/70 adjustment was based on a recognized EPA-methodology for determining cancer risk for projects lasting less than a lifetime (70-years). There was extensive evidence presented demonstrating that the 16/70 calculation was derived by taking the 788.4 million total production limit and the 135,000 daily average to determine the life of the mine would be, at a minimum, 16-years.[9] Applying the 16-year duration using the EPA-methodology resulted in a project cancer risk exposure of

[9] Given Conditions 3.5 and 3.6, a longer life-of-mine duration would result in lower annual emissions and the project cancer risk would remain less than the maximum allowed cancer risk of 1:100,000. REC 3875. 3878–79.

1:240,000, which is less than the maximum cancer risk allowed by the Air Rules of 1:100,000. REC 3876-3881. It was within DEQ's discretion to use the EPA methodology to effectuate the T-RACT limits found in Condition 3.5 and 3.6. Thus, the DEQ Board finds that the 16/70 calculation was acceptable under the Idaho Air Rules and complied with the Rule 161's directive that toxic pollutants not be emitted in quantities that will "injure or unreasonably affect human or animal life or vegetation."

IV. CONCLUSION

Based on the foregoing, it is hereby ordered:

1. There was Sufficient Evidence to Demonstrate that DEQ Acted Reasonably and in Accordance with Law in Using a Five-Year Rolling Average for T-RACT.

2. There was Sufficient Evidence to Demonstrate that DEQ Acted Reasonably and in Accordance with Law in Not Including Additional Permit Conditions Limiting the Non-West End Pit Production Limit.

3. There was Sufficient Evidence to Demonstrate that DEQ Acted Reasonably and in Accordance with Law When it Applied the 16/70 Adjustment.

This Order is final as to all issues presented, as well as to all issues previously decided in the *Final Order* issued in this matter on May 9, 2024. REC 3695–3720.

Dated this 27th day of May, 2025

Dr. John R. MacMillan
Chairman, Idaho Board of Environmental Quality

CERTIFICATE OF SERVICE

I HEREBY CERTIFY that on this 27th day of May 2025, I caused to be served a true and correct copy of the foregoing FINAL ORDER by transmitting a copy thereof in the manner listed below:

EXPLANATORY INFORMATION TO ACCOMPANY A FINAL ORDER

The accompanying order is a "**Final Order**" issued by the Board of Environmental Quality pursuant to section 67-5246, Idaho Code.

PETITION FOR RECONSIDERAQTION

Any party may file a petition for reconsideration of a final order within fourteen (14) days of the service date of this order as shown on the certificate of service. **Note: The petition must be received by the Board of Environmental Quality within this fourteen (14) day period.** The Board of Environmental Quality will act on a petition for reconsideration within twenty-one (21) days of its receipt, or the petition will be considered denied by operation of law. See Section 67-5246(4), Idaho Code.

APPEAL OF FINAL ORDER TO DISTRICT COURT

Pursuant to Section 67-5270 and 67-5272, Idaho Code, any party aggrieved by a final order or orders previously issued in a matter before the Board of Environmental Quality may appeal the final order and all previously issued orders in the matter to district court by filing a petition in the district court of the county in which:

i. A hearing was held,
ii. The final agency action was taken,
iii. The party seeking review of the orders resides, or
iv. The real property or personal property that was the subject of the agency action is located.

The appeal must be filed within twenty-eight (28) days of: a) the service date of the final order, b) the service date of an order denying a petition for reconsideration, or c) the failure within twenty-one (21) days to grant or deny a petition for reconsideration, whichever is later. See Section 67-5273, Idaho Code. The filing of an appeal to district court does not in itself stay the effectiveness or enforcement of the order under appeal.

Attorney for Save the South Fork Salmon

BEFORE THE BOARD OF ENVIRONMENTAL QUALITY
STATE OF IDAHO

IN THE MATTER OF AIR QUALITY PERMIT TO CONSTRUCT P-2019.0047	)	Agency Case No. 0101-22-01
	)	OAH Case No. 23-245-01
NEZ PERCE TRIBE, IDAHO CONSERVATION LEAGUE, and SAVE THE SOUTH FORK SALMON	)	**PETITIONER SAVE THE SOUTH FORK SALMON'S MOTION FOR RECONSIDERATION BASED ON NEW EVIDENCE AND MEMORANDUM IN SUPPORT**
Petitioners,	)	
v.	)	
IDAHO DEPARTMENT OF ENVIRONMENTAL QUALITY,	)	
Respondent,	)	
and	)	
PERPETUA RESOURCES IDAHO, INC.	)	
Intervenor-Respondent.	)	

Petitioner Save the South Fork Salmon ("SSFS") hereby moves the Idaho Board of Environmental Quality (the "Board") for reconsideration of the Board's May 9, 2024 Final Order regarding the issue of whether the Stibnite Road Access Route (the "Access Route") was appropriately excluded from ambient air protections in the permit to construct the Department of Environmental Quality ("DEQ") issued to Perpetua Resources Idaho ("Perpetua"). Specifically, the U.S. Forest Service's January 3, 2025 Final Record of Decision for the Stibnite Gold Project, and supporting documents, provide relevant new information that address the issue of whether Perpetua has legal control to preclude public access from the Access Route.

On June 12, 2024, the Board issued an Order on petitions for Reconsideration and/or Clarification of Final Order, which stayed the statutory deadlines under Idaho Code ("I.C.") § 67-5246 for the May 9, 2024 Final Order until other issues (ambient arsenic concentration) remanded back to the Hearing Officer were resolved. REC 3840 (stating the Board "will stay issuance of a final order on all five issues until the remand before the Hearing Officer is complete and all statutory deadlines for review of the Hearing Officer's Orders have run."). On May 27, 2025, the Board issued its Order on the remaining arsenic issues. This Motion for Reconsideration is timely brought under Idaho Code §§ 67-5246, 67-5276 and IDAPA 04.11.01.740.

BACKGROUND

In this contested case, Petitioners Nez Perce Tribe, Idaho Conservation League, and SSFS challenge the DEQ's approval of a permit to construct issued to Perpetua for the proposed Stibnite Gold Project (the "Project"): a massive open-pit mine in Valley County, Idaho.

On June 17, 2022, DEQ issued permit to construct P-2019.0047 (the "Permit"), which is the Permit at issue in this contested case. On July 22, 2022, Petitioners timely filed the original

Petition to Initiate Contested Case. One of the claims Petitioners raised was that DEQ acted unreasonably and not in accordance with the law when it determined, without specific evidence, that Perpetua would have legal control of the Stibnite Road Access Route such that it could exclude the Access Route from ambient air.

After briefing and a hearing on cross-motions for summary judgment in front of the Board, on May 9, 2024, the Board issued a Final Order, holding that "DEQ Acted Reasonably and in Accordance with law When it Determined that Perpetua Will have Legal Control of the Stibnite Road Access Route Such that it could Properly be Excluded from Consideration as Ambient Air." REC 3717. Specifically, the Board stated:

> Perpetua will have to obtain permission from the [Forest Service], to operate the mine. Part of obtaining permission from the [Forest Service] will involve an evaluation of the project under the National Environmental Policy Act ("NEPA"). During the NEPA process, the [Forest Service] will evaluate continuing access to the [Stibnite Gold Project] by the general public. The record demonstrates that "[o]ne of the alternatives currently being evaluated in the Draft environmental impact statement (EIS), Alternative 2, would provide continuing access through the [Stibnite Gold Project] site on a realigned Stibnite Road during mine operations." REC 893. However, it is noted that the "implementation of this Plan [Alternative 2 with continuing public access through the site] is contingent upon the selection of the applicable alternative by the [Forest Service] as the preferred alternative for the [Stibnite Gold Project] and inclusion of the proposed Stibnite Road access route as a component of the approved [Stibnite Gold Project]." REC 893, see also REC 895–896 (describing alternatives for alignment of the access route.).
>
> The NEPA process is not yet complete, and no final EIS has been issued by the [Forest Service]. Transcript p. 38, ln. 12. Thus, the record does not contain any evidence that the USFS will require continuing public access through the [Stibnite Gold Project]. DEQ recognized at oral argument that, should the [Forest Service] ultimately require public access through the [Stibnite Gold Project], the ambient air boundary analysis will have to be reevaluated. Transcript p. 88 ln. 19–p.89 ln. 17. The Board of

> Environmental Quality will not speculate as to the outcome of the [Forest Service] NEPA process and finds there is not sufficient evidence to support a conclusion that Perpetua will not have legal authority to control access to the federal lands within the project boundaries.

REC 3699-3700. The Board held that, without further "evidence suggesting that Perpetua will not have legal authority to prevent the general public from" using the Access Route, "[i]t was reasonable for DEQ to rely on Perpetua's representations in its application" that Perpetua would have legal control. REC 3701.

Since the May 9, 2024 Final Order was issued, the Final Environmental Impact Statement ("FEIS") and Record of Decision ("ROD") have been issued. *See* Thrower Decl., Ex. 1 (FEIS); Thrower Decl., Ex. 2 (ROD). As discussed in detail below, statements from the FEIS and ROD unequivocally demonstrate that "the [Forest Service] will require continuing public access through the [Stibnite Gold Project]." Accordingly, consistent with the U.S. Environmental Protection Agency ("EPA") policy, DEQ guidance, and the Clean Air Act, the Access Route cannot be excluded from ambient air protections and the Board should remand the Permit back to DEQ to reevaluate the ambient air boundary analysis.

MEMORANDUM IN SUPPORT

I. New information demonstrates Perpetua does not have legal control to preclude public access over the Stibnite Road Access Route.

On January 3, 2025, the Forest Service completed the environmental review process and issued the FEIS and ROD for the Stibnite Gold Project. The Forest Service's final decision documents unequivocally establish that the Stibnite Road Access Route is for public use and that Perpetua does not have legal authority to preclude such use. Specifically, the FEIS describes the Access Route in the alternative that was ultimately chosen as a route specifically for public use to access recreational sites on public land:

Under both action alternatives, there would also be a controlled public access route through the SGP during the operations, and closure and reclamation phases; however, public access would be intermittently interrupted during the construction phase. Thrower Decl., Ex. 1 (FEIS at ES-25).

All Phases: Access Routes: Construction/Operations: Access route around the Yellow Pine pit for public access. Thrower Decl., Ex. 1 (FEIS at 2-4 (Table 2.2-1).

Seasonal public access through the Operations Area Boundary provided by constructing new road through Yellow Pine pit and below mine haul road to link Stibnite Road to Thunder Mountain Road. Thrower Decl., Ex. 1 (FEIS at 2-5).

The Stibnite Road portion of the route is also a county-maintained native surface road, open to all vehicles with seasonal restrictions due to snow. This road is plowed in the winter by Perpetua through an agreement with Valley County. Stibnite Road connects to Thunder Mountain Road on the southeastern portion of the Stibnite site and currently provides seasonal (non-winter) public access through the site. Thrower Decl., Ex. 1 (FEIS at 2-15).

A new 4-mile long, 12-foot-wide gravel road would be constructed to provide public access from Stibnite Road (FR 50412) to Thunder Mountain Road through the SGP (Figure 2.4-2). The road would be constructed on a widened bench on the west side within the Yellow Pine pit, then head south of the Yellow Pine pit, where this road would utilize an underpass to cross under a SGP haul road and continue southward, parallel to and on the east side of the mine haul road on a partially revegetated portion of a former haul road (Figure 2.4-2). Southwest of the ore processing area, the public access road would connect with Thunder Mountain Road and continue toward the worker housing facility, exiting the SGP to the southeast. Thrower Decl., Ex. 1 (FEIS at 2-20).

During operations, the public access road through the Operations Area Boundary would provide seasonal use, open to all vehicles . . . . * * * Perpetua could restrict access to any vehicles due to concerns related to public or employee health and safety, such as during road construction and maintenance, blasting, highwall scaling, mining in the immediate area of the road, and similar operations. Thrower Decl., Ex. 1 (FEIS at 2-20).

A new 12-foot-wide gravel road would be constructed to provide public access from Stibnite Road (FR 50412) to Thunder Mountain

Road (FR 50375) through the SGP. During operations, the public access road would be used to travel through the SGP and would provide seasonal use, open to all vehicles. Thrower Decl., Ex. 1 (FEIS at 2-115).

The SGP may affect access to public lands during mine construction, operations, and closure and reclamation: Mine site public access during operations (not plowed). Thrower Decl., Ex. 1 (FEIS at 2-159 (Table 2.8.1)).

There would be public access through the Operations Area Boundary, which may result in less displacement of use to areas/facilities accessed from Thunder Mountain Road (FR 50375). Thrower Decl., Ex. 1 (FEIS at 2-164).

Stibnite Road connects to Thunder Mountain Road on the southeastern portion of the Stibnite mine site and currently provides public access through the mine area. Thrower Decl., Ex. 1 (FEIS at 3-423).

During operations, restricted public access through the site would be provided by constructing a new road around the Yellow Pine pit and below the mine haul road to link Stibnite Road to Thunder Mountain Road. Thrower Decl., Ex. 1 (FEIS at 4-36).

The 2021 MMP would include a 12-foot-wide gravel road to provide public access from Stibnite Road (FR 50412) to Thunder Mountain Road (FR 50375) through the SGP. Perpetua received a final PTC from IDEQ on June 17, 2022. This application proposed to exclude the public road on the basis of restricted access and maintaining full control, and that people traveling on the road would be considered "guests of the mine." IDEQ accepted the private road concept proposed by Perpetua . . . Thrower Decl., Ex. 1 (FEIS at 4-43).

Providing public access through the SGP reduces the miles of new motorized trails open to all vehicles in the Meadow Creek IRA, and this is expected to reduce net air quality effects due to vehicles traversing the SGP area. Thrower Decl., Ex. 1 (FEIS at 4-61).

Access to and through the Operations Area Boundary would be maintained during construction, operation, and closure and reclamation. There would be public access through the Operations Area Boundary during construction and operations via a new gravel road constructed to connect Stibnite Road to Thunder Mountain Road. Thrower Decl., Ex. 1 (FEIS at 4-78 – 4-79).

The reroute of Stibnite Road and the designation of a temporary OSV route to replace an existing OSV route are actions that fall under the Travel Management Rule (36 CFR 212), Subparts B and C, respectively (FSM7715.03(5)). These actions require consideration under the Travel Management Rule Minimization Criteria (36 CFR 212.55(b)). Thrower Decl., Ex. 1 (FEIS at 4-593).

The impacts to public access through the Operations Area Boundary would be the same as under the 2021 MMP. The public access road would provide access to recreation sites/areas via Thunder Mountain Road; therefore, the access road would allow continuous access to the Thunder Mountain Road sites/areas. Thrower Decl., Ex. 1 (FEIS at 4-597).

The reroute of Stibnite Road and the designation of a temporary OSV route to replace an existing OSV route are actions that fall under the Travel Management Rule (36 CFR 212), Subparts B and C respectively (FSM7715.03(5)). These actions require consideration under the Travel Management Rule Minimization Criteria (36 CFR 212.55(b)). The Travel Management Rule analysis was added to Section 4.19 of the Final EIS. Thrower Decl., Ex. 1 (FEIS, Appx. B at B-29).

Further the comment expresses concern about public access restrictions, which would be anticipated more so during mine construction. Public access would not be allowed on the newly constructed Burntlog Route segments; therefore, the public would need to utilize the public access route through the mine site to connect to Thunder Mountain Road once constructed. Thrower Decl., Ex. 1 (FEIS, Appx. B at B-496).

Section 4.16 of the SDEIS states that a permanent service road through the backfilled Yellow Pine pit would be established for public access, which would result in a total of approximately 2.2 additional miles of new road that would be accessible for public use following reclamation. Thrower Decl., Ex. 1 (FEIS, Appx. B at B-500).

Under the 2021 MMP, there would be a public access route through the SGP during the operations, and closure and reclamation phases, however, public access would be intermittently interrupted during the construction phase. Public access through the SGP would provide motorized access to Thunder Mountain Road. Thrower Decl., Ex. 1 (FEIS, Appx. B at B-502).

> Overall, public access and motorized vehicle use in the analysis area would still be permitted. Thrower Decl., Ex. 1 (FEIS, Appx. B at B-503).

The ROD–which is a legally binding document that provides the specific conditions that the Forest Service mandated in its approval of the Project and must be met by Perpetua[1]–unequivocally states that the Access Route is a new road built through the Stibnite Gold Project, and specifically for public access and open to all vehicles:

> A new 12-foot-wide gravel road will be constructed to provide public access from Stibnite Road (FR50412) to Thunder Mountain Road (FR 50375) through the Stibnite Gold Project. During operations, the public access road will be used to travel through the Stibnite Gold Project and will provide seasonal use, open to all vehicles. Thrower Decl., Ex. 2 (ROD at 74 (Table 6), 102).

These statements establish that: (1) the Stibnite Road Access Route will be constructed to provide public access through the mine site; (2) the Access Route will be open to "all vehicles" seasonally in a similar manner to current county maintenance standards; (3) the Access Route for public access will be separated from other mine roads and features where the public will not be allowed to access; and (4) although Perpetua has control to impose safety restrictions on the Access Route, the Access Route is open for public use. In short, the FEIS and ROD provide significant evidence that Perpetua does not have legal control to preclude public access over the Access Route.

Notably, allowing public access over the Access Route was analyzed in the FEIS (and ultimately approved in the ROD) pursuant to the Forest Service's Travel Management Rule, which governs the designation of roads and trails for motor vehicle use on National Forests, requires public involvement, and requires consideration of minimization criteria. Thrower Decl.,

[1] "Regulatory and Forest Service requirements and requirements associated with environmental design features are listed in Tables 5 and 6, and made conditions of this decision. These tables are also contained in the FEIS as Tables 2.4-12 and 2.4-13." Thrower Decl., Ex. 2 (ROD at 54).

Ex. 1 (FEIS at 4-593); *see* 36 C.F.R. §§ 212.51, 212.52, 212.55. Even more, revision of those designations–e.g., closure of the Access Route to public use–would require further public involvement and further analysis of the minimization criteria. 36 C.F.R. § 212.54.

In other words, because the Access Route is a designated road open to public use under the Travel Management Rule, Perpetua does not have the legal control to preclude public use; only the Forest Service has that authority after meeting "the requirements for public involvement in § 212.52, the requirements for coordination with governmental entities in § 212.53, and the criteria in § 212.55 . . . ." *Id.* § 212.54. Consequently, although Perpetua has been given legal control to restrict public access for safety purposes, *see* Thrower Decl., Ex. 1 (FEIS 2-20), it does not have control to preclude public access through the entirety of operations.

The final EIS and ROD provide the specific evidence that the Board determined was lacking to make a determination that "the USFS will require continuing public access through the [Stibnite Gold Project]." REC 3699. At a minimum, based on this information, the Board should hold DEQ to its word that "should the USFS ultimately require public access through the [Stibnite Gold Project], the ambient air boundary analysis will have to be reevaluated." REC 3699 (citing Transcript p. 88 ln. 19-p.89 ln. 17).

II. Without legal control to preclude public access, EPA policy, DEQ guidance, and the Clean Air Act mandate that DEQ cannot exclude the Stibnite Road Access Route from ambient air.

The Clean Air Act and Idaho's Air Rules, IDAPA 58.01.01 *et seq.*, require Perpetua to meet various air quality standards, including the National Ambient Air Quality Standards ("NAAQS") and acceptable ambient concentrations of carcinogens ("AACCs") for toxic air pollutants ("TAPs"), in ambient air. *See*, *e.g.*, Air Rules Sections 006.11 (NAAQS), 006.125 (TAPs). By contrast, in areas excluded from ambient air, a facility does not have to demonstrate

compliance with the NAAQS or TAPs. Both EPA and DEQ define "ambient air" as "that portion of the atmosphere . . to which the general public has access." 40 C.F.R. § 50.19(c); Air Rules Section 006.10. "The essence of EPA's regulatory definition of ambient air links ambient air to public access." *Resisting Envtl. Destruction on Indigenous Lands (REDOIL) v. U.S. EPA*, 716 F.3d 1155, 1164 (9th Cir. 2013). EPA's long-standing policy, therefore, has been to exempt from ambient air only "the atmosphere over land owned or controlled by the source and to which public access is precluded." REC 1138.

The Stibnite Road Access Route is a public access road traversing the Project site (*see* Fig. 1 below), and the Forest Service has chosen the mine alternative that will provide–not preclude–public access to the Access Route traversing the Project site. *See* Thrower Decl., Ex. 2 (ROD at 74 (Table 6)).

//

//

//

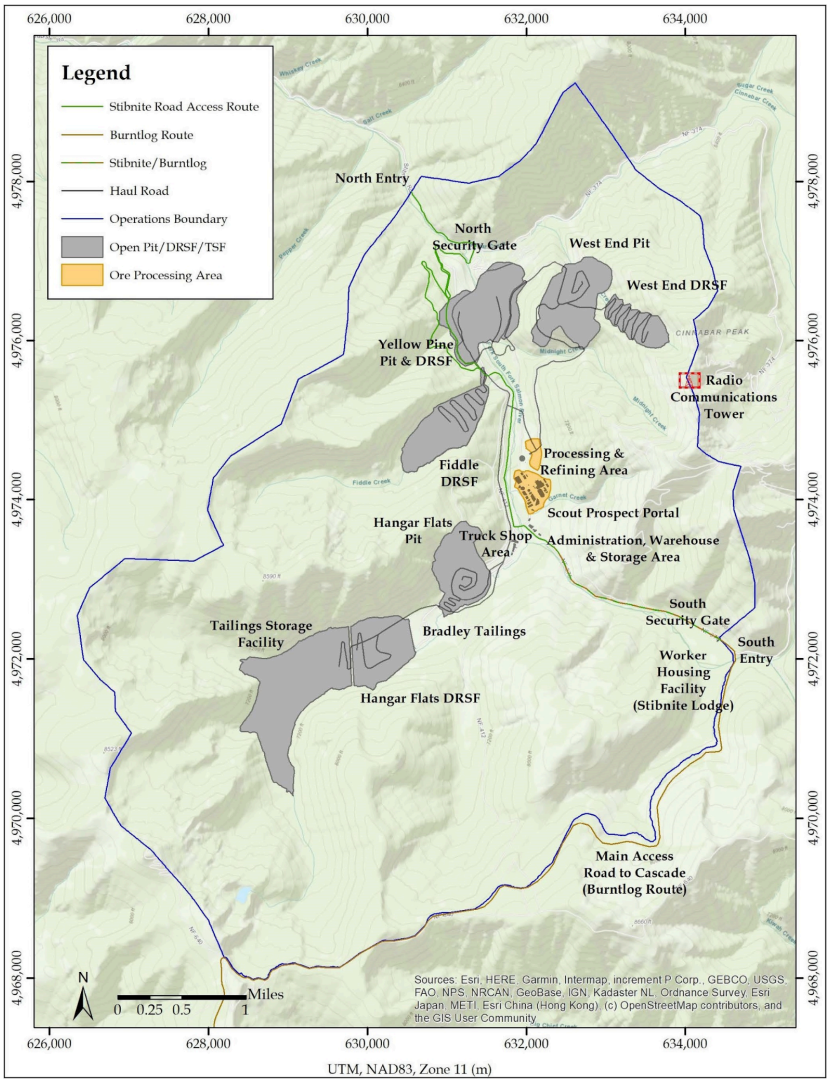
//

//

//

//

//



//

//

//

//

Fig. 1. Map reproduced from SOB (REC 0415) showing Project operations boundary, which is also the DEQ-approved ambient air boundary. The Stibnite Road Access Route is shown in green.

The importance of maintaining public access was highlighted in public comments received through the National Environmental Policy Act ("NEPA") process for the Project, "particularly for those in the Johnson Creek and Yellow Pine area who use Stibnite Road to access Thunder Mountain Road and points beyond." REC 0895. Maintaining access to these important recreational areas "is consistent with the [Forest Service] travel management plan." REC 0896. The Access Route will be *the only* way that the public will be able to access these

recreational sites on public lands as the Forest Service determined that the "Main Access road to Cascade (Burntlog Route)," *see* Figure 1, above, will not be open for public use during mine operations. Thrower Decl., Ex. 2 (ROD at 28) ("Public use of the Burntlog Route will be restricted. Seasonal use of the newly constructed portions of the Burntlog Route will be allowed *only* during the snow-free portion of Year -1 when there would be no other access to the Thunder Mountain Road".) (emphasis added); *see also* Thrower Decl., Ex. 1 (FEIS, Appx. B at B-496).

Because the public will be able to use the Access Route, it is ambient air where health-based air quality standards must be met. DEQ, however, excluded Perpetua's entire operations boundary showing in Fig. 1 below–including the Access Route–from ambient air. DEQ's decision to exclude the Access Route from ambient air cannot be squared with the CAA, the Air Rules, and EPA's national ambient air policy.

According to the Supreme Court in *Train v. Natural Resources Defense Council, Inc.*, 421 U.S. 60, 65 (1975), ambient air "is the statute's term for outdoor air used by the general public." EPA's policy for excluding certain portions from ambient air explains:

> [T]he EPA's policy allowing exclusion of some areas external to buildings is not based on language in the regulatory definition mandating exclusion or providing particular criteria for such an exclusion, but rather, is inferred as the inverse of what is affirmatively covered by that definition (*i.e.*, if "ambient air" is defined as that to which the general public has access, then that to which the general public does not have access is not ambient air. . . . The EPA continues to view the "general public" to include any person(s) other than those who are permitted access to the property as employees or business invitees of a specific stationary source (including trespassers).

REC 1145. Above all, EPA has long recognized that certain areas external to buildings may be excluded from the regulatory definition of ambient air because *the general public does not have access to them*." REC 1140 (emphasis added):

> [T]he general public does not have access to land occupied by a stationary source . . . when the land meets [two conditions:] (1) it is owned or controlled by the owner or operator . . .; and (2) the land is surrounded by a fence or other physical barriers that preclude general public access.

REC 1141; *see also* REC 1109 (DEQ guidance stating the same). "Controlled" means the owner or operator has "'the power to control public access' and 'the power to *exclude* the general public.'" REC 1141 (emphasis added). It is clear from EPA's policy that the exemption from ambient air is available only for areas where the general public *will be precluded from entering*–both because there is no legal right to access, as well as no "physical or practical access." REC 1145.

DEQ's guidance is similar to EPA's policy in that it "assume[s] that the air within the facility boundaries is ambient air unless the facility can demonstrate that public access is *precluded*." REC 1109. "The facility-proposed ambient air boundary must include justification that demonstrates the facility has reasonable control of the area *and effectively precludes public access on a routine basis*." *Id.*

Here, the Permit does not preclude access by the general public because it can't. Rather, the Permit allows, and the FEIS and ROD require, public access over the Access Route, and therefore, the Permit inappropriately exempts the Access Route from ambient air.[2]

//

//

[2] The fact that the FEIS Errata states that "[b]ecause public use of the road would be subject to Perpetua's control measures on general use, the public access road is not considered a public road" does not change the analysis. *See* Thrower Decl., Ex. 3 (FEIS Errata at 1). Under EPA's ambient air policy, ownership of the road or property is inconsequential as long as the public has the right to traverse it: "Although a source may restrict public access onto his or her private property, the owner and the individuals that are permitted access to his or her downwind property are, generally speaking, members of the general public relative to the upwind stationary source." REC 1145.

III. DEQ's determination that the public were "guests of the mine" is inconsistent with DEQ guidance, EPA policy, and the Clean Air Act.

When issuing the Permit, to circumvent the problem that it could not preclude public use on the Access Route but the air above the Access Route is not ambient air, DEQ maintained that the "roadway is not public" because Perpetua "has sole control of access through the site" and "is not obligated to allow access." REC 0956; REC 0958. The FEIS and ROD, as discussed above, demonstrate that is not the case. Control of the Access Route is a public use road pursuant to its designation as one under the Travel Management Plan. Perpetua does not have sole control to preclude public access.

Furthermore, DEQ erroneously rationalized because Perpetua will have the ability to "state the conditions of allowed access," the general public passing through the mine site to access public land are now "guests of [Perpetua] in the same manner as those touring the facility as part of a classroom fieldtrip [sic]." REC 0956. Disavowing itself of any responsibility for mine "guests," including schoolchildren, DEQ explained: "Since those requesting access to the site are guests of [Perpetua] and no longer members of the public, health and safety of such guests . . . is the responsibility of [Perpetua] and outside of the scope of the [Permit]." REC 0936. DEQ's rationalization is disingenuous, and as EPA warns in its policy "would expand the exclusion beyond reason and deny the protection of the NAAQS to large numbers of people." REC 1145.

Moreover, those guidelines state that an applicant's proposal to exclude an area from ambient air "must include justification that demonstrates the facility has reasonable control of the area and *effectively precludes public access on a routine basis*." REC 1109 (emphasis added). Notably, DEQ guidelines identify the precise situation here—when "general public [is] allowed on site as a part of a right-of-way easement or common service road"—as being ambient air.

REC 1110. DEQ guidelines also provide that the "'general public' is considered anyone not directly associated with the facility." REC 1109. The fact that the Access Route was authorized to be built specifically to provide public access, and is a designated motorized route under the Travel Management Plan, and users of the Access Road have no ability to access any of the mining facilities, contradicts DEQ's assertion that people traveling to access public lands are "guests" of the mine. *See* Thrower Decl., Ex. 1 (FEIS at 2-5) ("Seasonal public access through the Operations Area Boundary provided by constructing new road through Yellow Pine pit and below mine haul road to link Stibnite Road to Thunder Mountain Road."); REC 0895.

DEQ's guidance is consistent with EPA's policy:

> The EPA continues to view the "general public" to include any person(s) other than those who are permitted access to the property as employees or business invitees of a specific stationary source (including trespassers). Although a source may restrict public access onto his or her private property, the owner and the individuals that are permitted access to his or her downwind property are, generally speaking, members of the general public relative to the upwind stationary source.

REC 1145.

Notably, throughout the entirety of this case before the Office of Administrative Hearings and this Board, DEQ has never identified a single case where it has allowed the general public to travel through a facility where the route is exempt from ambient air protections.

Nothing in the Idaho Air Rules, DEQ's guidance, EPA policy, or DEQ's past practice suggests that, because "access for all guests will be carefully managed," the public is not afforded the protections of ambient air under the CAA.

The record thus does not, and cannot, demonstrate that Perpetua may legally or practically preclude public access to the Access Route, and DEQ's determination to the contrary was unreasonable, as was its decision to label the public as "guests of the mine." DEQ's

determination was not well-reasoned, and is inconsistent with the Idaho Air Rules, the CAA, and EPA policy. The Hearing Officer should vacate the permit and remand it back to DEQ for further review.

IV. The Permit must be set aside and remanded to re-evaluate the conditions in light of the new information.

Under the Idaho APA, when an agency action is not affirmed by a court, it "shall" be set aside, in whole or in part, and remanded for further proceedings as necessary. I.C. § 67-5279. *See also In re Variance ZV2011-2*, 156 Idaho 491, 496 (Idaho 2014) (vacating and remanding arbitrary agency action for further proceedings consistent with the Court's opinion).

Here, DEQ admitted in oral argument before the Board that if new information or changed circumstances would require DEQ "change the analysis" and "go back to the drawing board on the permit:

> BOARD CHAIR BOWEN: And just one follow-up. Let's say the permit goes through the NEPA process with U.S. Forest Service, and they determine or their stipulation is that you must provide public access through the site. What happens to the permit if they make a general ruling like that? What's the status of the permit?
>
> MS. YOUNG: Yes, that would be a change in circumstances; right? And not to throw Perpetua under the bus here, but that's a little bit of the risk that they took by applying for the process while the NEPA process was still ongoing. You know, but the bottom line -- and I don't want to -- Mr. Pooser will talk about this much more eloquently than I -- but the importance of the mine plan and why a lot, not just this piece, is riding on the mine plan. If the mine plan's not approved, then there's no project anyway so then they don't need an air permit anyways, right? But if it were to be approved with that caveat that they would have to be -- general public on that road, for example, that would change the analysis, and we'd probably have to go back to the drawing board on the permit.

Tr. 88:19-25, 89:1-17.[3] Because the Forest Service has unequivocally approved the mine plan that requires the Access Route to be open to public use; has designated the Access Route for public use under the Travel Management Rule, and because Perpetua has no legal authority to preclude public use, the Board should set aside the Permit and remand to DEQ for consideration of the new information and re-evaluation of whether the Access Route should be considered as ambient air.

CONCLUSION

The Forest Service has made its final determination regarding public use of the Stibnite Road Access Route; the Access Route is a designated motorized route open to the public, and Perpetua cannot change that designation. Neither DEQ nor the Board need to "speculate" any more about the status of public use of the Access Route. REC 3700. This new information presents sufficient evidence that Perpetua does not have legal authority to control the Access Route to preclude public use. As such, consistent with DEQ guidance, EPA policy, the Idaho Air Rules, and the Clean Air Act, the Access Road cannot be excluded from ambient air. The new information also demonstrates that DEQ's attempt to put a square peg in a round hole by calling the public "guests of the mine" will not suffice to comply with the law.

The Board should remand the Permit back to DEQ for reconsideration of the ambient air boundary analysis.

Dated June 6, 2025

Respectfully submitted,

/s/ Julia Thrower

Attorney for Save the South Fork Salmon

BEFORE THE BOARD OF ENVIRONMENTAL QUALITY
STATE OF IDAHO

IN THE MATTER OF AIR QUALITY PERMIT TO CONSTRUCT P-2019.0047	)	Agency Case No. 0101-22-01 OAH Case No. 23-245-01
NEZ PERCE TRIBE, IDAHO CONSERVATION LEAGUE, and SAVE THE SOUTH FORK SALMON Petitioners, v. IDAHO DEPARTMENT OF ENVIRONMENTAL QUALITY, Respondent, and PERPETUA RESOURCES IDAHO, INC. Intervenor-Respondent.	)	**DECLARATION OF JULIA THROWER**

I, JULIA THROWER, hereby declare as follows:

1. The following facts are personally known to me, and if called as a witness, I could and would competently testify thereto. I am over eighteen years of age.

2. I am counsel of record representing Petitioner Save the South Fork Salmon in this matter.

3. The attached Exhibits 1, 2, and 3 are true and correct copies of the following documents or excerpts of those documents, which were obtained online from the Payette National Forest Stibnit Gold Project EIS website: https://www.fs.usda.gov/project/?project=50516.

4. Exhibit 1 contains excerpts from the U.S. Forest Service, Stibnite Gold Project Final Environmental Impact Statement (January 2025).

5. Exhibit 2 contains excerpts of the U.S. Forest Service, Payette and Boise National Forests, Final Record of Decision, Stibnite Gold Project, Valley County, Idaho (January 2025).

6. Exhibit 3 contains excerpts of the U.S. Forest Service, Payette and Boise National Forests, Stibnite Gold Project, Final Environmental Impact Statement Errata (January 2025).

I declare under penalty of perjury that the foregoing is true and correct to the best of my knowledge, information and belief, and based on my personal experiences.

Signed this 6th day of June 2025, in McCall, Idaho.

/s/ Julia Thrower
Julia S. Thrower

CERTIFICATE OF SERVICE

I hereby certify that I have this 6th day of June 2025, served a true and correct copy of the foregoing DECLARATION OF JULIA THROWER upon all parties of record in this proceeding by delivering a copy by e-mail to the following:

Stibnite Gold Project

Final

Environmental Impact Statement

Forest Service, Region 4, Payette and Boise National Forests, Valley County, Idaho

REC 7396

Lead Agency:	USDA Forest Service
Cooperating Agencies:	U.S. Army Corps of Engineers, U.S. Environmental Protection Agency, Idaho Governor's Office of Energy and Mineral Resources, Idaho Department of Lands, Idaho Department of Water Resources, Idaho Department of Environmental Quality, Valley County
Responsible Official:	Matthew Davis, Forest Supervisor, Payette National Forest 500 N. Mission Street, Building 2, McCall, Idaho 83638 Phone: (208) 634-6945
For Information Contact:	Brian Harris, Public Affairs Officer, Payette National Forest 500 N. Mission Street, Building 2, McCall, Idaho 83638 Phone: (208) 634-0784 Email: brian.d.harris@usda.gov
Abstract:	This Final Environmental Impact Statement (EIS) is a public document that discloses the direct, indirect, and cumulative effects of the proposed action and alternative actions for the Stibnite Gold Project. This document follows the format established in the Council on Environmental Quality (CEQ) regulations (40 Code of Federal Regulations [CFR] Parts 1500–1508). It includes a discussion of the purpose and need for the proposal; alternatives to the proposal; the physical, biological, social, and economic impacts of the proposed action and alternatives; and a listing of agencies and persons consulted. The document tiers to and incorporates by reference material in the Final EIS and record of decision (ROD) for the 2003 Land and Resource Management Plan (Forest Plan), as amended for the Payette National Forest, and the Final EIS and ROD for the 2010 Boise Forest Plan.

Written Correspondence on this Final EIS can be directed to:

Matthew Davis, Payette Forest Supervisor
Stibnite Gold Project
500 N. Mission Street, Building 2, McCall, Idaho 83638

Electronic Correspondence on this Final EIS can be directed to: Link available on Project website

Please state "Stibnite Gold Project" in the subject line when providing any electronic correspondence, or on the envelope when providing correspondence by mail. Electronic correspondence must be submitted in a common digital format such as plain text (.txt), rich text format (.rtf), Word (.doc, .docx) or PDF (.pdf).

In accordance with Federal civil rights law and U.S. Department of Agriculture (USDA) civil rights regulations and policies, the USDA, its Agencies, offices, and employees, and institutions participating in or administering USDA programs are prohibited from discriminating based on race, color, national origin, religion, sex, gender identity (including gender expression), sexual orientation, disability, age, marital status, family/parental status, income derived from a public assistance program, political beliefs, or reprisal or retaliation for prior civil rights activity, in any program or activity conducted or funded by USDA (not all bases apply to all programs). Remedies and complaint filing deadlines vary by program or incident. Persons with disabilities who require alternative means of communication for program information (e.g., Braille, large print, audiotape, American Sign Language, etc.) should contact the responsible Agency or USDA's TARGET Center at (202) 720-2600 (voice and TTY) or contact USDA through the Federal Relay Service at (800) 877-8339. Additionally, program information may be made available in languages other than English. To file a program discrimination complaint, complete the USDA Program Discrimination Complaint Form, AD-3027, found online at http://www.ascr.usda.gov/complaint_filing_cust.html and at any USDA office or write a letter addressed to USDA and provide in the letter all of the information requested in the form. To request a copy of the complaint form, call (866) 632-9992. Submit your completed form or letter to USDA by: (1) mail: U.S. Department of Agriculture Office of the Assistant Secretary for Civil Rights 1400 Independence Avenue, SW Washington, D.C. 20250-9410; (2) fax: (202) 690-7442; or (3) email: program.intake@usda.gov. USDA is an equal opportunity provider, employer, and lender.

Executive Summary

Introduction

The Stibnite Gold Project (SGP) proposes mine operations on federal, state, and private lands located in Valley County, Idaho. This Final Environmental Impact Statement (Final EIS) was prepared in response to a revised Plan of Restoration and Operations (Plan) for the SGP. The Forest Service received the original SGP Plan in 2016, (Midas Gold Idaho, Inc. [Midas Gold] 2016a) for review and approval in accordance with regulations at 36 Code of Federal Regulations (CFR) 228 Subpart A. A revised Plan was submitted to the Forest Service in 2019 (Brown and Caldwell 2019a). A draft EIS (DEIS) evaluating five alternatives based on the revised Plan was released by the Forest Service in August 2020. A further modified Plan was initially submitted by Midas Gold in December 2020 with a revised submittal in October of 2021 (Perpetua 2021a). Midas Gold changed their name to Perpetua Resources Ltd (Perpetua) in February 2021. In consideration of the modified Plan, the Forest Service determined that a supplemental draft EIS (SDEIS) was warranted and released in October 2022. In the SDEIS, two of the previous action alternatives (August 2020 DEIS Alternatives 1 and 3) were eliminated from further consideration. Therefore, the SDEIS evaluated the Proposed Action, the Johnson Creek Route Alternative, and the No Action Alternative. After review and consideration of the public comments on the SDEIS, revisions were made to the Final EIS including addition of mitigation measures to offset Project effects. Environmental effects of the alternatives are described in this executive summary and a compilation and comparison of these effects is found in **Table 2.8-1** of this Final EIS.

The Forest Service is the lead agency in the preparation of this Final EIS (40 CFR 1501.5). The Project occurs on both the Boise and Payette National Forests; the Payette National Forest (PNF) is the agency lead. Cooperating agencies include the U.S. Army Corps of Engineers (USACE), U.S. Environmental Protection Agency (EPA), Idaho Governor's Office of Energy and Mineral Resources (OEMR), Idaho Department of Lands (IDL), Idaho Department of Environmental Quality (IDEQ), Idaho Department of Water Resources (IDWR), and Valley County, Idaho.

Purpose and Need

The Forest Service purpose is to consider approval of Perpetua's proposed use of the surface of NFS lands in connection with operations authorized by the U.S. mining laws as first described in the Plan submitted September 2016, then refined in 2019 (Brown and Caldwell 2019a), and further modified in 2021 as the 2021 Modified Mine Plan (2021 MMP; Perpetua 2021a). The Forest Service's need for action is to ensure that the proposed occupancy and use of NFS lands is consistent with statutory and regulatory requirements. For purposes of this environmental analysis, the agency is assuming the proposed uses would be able to be authorized under existing regulatory authorities.

The need for action is to:

- Consider approval of Perpetua's 2021 MMP for development of the SGP to mine and mill gold, silver, and antimony deposits that, where feasible, would minimize adverse environmental impacts on NFS surface resources; and ensure that measures are included that provide for mitigation of environmental impacts and reclamation of the NFS surface disturbance.

REC 7398

in slower travel times for non-mine-related traffic and may deter other travelers from using these roadways. Travelers may use alternative roadways including McCall-Stibnite Road to South Fork Salmon River Road.

During operations, mine-related traffic would include transport of employees to and from the SGP, delivery of supplies, and activities associated with road maintenance such as snowplowing and sanding. Under the 2021 MMP and the Johnson Creek Route Alternative, operational AADT would be 50 vehicles (33 heavy vehicles and 17 light vehicles), resulting in approximately four mine-related vehicles per hour traveling outside the SGP.

The upgraded Burnt Log Road and the newly constructed Burntlog Route would experience an increase in traffic of over 71 percent under the 2021 MMP, with 27.5 percent of the traffic comprised of heavy vehicles. Under the Johnson Creek Route Alternative, traffic on Johnson Creek Road and Stibnite Road would increase approximately 71 percent as well, also with 27.5 percent of the traffic comprised of heavy vehicles. Although heavy vehicles currently use Johnson Creek Route to access the SGP, the Johnson Creek Route Alternative traffic would result in a noticeable change in baseline driver experience and slower drive times due to the substantial increase in mine-related heavy vehicles along the Johnson Creek Route during the life of the SGP. Even though upgrades to Johnson Creek Road and Stibnite Road would be made, these roads would still have many curves and slopes.

During closure and reclamation, activities including slope recontouring, facility removal, seeding and planting, and post-closure environmental monitoring would require approximately 7 years. Closure and reclamation would generate a total estimated AADT of 27 vehicles (15 heavy vehicles and 12 light vehicles). Post-closure monitoring activities would generate a total estimated AADT of six light vehicles.

Local roads experience a seasonal effect which results in noticeable differences in traffic. Valley County has many summer recreational areas that attract visitors from May through October with peak AADT levels in June, July, and August. Mine access via the Johnson Creek Route would be more impactful on summer recreational traffic because it would utilize established roads rather than new road development. Winter driving conditions influence the amount of traffic and result in lower AADT levels during the winter months. Therefore, the effect of SGP traffic on these roads would show a noticeably greater increase in mine-related winter traffic during winter. Post-closure winter traffic would not be as noticeable as heavy vehicle deliveries would not occur and approximately six mine-related light vehicles per day would utilize the accessible roadways in the analysis area for monitoring and maintenance purposes.

Public Access

Under the 2021 MMP, public access to the SGP area would be enhanced by the development of a new access road (Burntlog Route) compliant with current road standards. Under both action alternatives, there would also be a controlled public access route through the SGP during the operations, and closure and reclamation phases; however, public access would be intermittently interrupted during the construction phase. Under the Johnson Creek Route Alternative, the Burntlog Route would not be constructed, and the Johnson Creek Route would be used for both public and SGP-related access. To continue providing OSV access to Landmark, a groomed OSV route between Warm Lake and Trout Creek Campground on Cabin Creek Road would be established as part of the 2021 MMP to connect to Landmark from Trout Creek

REC 7399

Campground via an OSV route on the west side of Johnson Creek Road, along with a parking area, resulting in a new winter access facility that would be maintained by Valley County.

Safety and Emergency Access

For the duration of the SGP, the increase in total volume of mine-related vehicles, specifically heavy vehicles or trucks, on the Johnson Creek and Burntlog routes would result in an increased risk for accidents occurring between public and SGP-related traffic due to the one-lane constraints during construction that restrict the passing of slower moving vehicles and due to increasing traffic on the road with more frequent heavy vehicle travel. Proposed controls for deliveries of hazardous materials would address the risk of accidents for those convoys. The steep terrain would be a greater risk to safety along the Johnson Creek Route under the Johnson Creek Route Alternative as it would be the only route used for the life of the SGP and would require safety considerations for geotechnical hazards, landslides, and avalanche zones, including intermittent and extended road closures during the four years of construction. Additionally, access into the SGP mine site under the Johnson Creek Route Alternative would be through a single point of ingress and egress and would require additional safety considerations for mine deliveries and public access. The steep climb to provide access around the Yellow Pine pit would require a wider road with more switchbacks to accommodate the heavy trucks transporting mine supplies and may increase hazardous driving conditions for crew rotation, emergency responses, and wildfire evacuation.

Other Modes of Transportation

Under both action alternatives, a helipad would be located at the SGP for exploration during daylight hours, Medevac purposes, and avalanche control activities. Approximately one round trip (two truck trips) of antimony concentrate would be hauled off-site daily. The daily shipment of antimony and the potential transport of supplies and materials to and from the SGP would generate minimal to negligible changes in regional water transportation. Although there is no commercial rail transportation system in the analysis area, there is potential for the trucks to transport mine products to rail lines located in Boise or for supplies and materials to be indirectly transported to and from the SGP by trucks originating from rail shipments. Nevertheless, these impacts would generate negligible changes to rail transport during operation of the SGP and would not substantially alter the regional level of service.

Heritage Resources

Of the 250 heritage resources in the area of potential effects (APE), 100 have been determined not eligible for listing on the National Register of Historic Places (NRHP) and would require no further management. The remaining 150 sites, however, would require additional consideration and/or management if impacted by the SGP and its components and include 64 resources documented as eligible for listing on the NRHP, three NRHP-listed resources, and 83 resources identified as unevaluated for listing on the NRHP. Unevaluated heritage resources are addressed the same way as NRHP-eligible heritage resources for the assessment of impacts, until their eligibility is determined.

Under the 2021 MMP, 53 historic properties would be within the physical and visual/auditory/vibratory (VAV) APE and an additional 97 historic properties within the VAV APE only.

Under the Johnson Creek Route Alternative, a total of 51 historic properties are located within the physical and VAV APEs and an additional 84 historic properties are located only within the VAV APE.

2.0 ALTERNATIVES INCLUDING THE PROPOSED ACTION

2.1 Introduction

Chapter 2 describes the action proposed by Perpetua in its 2021 MMP submitted in October 2021 (Perpetua 2021a), an additional alternative utilizing another access route, and the No Action Alternative. Each alternative (including the No Action Alternative) would result in different environmental effects, which are analyzed in detail in Chapter 4. In addition, **Section 2.6** includes a discussion of other alternatives considered but eliminated from further analysis. **Section 2.7** summarizes the Agency Preferred Alternative. **Section 2.8** concludes with a comparative summary of the environmental effects.

2.2 Development of Alternatives

2.2.1 Regulatory Setting for Alternatives Development

Alternatives to the Proposed Action were developed by the Forest Service, with input from other cooperating agencies, guided by the NEPA, CWA, and U.S. Department of Agriculture Forest Service regulations (40 CFR 1502.14, 40 CFR 230, and 36 CFR 220.5, respectively), Forest Service Region 4 guidance, and the FSH. The Organic Administration Act, and Forest Service regulations at 36 CFR 228 Subpart A, governing mineral development on NFS lands also provided guidance regarding alternatives development.

2.2.2 Alternatives Screening Criteria

As used in this EIS, an action "alternative" is a complete package of operations, activities, and facilities that comprise a functioning mine project. A complete mining plan has several "component" parts, each necessary to allow production. In many instances, operational components may be further comprised of "subcomponents." To develop a range of reasonable alternatives, Perpetua's plan of operations, as supplemented by additional information and clarifications, was separated into components and subcomponents.

Public comments received during scoping provided early input into potential alternatives to the proposed SGP. An iterative review by the Forest Service and cooperating agencies, evaluated these comments to determine whether they were reasonable alternatives to the proposed SGP using four basic screening criteria described below. In addition to alternatives suggested during scoping, the Forest Service, cooperating agencies, and Perpetua also completed an alternatives development and review process. This process incorporated a review of the Plan and included consideration of alternatives Perpetua had already evaluated prior to the submission of their Plan (Midas Gold 2016a, Appendix G). Potential alternatives and component options were screened based upon four criteria:

1. Does the alternative, including a combination of component options, meet the purpose and need of the SGP?

2. Would the alternative or component option potentially reduce environmental effects to at least one resource?
3. Is the alternative or component option technically feasible?
4. Is the alternative or component option economically feasible?

Alternatives or component options not meeting the purpose and need (described in **Section 1.6**) were documented and eliminated first. Each remaining alternative was then evaluated for technical and economic feasibility and potential environmental impacts using the significant impact issues identified through the scoping process (**Section 1.10**). Infeasible alternatives or alternatives lacking any environmental benefit over the Proposed Action were then eliminated. In addition, options similar in design to an alternative that was carried forward into detailed analysis were screened out to avoid duplication. **Section 2.6** provides additional discussion of specific component alternatives and options that were considered but eliminated.

Further review of alternatives after consideration of comments on the DEIS and submittal of a 2021 MMP by Perpetua eliminated certain action alternatives considered in the DEIS (**Section 2.6**).

Project refinements included in the 2021 MMP: (1) are supported by updated data and analysis that identify opportunities to reduce potential environmental impacts; (2) further ameliorate potential environmental impacts; (3) are informed by public and agency comments on the DEIS, and; (4) align with the NEPA, and all applicable federal, State, and local regulations and permit requirements.

2.2.3 Alternatives Overview

As described below, there are two action alternatives and the No Action Alternative. In general terms, these alternatives are:

No Action Alternative – The No Action Alternative provides an environmental baseline for comparison of the action alternatives. Under the No Action Alternative, the mining, ore processing, and related activities under the action alternatives, including removal of legacy materials, would not take place. However, existing, and approved activities (i.e., approved exploration activities and associated reclamation obligations) would continue and Perpetua would not be precluded from subsequently submitting another plan of operations for consideration and evaluation pursuant to the General Mining Law of 1872.

2021 MMP – The 2021 MMP is based upon Perpetua's Modified Plan of Operations submitted in October 2021 for the SGP. The SGP operations footprint would be within the identified Operations Area Boundary (**Figure 2.4-1**). The Operations Area Boundary is defined as the ambient air boundary (Air Sciences 2018a) and encompasses 14,221 acres, of which 13,441 acres are NFS lands and 780 acres of private lands. Within the Operations Area Boundary, the SGP operations footprint is where mining activities would occur, such as explosives handling, blasting, drilling, and heavy equipment operation which require strict safety protocols and controlled access. For access, the 2021 MMP would utilize Warm Lake Road, Johnson Creek Road, and Stibnite Road (comprising the Johnson Creek Route) during construction of the Burntlog Route, then utilize the Burntlog Route for the last year of construction of the mine site through operations and reclamation. The 2021 MMP primarily refines the open pit mining, pit

backfill, water management, and closure aspects of the project compared to earlier Plan of Operations submittals.

In the 2021 MMP, public access on the newly constructed portions of the Burntlog Route was not restricted. Therefore, this EIS analyzed the effects of unrestricted public access along the existing and new portions of the Burntlog Route, describing the full Burntlog Route as available for access along with the potential effects of that access. Based on the analysis of these effects, restrictions on public access to the new portions of the Burntlog Route were developed by the Forest Service (see **Section 4.16.3**) and have been included in the draft Record of Decision.

Johnson Creek Route Alternative – The Johnson Creek Route Alternative was developed by the Forest Service and the cooperating agencies to evaluate potential reductions from access related effects. The mining portion of this alternative would be the same as the 2021 MMP. Therefore, the primary focus of the Johnson Creek Route Alternative is consideration of using an existing route, which would require improvements, for mine access during operations and reclamation instead of a route that under the 2021 MMP requires new road construction in and through IRAs.

2.2.4 Components Common to and Primary Differences Between the Action Alternatives

The following mine components would be common to the two action alternatives:

- Mine pit locations, areal extents, and mining and backfilling methods
- Transportation management on existing and proposed roads
- Pit dewatering, surface water management, and water treatment
- Ore processing
- Lime generation
- Tailings Storage Facility (TSF) construction and operation
- TSF Buttress construction methods
- Water supply needs and uses
- Management of mine impacted water and stormwater runoff
- Electrical transmission lines
- Stibnite Gold Logistics Facility (SGLF)
- A road maintenance facility (location different depending on alternative, see **Table 2.2-1**)
- Surface and underground exploration
- Stibnite Gold Project worker housing facility

These mine components are described under the 2021 MMP and would remain the same under the Johnson Creek Route Alternative. **Table 2.2-1** provides a summary of the differences between the action

alternatives. Because **Table 2.2-1** describes primary differences, not all the components listed above are included in the table.

Table 2.2-1 Action Alternatives Summary

SGP Phase	Component/ Subcomponent	2021 MMP	Johnson Creek Route Alternative
All Phases	SGP timeline	• Construction: Approximately 3 years. • Operations: Approximately 15 years. • Exploration: Approximately 17 years (during construction and operations). • Reclamation: Approximately 5 years (except for the TSF which would require an additional 9 years for tailings dewatering and consolidation). • Closure/Post-Closure Water Treatment: Approximately through Mine Year 40. • Environmental Monitoring: As long as needed.	Same as 2021 MMP except: • Construction: Approximately 5 years (upgrading the existing Johnson Creek and Stibnite Roads to provide permanent mine access).
All Phases	Access Roads	Construction/Operations: • Warm lake road from State Highway (SH) 55 to Johnson Creek Route intersection (34 miles). • Johnson Creek Route for SGP access during early construction with minor improvements within the road prism. • Burntlog Route (38 miles) for SGP access during last year of construction, mining and ore processing operations, and closure and reclamation. Includes improvements of existing segments (23 miles) and road construction for new segments (15 miles). • Up to eight borrow areas developed along Burntlog Route for materials needed for road improvements and maintenance. • Access route around the Yellow Pine pit for public access. Closure and Reclamation: • New sections of Burntlog Route to be reclaimed after the closure and reclamation period.	• Warm lake road from SH 55 to Johnson Creek Route intersection (34 miles). • Johnson Creek Route (39 miles: Johnson Creek Road 25 miles, Stibnite Road 14 miles) upgraded and used for access throughout life of mine (LOM) instead of the Burntlog Route. • Access route around the Yellow Pine pit for public access, employee access, and deliveries of supplies and equipment to the processing, warehouse, worker housing facility, and administration areas. • No improvements or construction of new segments for Burntlog Route. • Up to seven borrow sources developed along the Johnson Creek Route for materials needed for road improvements and maintenance. Closure and Reclamation: • Improved Johnson Creek and Stibnite roads would not be reclaimed to pre-existing conditions.

SGP Phase	Component/ Subcomponent	2021 MMP	Johnson Creek Route Alternative
All Phases	Public Access	Construction: • Temporary groomed over-snow vehicle (OSV) route on the west side of Johnson Creek from Trout Creek to Landmark while Burntlog Route is constructed (8 miles). • OSV route on Johnson Creek Road from Wapiti Meadows to Trout Creek Campground closed during construction (9 miles). • OSV route from Warm Lake to Landmark closed during construction through reclamation and closure (8.5 miles). • Cabin Creek Road groomed OSV route (11 miles). • Public roads remain open through the Operations Area Boundary with temporary closures as needed to accommodate construction. Operations: • Groomed OSV route moves from west side of Johnson Creek Road to Johnson Creek Road from Landmark to Wapiti Meadows (16.7 miles). • Stibnite Road (County Road [CR] 50-412) / Thunder Mountain Road (FR 50375) closed through the Operations Area Boundary. • Seasonal public access through the Operations Area Boundary provided by constructing new road through Yellow Pine pit and below mine haul road to link Stibnite Road (FR 50412) to Thunder Mountain Road (FR 50375). • Public access allowed on Burntlog Route to Thunder Mountain Road (FR 50375). Closure and Reclamation: • New road constructed over the Yellow Pine Backfill (backfilled Yellow Pine pit) connecting Stibnite Road (FR 50412) to Thunder Mountain Road (FR 50375).	Construction and Operations: Same as 2021 MMP except: • OSV route on the west side of Johnson Creek from Wapiti Meadows to Trout Creek Campground would be closed from construction through mine closure (9 miles). • Groomed OSV route on the west side of Johnson Creek from Trout Creek to Landmark lasting from construction through mine closure. Closure and Reclamation: Same as 2021 MMP.

OSV route would minimize the interactions between SGP traffic and recreational traffic in the winter. The proposed OSV route is illustrated in **Figure 2.4-4**.

- Expanded wintertime public vehicle access on Warm Lake Road east of Warm Lake Lodge would commingle SGP and public travel.

Changes to the SH 55 and Warm Lake Road intersection would improve access for large trucks carrying equipment and supplies to the SGP and would facilitate turns from SH 55 onto Warm Lake Road and from Warm Lake Road back onto SH 55. Any changes proposed to the intersection would need to be approved and implemented by the Idaho Transportation Department (ITD). Recommended changes to the intersection include: the addition of left and right turning lanes (Parametrix 2018a); an intersection modification to accommodate larger trucks; potential relocation of two power poles (HDR Engineering, Inc. [HDR] 2017a); and a modification to the westbound approach at Warm Lake Road to improve the view of traffic coming from the north.

Johnson Creek Route

During the initial construction period of the Burntlog Route (approximately 2 to 3 years), mine-related traffic would access the SGP from SH 55, north of the city of Cascade, via Warm Lake Road for approximately 34 miles, then north on Johnson Creek Road (CR 10-413) for approximately 25 miles to the village of Yellow Pine, and from Yellow Pine east approximately 14 miles to the SGP via the Stibnite Road (CR 50-412). The portion of the route that includes Johnson Creek Road and Stibnite Road is known as the Johnson Creek Route. This route is primarily situated topographically adjacent to the valley bottom, paralleling Johnson Creek and then the East Fork SFSR.

Johnson Creek Road is a county-maintained, native-surface road that is open to vehicles with seasonal restrictions due to snow. During the winter, Valley County plows approximately 10 miles of Johnson Creek Road from Yellow Pine south to Wapiti Meadow Ranch and grooms the remaining 17 miles of Johnson Creek Road from Wapiti Meadow Ranch to Warm Lake Road at Landmark for OSV use. Valley County does not plow Warm Lake Road from Warm Lake to Landmark; this section is a designated groomed OSV route.

The Stibnite Road portion of the route is also a county-maintained native surface road, open to all vehicles with seasonal restrictions due to snow. This road is plowed in the winter by Perpetua through an agreement with Valley County. Stibnite Road connects to Thunder Mountain Road on the southeastern portion of the Stibnite site and currently provides seasonal (non-winter) public access through the site.

Minor surface improvements (such as ditch and culvert repair, adding gravel, winter snow removal, resurfacing if required, and summer dust suppression) would occur on the Johnson Creek Route under the 2021 MMP to reduce sediment runoff and dust generation. However, there would be no road alignment modification or widening of these existing roads along the Johnson Creek Route. The road varies in elevation from approximately 4,750 to 6,700 feet amsl with an average grade of 1.5 to 2 percent with occasional local segments with grade up to approximately 8 percent.

2.4.4.4 Public Access

During construction of the SGP and completion of the Burntlog Route, to the degree practicable, the public would continue to have access on forest roads currently available to the public (**Figure 2.4-1**). However, public access through the Operations Area Boundary on Stibnite Road would be restricted for a period of approximately one year while a new through-site public access road is constructed. A new 4-mile long, 12-foot-wide gravel road would be constructed to provide public access from Stibnite Road (FR 50412) to Thunder Mountain Road through the SGP (**Figure 2.4-2**). The road would be constructed on a widened bench on the west side within the Yellow Pine pit, then head south of the Yellow Pine pit, where this road would utilize an underpass to cross under a SGP haul road and continue southward, parallel to and on the east side of the mine haul road on a partially revegetated portion of a former haul road (**Figure 2.4-2**). Southwest of the ore processing area, the public access road would connect with Thunder Mountain Road and continue toward the worker housing facility, exiting the SGP to the southeast.

During operations, the public access road through the Operations Area Boundary would provide seasonal use, open to all vehicles; access would not be provided in winter when impassable (current county maintenance standards) and signs would inform the public of seasonal and temporary closures. Public vehicles passing through would be required to check-in with mine personnel at the North or South SGP entry points and would receive a safety briefing and would also be required to check-out with SGP personnel upon exiting the SGP. For safety purposes, public access would be separated from other SGP roads by berms, security fencing, and the underpass to allow the public road to pass beneath the mine haul road. No stopping or deviating from the public access road would be allowed. Perpetua could restrict access to any vehicles due to concerns related to public or employee health and safety, such as during road construction and maintenance, blasting, highwall scaling, mining in the immediate area of the road, and similar operations.

Public access along Johnson Creek Road during the life of the SGP would be unchanged; however, closures spanning from a half-day to multiple days could occur due to construction activities. Total closures of half-day to multiple days could occur during construction work on Stibnite Road between the village of Yellow Pine and the SGP, part of Thunder Mountain Road, and Burnt Log Road.

Public access on existing segments of the Burnt Log Road would be restricted for limited periods of time to upgrade road segments during construction of the Burntlog Route. Other routes available for public use are shown on **Figure 2.4-1**.

Public access by foot via existing trails or on roads would be restricted within the Operations Area Boundary shown on **Figure 2.4-2**. Security personnel, fencing (including wildlife exclusion fencing), and signs would restrict public access to vehicular traffic on the designated public access roadway inside the Operations Area Boundary.

Warm Lake to Landmark Groomed OSV Route Closure

Due to year-round mine access to the SGP Operations Area along the Warm Lake Road, an existing, approximately 8.5-mile-long groomed OSV route from Warm Lake to Landmark would be closed for the life of the SGP. To replace this recreational use, a dedicated alternative OSV route would be established from the Warm Lake area to Landmark via the Cabin Creek Road and Johnson Creek Road (**Figure 2.4-4**).

Cabin Creek Road Groomed OSV Route

Near Warm Lake, an approximately 2-acre parking area would be established west of South Fork Road on FR 474B. A new 3.2-mile groomer access trail would be established from the parking area to the Forest Service Warm Lake Project Camp south of Paradise Valley Road (FR 488) where the groomer would be stored. An approximate 0.1-mile segment would be groomed from the intersection of Paradise Valley Road and FR 488A to Warm Lake Road. The Cabin Creek Road (FR 467) groomed OSV route would extend approximately 11 miles to the Trout Creek Campground on Johnson Creek Road. Portions of Cabin Creek Road would require stream crossing improvements, road widening, and surface grading to support the OSV route grooming equipment.

Johnson Creek Groomed OSV Route

An approximately 8-mile temporary groomed OSV route would be created and maintained on NFS lands adjacent to the west side of Johnson Creek Road (CR 10-413) from Trout Creek Campground to Landmark. Portions of the temporary groomed OSV route would be established using a snowplow wing attachment requiring some vegetation and tree removal to allow for safe snowplowing. In areas where topography and vegetation prevent using the wing attachment to establish the groomed OSV route, sections would merge with Johnson Creek Road. During construction, operations, and closure, the OSV route would include an additional 0.34-mile segment south of and paralleling the Warm Lake Road heading east connecting Johnson Creek Road to Deadwood-Stanley Road (FR 579) (**Figure 2.4-4**).

Warm Lake Area OSV Connection

A 0.3-mile, 16-foot-wide groomed OSV route would be created and maintained north of Warm Lake Road to connect the southern end of the Cabin Creek Road OSV route to the Warm Lake Road (FR 579). It would also provide access to North Shoreline Drive (FR 489) from the Cabin Creek Road OSV route. This 0.3-mile route would be used throughout construction, operations, and closure, and would require the removal of some vegetation and trees.

Temporary OSV Closure Trout Creek Campground to Wapiti Meadows

OSV access would be temporarily halted between Trout Creek Campground and Wapiti Meadows (about 9 miles north of Trout Creek Campground on Johnson Creek Road; **Figure 2.4-4**) for approximately 2 to 3 years during construction of the Burntlog Route. Once construction of the Burntlog Route has been completed, the Johnson Creek Route would no longer be used by mine-related traffic and the OSV route would be returned to the unplowed Johnson Creek Road and extended northward to provide approximately 17 miles of groomed OSV access between Landmark and Wapiti Meadows. Resumption of OSV access between Trout Creek Campground and Wapiti Meadows would occur following construction of the Burntlog Route.

Travel Management Rule

The reroute of Stibnite Road and the designation of a temporary OSV route to replace an existing OSV route are actions that fall under the Travel Management Rule (36 CFR 212), Subparts B and C, respectively (FSM7715.03(5)). These actions require consideration under the Travel Management Rule Minimization Criteria (36 CFR 212.55(b)). This is presented in **Section 4.19**, Recreation Resources.

2.4.4.5 Traffic

Traffic associated with SGP construction would occur year-round, depending upon road and weather conditions. Construction-related traffic and material hauling would be most concentrated from May through November, and personnel would be transported primarily using buses and vans. The total estimated annual average daily traffic (AADT) for construction and operations activities driving from SH 55 to the SGLF and between the SGLF and the SGP are listed in **Table 2.4-2**. Supplies and deliveries for the SGP during construction would access the SGLF using SH 55 to Warm Lake Road and would use SH 55 through Cascade and other communities along SH 55 south of Cascade including Banks and Horseshoe Bend.

Table 2.4-2 Project Construction and Operations SGP Traffic

Phase	Route	Transport Type	AADT
Construction	SH 55 to SGLF	HV	30
Construction	SH 55 to SGLF	LV	169
Total			**199**
Construction	SGLF to SGP	HV	45
Construction	SGLF to SGP	LV	20
Total			**65**
Operations	SH 55 to SGLF	HV	25
Operations	SH 55 to SGLF	LV	131
Total			**156**
Operations	SGLF to SGP	HV	33
Operations	SGLF to SGP	LV	17
Total			**50**
Reclamation and Closure	SH 55 to SGP	HV	15
Reclamation and Closure	SH 55 to SGP	LV	12
Total			**27**

SH 55 to SGLF – State Highway 55 to Stibnite Gold Logistics Facility
SGLF to SGP - Stibnite Gold Logistics Facility to Stibnite Gold Project
HV – heavy vehicle
LV – light vehicle
AADT – annual average daily traffic

Supplies and deliveries for the SGP during operations would access the SGLF using SH 55 to Warm Lake Road. Approximately two-thirds of all mine-related traffic would originate south of Warm Lake Road and would use SH 55 through Cascade and other communities along SH 55 south of Cascade including Banks

Description	Resources Affected
Perpetua would submit an annual report to the USFS and the other federal and state agencies that are responsible for issuing authorizations applicable to reclamation for the preceding calendar year. The annual report would contain descriptions of the reclamation activities completed during the previous year, a summary of areas reclaimed, a discussion of the results of the reclamation monitoring conducted, and corrective actions implemented.	Soils, Reclamation
A new 12-foot-wide gravel road would be constructed to provide public access from Stibnite Road (FR 50412) to Thunder Mountain Road (FR 50375) through the SGP. During operations, the public access road would be used to travel through the SGP and would provide seasonal use, open to all vehicles. Vehicles passing through the SGP would be required to check-in with mine personnel at the North or South SGP entry points.	Transportation and Access, Health and Safety
Post reclamation, a road would be established over the backfilled Yellow Pine pit to allow public access through the reclaimed site and connect Stibnite Road (FR 50412) to Thunder Mountain Road (FR 50375). This would replace the operational phase public access route.	Transportation and Access
Prior to site preparation and construction of surface facilities, vegetation would be removed from operating areas. Trees and deadwood, shrubs, and slash not needed to construct windrows at the edge of Burntlog Route disturbance (to function as sediment barriers), would be chipped, and suitable soil would be separately salvaged and stockpiled (except for a small portion that would be 'live handled') for use as part of site reclamation and restoration. Portions of the salvaged soil would be blended with the chipped wood to create growth media. All growth media placed in stockpiles would be stabilized, seeded, and mulched to protect the stockpiles from wind and water erosion.	Vegetation
Perpetua would inspect and remove vegetation material (including noxious weeds) from mechanical equipment and properly dispose to minimize the spread of unwanted vegetation.	Vegetation
Wood wastes and wood mulch are the two primary sources of compost. Food waste produced from on-site meal preparation and wastes may provide another source. Combined and properly managed during composting, these materials would provide a source of organic matter to be blended into substrate materials suitable for mitigation.	Vegetation
Perpetua would be responsible for noxious weed control within areas disturbed by SGP activities.	Vegetation, Wildlife
Develop and employ planting plans for wildlife benefits (cover, forage, etc.) using approved seed mixes.	Vegetation, Wildlife
Perpetua would use aquatic safe herbicides during vegetation management activities and noxious weed control. Adhere to chemical label restrictions, Federal and State rules on usage. Use proper equipment for chemical application by trained personnel.	Vegetation, Fish
Perpetua or its designated contractor(s) would perform long-term maintenance as necessary, including maintaining and monitoring the Mitigation Area (including stream and wetlands) in perpetuity once the final performance standards are met or until such responsibility is relinquished to an appropriate third party (Forest Service, etc.) as approved by the USACE.	Vegetation, Wetlands
Perpetua would plant stream reclamation reaches and wetland reclamation areas with native plant species that are present in PAB, PEM, PSS, and palustrine forested wetlands and riparian areas along streams throughout the Mitigation Area.	Vegetation, Wetlands
To address stream temperature, riparian planting widths along restored and enhanced stream reaches would be 18 feet wide on each stream bank where possible. Taller and denser vegetation such as spruce trees would be planted. Further, the creation of the lined Stibnite Lake, a feature similar in size to the present Yellow Pine pit lake, would replace the function of the existing Yellow Pine pit lake in buffering stream temperature extremes and reduce maximum stream temperatures in East Fork SFSR in and downstream of the SGP.	Vegetation, Wetlands, Surface Water, Reclamation

Issue	Indicator	Baseline Conditions	No Action Alternative	2021 MMP	Johnson Creek Route Alternative
Land Use and Land Management					
The SGP would cause changes in land use or land management.	Acres of land used for SGP components by land management agency.	(Analysis area) Private: 925 acres State: 77 acres BNF: 1,027 acres PNF: 2,373 acres BOR: 25 acres	Same as Baseline Condition.	Private: 819 acres State: 62 acres BNF: 933 acres PNF: 1,439 acres BOR: 12.5 acres	Private: 828 acres State: 62 acres BNF: 820 acres PNF: 1,372 acres BOR: 12.5 acres
	Acres of total and new land disturbance within SGP area.	Existing disturbance acreage within analysis area: 1,554 acres (includes historic mine disturbance, existing roads and utilities)	Same as Baseline Condition.	Disturbance acreage impacts: 3,266 total acres 51% (1,674 acres) of total is new disturbance	Disturbance acreage impacts: 3,095 total acres 50% (1,544 acres) of total is new disturbance
The SGP could cause changes in or create new ROWs or easements.	Miles or acres of new or changed ROWs or easements, regardless of jurisdiction.	Total existing ROW (transmission lines and roads): 666 acres	Same as Baseline Condition.	Total new ROW (transmission lines and roads): 763 acres	Total new ROW (transmission lines and roads): 639 acres
Access and Transportation					
The SGP may affect access to public lands during mine construction, operations, and closure and reclamation.	Number, location, and description of changes in access due to new and improved roadways.	See **Table 3.16-1** and **Figure 3.16-1**.	Same as Baseline Condition.	Burntlog Route (plowed). Mine site public access during operations (not plowed). Loss of winter groomed OSV route on Warm Lake Road to Landmark. Loss of winter groomed OSV route on Johnson Creek Road from Wapiti Meadows to Trout Creek Campground during construction of Burntlog Route.	No Burntlog Route, only Johnson Creek Route (plowed). Mine site public access during operations (not plowed). Loss of winter groomed OSV route on Warm Lake Road to Landmark. Loss of winter groomed OSV route on Johnson Creek Road from Wapiti Meadows to Trout Creek Campground for life of SGP.
The SGP may change the miles of roads and trails, the amount of use, and types of vehicles on each road or trail.	Miles of new road for public use.	Forest Service = 1,557 miles Valley County = 278 miles State = 131 miles	Same as Baseline Condition.	Forest Service = no change Valley County = 2.2 miles State = no change Private = 15 miles (with an additional 4 miles through the SGP)	Forest Service = no change Valley County = 2.2 miles State = no change Private = 4 miles through the SGP
	Change in amount of use.	See **Table 3.16-2** for existing roads.	Same as Baseline Condition.	Johnson Creek Route = 5 mine-related vehicles/hr. during construction Burntlog Route = 4 mine- related vehicles/hr. during operations; 2 mine-related vehicles/hr. closure and operations	Johnson Creek Route = 5 mine-related vehicles/hr. during construction; 4 mine- related vehicles/hr. during operations; 2 mine-related vehicles/hr. closure and reclamation
	Changes in frequency of rail, air, and water transportation.	Rail – no active lines Air – 7 public use airports Water – Port of Lewiston	Same as Baseline Condition.	Rail - No impact. Air – Helicopter usage for when roads are inaccessible. Water – potentially 1 roundtrip (2 truck trips) daily of antimony concentrate that could be shipped out via the Port of Lewiston.	Rail - No impact. Air – Helicopter usage for when roads are inaccessible. Helicopter usage during construction to install repeaters. Water – potentially 1 roundtrip (2 truck trips) daily of antimony concentrate that could be shipped out via the Port of Lewiston.

REC 7411

Issue	Indicator	Baseline Conditions	No Action Alternative	2021 MMP	Johnson Creek Route Alternative
The SGP may affect public safety on the roads used by mine vehicles during construction, operations, and closure and reclamation activities.	Approximate miles of roads used by mine vehicles.	Johnson Creek Route = 70 miles Burntlog Route = 0 mile (does not exist)	Same as Baseline Condition.	Johnson Creek Route = 70 miles Burntlog Route = 71 miles	Johnson Creek Route = 70 miles Burntlog Route = 0 mile
	Change in traffic volume. (AADT)	Refer to **Table 3.16-2**.	Same as Baseline Condition.	Construction = 65 (45 HV) Operations = 50 (33 HV) Closure and Reclamation = 25 (13 HV) Post Closure = 6 (0 HV)	Construction = 65 (45 HV) Operations = 50 (33 HV) Closure and Reclamation = 25 (13 HV) Post Closure = 6 (0 HV)
	Number of accidents, both current and projected.	Warm Lake Road = 8/year Johnson Creek Road = 2/year Stibnite Road = 1/year	Same as Baseline Condition.	Perpetua would implement safety measures to reduce accidents including radio communications, pilot cars, and hour restrictions.	Perpetua would implement safety measures to reduce accidents including radio communications, pilot cars, and hour restrictions. Johnson Creek Route has a steeper topography and terrain that would require wider roads, more cut/fill sections, and more switchbacks.
	Change in emergency access.	N/A	N/A	Additional access routes through the SGP.	Additional access routes via public access during the winter.
	Change in OSV access.	Groomed OSV route along Warm Lake Road from Warm Lake Parking Area to Landmark Groomed OSV route along Johnson Creek Road from Landmark north to Wapiti Meadows	Same as Baseline Condition.	Groomed OSV from Warm Lake to Landmark closed for use for life of SGP. An alternative OSV route would be established from Trout Creek Campground to Landmark. Warm Lake area OSV would be created north of Warm Lake Road to southern end of Cabin Creek Road OSV Route to Warm Lake Road. Paradise Valley, North Shore Lodge, and Johnson Creek Road to FR 579 OSV connectors. OSV from Trout Creek Campground to Wapiti Meadows closed through construction of Burntlog Route. Groomed OSV route would be re-established on Johnson Creek Road between Landmark and Wapiti Meadows following construction.	Same as under the 2021 MMP; except the OSV from Trout Creek Campground to Wapiti Meadows closed for life of SGP.
Heritage Resources					
The SGP may affect historic properties through ground disturbance.	Locations of ground disturbance.	N/A	N/A	3,266 acres Ground disturbing activities could affect historic properties at these locations: Access Roads (including OSV routes) Construction of Burntlog Route and associated facilities (access roads, borrow areas) VHF repeater sites and telecommunications tower location and associated access roads Transmission line corridor upgrades and access roads	3,095 acres Same as 2021 MMP except: Reduces ground disturbance. Limits disturbance for new road construction as Burntlog Route would not be constructed. Extensive upgrades to Johnson Creek and Stibnite Roads would be required including cut and fill areas.

REC 7412

Issue	Indicator	Baseline Conditions	No Action Alternative	2021 MMP	Johnson Creek Route Alternative
The SGP may affect infrastructure and services as related to emergency services, medical services, law enforcement, social services, sanitation, and wastewater treatment.	Capacity of existing infrastructure and services to meet anticipated increased use.	Due to the remote nature, most of the SGP area is located more than 30 miles from the nearest local emergency services.	Same as Baseline Condition.	Moderate and positive. Emergency medical technicians and emergency equipment and supplies would be on-site, including an ambulance, first aid, and medical supplies.	Same as the 2021 MMP.
The SGP may cause public health effects related to changing environmental conditions.	Disruption of recreational areas during construction, operation, and closure and reclamation.	Recreation is a major use throughout much of the SGP area; activities commonly include hunting, fishing, sightseeing, hiking, camping, all-terrain vehicle use, snowmobiling, and horseback riding.	Same as Baseline Condition.	Negligible. Displacement of project-area recreational activities would be offset by improved access to alternative recreational areas.	Same as the 2021 MMP.
	Psychological effects due to noise.	Sound levels at the 12 baseline noise measurement locations in the SGP area ranged from 34 dBA to 64 dBA.	Same as Baseline Condition.	Negligible. Predicted noise levels would be under, at, or slightly over the outdoor threshold level of 55 dBA.	Same as the 2021 MMP.
Recreation					
The SGP may cause changes to recreation setting, access, facilities, and/or opportunities.	Changes in motorized access (including restrictions and/or changes in maintenance) to recreation opportunities.	State and County roads provide access to connecting unpaved Forest Service roads, which provide access to NFS lands and facilities.	Current access to the area via Johnson Creek Road and Stibnite Road would remain unimpeded. In general, areas that are inaccessible to motorized vehicles would continue to be inaccessible to vehicles or certain vehicle types in summer.	Access to the areas/facilities accessed from Thunder Mountain Road (FR 50375) east of the Operations Area Boundary would be modified due to closure of Stibnite Road (CR 50-412) and construction of the Burntlog Route, which would provide motorized access (year-round) to areas that currently do not have motorized access. Winter access would be increased along Cabin Creek Road due to new OSV route. There would be direct access to Thunder Mountain Road through the Operations Area Boundary during operations, in addition to access via the Burntlog Route. The re-routed segment of the Burntlog Route would provide increased motorized access to areas without such access currently. Access to several OSV routes would be affected by plowing of Johnson Creek Road, Warm Lake Road, and the Burntlog Route. Construction activities for transmission lines and the maintenance facility may result in delays or detoured access. After mine reclamation, the Stibnite Road public access through the mine to Thunder Mountain Road would be restored.	Similar to the 2021 MMP, except there would be no Burntlog Route and resulting new motorized access to areas from these facilities. Access to several OSV routes would be affected by plowing of Johnson Creek Road and Warm Lake Road.

REC 7413

Issue	Indicator	Baseline Conditions	No Action Alternative	2021 MMP	Johnson Creek Route Alternative
	Changes in recreation physical setting characteristics and related ROS class (by season) measured in acres.	Designated ROS classes in the analysis area vary by season, and include Rural, Roaded Natural, Roaded Modified, Semi-Primitive Motorized, Semi-Primitive Non-Motorized, and Primitive. Estimated existing ROS physical settings are similar.	Generally, existing designated ROS classes and physical recreation setting characteristics would remain as is. Modifications to the recreation setting in the SGP area continued low level of unauthorized motorized use, and increased winter motorized access and use could lead to changes in the designated ROS class and/or ROS physical setting of some areas due to additional motorized use both in the summer and winter. Acreage of Estimated ROS Physical Setting Classes – Summer/Winter: • Primitive: 17,278/21,370 acres • Semi Primitive Non-Motorized: 218,512/245,210 acres • Semi-Primitive Motorized: 83,497/240,387 acres • Semi-Primitive Motorized Groomed (winter only): 50,436 acres (this acreage overlaps other features) • Roaded Natural: 140,594/7,511 acres • Rural: 81,450/26,853 acres	Several components would result in inconsistencies with existing designated ROS classes including: Burntlog Route, plowing of the Burntlog Route, temporary plowing of the Johnson Creek Road and Stibnite Road, plowing of Warm Lake Road (CR 10-579), new transmission line. Acreage of Disturbance to ROS Physical Setting Classes During Operations – Summer/Winter: Primitive: 0/0 acres Semi Primitive Non-Motorized: 0/0 acres Semi-Primitive Motorized: 42/364 acres Semi-Primitive Motorized Groomed (winter only): 163 acres Roaded Natural: 685/387 acres Rural: 345/322 acres	Similar to the 2021 MMP, except there would be no inconsistencies with existing designated ROS classes related to the Burntlog Route or plowing of the Burntlog Route. Inconsistency with the existing designated ROS class for Johnson Creek and Stibnite Roads in the winter would not be temporary during construction (as in the 2021 MMP) but would continue through operations and reclamation because the roads would be plowed as part of the Johnson Creek Route. Acreage of Estimated ROS Physical Setting Classes During Operations – Summer/Winter: Primitive: 0/0 acres Semi Primitive Non-Motorized: 0/0 acres Semi-Primitive Motorized: 43/212 acres Semi-Primitive Motorized Groomed (winter only): 113 acres Roaded Natural: 387/34acres Rural: 353/536 acres
	Changes in recreation facilities (trails, campgrounds, trailheads), including the level of development and setting.	The Warm Lake area contains most of the developed recreation facilities (apart from trailheads). Scattered campgrounds and other facilities also are located in the Big Creek and Landmark areas and along Johnson Creek Road around and south of Yellow Pine. Developed recreation facilities primarily include campgrounds, cabins/lookouts, trailheads, and trails.	Same as Baseline Condition	The Stibnite Mining District Interpretive Site would be closed until after mine reclamation. Mine components would alter the setting of recreation facilities adjacent to them to a more developed setting due to increased man-made development, noise, traffic, etc. These components include the mine and facilities within the Operations Area Boundary, Burntlog Route, upgraded transmission lines, new transmission line to the Operations Area, Johnson Creek substation, a small VHF repeater on Meadow Creek Lookout, use of Warm Lake Road, and temporary use of the Johnson Creek Route.	Similar to the 2021 MMP, except the Burntlog Route would not be built and therefore would not affect the setting of existing recreation facilities. In addition, changes to the setting of recreation facilities along the Johnson Creek Route would be affected through reclamation and not just temporarily during construction.
	Changes in recreation use, potentially due to changes in recreation facilities, opportunities, access, and setting.	Developed recreation use is limited to the developed recreation sites (i.e., overnight facilities) located primarily in the Warm Lake, Landmark and Johnson Creek Road areas. Most recreation in the analysis area is dispersed use, which occurs outside of developed recreation sites.	Existing recreation use would continue. Some unauthorized motorized use may continue to occur off of existing roads and motorized trails. Motorized winter use has expanded in recent years, and may continue to expand in the future, resulting in additional OSV routes and additional areas receiving winter motorized use.	There would be public access through the Operations Area Boundary, which may result in less displacement of use to areas/facilities accessed from Thunder Mountain Road (FR 50375). In addition, there could be increased dispersed recreation use along the Burntlog Route . Some recreation use may return to the Operations Area Boundary after reclamation; however, due to the changes in the recreation setting, some use may be displaced to areas where the recreation setting is more natural.	Similar to the 2021 MMP. The Burntlog Route would not be built; therefore, there would be no resulting displacement or increase in recreation use from this route.

REC 7414

3.0 AFFECTED ENVIRONMENT

3.1 Introduction

Chapter 3 describes the existing natural and human environment that would potentially be affected by the SGP. The natural and human environment is further divided into resources or resource uses - physical environment, biological resources, and social resources/environment. Each resource section is organized as follows: a brief introduction and scope of analysis including a definition of the analysis area specific to the resource; relevant laws, regulations and policies; and existing conditions of the resource in the analysis area.

This EIS is purposely designed to efficiently detail what is necessary in order to understand the affected environment and environmental effects related to the alternatives that are evaluated. Many of the subsections of this EIS summarize more detailed information that is discussed in specialist reports which are cited in the subsections. These reports include any information that has become available since the DEIS was released in August 2020. Readers who are interested in reviewing the more detailed information may download the specialist reports of interest from the same website hosting this EIS. The specialist reports that are available include:

- Air Quality Specialist Report (Forest Service 2023a)
- Climate Change Specialist Report (Forest Service 2023b)
- Soils and Reclamation Cover Materials Specialist Report (Forest Service 2023c)
- Noise Specialist Report (Forest Service 2023d)
- Surface Water and Groundwater Quantity Specialist Report (Forest Service 2023e)
- Surface Water and Groundwater Quality Specialist Report (Forest Service 2023f)
- Vegetation: General Vegetation Communities, Botanical Resources, and Non-Native Plants Specialist Report (Forest Service 2023g)
- Wetland and Riparian Resources Specialist Report (Forest Service 2023h)
- Fisheries and Aquatic Habitat Including Threatened, Endangered, Proposed, and Sensitive Species Specialist Report (Forest Service 2023i)
- Wildlife and Wildlife Habitat Including Threatened, Endangered, Candidate, and Sensitive Species Specialist Report (Forest Service 2023j)
- Access and Transportation Specialist Report (Forest Service 2023k)
- Heritage Resources Specialist Report (Forest Service 2023l)
- Recreation Specialist Report (Forest Service 2023m)
- Scenic Resources Specialist Report (Forest Service 2023n)
- Social and Economic Conditions Specialist Report (Forest Service 2023o)
- Special Designations Specialist Report (Forest Service 2023p)
- Tribal Rights and Interests Specialist Report (Forest Service 2023q)

Certain of the environmental resources evaluated in this EIS are essentially unchanged from 2020 so specialist reports were not prepared for these resources, which include: geology, hazardous materials, environmental justice, timber, land use, and public health and safety.

Johnson Creek Road

During non-winter conditions (roads clear of snow), the Operations Area Boundary can be accessed from the City of Cascade by traveling northeast on Warm Lake Road for about 34 miles to Landmark, then north on Johnson Creek Road for approximately 25 miles to the village of Yellow Pine, and approximately 14 miles east on the Stibnite Road portion of McCall-Stibnite Road (Stibnite Road). Johnson Creek Road and the Stibnite Road portion of McCall-Stibnite Road is currently used to access the Operations Area Boundary during the summer.

The Johnson Creek Road is a county maintained, native surface road that is open to vehicles with seasonal restrictions due to snow. During the winter, Valley County plows approximately 10 miles of Johnson Creek Road from Yellow Pine to Wapiti Meadow Ranch and Perpetua (under agreement with Valley County) plows along Stibnite Road. Valley County grooms the remaining 17 miles of Johnson Creek Road from Wapiti Meadow Ranch to Warm Lake Road at Landmark for OSV use. Valley County does not plow Warm Lake Road from Warm Lake to Landmark. This section is a designated groomed OSV route.

McCall-Stibnite Road

The Stibnite Road from the intersection with Johnson Creek Road then east to the mine is also a county-maintained native surface road, open to all vehicles with seasonal restrictions due to snow. This road is plowed in the winter by Perpetua through an agreement with Valley County. Stibnite Road connects to Thunder Mountain Road on the southeastern portion of the Stibnite mine site and currently provides public access through the mine area.

The analysis area can be accessed from McCall during non-winter conditions by traveling east on the Lick Creek Road portion of McCall-Stibnite Road for approximately 37 miles to the East Fork Road portion of McCall-Stibnite Road, then approximately 16 miles to the village of Yellow Pine, and approximately 14 miles east on Stibnite Road. Lick Creek Road is not maintained during the winter; however, East Fork Road and Stibnite Road are plowed from the intersection with SFSR Road to Yellow Pine by Valley County and from Yellow Pine to the Operations Area Boundary by Perpetua to access their private land inholdings in the area. Although the Lick Creek and East Fork roads are not proposed to be used by the SGP, they provide access for other users of the analysis area.

South Fork Salmon River Road

The SFSR Road can be accessed year-round from Cascade by traveling approximately 24 miles northeast on Warm Lake Road to the intersection with SFSR Road. It then travels north for approximately 30 miles to intersect with the East Fork Road portion of the McCall-Stibnite Road. Some segments along SFSR Road have sharp curves which can be challenging for heavy vehicle travel. Although this route currently provides the only access to the Operations Area Boundary during winter months, it is not proposed to be used by the SGP.

3.16.4.3 Existing Stream Crossings

Existing stream crossings along the existing Johnson Creek, Stibnite, and Burnt Log roads are shown on **Figure 3.13-7**. There are 213 existing stream crossings along existing main access roads in the analysis

4.0 ENVIRONMENTAL CONSEQUENCES

4.1 Introduction

Chapter 4 describes the potential environmental consequences of implementing each of the alternatives presented in Chapter 2. Pursuant to 40 CFR 1500.1(b) and 1500.4, this section summarizes the completed analysis and forms the scientific and analytical basis for the comparison of alternatives. The alternatives described in Chapter 2 may cause, either directly or indirectly, changes in the human and natural environment. This EIS analyzes these potential changes and discloses the effects to the decision-makers and the public. Disclosure is a fundamental goal of NEPA. In addition, applicable mitigation measures and irreversible and irretrievable effects also are discussed. Effects of each action can be neutral, beneficial, and/or adverse. Effects are quantified whenever possible, and/or are qualitatively discussed.

The individual resource discussions are generally presented by issue(s) and organized with the presentation of the effects analysis issues and indicators for the resource; a brief methodology for the analysis of impacts; an evaluation of the alternatives' impacts to the resource; irreversible and irretrievable commitments, and short-term uses versus long-term productivity. A table summarizing and comparing these quantitative and qualitative impacts to each resource by alternative is located in **Section 2.8**.

4.1.1 Effects Analysis Indicators and Methodology of Analysis

An issue is defined as a point of concern, disagreement, debate, or dispute with a proposed activity based on some anticipated effect. Issues are described in terms of cause and effect; that is, if an action occurs, an impact could result. Issues are addressed by describing comparative factors that provide a way to define, compare, and contrast the effects of the alternatives, including the No Action.

An indicator is an element or parameter used to determine change (and the intensity of change) in a resource (e.g., acres of wetlands disturbed). These issues and indicators are used to predict or detect change in a resource related to causal effects of the alternatives in Chapter 4 (i.e., environmental consequences).

In addition, the analysis procedures and assumptions used to develop the current conditions and environmental consequences are summarized in this section. Unless specifically stated otherwise, additional supporting information, including detailed analysis procedures and assumptions for each resource area, can be found in the SGP record.

The modeling, analysis, and unit amounts for indicators such as acreage and road miles are all best estimates based on the latest available information. The modeling and analysis conducted for this SDEIS are intended to indicate relative differences among the alternatives, rather than to predict absolute amounts of activities, outputs, or effects.

If none of the action alternatives proceed, the current uses by Perpetua and other users on patented mine/mill site claims and on NFS lands would continue to follow all existing applicable air quality regulations. Uses of NFS lands that may result in air pollutant emissions include mineral exploration, dispersed OHV use, snowmobiling, and other forms of recreation.

4.3.4.2 2021 MMP

Construction and Operations Description

The construction of the 2021 MMP includes building power transmission, access roads, and mining/processing facilities. These operations are to be performed during LOM 1 through LOM 3. Operations would begin in LOM 4 through LOM 18. Access road construction would consist of development of the Burntlog Route for mine access and minor improvements for the Johnson Creek route. Also, while the Burntlog Route is being developed, a temporary groomed OSV trail would be constructed on the west side of Johnson Creek from Trout Creek to Landmark for public access. Other public access construction would be a Cabin Creek Road groomed OSV trail. Eight borrow sources along the Burntlog Route would also be constructed.

During operations, restricted public access through the site would be provided by constructing a new road around the Yellow Pine pit and below the mine haul road to link Stibnite Road to Thunder Mountain Road.

Lastly, operations would include communication towers and an offsite logistics and road maintenance facilities. A cell tower would be located north of the Hangar Flats pit with very high frequency repeater sites. There would also be a communication site at the SGLF with upgrades to the existing site. The Burntlog road maintenance facility would be located approximately 4.4 miles east of the junction of Johnson Creek Road and Warm Lake Road along the proposed Burntlog Route.

Construction and Operations Air Emissions Inventory

Air pollutant emissions were initially estimated for activities and process sources included in the 2021 MMP for each LOM year. The LOM years presented in this discussion are based on years starting with LOM 1 as the first year of construction. LOM 6 is expected to produce the highest overall annual total of criteria pollutant emissions.

Air pollutant emission point sources for the construction phase would include engine-driven generators, portable conical crusher and screens, diesel-fired heaters, and engine-driven air compressors. The fugitive sources related to mine construction and operations would be haul, access, and construction road dust from vehicle travel during the pre-production years, as well as earth-moving equipment, material transfers, storage in several construction stockpiles and development rock piles, tailpipe emissions and exploratory activities. The use of ANFO explosives also would be considered a mine construction phase source, as well as an ongoing operations phase source.

emissions. These process exhaust control technologies are accounted for in the maximum emissions estimates in **Table 4.3-5**:

- Activated carbon regeneration kiln – wet scrubber and activated carbon filter;
- Retort – activated carbon canisters and filter pack; and
- Induction furnaces – baghouse filter and activated carbon filter pack.

Near-Field Analysis NAAQS

Assessment of conformance to the NAAQS is based on the highest receptor concentration in the modeling domain for the pollutants and averaging times corresponding to the standards. The modeled maximum concentration at each receptor is added to the selected background concentrations that represent current existing conditions. If the results from this computation are below the NAAQS, then impacts at other locations in the domain would be below the NAAQS as well.

For NAAQS modeling inputs, the highest emissions of each pollutant during any LOM year were determined and provided in **Table 4.3-6**. For the 2021 MMP, the highest criteria pollutant emissions occur during two different years, LOM 6 (CO, NO_X, and SO_2) and LOM 10 ($PM_{2.5}$ and PM_{10}). Therefore, to capture the highest modeled concentration for each pollutant, separate modeling was performed for LOM 6 and 10 (i.e., two models). Note that VOC emission maximums from LOM 3 were not modeled because there is no specific NAAQS for these emissions, however VOCs are addressed as part of the secondary $PM_{2.5}$ analysis.

Table 4.3-6 LOM Years for Pollutant-Specific Maximum Annual Emissions

Pollutant	LOM Year	SGP Total Annual Emissions (tpy)
CO	6	535.5
NO_2	6	335.2
PM_{10}	10	320.1
$PM_{2.5}$	10	69.2
SO_2	6	7.3
VOC	3	27.4
HAPs	10	8.5
Hg	10	13.3 (lb/yr)

The 2021 MMP would include a 12-foot-wide gravel road to provide public access from Stibnite Road (FR 50412) to Thunder Mountain Road (FR 50375) through the SGP. Perpetua received a final PTC from IDEQ on June 17, 2022. This application proposed to exclude the public road on the basis of restricted access and maintaining full control, and that people traveling on the road would be considered "guests of the mine." IDEQ accepted the private road concept proposed by Perpetua (see PTC Condition 2.7, Response to Comments #16 and Statement of Basis on the IDEQ website) and in response to comments on February 18, 2021, also states that the roadway between Stibnite Road at Sugar Creek and Thunder Mountain Road at Meadow Creek was appropriately excluded from ambient air. Additionally, the EPA

Region X has indicated that the access road could possibly be excluded from ambient air if sufficient enforceable measures are taken to comply with the 2019 revised policy (EPA 2019a). Exclusion of the public access road from ambient air protections is a unique case that relies on measures assumed to meet the standards inferred in the 2019 revised ambient air policy. However, a formal EPA policy review of the ambient air boundary for the SGP has not been conducted nor requested. A formal review is not necessarily required. The EPA did provide formal comment on IDEQ's air quality PTC recommending a review be requested by the State and that initial measures in the PTC were too ambiguous to determine compliance with the revised ambient air policy. To comply with this measure, Perpetua has developed a transportation management plan that is included as Appendix D of the Air Quality Specialist Report (Forest Service 2023a).

The AERMOD dispersion modeling results for the 2021 MMP analysis emissions and comparison with the applicable NAAQS are provided in **Table 4.3-7**. The geographic location of the maximum impacts amongst the criteria pollutants and averaging periods between LOM 6 and 10 are provided in Figure 4 of the Air Quality Analysis Addendum ModPro2 (Air Sciences 2021a). The results demonstrate compliance with all NAAQS and would be considered to have a moderate impact locally and minor impact regionally. Additionally, **Table 4.3-8** provides geographic locations of the NAAQS maximums.

Table 4.3-7 Near-Field NAAQS Compliance Demonstration

Pollutant	Averaging Time	Maximum Modeled Conc. (µg/m^3)	Background Conc.[3] (µg/m^3)	Total Impact Conc. (µg/m^3)	NAAQS (µg/m^3)	NAAQS Compliance
CO	8 hours	404.6	1,110	1,515	10,000	Yes
CO	1 hour	495.5	1,740	2,236	40,000	Yes
Lead	3-month rolling	Not Required[1]	Not Required[1]	Not Required[1]	Not Required[1]	Not Required[1]
NO_2	Annual	19.8	0.9	20.7	100	Yes
NO_2	1 hour	129.8	4.3	134.1	188	Yes
O_3	8 hours	3.0	117.7	120.7	137	Yes
PM_{10}	24 hours	15	37.0	51.9	150	Yes
$PM_{2.5}$ [2]	Annual	1.1	3.5	4.6	12	Yes
$PM_{2.5}$ [2]	24 hours	2.7	15.0	17.7	35	Yes
SO_2	1 hour	3.0	12.3	15.3	196	Yes
SO_2	3 hours	1.8	16.8	18.6	1,300	Yes

[1] Lead modeling is not required per IDEQ as the facility-wide emissions are less than 10 percent of the lead significant emission rate of 0.6 tpy and considered "Below Regulatory Concern".
[2] Includes the secondary impacts.
[3] All background concentrations are derived from the NW Airquest data (WSU 2018).

SGP would be slightly less for this alternative. The location of ambient air pollutant concentrations due to vehicle traffic would differ, with such effects being located along the Johnson Creek Route.

Providing public access through the SGP reduces the miles of new motorized trails open to all vehicles in the Meadow Creek IRA, and this is expected to reduce net air quality effects due to vehicles traversing the SGP area.

Several air pollution design features proposed by Perpetua are common to both action alternatives and are described in **Section 2.4.9**. Emission control devices and designs would be put in place to abate emissions of particulate matter, Hg, and criteria pollutant emissions from internal-combustion engines the same as the 2021 MMP. Operational and reclamation air emission impacts for this alternative would therefore be the same as the 2021 MMP.

The stationary facilities would be designed, constructed, and operated with the same air pollution controls as the 2021 MMP to comply with applicable regulations and any air quality permits issued by IDEQ. The PTC includes stipulations for control of airborne dust from vehicle traffic along the Johnson Creek Route that are based on applicable state and federal regulations.

4.3.5 Mitigation Measures

Mitigation measures required by the Forest Service would represent reasonable and effective means to reduce the impacts identified in the previous narrative or to reduce uncertainty regarding the forecasting of impacts into the future. These mitigation measures would be in addition to the Forest Service requirements and EDFs (**Section 2.4.9**) accounted for in the preceding impact analysis.

A number of emission controls and monitoring actions have been proposed by Perpetua in compliance with government requirements. These are described below:

Perpetua would develop a fugitive dust control plan (FDCP) that would address the following at a minimum:

- Procedures followed by Perpetua employees to control and minimize fugitive dust emissions.
- Trigger levels to be set that require corrective action.
- Actions to bring fugitive dust emissions within acceptable ranges.
- Steps to demonstrate that appropriate corrective procedures are followed.
- Procedures to verify that Perpetua is controlling avoidable fugitive dust emissions.

Additionally, the IDEQ permit would include the following control measures proposed by Perpetua for HAP and mercury emissions. The implementation of these requirements was included in the Forest Service's assessment of air quality effects and the Forest Service decision includes implementation of these control measures:

- Mining – chemical dust suppressant and water application on haul roads, reasonable controls, FDCP
- Rock dumps and storage piles - reasonable controls, FDCP

temperatures and reduced stream flows. The SGP area could experience climate change impacts to fish resources and fish habitat by lowering streamflows, increased water temperatures, and decreased water quality which would adversely impact aquatic species and habitat. Process and design modifications, such as rerouting Hennessy Creek, lining the Meadow Creek diversion channel, piping low flows, and the complete backfill of Hangar Flats pit that would improve streamflow and temperature in Meadow Creek, would help to reduce these impacts.

Wildlife and Wildlife Habitat

Climate change impacts to wildlife and wildlife habitat in the SGP area would include habitat loss and fragmentation, physiological sensitivities, and alterations in the timing of seasonal life cycles. Habitat loss and fragmentation may occur in the region and analysis area due to the increased potential for wildfire that is anticipated from changing climatic conditions (Halofsky et al. 2018). Construction and operation of the SGP, access roads, utilities, and off-site facilities would additionally impact wildlife from habitat loss and fragmentation. Reclamation activities are intended to achieve post-mining land use for wildlife habitat as reasonably possible, which would help to reclaim habitat connectivity. However, some displacement and habitat fragmentation would be a long-term effect.

Timber Resources

Timber resources in the SGP area are vulnerable to climate change impacts from changing temperatures and precipitation patterns, increased wildfire frequency and intensity, and insects and disease. Direct effects of climate change on timber (e.g., temperature and precipitation) are likely to be minor, but indirect effects from various disturbances (e.g., increased temperatures and warmer winters causing insect and disease outbreaks) may be significant for the timber industry (Halofsky et al. 2018).

The 2021 MMP would result in ground disturbance in locations currently covered by forested vegetation. Post-closure, disturbed areas would be revegetated. To address losses of vegetation from disturbance, the Reclamation and Closure Plan (Tetra Tech 2021a) proposes to replant with conifer and other tree species, which would be located completely within the Operations Area Boundary. The success of the reclamation could be impacted due to the increased risk to timber from wildfire, insects, and disease due to climate change (American Forests 2017; Halofsky et al. 2018).

Land Use and Land Management

The 2021 MMP would alter land use in areas of new or expanded right-of-way and easements to accommodate access roads, utilities, and off-site facilities. Climate change could also impact how lands in the SGP area are used in the long term, altering the surrounding environment (e.g., decreasing ground cover, larger wildfire burn areas, decreased stream flows impacting how the area is used for recreational or tribal purposes) and impacting accessibility. Land management effects caused by the SGP are not expected to be noticeably impacted by climate change.

Access and Transportation

Access to and through the Operations Area Boundary would be maintained during construction, operation, and closure and reclamation. There would be public access through the Operations Area Boundary during construction and operations via a new gravel road constructed to connect Stibnite Road

to Thunder Mountain Road. Climatic changes causing an increase in severe events, such as floods, landslides, and avalanches, can add stress to roadways and other infrastructure, which may result in more frequent maintenance and repairs.

Heritage Resources and Tribal Rights and Interests

The 2021 MMP could impact historic properties, due to ground and visual disturbance in the SGP area. Changing climatic conditions are expected to exacerbate the damage and loss of heritage resources and natural areas utilized by tribes for activities such as hunting, fishing, and gathering in the SGP area through increased soil erosion, more frequent and intense wildfires, flooding, degraded water quality, and wildlife and fish habitat impacts.

Public Health and Safety

Climate change impacts to public health and safety would be experienced through impacts to air, soil, and water quality. The 2021 MMP has the potential to impact public health and safety through the transportation and use of fuels and chemicals, natural environmental hazards, economic impacts, changes to public services and infrastructure, and impacts to the local population.

Climate change could exacerbate some impacts to public health and safety by affecting the way potential hazardous material spills enter the environment. It also could increase the frequency and amplify the impacts of natural hazards such as avalanches and landslides, flash floods, and wildfires (Halofsky et al. 2018). More extreme heat days and higher temperatures over time could increase air quality and health risks over both the short and long term, impacting the public and the employees' abilities to work (Runkle et al. 2017).

Recreation

Much of the SGP area is used for recreation year-round, which would be both directly and indirectly impacted by climate change. The 2021 MMP has the potential to impact recreational access, recreation facilities, dispersed recreation areas, special use permits, recreational motorized travel, and recreation use. Direct impacts from climate change would include variable precipitation and rising temperatures, which could affect individual decisions to recreate in a certain area. Indirect impacts from climate change would be experienced through the changing conditions that may alter the recreation facilities, opportunities, and setting.

Changing climatic conditions could alter the ecological conditions that affect the quality of the recreation experience, including warmer water temperatures, decreased streamflow, and habitat loss and fragmentation. In the Rocky Mountain region, it is expected that snow-based activities (skiing, snowmobiling) would be impacted negatively by climate change due to warmer winters (Halofsky et al. 2018). Primitive area use, horseback riding on trails, motorized water activities, birding, hunting, and fishing in the region also are expected to be negatively influenced by climate change; however, longer periods of warmer temperatures are expected to increase participation in warm-weather activities such as water recreation and hiking (Askew and Bowker 2018).

the area, as some species sensitive to human presence may not return to the area for years after the mine is closed, resulting in a minor, permanent, and localized impact.

The 2021 MMP components that would affect the Idaho Wilderness Company operating area during closure and reclamation would be similar to those described for construction and operations. The loss of cellular coverage on portions of the analysis area may impact customer safety in the SGP but would aid in returning primitive recreation experiences to the FCRNRW areas in the Idaho Wilderness Company operating area. Providing public access through the SGP after closure and reclamation would restore the ability for the Idaho Wilderness Company to reach portions of their operating area without a detour. Displacement of permitted use may continue past reclamation due to permanent changes in the recreation setting within the Operations Area Boundary and potential changes to wildlife present in the area, as some species sensitive to human presence may not return to the area for years after the mine is closed, which would result in a minor, permanent, and localized impact.

Closure and reclamation of all 2021 MMP components would affect the Juniper Mountain Outfitters operating area either directly or indirectly due to recreation displacement from other areas. The ability of Juniper Mountain Outfitters to access their operating area, provide IOGLB licensed activities, and the quality of recreation experiences for customers participating in guided activities near these components may be impacted during closure and reclamation due to noise and reclamation activity. Displacement of permitted use may continue past reclamation due to the changes in the recreation setting in the Operations Area Boundary, and potential changes to wildlife present in the area, as some species sensitive to human presence may not return to the area for years after the mine is closed, which would result in a negligible, permanent, and localized impact.

There are no 2021 MMP components that would impact the North Shore or Warm Lake Lodges, Warm Lake Camp, YWAM, or Warm Lake recreation residence tract during closure and reclamation; therefore, no impacts are anticipated.

Winter use of the Cabin Creek Road OSV route during closure and reclamation would continue to impact the Paradise Valley recreation residence tract as described for construction and operations.

Travel Management Rule

The reroute of Stibnite Road and the designation of a temporary OSV route to replace an existing OSV route are actions that fall under the Travel Management Rule (36 CFR 212), Subparts B and C, respectively (FSM7715.03(5)). These actions require consideration under the Travel Management Rule Minimization Criteria (36 CFR 212.55(b)). The responsible official shall consider the effects on the following, with the objective of minimizing:

- Damage to soil, watershed, vegetation, and other forest resources;
- Harassment of wildlife and significant disruption of wildlife habitats;
- Conflicts between motor vehicle use and existing or proposed recreations uses of NFS lands or neighboring federal lands;
- Conflicts among different classes of motor vehicle uses of NFS lands or neighboring federal lands; and,

- Compatibility of motor vehicle use with existing conditions in populated areas, taking into account sound, emissions, and other factors.

Table 4.19-3 describes where the Travel Management Rule criteria were addressed in the EIS.

Table 4.19-3 Criteria for Designation of Roads, Trails, and Areas Review

Criteria	Section of EIS Addressing Criteria	Applicable Screening Criteria
General Criteria 36 CFR 212.55(a)		
NFS natural and cultural resources, public safety, provision of recreation opportunities, access needs, conflicts among uses of NFS lands, the need for maintenance and administration of roads, trails, and areas that would arise if the uses under consideration are designated, and availability of resources for maintenance and administration.	Sections 4.17, 4.18, 4.19, 4.16, and 4.15	Heritage resources, public health and safety, recreation, access and transportation, land use and land management.
Consider combinations of uses (such as motorized and non-motorized, different vehicle classes, and highway-legal and non-highway-legal vehicles).	Section 4.16	Access and transportation.
Minimization Criteria 36 CFR 212.55(b)		
Damage to soil, watershed, vegetation, and other forest resources.	Sections 4.5, 4.8, 4.9, 4.10, and 4.14	Watersheds and water resources, soils, vegetation, and other forest resources
Harassment of wildlife and significant disruption of wildlife habitats.	Section 4.13	Wildlife and TES Wildlife
Conflicts between motor vehicle use and existing or proposed recreation uses of NFS lands or neighboring federal lands.	Sections 4.16 and 4.19	Recreation conflict. Motor vehicle conflict and compatibility
Conflicts among different classes of motor vehicle uses of NFS lands or neighboring federal lands.	Section 4.16, the Transportation Management Plan, EDFs (Table 2.4-13), and Forest Service Requirements (Table 2.4-12)	Motor vehicle conflict and compatibility Road engineering geometry and criteria.
Compatibility of motor vehicle use with existing conditions in populated areas, taking into account sound, emissions, and other factors.	Section 4.23, the Transportation Management Plan, EDFs (Table 2.4-13), and Forest Service Requirements (Table 2.4-12)	Designated areas, special designations, or potential special designations. Rights of access.

The 2021 MMP considered the minimization criteria for the reroute of Stibnite Road through the mine site and the temporary relocation of the Warm Lake OSV route to Cabin Creek Road and west of Johnson

Creek Road. Damage to soil, watershed, vegetation, and other forest resources was analyzed by determining if the routes intersect with impaired watersheds, wetlands, riparian areas, high-risk flood hazard areas, soils having erosion potential, and riparian vegetation communities.

4.19.2.3 Johnson Creek Route Alternative

The Johnson Creek Route Alternative is similar to the 2021 MMP, with the main differences that affect recreation consisting of use of the Johnson Creek Route for access to the mine for all phases (no construction or use of the Burntlog Route); a change in the location of the Landmark Maintenance Facility; and use of helicopters for construction and maintenance of cell towers and repeater sites in IRAs managed for backcountry/restoration. These changes would result in different impacts than the 2021 MMP, particularly the use of the Johnson Creek Route.

Recreation Opportunities, Facilities, Access, and Use

Construction and Operations

Impacts of the Johnson Creek Route Alternative during construction and operations would be the same as those described under the 2021 MMP, except for those described below. The Burntlog Route and Burntlog Maintenance Facility would not be constructed under the Johnson Creek Route Alternative; therefore, there would be no construction impacts related to those facilities.

Johnson Creek Route

Year-Round

Use of Johnson Creek and Stibnite roads as the route to the Operations Area Boundary during construction, operations, and reclamation and closure would result in impacts to the recreation setting of the existing recreation sites/areas along these roads due to increased noise, traffic, and safety-related issues from mine-related traffic (Forest Service 2023d, 2023k), leading to a change in recreation experiences for some visitors. Traffic on Johnson Creek and Stibnite roads would substantially increase (almost two times the current traffic conditions, respectively), thereby increasing the noise and activity near campgrounds and trailheads adjacent to these roads. Impacts are anticipated to be moderate, short-term, and localized.

Recreation facilities affected by the increase in traffic and traffic noise would include Burntlog and Quartz Creek Trailheads; Buck Mountain, Trout Creek, Ice Hole, Golden Gate, and Yellow Pine Campgrounds; Twin Bridges dispersed camping area; and Johnson Creek Cabin. The recreation setting of these facilities would be altered to a more developed setting due to an increase in the sights and sounds of humans, which would displace recreationists to avoid noise associated with activities and traffic along Johnson Creek and Stibnite roads, particularly recreationists participating in non-motorized activities. Motorized users who use Johnson Creek and Stibnite roads for recreation also may be displaced due to the increased traffic along the roadways. Wildlife-related recreation opportunities also would decrease along these roadways due to wildlife displacement from traffic and noise. This impact is anticipated to be minor, short term, and localized.

During construction, there would be periodic temporary road closures on Johnson Creek Road that would result in reduced access to recreation sites/areas, reduced recreation opportunities, reduced use due to a lack of access, and impacts to recreation experiences due to visitor expectations regarding site/area availability. Impacts from road closures would affect recreation sites/areas along Johnson Creek Road, as well as sites, trails, and areas accessed from this main route. Impacts would persist throughout construction and are anticipated to be moderate, short term, and localized. There also would be daily closure of Stibnite Road for most of the middle of the day during mine construction that would result in reduced access to recreation sites/areas off Stibnite Road and Thunder Mountain Road, reduced recreation opportunities and use due to temporary reductions in access and impacts to recreation experiences due to delays in reaching destinations. Impacts from road closures would affect recreation sites/areas along Stibnite Road, as well as sites, trails, and areas accessed from this main route, particularly sites off Thunder Mountain Road. Depending on where the closure started on Stibnite Road, access to the Big Creek area north of the mine also may be affected. Impacts would persist throughout the mine construction period and are anticipated to be moderate, short term, and localized.

Although Stibnite Road would be open for public access as part of the Johnson Creek Route, the Stibnite Mining District Interpretive Site would not be available for public use, because it would be within the Operations Area Boundary where no public use would be allowed. This impact is anticipated to be moderate, long term, and localized.

The Yellow Pine Escapades are Special Use Permit ATV and UTV events that frequently use Johnson Creek and Stibnite roads in addition to varying Forest Service trails based on the event type. The Yellow Pine Escapades are hosted by the Yellow Pine Community Hall Committee as fundraising events for the community hall maintenance (Yellow Pine Escapades 2022) and may include stops at interpretive sites for educational purposes. Increased traffic on Johnson Creek and Stibnite roads, decreased trail access due to road closures, and the closure of the Stibnite Mining District Interpretive Site are anticipated to have a moderate, long-term, and localized impact on these recreational events.

Impacts during construction and operations would be the same as under the 2021 MMP because Johnson Creek and Stibnite roads would continue to be used as the main access roads into the Operations Area Boundary and would require periodic road maintenance activities. AADT for these roads would be lower during operations than described under construction, but within 15 vehicles, thus resulting in similar impacts described under construction; however, impacts due to temporary closure of Johnson Creek and Stibnite Roads would not occur during operations. Fish adjacent to the Johnson Creek Route may be affected by increased sediment and could be affected if a spill were to occur. While there may be injury or mortality to individual fish, population-level effects are not expected (**Section 4.12**). There may be decreased fishing success immediately along the Johnson Creek Road, but there would continue to be opportunities for fishing within the creeks in the adjacent areas. Operational impacts from the Johnson Creek Route to fishing recreation would be minor, long term, and localized.

Winter

Impacts during construction and operations from the plowing of Johnson Creek Road would be similar to those described for construction under the 2021 MMP; however, the groomed OSV route parallel and along the western side of Johnson Creek Road would run from Trout Creek Campground to Landmark (approximately 8 miles) under the Johnson Creek Route Alternative. The Ditch Creek Road infrequently

groomed OSV route would be inaccessible as it is north of the Trout Creek Campground on the closed OSV route between the campground and Wapiti Meadows. The new groomed OSV route along Johnson Creek Road would remain through operations and closure/reclamation under the Johnson Creek Route Alternative as the Johnson Creek Route would be used throughout the life of the SGP. Therefore, impacts from the plowing of Johnson Creek Road under the Johnson Creek Route Alternative are anticipated to be minor, long term, and localized.

Public Access

Road closure impacts on the Johnson Creek route would be the same as those described under the 2021 MMP, except impacts to recreation access, use, and opportunities along Thunder Mountain Road would begin during construction and continue until the public access road through the Operations Area Boundary was complete and open to public use to provide access to the Thunder Mountain area. Construction under the Johnson Creek Route Alternative is expected to take 2 years longer than the 2021 MMP.

The impacts to public access through the Operations Area Boundary would be the same as under the 2021 MMP. The public access road would provide access to recreation sites/areas via Thunder Mountain Road; therefore, the access road would allow continuous access to the Thunder Mountain Road sites/areas. However, as described under the 2021 MMP, there would be temporary closures of this route during some mining activities that would result in minor, short term, and localized impacts to recreation.

Landmark Maintenance Facility

The Landmark Maintenance Facility would be located approximately 0.1 mile south of Landmark and the historic cabins located there. Access to the maintenance facility would be off Warm Lake Road. There would be no delays or additional traffic along Warm Lake Road in this area since the Burntlog Route would not be constructed, but rather from all construction-related traffic using Warm Lake Road to Johnson Creek Road. It is assumed that construction equipment would travel east on Warm Lake Road; therefore, delays would likely affect access to Horn Creek Road, Rec Spur 579U2, 450 South, and Burnt Log Road, which are east of the maintenance facility site. This impact is anticipated to be moderate, short term, and localized.

Noise associated with construction activities could reduce opportunities for noise-sensitive recreation activities at and around the maintenance facility location (up to 1.1 miles away) (AECOM 2019c), including wildlife-related recreation activities, because wildlife may be displaced. Construction activities would not affect use of the historic cabins; however, construction noise at the site may affect the recreation setting of the cabins, because it may be audible from the cabin sites. Some recreationists may choose to visit other areas or sites to avoid delays or noise from construction activities. Any reduction in recreation opportunities, displacement of dispersed recreational use, or changes in access would be temporary until maintenance facility construction was completed. These impacts would be minor, short term, and localized.

Development of the Landmark Maintenance Facility would reduce recreation opportunities due to physical removal of acreage for the facility (3.5 acres). Traffic due to maintenance activities and vehicles would not be expected to result in frequent traffic delays on Warm Lake Road but may result in

Appendix B

Response to Public Comments on the SDEIS and Response to Public Concerns on the 2020 DEIS

Author	Comment Letter	Comment Number	Comment	Comment Category	Comment Response
			for our organizations, given the location of these proposed routes, is the impact that each route will have on wildlife populations and on roadless characteristics. The SDEIS does not even mention that there are requirements the Forest Service must abide by when designating ORV routes, including groomed snowmobile trails, much less apply these requirements to the proposed new routes. The Forest Service must explain how taking actions that could dramatically increase OSV use on the Cabin Creek Road and along Johnson Creek will satisfy the requirement to minimize harassment of wildlife or significant disruption of their habitat. If these routes cannot be located in a manner that complies with the minimization criteria, they cannot be designated. The Forest Service's assertion that these trails can be authorized under 36 CFR 228A as part of a plan of operations246 is incorrect. Access and infrastructure for recreation is not necessary to conducting mine operations. Designating routes for recreational use and access falls squarely under the Travel Management Rule. While the Forest Service can certainly designate routes for this purpose as part of the Stibnite Gold Mine NEPA analysis, it must apply the requirements of the Travel Management Rule when doing so.		
Bonnie Gestring (Northwest Program Director, Earthworks) and seven others	17634	221	The SDEIS fails to discuss in any way what impact the proposed OSV route along Johnson Creek will have. Because the Payette National Forest has not conducted winter travel management planning in accordance with Subpart C of the Travel Management Rule, it cannot assume that its existing system of OSV routes and areas comply with this Rule. The forest must apply the OSV Rule when designating new OSV routes in association with this project, even if the new routes are temporary or are adjacent to an existing route. Therefore, even though the Johnson Creek route will parallel an existing OSV route (the Johnson Creek road), the Forest Service cannot assume that a) the impacts of this route are the same as the existing route or b) that the existing route complies with the Travel Management Rule.	REG	The reroute of Stibnite Road and the designation of a temporary OSV route to replace an existing OSV route are actions that fall under the Travel Management Rule (36 CFR 212), Subparts B and C respectively (FSM7715.03(5)). These actions require consideration under the Travel Management Rule Minimization Criteria (36 CFR 212.55(b)). The Travel Management Rule analysis was added to Section 4.19 of the Final EIS.
Bonnie Gestring (Northwest Program Director, Earthworks) and seven others	17634	225	As recounted elsewhere, this violates the Idaho Roadless Rule and the Forest Plan. The added recreational pressures on this area are in no way related to mining activities and would make the mining impacts on ecological integrity even worse instead of mitigating them. As such, the Forest Service should make as few changes in existing recreational access as possible and not expand motorized use unless necessary. The Forest Service and Perpetua should continue to allow public access through the Stibnite Operational Area on to Thunder Mountain, with a new route sited through the project area to avoid mining operations. As noted elsewhere, we believe that this is a public road and that Perpetua and the Forest Service need to utilize the normal ambient air quality standards for members of the public on this route. To manage public expectations and avoid delays, we recommend that Perpetua and the Forest Service have a web page describing the estimated schedule and potential closure times for each day and week.	REG	The proposed public access road through the operations area would avoid interaction with mining activities. The EPA and IDEQ agree that the public access road through the proposed mining operations area would be under the control of Perpetua while mining is in progress. They have concluded that ambient air quality standards would not apply to the road during this time. The recommendation for up-to-date scheduling of when public access might be interrupted on certain roads has been included in the EIS as a mitigation measure.
Bonnie Gestring (Northwest Program Director, Earthworks) and seven others	17634	379	CC. Additional Review of State Regulations Needed In the SDEIS, the Forest Service consistently defers to the state of Idaho on issues involving the management of federal lands and the effects on public resources. In many instances, the Forest Service assumes to some degree that various state processes have sufficiently addressed key resource issues associated with the SGP. However, these state rulemaking and permitting processes may actually have fewer safeguards in place to protect taxpayers, public health, water quality, fisheries and wildlife compared to NEPA and other federal laws. Perpetua Resources has been closely involved in several recent state rulemaking and permitting processes that will impact the SGP. These include the Idaho Department of Lands rulemaking regarding financial assurances and cyanidation regulations, and Idaho Department of Environmental Quality's air quality permit. In each of these instances, the mining company successfully reduced the permitting requirements or safeguards for key elements over the objections of conservation organizations and others. Groups like the Idaho Conservation League had pointed out that the new proposed rules and permits are less protective than regulations in other states. The federal government was not directly involved in the rulemaking processes or air quality permitting, but the EPA did comment on the final draft of the state air permit expressing significant concerns.	REG	This comment suggests that the Forest Service is deferring to state regulatory programs for the environmental analysis. This is not correct. The SDEIS clearly identifies the state regulatory programs that would apply to the Proposed Action and where the state has created certain environmental standards that would apply to the project these have been included in the EIS. The Forest Service has not deferred the necessary hard look at the environmental impacts required under NEPA and has required Perpetua to provide separate environmental documentation to support the NEPA analysis separately from what they may prepare for the state agencies. An example of this is discussed in Section 4.3 of the SDEIS where separate air emission inventory and air quality impact modeling was required by the Forest Service to support its evaluation of the reasonably foreseeable impacts as required under NEPA. The Forest Service NEPA air impact evaluation included impacts from fugitive dust emission as well as off-site vehicle emissions.

Small, Nathan (Chairman, Fort Hall Business Council, Shoshone-Bannock Tribes)	18903	26	Please consider using FR 440 as a route off of the Johnson Creek road and into the mine area, completely avoiding the Stibnite Road and the town of Yellow Pine.	ACC	The two alternatives analyzed in the SDEIS include the 2021 MMP, which would involve construction and use of Burntlog Route from Warm Lake Road to access the Operations Area Boundary, and the Johnson Creek Route Alternative, which would involve access to the Operations Area Boundary via Johnson Creek Road connecting to Stibnite Road from the Town of Yellow Pine. These two alternatives were deemed as the most environmentally, economically, and technically feasible to carry forward for analysis in the SDEIS. Other potential identified transportation and access road alternatives that were considered but eliminated from detailed analysis are discussed in Section 2.6.4.
Michael Gibson (Trout Unlimited), Aaron Lieberman (Idaho Outfitters & Guides Association), Garret Visser (Idaho Wildlife Federation)	18871	13	We are concerned about the dramatic changes to public access proposed in the SDEIS. Increases in motorized use seem inevitable and the risk for illegal use could have major impacts to both the roadless character of the area and wilderness characteristics found in the Burntlog, Black Lake, Meadow Creek and Horse Heaven Inventoried Roadless Areas, all of which are classified as Backcountry Restoration under the Idaho Roadless Rule. Additionally the close proximity of the Burnt Log route could affect wilderness characteristics in the Frank Church - River of No Return Wilderness area. The SDEIS proposes closing 14,221 acres of public access in the project area. These acres provide important public access for outdoor pursuits, such as hunting and fishing, and we question why the closure area proposed is so large.	ACC	The comment expresses concern first about the increase in access and that it may lead to increased motorized use. In Section 4.16 of the SDEIS, it is discussed that there would be an overall increase in road traffic that varies slightly between the 2021 MMP and the Johnson Creek Route Alternative. The concern in the comment is that motorized access that doesn't exist now, specifically the Burntlog Route, would have a detrimental impact on the area. The impacts associated with the Burntlog Route are discussed in relation to the Alternatives in the SDEIS (Section 4.16.2). Upon completion of construction, the Burntlog Route would provide main access to the SGP. Upon closure, the Burntlog Route would be returned to current existing conditions, including reclamation of newly constructed segments where it does not currently exist. Further the comment expresses concern about public access restrictions, which would be anticipated more so during mine construction. Public access would not be allowed on the newly constructed Burntlog Route segments; therefore, the public would need to utilize the public access route through the mine site to connect to Thunder Mountain Road once constructed. Public access would be reduced by road closures from half-day to multiple days during construction on the Stibnite Road, east of Yellow Pine.
Michael Gibson (Trout Unlimited), Aaron Lieberman (Idaho Outfitters & Guides Association), Garret Visser (Idaho Wildlife Federation)	18871	14	While the Idaho Roadless Rule does not prohibit road building in roadless as needed for access to claims related to the Mining Law of 1872 (36 CFR 294.25 (b)), the question of whether the proposed Burntlog route can be accessed by the public or be closed to administrative use only falls to general mining laws and should be considered by the USFS before approving this alternative. Additionally, any new claims for mineral development (i.e. gravel pits) within the four roadless areas affected by this alternative would seem to run contrary to restrictions to new mineral development set forth in the Idaho Roadless Rule for areas designated as Backcountry Restoration. Further, we have serious concerns about impacts to roadless characteristics that a road of this length and size will have if used for mining and/or public travel for the life span of the project. Additionally, the opportunity exists for the illegal pioneering of routes in such a remote area without a serious enforcement presence.	ACC	A mitigation measure has been added to the EIS regarding public use restrictions for newly constructed segments of the Burntlog Route. After construction is completed, public use would be allowed on Burntlog Route only when other public access roads are blocked by mine operations per 36 CFR 261.13 for public use exceptions. Impacts to special designation areas, including Idaho Roadless Areas, are fully analyzed for all alternatives under Section 4.23 of the SDEIS.
Michael Gibson (Trout Unlimited), Aaron Lieberman (Idaho Outfitters & Guides Association), Garret Visser (Idaho Wildlife Federation)	18871	15	The Johnson Creek route parallels Johnson Creek, a known bull trout stronghold. While disturbances to roadless character associated with the Burntlog route are not preferable, the Johnson Creek route could prove deleterious to resident bull trout. The SDEIS seems to downplay the risks of spills and sediment load associated with needed road improvements, would impact bull trout that are using this stream.	ACC	The 2021 MMP utilizing the Burntlog Route is the agency preferred alternative. As stated in the SDEIS Section 4.7.2, the use of the Johnson Creek Route rather than construction of the Burntlog Route would increase the risk of spills and sedimentation in Johnson Creek and the East Fork SFSR, as analyzed for fish resources and fish habitat in Section 4.12 and 5.12.
Jolie Drake	18929	5	Along with on-site use, the transportation of hazardous material is dangerous. The supply and export of mining materials will use the only rural road that accesses the mine: a narrow, treacherous 50-mile stretch of road that sits directly adjacent to the EFSFSR. The project estimates half a million round trips on this road, with many trucks requiring a HAZMAT vehicle escort, where even one spill into the river just feet away could sterilize all life for the foreseeable future.	ACC	The Project includes development of a new mine access route, the Burntlog Route, to limit the amount of traffic and material transportation adjacent to the East Fork SFSR.

Alan Haslam (Vice President, Permitting, Perpetua Resources Idaho, Inc.)	19325	104	Proposed (new) to be plowed: "***2021 MMP:*** *Burnt Log Road – 21 miles (currently groomed). Burnt Log Road Extension – 15 miles (proposed new).* " "***Johnson Creek Route Alternative:*** *Johnson Creek Road – 17 miles (conversion of existing OSV portion of Johnson Creek Road).* " Should include 8 miles of Warm Lake Rd between Warm Lake and Landmark. Please review and revise.	ACC	Revision complete.
Alan Haslam (Vice President, Permitting, Perpetua Resources Idaho, Inc.)	19325	105	"***Burnt Log Road*** *(plowed).* *Mine site public access during operations (not plowed).* ***Loss of winter groomed OSV trail on Warm Lake Road to Landmark. Loss of winter groomed OSV trail on Johnson Creek Road from Wapiti Meadows to Trout Creek campground during construction of Burntlog Route.*** " "**Burnt Log Road**" should read "**Burntlog Route**". These two statements about OSV losses (for both MMP and JCR alt) fail to describe how these losses will be mitigated, i.e. new OSV routes along CC and the west side of JC Rd to maintain access to Landmark. Should also include that as part of the MMP that following construction JC Rd will be groomed again between Landmark and Wapiti. Please review and revise.	ACC	Table 2.8-1 of the SDEIS provides only a summary of the comparison of impacts under the three alternatives analyzed. Environmental protection measures and mitigation for these losses is described in full and analyzed in Section 4.16 of the SDEIS. Revision to "Burntlog Route" complete.
Alan Haslam (Vice President, Permitting, Perpetua Resources Idaho, Inc.)	19325	106	"***2021 MMP:*** *Forest Service = no change; Valley County = 2.2 miles; State = no change; Private = 13.5 miles (with an additional 4 miles through the SGP)* " "***Johnson Creek Alternative Route:*** *Forest Service = no change; Valley County = 2.2 miles; State = no change; Private = 4 miles through the SGP* " Please provide the source for this information as it differs from what is presented in Chapter 4.	ACC	Section 4.16 of the SDEIS states that a permanent service road through the backfilled Yellow Pine pit would be established for public access, which would result in a total of approximately 2.2 additional miles of new road that would be accessible for public use following reclamation. This section also states that approximately 13.5 miles of new private access roads would be created during the life of the mine.
Alan Haslam (Vice President, Permitting, Perpetua Resources Idaho, Inc.)	19325	677	"***Access and Transportation*** " Access and transportation direct and indirect effects include air, water and rail. Please included in this subsection.	ACC	Text explaining cumulative effects on other modes of transportation has been added to the cumulative analysis.
Alan Haslam (Vice President, Permitting, Perpetua Resources Idaho, Inc.)	19325	678	"*The contribution to traffic volumes of the action alternatives which include traffic generated from the reconstruction of the transmission line combined with these projects would likely have a greater cumulative effect on the* ***roadways closer to the SGP*** . " Please clarify if there is an assumption that other projects will use Burntlog Route for access.	ACC	The text has been clarified to note that this assumption does include the Burntlog Route, given that the Burntlog Route would allow for public access when other routes are not available, despite that it would be constructed as a temporary road that is necessary for mining purposes.
Alan Haslam (Vice President, Permitting, Perpetua Resources Idaho, Inc.)	19325	679	"*The ASAOC (EPA 2021) (Table 5.1-3) would be additive to anticipated SGP traffic.* " ASAOC precedes SGP , which means it would not be temporally additive. ASAOC is also part of the No Action, in which it is additive to Golden meadows exploration and other geotech programs, NOT the SGP. Please revise.	ACC	Because the ASAOC is considered a Reasonably Foreseeable Future Action as an authorized project that is anticipated to be constructed between 2022 through 2025 (Table 5.1-2 and 5.1-3), impacts of such would be additive to the SGP and is therefore considered a cumulative effect under all alternatives.
Alan Haslam (Vice President, Permitting, Perpetua Resources Idaho, Inc.)	19325	680	"*Projects that are currently undergoing reclamation or will in the future* ***would likely*** *cause further damage to any historic properties in the area. These projects would likely be closed, which involves the removal of some of the infrastructure and reclamation of the land to restore native wildlife and plant habitats that are important to Native American tribes.* ***However, mature forest types wouldn't be available for decades.*** *Several CERCLA Removal Actions were conducted by the Forest Service, EPA, and Exxon-Mobil Corporation. These actions also can impact historic properties by removing*	ACC	Revision complete.

REC 7432

Author	Comment Letter	Comment Number	Comment	Comment Category	Comment Response
			submitted to Idaho Transportation Department and Valley County as recently as September 2020 as needing safety improvements to accommodate the turning geometry of their large vehicles. These concerns are not addresses in the DSEIS.		accessible via the SH 55 and Warm Lake Road intersection, were carried forward for the analysis in the SDEIS (2021 MMP Burntlog Route and the Johnson Creek Route Alternative). Perpetua would commit to meeting the ITD requirements for SH 55.
Ruth Lewinski	19378	9	A significant increase in traffic is also anticipated. For all road sections, it was unclear if/how Perpetua would be contributing for the burden of increased heavy truck traffic along any of the roadways they will be using.	ACC	Under the 2021 MMP, delivery of materials to the SGP would be planned in advance with established dates and times; therefore, vehicle traffic outside the Operations Area Boundary would likely occur between 5:00 am and 7:00 pm (daylight hours) everyday resulting in approximately five mine-related vehicles traveling on the Johnson Creek Route per hour during the two years the Burntlog Route is constructed. Overall, there would be less mine-related traffic on the road during operations than during construction; however, the driver experience would still be noticeably different than existing conditions with an increase in mine-related heavy vehicles and slower travel times. Similarly, during closure and reclamation, hauling materials would be planned in advance with established dates and times; therefore, vehicle traffic outside the Operations Area Boundary would likely occur between 5:00 am and 7:00 pm (daylight hours) resulting in approximately two mine-related vehicles traveling on the Burntlog Route per hour during closure and reclamation. The more traveled roadways would have a less noticeable change in daily traffic.
Jesse Lutz	19386	11	Average daily traffic counts are not available in the DEIS (or SDEIS). There should be data available on this subject within the document. Road counter data would show current user trends on country and forest service roads within the analysis area. It could also be used in reference to the use proposed on new or improved routes in the analysis area.	ACC	AADT is provided for the SGP access roads within the access and transportation analysis area, provided in Section 3.16 of the SDEIS. AADT increases under the 2021 MMP and the Johnson Creek Route Alternative are provided in Section 4.16 of the SDEIS.
Bonnie Gestring (Northwest Program Director, Earthworks) and seven others	17634	158	The Stibnite Gold Project also represents an activity that is not covered by the South Fork Salmon River Road EIS or Biological Opinion and needs to be analyzed for Forest Plan compliance and cumulative effects. The Burntlog Route will likely be impassable for periods of time in winter. Such closures are reasonably foreseeable and should not constitute an emergency and allow for a time-critical, emergency, or weather-related excuses to haul hazardous chemicals down the South Fork Salmon River Road. Instead, the Forest Service should ensure that the Johnson Creek Route is available as an alternative. In addition, the SGP should be designed from the beginning to factor in extensive and multiple delays in transporting materials as a normal part of its winter operations. The Forest Service needs to verify that transportation of hazardous materials, including diesel fuel, will not be allowed at any time on the South Fork Salmon River Road.	ACC	The Burntlog Route and the Johnson Creek Route Alternative are the only two action alternatives analyzed in the SDEIS. All previously analyzed and/or considered alternatives have not been carried forward for analysis (SDEIS Section 2.6). The 2021 MMP (Burntlog Route) is the preferred alternative as it would be the safest alternative for both the human and wildlife environment. Under the 2021 MMP, the Johnson Creek Route would be utilized during the 2 to 3 years of construction for the Burntlog Route, and those improvements would remain during the life of the mine. Further, the 83-mile South Fork Salmon River Route would not be used as access to the SGP (SDEIS Section 4.16.2).
Bonnie Gestring (Northwest Program Director, Earthworks) and seven others	17634	166	To begin, the SDEIS is unclear about whether the Stibnite Road between Yellow Pine and the mine site will be maintained year-round as an alternative ingress/egress even if the Burntlog Route is chosen for primary mine site access. As discussed below, due to location and elevation, the Burntlog Route may be impassable for days to a week or more during winter/early spring. Indeed, the Burntlog Route would be the second highest road in the state of Idaho that is maintained year-round. And unlike Galena Summit on State Highway 75, the Burntlog Route travels for 30 miles over 7000 feet and 10 miles over 8000 feet in an area that receives twice the annual snow water equivalent as Galena. Alternate access, such as the Johnson Creek Road from Warm Lake to Yellow Pine and the Stibnite Road between Yellow Pine and the mine site, to allow for emergency services or uninterrupted mining operations, may be necessary.	ACC	Comment noted. Refer to Section 4.16.2 of the SDEIS regarding the Stibnite Road maintenance agreement, wherein it is stated that the existing maintenance agreement with Valley County would continue.
Bonnie Gestring (Northwest Program Director, Earthworks) and seven others	17634	186	Encouraging public motorized use along these routes may also reduce the opportunities for non-motorized recreation in the area. As such, we recommend that these routes remain closed to public motorized vehicle access, and that Perpetua and the Forest Service provide a more thorough description of measures to prevent unauthorized use, with Perpetua committing to compensate Idaho Power for additional gates and outreach, education and enforcement costs related to restricting access to these routes. The upgraded and newly constructed transmission lines may dramatically increase the amount of unauthorized motorized vehicle use and associated negative impacts, including human-caused wildfire ignitions. Additional outreach and education regarding travel management plans will help keep OHVs on designated routes and slow weed expansion. As part of this effort, we recommend partnering with user groups to help educate users on open routes. Signs and informational kiosks with maps should be placed	ACC	A mitigation measure has been added to the revised EIS describing public use restrictions for the newly constructed segments of the Burntlog Route. Under the 2021 MMP, there would be a public access route through the SGP during the operations, and closure and reclamation phases, however, public access would be intermittently interrupted during the construction phase. Public access through the SGP would provide motorized access to Thunder Mountain Road. Under the Johnson Creek Route Alternative, public access on Johnson Creek Road would be completely restricted for one full year during the first year of construction due to improvements to Johnson Creek Road. Periodic lane restrictions and appropriate signage would be posted to notify motorized vehicle users of construction activities and electronic signage and automated timed stoplights would be present at points of public access to inform the public of seasonal and temporary closures.

REC 7433

Author	Comment Letter	Comment Number	Comment	Comment Category	Comment Response
			at all trailheads and staging areas that communicate the Forest Service's policies and regulations regarding the use of motor vehicles on public lands. Printed materials in maps and at kiosks should include the following points: taking a map and knowing the trail system, keeping vehicles clean, using spark arrestors to avoid wildfires, staying on designated trails, and staying off muddy trails. Photos in outreach materials should display recreationists using proper trail etiquette. These resources should also be available online, and perhaps be accessible using a QR code incorporated into all signs and information kiosks. The agency should indicate it reserves the right to close an area to motorized travel if recreationists do not follow the policies and regulations, or if recreationists participate in destructive riding practices on public lands. Outreach materials should include phone numbers for the relevant Forest Service or utility offices so that members of the public can report violations in a timely manner, thus increasing the capacity of user groups to encourage responsible use of the land.		Overall, public access and motorized vehicle use in the analysis area would still be permitted. The development of recreational print and signage materials is not related to the Forest Service decision to be made on the SGP and is therefore outside the scope of this EIS.
Bonnie Gestring (Northwest Program Director, Earthworks) and seven others	17634	187	We also recommend that all signs and trail markers should include an emblem of an American flag and the logo of local OHV groups that support the designated trail system in order to discourage theft and vandalism to help ensure that information remains readable and available. The Forest Service and Perpetua need to commit to additional trail rangers in the area for outreach, education, and enforcement actions.	ACC	The development of Forest Service recreational signage is outside the scope of this EIS. Neither the 2021 MMP nor the Johnson Creek Route Alternative propose agency employment within the proposed employee descriptions for construction, operations, and closure and reclamation.
Bonnie Gestring (Northwest Program Director, Earthworks) and seven others	17634	194	7. The SDEIS fails to clarify public access along the Burntlog Route Adding to this confusion, the SDEIS is inconsistent regarding whether the new 15-mile section of the Burntlog Route will be open to the public or not. The SDEIS states that, "Approximately 13.5 miles of new private access roads would be created during the life of the mine," (SDEIS, p. 4-490, emphasis added). This statement appears to align with the provisions of the Idaho Roadless Rule being cited for authorizing the extension of the Burntlog Route with new construction that will lead to the SGP mine site. Several Specialist Reports also say that the Burntlog Route will be closed to public access, whereas other documents inconsistently state that the route could be open, will be open when other access is closed or simply will be open. The analysis fails to describe how the Forest Service/Perpetua will ensure that the proposed new section of the Burntlog Route will remain "private" and only available for direct mine-related traffic. Because new road construction for public access is prohibited under the Idaho Roadless Rule, and the Forest Service has failed to identify potential methods enforcing this restriction, authorizing the construction of the route will represent a violation of the Roadless Rule and the Forest Plan. As it stands, increased traffic volumes associated with mine construction, operations, and closure activities will result in decreased wildlife security and impacts to roadless and wilderness values (see below and our specific comments regarding Special Designations). Allowing public access on roads proposed for authorization specifically for mine access will increase impacts to the roadless areas through unauthorized trail creation, increased sediment delivery, and will significantly increase Perpetua's liability should a traffic accident occur between mine-associated trucks/equipment and a private citizen traveling within the mine site or along the Burntlog Route. Further, traditional closure methods such as Kelly humps or large boulders are obviously inappropriate for this application. Therefore, we recommend the Forest Service require Perpetua to construct and staff an "access control booth" at the point where the existing Burnt Log Road ends and where the proposed new construction of the Burntlog Route would begin during summer operations when the Burnt Log road is open to wheeled vehicles. If mine operations are to extend to 24 hour shifts with traffic potentially moving through this corridor potentially at all times of the day and night, then the booth should be staffed 24 hours/day, seven days/week unless the mine and all associated operations and transportation is closed. During those periods, the road should be heavily gated with all potential "drive around" opportunities closed and/or removed. The recommendation for a staffed access control point will adequately restrict summer traffic on the newly constructed portion of the Burnt Log Road; however, it does not address the increased traffic that will occur on the existing portion of the Burntlog Route during the winter when it is plowed and maintained for mine access. This portion is currently unavailable to the majority of summer motorized	ACC	As stated in the Transportation Management Plan (July 2021), the Burntlog Route would be a two-lane, all-weather, gravel-surfaced road. It would be required to meet all applicable Forest Service design criteria as well as criteria for semi-trailers (WB-50) and oversize deliveries of large equipment (WB-67) and (Parametrix 2018c). Following closure and the reclamation of the Burntlog Route, Stibnite Road from Yellow Pine to the SGP would be restored to the current alignment.

Final Record of Decision

Stibnite Gold Project

Valley County, Idaho

January 2025

The United States Department of Agriculture (USDA) is committed to making its digital content accessible. USDA customers, employees, job applicants, and members of the public with disabilities must have access to information and communication technology (ICT) comparable to the access available to those without disabilities. The U.S. Access Board ("Access Board") is responsible for developing accessibility standards. In 2017, the Access Board published a Final Rule that updated the accessibility requirements in Section 508 of the Rehabilitation Act of 1973 (Section 508), 29 U.S.C. 794d, and refreshed the guidelines in the law. The Final Rule went into effect on January 18, 2018. The standards are available at Information and Communication Technology: Revised 508 Standards and 255 Guidelines.

For more information, see the USDA Accessibility Statement.

In accordance with Federal civil rights law and U.S. Department of Agriculture (USDA) civil rights regulations and policies, the USDA, its Agencies, offices, and employees, and institutions participating in or administering USDA programs are prohibited from discriminating based on race, color, national origin, religion, sex, gender identity (including gender expression), sexual orientation, disability, age, marital status, family/parental status, income derived from a public assistance program, political beliefs, or reprisal or retaliation for prior civil rights activity, in any program or activity conducted or funded by USDA (not all bases apply to all programs). Remedies and complaint filing deadlines vary by program or incident.

Persons with disabilities who require alternative means of communication for program information (e.g., Braille, large print, audiotape, American Sign Language, etc.) should contact the responsible Agency or USDA's TARGET Center at (202) 720-2600 (voice and TTY) or contact USDA through the Federal Relay Service at (800) 877-8339. Additionally, program information may be made available in languages other than English.

To file a program discrimination complaint, complete the USDA Program Discrimination Complaint Form, AD-3027, found online at How to File a Program Discrimination Complaint and at any USDA office or write a letter addressed to USDA and provide in the letter all of the information requested in the form. To request a copy of the complaint form, call (866) 632-9992. Submit your completed form or letter to USDA by: (1) mail: U.S. Department of Agriculture, Office of the Assistant Secretary for Civil Rights, 1400 Independence Avenue, SW, Washington, D.C. 20250-9410; (2) fax: (202) 690-7442; or (3): mail to: program.intake@usda.gov.

USDA is an equal opportunity provider, employer, and lender.

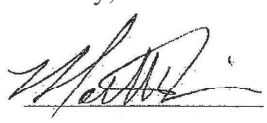
U.S. Army Corps of Engineers
U.S. Environmental Protection Agency
Valley County

Preface

In 2016, the Payette National Forest accepted a proposed Plan of Operations submitted by Perpetua Resources Idaho Inc. (Perpetua). Based on my review of the environmental analysis disclosed in the Stibnite Gold Project Final Environmental Impact Statement (FEIS), specialist reports, other supporting analyses, associated land management plans, the project record, and in consideration of public comments received on the Stibnite Gold Project Draft Environmental Impact Statement (DEIS), and Supplemental DEIS, this Final record of decision (ROD) describes my decision and the rationale for my decision. The draft and final environmental impact statement documents along with other supporting documents can be accessed on the project website (https://www.fs.usda.gov/project/?project=50516).

Perpetua is proposing to develop an open pit mining operation on National Forest System lands located approximately 98 miles by air and 146 miles by road northeast of Boise, Idaho; approximately 44 miles by air and 68 miles by road northeast of Cascade, Idaho; and approximately 10 miles by air and 14 miles by road east of the community of Yellow Pine, Idaho. The deposit associated with the Stibnite Gold Project, which has been explored to date, is located primarily on National Forest System land that is open to mineral entry under the General Mining Law of 1872. The Stibnite Gold Project is located within the Payette and Boise National Forests. The Forest Supervisor for the Payette National Forest was delegated as the responsible official for the Stibnite Gold Project because the proposed mining activities are proposed to occur on the Payette National Forest. Secondary proposed project activities to mining operations such as the access road are proposed to occur within the Boise National Forest.

In the United States, the General Mining Law of 1872 (30 U.S.C. 21-54) is the principal law governing the exploration and development of locatable minerals on federal lands. Surface use of National Forest System lands in connection with operations authorized by the United States mining laws is governed by regulations found at 36 Code of Federal Regulations (CFR) Part 228 Subpart A. Pursuant to 36 CFR 228.8, all such operations shall be conducted so as, where feasible, to minimize adverse environmental impacts on National Forest surface resources.



Prior to authorizing the use of National Forest System lands and approving a plan of operations, the Forest Service must analyze the potential effects of the activities that the agency will authorize in accordance with the National Environmental Policy Act (NEPA). In this case, the Stibnite Gold Project, and its associated activities, proposed by Perpetua, was analyzed in a FEIS (Forest Service 2024a).

Because the Stibnite Gold Project includes the discharge of dredge and fill material into waters of the U.S., including wetlands, the U.S. Army Corps of Engineers, pursuant to Section 404 of the Clean Water Act, will review the Stibnite Gold Project and render a decision to either issue, issue with special condition, or deny a permit for the Stibnite Gold Project. Because of separate agency authorities, the Forest Service and U.S. Army Corps of Engineers each prepared a separate ROD for their respective decisions. The decisions of each agency are developed in coordination with the other. This decision presumes the U.S. Army Corps of Engineers will select the Agency Preferred Alternative identified in the FEIS.

The Draft ROD was published in conjunction with the FEIS and was made available to people and entities on the Stibnite Gold Project mailing list and the general public. This Final ROD was developed following the conclusion of the pre-decisional objection process, as required under 36 CFR 218 Subparts A and B.

Questions can be directed to Kara Kirkpatrick-Kreitinger, Forest Environmental Coordinator at (208) 631-8427 or kara.kirkpatrick-kreitinger@usda.gov.

Sincerely,

Matthew Davis
Forest Supervisor, Payette National Forest

Mitigation Measure – Burntlog Route public access restriction: Construction of the Stibnite Gold Project is expected to take three years (Mine Years -3 through -1). The Burntlog Route is anticipated to take two years to construct (i.e., Mine Year -3 and -2). The access to Meadow Creek Lookout Road will experience short-term closures during Year -3 when crossings of the new Burntlog Route are constructed.

The through-site public access to Thunder Mountain Road will be largely unaffected during Year -3 with more temporary closures in Year -2, then completely closed during Year -1 before re-opening on a new seasonal access route in Year 1 (Table 3).

Table 3 Access Impacts During Construction and Operations

Road	Mine Year -3	Mine Year -2	Mine Year -1	Mine Operations
Warm Lake Road (Cascade to Landmark)	Limited effects	Limited effects	Limited effects	Limited effects
Johnson Creek Road (Landmark to Yellow Pine)	Limited effects	Temporary closures	Seasonal access	Seasonal access
Stibnite Road (Yellow Pine to Stibnite)	Limited effects	Temporary closures	Closed in Operations Area	Seasonal access
Thunder Mountain Road (Stibnite to Thunder Mountain)	Limited effects	No access when Stibnite Road is temporarily closed	Access through new Burntlog Route only	Seasonal access via new public access road through site
Meadow Creek Lookout Road	Temporary closures for nearby Burntlog Route construction	Limited effects	1.8-mile shared segment with new Burntlog Route	1.8-mile shared segment with new Burntlog Route
New Burntlog Route (Landmark to Stibnite)	Under construction	Under construction	Site access plus public access	Site access with public access restriction

The Burntlog Route will be a mine access road operated by the Stibnite Gold Project for the duration of the project. As such, project-related use of the route will be regulated per the Forest Service's decision on the Stibnite Gold Project and incorporate compliance with the project's Transportation Management Plan. Public use of the Burntlog Route will be restricted. Seasonal use of the newly constructed portions of the Burntlog Route will be allowed only during the snow-free portion of Year -1 when there would be no other access to the Thunder Mountain Road.

Public use of existing segments of the Burntlog Route will not be modified by the Stibnite Gold Project decision but would be subject to temporary closures for new Burntlog Route construction. During operations, public use of existing segments of the Burntlog Route (i.e., Burnt Log Road [FS447], Meadow Creek Lookout Road [FR51290], and Thunder Mountain Road [FR50375]) will be unrestricted. The main road segment where public access would continue will be a 1.8-mile section of the Meadow Creek Lookout Road, coincident with the Burntlog Route. Signage would be placed at all intersections with Forest Service roads and trails to identify road segments with public access restrictions.

The Forest Service will require the Project Operator, to develop and implement a Burntlog Route Access Plan to restrict public access per this mitigation measure and to provide notifications to the public when the newly constructed segments of the Burntlog Route would be open.

Any Forest Service decision to allow operations to be conducted would be based on the impacts analyzed for under NEPA, and compliance would be based on adherence to the actions for which that analysis was based, independent of the mine's compliance status with decisions and permits from other agencies. For example, if groundwater and/or surface water diversion within Idaho Department of Water Resources' water authorizations resulted in an impact to streamflow significantly different from what the Forest Service analyzed and based its decision on, that impact would not be authorized without further analysis and approval.

The Stibnite Gold Project incorporates a number of environmental design features, operational activities, best practices, mitigation measures, and monitoring plans intended to reduce impacts to the environment. The Forest Service will form an Interested Agency Review Board to provide oversight for the Stibnite Gold Project's environmental-related activities including adaptive management. The Interested Agency Review Board will consist of all permitting agencies including Idaho Department of Environmental Quality, Idaho Department of Lands, Idaho Department of Water Resources, National Marine Fisheries Service, U.S. Fish and Wildlife Service, U.S. Environmental Protection Agency, U.S. Army Corps of Engineers, Valley County, and the Forest Service.

Member agencies on the Interested Agency Review Board will have access to Stibnite Gold Project design reports, Stibnite Gold Project as-built drawings, environmental monitoring reports, model updates required by environmental mitigation measures, and any environmental action plans. These agencies will also have the opportunity to provide input where appropriate on Stibnite Gold Project documentation. Specific construction stage documentation subject to Interested Agency Review Board review upon their completion include:

- Construction-level design of the water treatment plants,
- Construction-level design of the tailings storage facility,
- Construction-level design of the processing plant facility components,
- Construction-level design of the Burntlog Route,
- Construction-level design of the fish tunnel,
- Construction-level design of the East Fork South Fork Salmon River water intake,
- The final Stormwater Pollution Prevention Plan,
- The final Compensatory Mitigation Plan,
- Monitoring and mitigation plans under the Environmental Monitoring and Management Plan (EMMP) (including adaptive management), and
- Engineering as-builts for completed facilities.

The Interested Agency Review Board will meet at least annually to review road maintenance activities, environmental monitoring data, project development, and any adaptive management measures.

10.2 Regulatory and Forest Service Requirements

Regulatory and Forest Service requirements and requirements associated with environmental design features are listed in Tables 5 and 6, and made conditions of this decision. These tables are also contained in the FEIS as Tables 2.4-12 and 2.4-13.

Description	Resources Affected
Soil stability will be estimated for all reclaimed areas using qualitative descriptors.	Soils, Reclamation
Slope stability will be monitored during the erosion inspections.	Soils, Reclamation
If the performance of reclaimed areas is not satisfactory, appropriate maintenance activities will be implemented. Maintenance activities may include one or more of the following: • Sediment removal from sediment basins, stormwater drainage channels, and diversions as necessary to maintain their design capacity; • Diverting surface water away from reclaimed areas where erosion jeopardizes attainment of reclamation standards; • Stabilizing rills, gullies, and other erosion features or slope failures that have exposed development rock; • Noxious weed and invasive plant species control; and, • Re-seeding or re-applying reclamation treatments in areas where it is determined through monitoring and agency consultation that reclamation will not meet standards.	Soils, Reclamation
The Project Operator will submit an annual report to the Forest Service and the other federal and state agencies that are responsible for issuing authorizations applicable to reclamation for the preceding calendar year. The annual report will contain descriptions of the reclamation activities completed during the previous year, a summary of areas reclaimed, a discussion of the results of the reclamation monitoring conducted, and corrective actions implemented.	Soils, Reclamation
A new 12-foot-wide gravel road will be constructed to provide public access from Stibnite Road (FR 50412) to Thunder Mountain Road (FR 50375) through the Stibnite Gold Project. During operations, the public access road will be used to travel through the Stibnite Gold Project and will provide seasonal use, open to all vehicles. Vehicles passing through the Stibnite Gold Project will be required to check-in with mine personnel at the North or South Stibnite Gold Project entry points.	Transportation and Access, Health and Safety
Post reclamation, a road will be established over the backfilled Yellow Pine pit to allow public access through the reclaimed site and connect Stibnite Road (FR 50412) to Thunder Mountain Road (FR 50375). This will replace the operational phase public access route.	Transportation and Access
Prior to site preparation and construction of surface facilities, vegetation will be removed from operating areas. Trees and deadwood, shrubs, and slash not needed to construct windrows at the edge of Burntlog Route disturbance (to function as sediment barriers), will be chipped, and suitable soil will be separately salvaged and stockpiled (except for a small portion that will be 'live handled') for use as part of site reclamation and restoration. Portions of the salvaged soil will be blended with the chipped wood to create growth media. All growth media placed in stockpiles will be stabilized, seeded, and mulched to protect the stockpiles from wind and water erosion.	Vegetation
The Project Operator will inspect and remove vegetation material (including noxious weeds) from mechanical equipment and properly dispose to minimize the spread of unwanted vegetation.	Vegetation
Wood wastes and wood mulch are the two primary sources of compost. Food waste produced from on-site meal preparation and wastes may provide another source. Combined and properly managed during composting, these materials will provide a source of organic matter to be blended into substrate materials suitable for mitigation.	Vegetation
The Project Operator will be responsible for noxious weed control within areas disturbed by Stibnite Gold Project activities.	Vegetation, Wildlife
Develop and employ planting plans for wildlife benefits (cover, forage, etc.) using approved seed mixes.	Vegetation, Wildlife

10.3.10 Road Use and Maintenance

Description	Reference
Minor surface improvements (e.g., ditch and culvert repair, adding gravel, winter snow removal, and summer dust suppression) will occur on the Yellow Pine Route to reduce sediment runoff and dust generation.	2021 Modified Mine Plan
Once all final mine closure and reclamation work has been completed, the Project Operator will reduce the 21-foot-wide travel way of 19.8 miles of Burntlog Road (FR 447), 1.3 mile of Meadow Creek Lookout Road (FR 51290), and 2.0 miles along Thunder Mountain Road (FR 375) of Burntlog Route to their approximate pre-mining width.	2021 Modified Mine Plan
The approximately 15 miles of Burntlog Route connecting to Meadow Creek Lookout Road (FR 51290) and Thunder Mountain Road (FR 50375) will be decommissioned.	2021 Modified Mine Plan
Following mining and ore processing operations, unless they are taken over by a third-party for ongoing use and maintenance, the Burntlog Maintenance Facility buildings will be removed. The sewer system and septic tanks for the facility will be decommissioned. Soil and rock beneath fuel storage areas and chemical storage buildings will be tested for contamination. All reagents, petroleum products, solvents, and other hazardous or toxic materials will be removed from the site and disposed of according to applicable state and federal regulations. After demolition of the buildings and facilities, the site will be graded, and drainage restored.	2021 Modified Mine Plan
A new 12-foot-wide gravel road will be constructed to provide public access from Stibnite Road (FR 50412) to Thunder Mountain Road (FR 50375) through the Stibnite Gold Project. During operations, the public access road will be used to travel through the Stibnite Gold Project and will provide seasonal use, open to all vehicles. Vehicles passing through the Stibnite Gold Project will be required to check-in with mine personnel at the North or South Stibnite Gold Project entry points.	2021 Modified Mine Plan
Post reclamation, a road will be established over the backfilled Yellow Pine pit to allow public access through the reclaimed site and connect Stibnite Road (FR 50412) to Thunder Mountain Road (FR 50375). This will replace the operational phase public access route.	2021 Modified Mine Plan
New roads constructed for the Project on National Forest System lands will be closed and reclaimed, as required by Forest Service, once they are no longer needed to support Project construction, operations,	2021 Modified Mine Plan
Project-related traffic will be restricted to existing roadways and Project areas. Off-road travel in previously undisturbed areas will be forbidden.	2021 Modified Mine Plan

REC 7449

10.3.11 Reclamation and Restoration

Description	Reference
Facilities will be located on previously impacted lands when that location fits into mine operations.	2021 Modified Mine Plan
Productive lands that support wildlife and fisheries habitat and dispersed recreation will be established on Project-related surface disturbance.	2021 Modified Mine Plan
Approximately 37 percent of the reclamation will be done concurrent to mining and ore processing; the remaining 63 percent will be accomplished during closure. Annual reclamation activities are described in a schedule provided in Table 3-1 of the Reclamation Closure Plan. Concurrent reclamation areas will focus on construction period restoration efforts (e.g., East Fork Meadow Creek, aka Blowout Creek) and laydown yards, Yellow Pine Pit area facilities, and Hangar Flats Pit area facilities. Closure period activities are focused on the West End Pit area, tailings storage facility area, Fiddle growth media stockpile, and process plant area. This information is also presented graphically in Appendix C to the Compensatory Mitigation Plan.	2021 Modified Mine Plan
The Yellow Pine pit will be backfilled with West End pit development rock during operations.	2021 Modified Mine Plan
A sinuous channel will be constructed through the backfilled area for the reconstructed East Fork South Fork Salmon River with an average valley gradient approximating the historical, pre-disturbance river gradient.	2021 Modified Mine Plan
The backfill will be placed to achieve a mounded final reclamation surface to promote drainage away from the West End pit and prevent formation of a pit lake within Midnight pit.	2021 Modified Mine Plan
The floor of the sidehill pit southwest of the main West End pit will be graded to drain, covered with growth media, and revegetated.	2021 Modified Mine Plan

The United States Department of Agriculture (USDA) is committed to making its digital content accessible. USDA customers, employees, job applicants, and members of the public with disabilities must have access to information and communication technology (ICT) comparable to the access available to those without disabilities. The U.S. Access Board ("Access Board") is responsible for developing accessibility standards. In 2017, the Access Board published a Final Rule that updated the accessibility requirements in Section 508 of the Rehabilitation Act of 1973 (Section 508), 29 U.S.C. 794d, and refreshed the guidelines in the law. The Final Rule went into effect on January 18, 2018. The standards are available at Information and Communication Technology: Revised 508 Standards and 255 Guidelines.

For more information, see the USDA Accessibility Statement.

In accordance with Federal civil rights law and U.S. Department of Agriculture (USDA) civil rights regulations and policies, the USDA, its Agencies, offices, and employees, and institutions participating in or administering USDA programs are prohibited from discriminating based on race, color, national origin, religion, sex, gender identity (including gender expression), sexual orientation, disability, age, marital status, family/parental status, income derived from a public assistance program, political beliefs, or reprisal or retaliation for prior civil rights activity, in any program or activity conducted or funded by USDA (not all bases apply to all programs). Remedies and complaint filing deadlines vary by program or incident.

Persons with disabilities who require alternative means of communication for program information (e.g., Braille, large print, audiotape, American Sign Language, etc.) should contact the responsible Agency or USDA's TARGET Center at (202) 720-2600 (voice and TTY) or contact USDA through the Federal Relay Service at (800) 877-8339. Additionally, program information may be made available in languages other than English.

To file a program discrimination complaint, complete the USDA Program Discrimination Complaint Form, AD-3027, found online at How to File a Program Discrimination Complaint and at any USDA office or write a letter addressed to USDA and provide in the letter all of the information requested in the form. To request a copy of the complaint form, call (866) 632-9992. Submit your completed form or letter to USDA by: (1) mail: U.S. Department of Agriculture, Office of the Assistant Secretary for Civil Rights, 1400 Independence Avenue, SW, Washington, D.C. 20250-9410; (2) fax: (202) 690-7442; or (3): mail to: program.intake@usda.gov.

USDA is an equal opportunity provider, employer, and lender.

Stibnite Gold Project Final Environmental Impact Statement Errata Document

1. Introduction

The Stibnite Gold Project Draft Record of Decision and the Final Environmental Impact Statement (FEIS) were released on September 6, 2024. This errata sheet documents corrections to the text of the September 2024 published FEIS and should be reviewed along with the FEIS. These corrections reflect instructions provided by Kelly Orr, the Intermountain Region Deputy Regional Forester, in the response to objections dated October 21, 2024, and additional clarifications. These corrections are consistent with the direction given in Forest Service Handbook 1909.15, Chapter 10, Section 18. There are no changes to the project or significant new circumstances identified in this errata sheet that affect the analysis and conclusions in the Stibnite Gold Project FEIS, therefore, a supplement to or revision of the FEIS is not needed. These changes also apply to the Stibnite Gold Project specialist reports, as applicable.

Article II. Chapter 2

1. FEIS, Chapter 2, Section 2.4.4.4 Public Access (page 2-20)

The description regarding seasonal public access through the operating mine site to Thunder Mountain Road is modified per the italicized text:

During operations, the public access road through the Operations Area Boundary would provide seasonal use, open to all vehicles; access would not be provided in winter when impassable (current county maintenance standards) and signs would inform the public of seasonal and temporary closures. Public vehicles passing through would be required to check-in with mine personnel at the North or South SGP entry points and would receive a safety briefing and would also be required to check-out with SGP personnel upon exiting the SGP. For safety purposes, public access would be separated from other SGP roads by berms, security fencing, and the underpass to allow the public road to pass beneath the mine haul road. No stopping or deviating from the public access road would be allowed. Perpetua could restrict access to any vehicles due to concerns related to public or employee health and safety, such as during road construction and maintenance, blasting, highwall scaling, mining in the immediate area of the road, and similar operations. *Because public use of the road would be subject to Perpetua's control measures on general use, the public access road is not considered a public road.*

Significance: The addition clarifies the status of the access road through the site with regard to whether it will be operated as a public road.

2. FEIS, Chapter 2, Section 2.4.9 Environmental Design Features (Table 2.4-12 on page 2-106)

An environmental design feature used in the wildlife specialist report effects analysis unintentionally omitted from Table 2.4-12. The following row is added into Table 2.4-12 on page 2-106.

BEFORE THE BOARD OF ENVIRONMENTAL QUALITY
STATE OF IDAHO

IN THE MATTER OF AIR QUALITY PERMIT TO CONSTRUCT P-2019.0047 NEZ PERCE TRIBE, IDAHO CONSERVATION LEAGUE, and SAVE THE SOUTH FORK SALMON, Petitioners, v. IDAHO DEPARTMENT OF ENVIRONMENTAL QUALITY, Respondent, and PERPETUA RESOURCES IDAHO, INC., Intervenor-Respondent.	Agency Case No. 0101-22-01 OAH Case No. 23-245-01 **NOTICE OF SPECIAL MEETING OF THE BOARD OF ENVIRONMENTAL QUALITY | June 24, 2025**

NOTICE IS HEREBY GIVEN that the Board of Environmental Quality (DEQ Board) has scheduled a Special Meeting to take action in the above-captioned matter. The DEQ Board will hold an executive session pursuant to Idaho Code § 74-206(1)(f) to communicate with legal counsel to discuss the ramifications of and legal options regarding this pending contested case. The Board will also consider the *Petitioner Save the South Fork Salmon's Motion for Reconsideration Based on New Evidence* filed June 6, 2025.

The Special Board Meeting will be held on June 24, 2025, at 12:00 p.m. Mountain Time in conference rooms A and B at the Department of Environmental Quality State Office, 1410 N. Hilton, Boise, Idaho. The public may attend the meeting in person or via Microsoft Teams. The

Teams link will be available in the Meeting Notice posted at https://www.deq.idaho.gov/board-of-environmental-quality/ at least 24 hours prior to the meeting date.

Dated this 13th day of June, 2025.

Case Docket No. 0101-22-01
OAH Case No. 23-245-01

RESPONDENT IDAHO DEPARTMENT OF ENVIRONMENTAL QUALITY'S RESPONSE TO PETITIONER SAVE THE SOUTH FORK SALMON'S MOTION FOR RECONSIDERATION BASED ON NEW EVIDENCE

Respondent, the Idaho Department of Environmental Quality ("DEQ"), by and through the Office of the Attorney General, hereby submits this Response to Petitioner Save the South Fork Salmon's ("SSFS") *Motion for Reconsideration Based on New Evidence* ("Motion for Reconsideration").

INTRODUCTION

On June 17, 2022, DEQ issued an air quality permit, a Permit to Construct ("PTC"), to Perpetua Resources Idaho, Inc. ("Perpetua") for the Stibnite Gold Project ("SGP"). REC 1274. In the PTC, DEQ determined that the Stibnite Access Route ("the Route"), an access road that runs through the SGP, was not accessible by the general public and was, therefore, not "ambient air," as that term is defined in the applicable rules. REC 3475. The Hearing Officer and then the Board of Environmental Quality ("the Board") ultimately agreed with DEQ's determination that the Route was not ambient air. *See* REC 3297, REC 3701. On January 24, 2025, SSFS filed its first motion for reconsideration, appealing the Board's decision due to "new evidence." REC 7147. On February 24, 2025, the Board issued its Order on SSFS's motion, finding it was premature given the Board's May 9, 2024 *Final Order* ("2024 Final Order") was not final for purposes of I.C. §§ 67-5246(5), 67-5270, and 67-5273. REC 7343-7348. After the Board issued its final decision on all issues on May 27, 2025 ("2025 Final Order"), SSFS filed its instant Motion for Reconsideration. REC 7374-7391. DEQ continues to assert there is no new evidence that should change the Board's decision, and the Board should find that DEQ acted both reasonably and lawfully in excluding the Route from ambient air.

PROCEDURAL HISTORY

On July 22, 2022, SSFS, the Nez Perce Tribe, and the Idaho Conservation League (collectively, "Petitioners") initiated a contested case, challenging DEQ's issuance of the PTC to

Perpetua for the SGP. REC 0001-0028. Thereafter, the Board appointed a Hearing Officer to oversee and decide the contested case. REC 0031-0032. On August 12, 2022, DEQ responded to the Petition, denying it committed any error in issuing the PTC. REC 0033-0039. Perpetua then moved to intervene in the contested case, which the Hearing Officer granted. REC 0040-0045.

On September 6, 2022, Perpetua filed a *Motion to Dismiss the Petition*, which DEQ joined. REC 0052-0124. In ruling on the Motion, the Hearing Officer dismissed three of Petitioners' claims and partially dismissed a fourth. REC 0160-0186. Petitioners were given leave to amend their Petition, and an Amended Petition was filed in January 2023. REC 0263-0292.

Petitioners filed a *Motion for Summary Judgment* on April 14, 2023, and DEQ and Perpetua filed their own Motions for Summary Judgment on May 12, 2023. REC 0319-0363; REC 1204-1232; REC 1276-1336. After hearing oral argument, the Hearing Officer issued his *Memorandum Decision on Motions for Summary Judgment and Preliminary Order* on October 31, 2023, appearing to dismiss all of Petitioners' claims. REC 3280-3328. Seeking clarity on his decision, DEQ and Perpetua filed a *Joint Motion for Reconsideration and/or Clarification* on November 10, 2023. REC 3332-3341. On December 5, 2023, the Hearing Officer issued his *Amended Memorandum Decision on Motions for Summary Judgment and Preliminary Order*. REC 3372-3425. The Hearing Officer made it clear he dismissed all of Petitioners' claims. *Id*.

On December 15, 2023, Petitioners filed their *Amended Petition for Review of Preliminary Orders*, initiating its first appeal to the Board. REC 3426-3441. After briefing and oral argument, the Board issued its 2024 Final Order, finding that DEQ acted reasonably and in accordance with the law on four of the five issues before the Board. Relevant to this Motion for Reconsideration, the Board found that DEQ acted reasonably and in accordance with law when it found Perpetua has both legal and practical control of the Stibnite Access Route and properly excluded it from

consideration as ambient air. REC 3701. After a remand on the fifth issue, related to DEQ's analysis of arsenic emissions, the Board then found that DEQ was reasonable and lawful on all issues before the Board in its 2025 Final Order. REC 7371.

On January 24, 2025, SSFS first filed its first motion to reconsider. REC 7146-7185. As discussed above, the Board determined SSFS's motion was premature. REC 7343-7348. Now that this matter has been fully decided, SSFS once again brings its Motion to Reconsider. REC 7374-7391. In its Motion to Reconsider, SSFS again claims that "the U.S. Forest Service's January 3, 2025 Final Record of Decision for the Stibnite Gold Project, and supporting documents, provide relevant new information that address the issue of whether Perpetua has legal control to preclude public access from the Stibnite Road Access Route." REC 7375. Thus, SSFS asks the Board to "remand the Permit back to DEQ to reevaluate the ambient air boundary analysis". REC 7377

LEGAL STANDARD

In a contested case proceeding, "the Board must determine whether DEQ has acted reasonably and in accordance with law." *In the Matter of Sunnyside Park Utilities' Application for Sewage Disposal Permit*, Final Order on Petition for Review of Preliminary Order, at 10 (BEQ Dkt. 0103-07-02, Apr. 7, 2009).[1] A court will affirm the Board's decision, should it be appealed, unless the court finds that DEQ and the Board's decision is in violation of constitutional or statutory provisions, is in excess of statutory authority, is made on unlawful procedure, or is arbitrary, capricious, or an abuse of discretion. *See* I.C. § 67-5279(3).[2] But, it is the Petitioners who have "the burden of proving by a preponderance of the evidence, the allegations in the

[1] Publicly available at https://www2.deq.idaho.gov/admin/LEIA/api/document/download/5566.

[2] The Hearing Officer recognized the helpfulness of using the judicial standard of review in I.C. § 67-5279, "[b]ecause those are the standards that ultimately govern the disposition of this matter…" REC 3377. Further, and importantly, Petitioners use the judicial standard of review set out in I.C. § 67-5279 in asking for relief. REC 3474.

petition." IDAPA 58.01.23.062. Thus, the Board must uphold DEQ's decision to issue the PTC unless it determines that Petitioners have in fact proven, by a preponderance of the evidence, that DEQ's decision was (1) unreasonable, (2) not in accordance with law, (3) issued upon unlawful procedure, and (4) was arbitrary, capricious, or an abuse of discretion.

ARGUMENT

In its 2024 Final Order, the Board found "that there is sufficient evidence in the record to support DEQ's conclusion that Perpetua has practical and legal control over the Stibnite Road Access Route such that it may be excluded from consideration as ambient air." REC 3703. The evidence has not changed. The Board's analysis should also remain unchanged. For the reasons discussed below, DEQ's decision to exclude the Route from ambient air remains reasonable and lawful.

I. The PTC Requires Perpetua to Have the Ability to Restrict the General Public from the Route.

SSFS does not assert that any condition of the PTC has changed or that Perpetua will be unable to comply with the terms of the PTC. The PTC requires that the "general public" be precluded from accessing the Route and requires that access for all guests be carefully managed. REC 0376. For example, Permit Condition 2.7 requires a combination of security escort vehicles, manned guardhouses, locked gates, barriers, warning signs, and registration of all guests to the mine site. *Id*. Condition 2.7 also requires Perpetua to submit an Access Management Plan, which must include the specific measures Perpetua will use to discourage public access, including those included in Condition 2.7. *Id.* These conditions will be more than sufficient to notify a reasonable person that his or her presence is not permitted unless specifically granted by

Perpetua and therefore punishable under I.C. § 18-7008 for criminal trespass and actionable under I.C. § 6-202 for civil trespass.

In its initial review, the Board agreed, finding "there are substantial conditions in the PTC that require Perpetua to implement practical and physical restrictions on access to the SGP by the general public." REC 3701. None of the language cited by SSFS from the Forest Service's Final Environmental Impact Statement ("FEIS") prevents Perpetua from complying with the conditions of the PTC. For example, SSFS points to the following language:

> A new 12-foot-wide gravel road will be constructed to provide public access from Stibnite Road (FR50412) to Thunder Mountain Road (FR 50375) through the Stibnite Gold Project. During operations, the public access road will be used to travel through the Stibnite Gold Project and will provide seasonal use, open to all vehicles.

REC 7981. The Forest Service has always referred to this as a public access road – Perpetua agreed to include the road to benefit the public and to provide members of the public with access. *See* REC 3295. Accordingly, in the FEIS sections quoted by SSFS, the Forst Service consistently refers to the Route as a "public access route." REC 7388-7381. But SSFS is asking the Board to interpret these simple references to "public access" as some mandate that Perpetua must allow unfettered access on the road or as an admission that Perpetua does not have the ability to preclude access. *See* REC 7381-7382. However, in the more than three pages of cherry-picked language from the Forest Service's FEIS, never does the Forest Service say that Perpetua *must* grant the public unfettered access. The Forest Service never states that Perpetua *shall* allow the public to access the Route without the ability to also preclude access. The fact has not changed that Perpetua must be able to preclude the public from using the road at any time, for any reason, or discontinue access at its discretion. REC 1238.

In addition, nothing in the FEIS or Record of Decision changes the fact that the members of the public become "invitees" of Perpetua once they enter the mine boundary, for purposes of an ambient air analysis. *See* REC 1145 (EPA's Revised Policy on Exclusions from "Ambient Air"). Nothing in the FEIS or other related documents prevents Perpetua having or asserting this level of control. And SSFS does not allege that the Forest Service's interpretation or assessment of the road has changed throughout its review. Thus, there is no new evidence demonstrating that Perpetua will now be unable to meet the PTC requirements.

II. DEQ Reasonably Relies on Perpetua's Assertions Regarding Control of the Stibnite Access Route.

DEQ excluded the Route from ambient air because, in part, Perpetua represented during the permitting process that it would have legal authority to prohibit access by the "general public" and the practical ability to do so. REC 1260; REC 1236-1240. Under the Rules for the Control of Air Pollution in Idaho, IDAPA 58.01.01 ("Air Rules"), a permit applicant is required to certify that the information and statements provided in a permit application are "true, accurate, and complete." IDAPA 58.01.01.123. In its permit application, Perpetua (then Midas Gold) stated that it "will legally control the SGP, an active industrial site where mining activities will occur, such as heavy equipment operation," and that it "has established an operations boundary to identify the area where public access will be excluded." REC 1807. DEQ's reliance on these assertions was completely reasonable and supported by the Air Rules. The Board agreed, finding: "It was reasonable for DEQ to rely on Perpetua's representations in its application form that it would have legal control over access to the Stibnite Road Access Route." REC 3700.

The Board went on to state that "DEQ recognized at oral argument that, should the [Forest Service] ultimately require public access through the SGP, the ambient air boundary analysis will have to be reevaluated." REC 3700, TR 0080. According to the information provided by SSFS,

the Forest Service is not *requiring* public access through the SGP. The information presented by SSFS does not conflict with the information provided to DEQ, and SSFS does not allege that Perpetua has in any way changed the assertions made to DEQ. In fact, in its Response to SSFS's initial motion for reconsideration, Perpetua continued to assert that "[t]he FEIS and ROD authorize Perpetua to restrict and control when and under what conditions vehicles use the Stibnite Access Route as DEQ authorized in the PTC," and, therefore, "Perpetua will have legal control over access through the Stibnite Access Route." REC 7273-7274. Therefore, there is no evidence in the record that would make DEQ's reliance on Perpetua's statements related to the Route unreasonable or unlawful.

III. DEQ and EPA Guidance Continue to Support DEQ's Determination.

Finally, DEQ's determination that the Route is not ambient air is still supported by both DEQ and EPA guidance. The Hearing Officer summarized the Environmental Protection Agency ("EPA") guidance well when he stated:

> According to EPA's 2019 ambient air policy: (1) it is appropriate to exclude areas from ambient air where measures are employed that are "effective in precluding access to the land by the general public;" (2) such measures can include physical barriers, but physical barriers are not required; (3) determinations by the agency are discretionary on a case-by-case basis; (4) the permit applicant must have the legal ability to preclude access by the general public and must employ measures that actually preclude the general public as a practical matter; (5) in evaluating the adequacy of the preclusion measures, the agency applies a "rule of reason" as to whether the general public will have access "under reasonably anticipated circumstances.

REC 3392. Similarly, DEQ's guidance focuses on the ways in which the permittee will discourage public access. REC 3392. The nature or remote location of the facility may discourage public access, or the permittee may take steps to prevent access. *Id.* If the general public is sufficiently precluded, it is reasonable to consider that the facility or specific area would not qualify as ambient air. *Id.* This is different from a "right-of-way easement" or "common service road." As one

example, PTC condition 2.7 requires registration of all guests of a mine—surely no easement or common service road requires such registration.[3]

The Board has already reviewed both EPA and DEQ guidance and determined that the Route was properly excluded from ambient air. REC 3698. Again, the guidance continues to support DEQ's decision. The general public will be sufficiently excluded due to the measures Perpetua must take to comply with the PTC. And while the general public *may* be given access on Perpetua's terms, that is not the same as Perpetua relinquishing legal or practical control. Accordingly, nothing in the FEIS or related documents changes the analysis.

CONCLUSION

The PTC requires Perpetua to have legal and practical control of the Stibnite Access Route. Perpetua continues to assert, and the evidence continues to demonstrate, that Perpetua has the necessary control over the Stibnite Access Route. Thus, DEQ's decision to exclude the Route from ambient air is reasonable and lawful. The Board should confirm its 2024 Final Order and 2025 Order and deny SSFS's Motion to Reconsider.

[3] The FEIS discusses the need for users of the Route to check-in with Perpetua. The language from the FEIS, and quoted by SSFS, states: "Public vehicles passing through would be required to check-in with mine personnel at the North or South SGP entry points and would receive a safety briefing and would also be required to check-out with the SGP personnel upon exhibiting the SGP." REC 7149.

BEFORE THE BOARD OF ENVIRONMENTAL QUALITY
STATE OF IDAHO

IN THE MATTER OF AIR QUALITY PERMIT TO CONSTRUCT P-2019.0047 NEZ PERCE TRIBE, IDAHO CONSERVATION LEAGUE, and SAVE THE SOUTH FORK SALMON, Petitioners, v. IDAHO DEPARTMENT OF ENVIRONMENTAL QUALITY, Respondent, and PERPETUA RESOURCES IDAHO, INC., Intervenor-Respondent.	Case Docket No. 0101-22-01 OAH Case No. 23-245-01 PERPETUA'S BRIEF IN OPPOSITION TO PETITIONER'S MOTION FOR RECONSIDERATION BASED ON NEW EVIDENCE

Intervenor-Respondent Perpetua Resources Idaho, Inc. ("Perpetua") submits this opposition to the Motion for Reconsideration Based on New Evidence ("Pet. Mot.") submitted by Petitioner Save the South Fork Salmon ("Petitioner"). Petitioner claims that the Final Environmental Impact Statement ("FEIS") and Record of Decision ("ROD") issued by the United States Forest Service ("Forest Service") for the Stibnite Gold Project (the "Project") constitute new evidence that Perpetua does not have legal control over the Stibnite Access Route. Petitioner's claim fails on its face. The Forest Service's Errata to the FEIS expressly confirms that the Stibnite Access Route is not a public road. Moreover, Perpetua maintains the same control over access to the Stibnite Access Route as has been described by the Forest Service throughout the National Environmental Policy Act ("NEPA") process and the Idaho Department of Environmental Quality ("DEQ") in development of the Permit to Construct ("PTC"). The Board should reject Petitioner's claims and dismiss the Motion.

INTRODUCTION

I. Procedural History

The Project is a mining and mineral processing operation that will be constructed and operated on state, private, and federal land in Valley County, Idaho. In addition to gold and silver, Perpetua will produce antimony essential to military applications critical for national security. The Forest Service and various other federal and state agencies have issued their approvals for the Project, with a few state permit applications still under review.[1]

[1] Perpetua has received all of the federal permits it is required to obtain for the Project, including, in addition to the ROD, a Section 404 permit from the United States Army Corps of Engineers required under the federal Clean Water Act and biological opinions from the United States Fish and Wildlife Service and the National Marines Fisheries Service required under the federal Endangered Species Act. Idaho state agencies that have issued various regulatory approvals include the DEQ, Department of Lands, and Department of Water Resources ("DWR"). The Idaho Pollution Discharge Elimination System ("IPDES") and stream alteration permits required to commence construction of the Project are in the advanced stages of review by DEQ and DWR, respectively.

Before commencing construction on the Project, Perpetua must obtain various regulatory approvals, including a PTC from DEQ , as well as a separate federal regulatory processes that includes review under NEPA and that provides Perpetua with the authorization to conduct operations on Forest Service lands. This comprehensive NEPA review required the Forest Service to develop an Environmental Impact Statement ("EIS") prior to issuing a ROD to authorize Perpetua's Mine Plan.[2] 42 U.S.C. § 4332(2)(C). The Forest Service issued a Draft EIS ("DEIS") on August 14, 2020, and a Supplemental DEIS on October 28, 2022. The Forest Service issued the FEIS in September 2024 and the Final ROD in January 2025.

In 2017, during the initial scoping phase of the NEPA process, Perpetua modified its original Mine Plan to include the Stibnite Access Route after receiving feedback from various communities, including comments from local residents that the Project would lengthen travel time for those who use the existing Stibnite Road to access Thunder Mountain Road. *See* REC 676, 893–895, 1758. Under the modified Mine Plan, Perpetua will control the Stibnite Access Route and will allow registered visitors restricted and limited use for the sole purpose of accessing other National Forest areas on the north side of the Project. This has not changed throughout the PTC and NEPA processes. *See* Declaration Of W. Christopher Pooser In Support Of Perpetua's Opposition To Reconsideration ("Pooser Decl."), Exh. 1 at REC 376, Exh. 2 at REC 415, 676–677, 893–897, Exh. 3, Exh. 4, Exh. 5, Exh. 6, Exh. 7. The PTC, issued by DEQ on June 17, 2022, includes the same ambient air boundary as set forth in the DEIS (and subsequently the SDEIS and FEIS). *See id.*, Exh. 1 at REC 376, Exh. 2 at REC 676–677.

[2] An EIS includes a comprehensive environmental analysis of the proposed activity and its potential impacts, as well as possible alternatives. The ROD completes the NEPA process by documenting the responsible federal agency's decision on the proposed activity—or an alternative—subject to mitigation measures. *See* 42 U.S.C. § 4321.

On May 9, 2024, the Idaho Board of Environmental Quality (the "Board") issued a Final Order finding that "DEQ acted reasonably and in accordance with law when it found Perpetua has legal and practical control of the Stibnite Access Route such that it could be excluded from the ambient air boundary." REC 3698–3703. The Board found that (1) there was sufficient evidence to demonstrate that Perpetua will have legal control over access to the ambient air boundary and (2) the PTC contains enforceable conditions that will preclude practical access by the general public. *Id.* Both of these findings remain accurate and supported by the evidence.

At the time of the issuance of the PTC and the Board's Final Order, the Forest Service had not issued the FEIS and ROD. The Board stated that it would not speculate as to the outcome of the NEPA process but found that there was sufficient evidence in the record to support DEQ's conclusion that Perpetua will have legal authority to control access. *Id.* The Board acknowledged DEQ's statement during oral argument that "should the [Forest Service] ultimately require public access through the [Project], the ambient air boundary analysis will have to be reevaluated." REC 3700.

On September 6, 2024, the Forest Service issued the FEIS. On January 3, 2025, the Forest Service issued the ROD. The ROD gives Perpetua legal authority to control the Project's boundary, including control of access to the Stibnite Access Route. Along with the ROD, the Forest Service also issued an Errata to the FEIS to provide clarifications in response to objections. The Errata states that because of the control Perpetua will exercise over the Stibnite Access Route (which was the same basis for the Board's relevant findings), the Route is not a public road. Pooser Decl., Exh. 6 at PRI 1070. The FEIS, Errata, and ROD issued after the Board's initial findings approving the air boundary for the PTC are all consistent with the DEIS and Supplemental DEIS, on which Board relied for its decision on the air boundary. Each of

these documents, issued by the Forest Service after the Board's relevant decision, reflect Perpetua's legal control over the Stibnite Access Route, and the conditions for practical control over the Route mirror the conditions originally set forth in the DEIS and the Supplemental DEIS. *Compare id.*, Exh. 5, 6, 7 *with* Exh. 3, 4. Perpetua's legal ability to control access to the Stibnite Access Route did not change in any substantive fashion between the DEIS in 2020, the Supplemental DEIS in 2022, the FEIS in 2024, and the Errata and ROD in 2025.

Despite this reality, Petitioner now seeks reconsideration of the Board's Final Order based on its assertion of "new evidence" in the FEIS and the ROD—where there is none—and requests remand of the PTC to DEQ for reconsideration of the ambient air boundary analysis. Pet. Mot. at 5.

II. EPA Guidance on Ambient Air and the Board's Conclusion that the Stibnite Access Route is Not Ambient Air

Idaho regulations define "ambient air" consistent with EPA regulations as "that portion of the atmosphere, external to buildings, to which the general public has access." IDAPA 58.01.01.006.05. *See also* 40 C.F.R. § 50.1(e) (same definition). EPA and DEQ have long recognized that an applicant need not demonstrate the impact of a source's emissions on air within areas where general public access is restricted. *See* REC 1138, 1341, 1805.

EPA has consistently exempted from "ambient air" "the atmosphere over land [1] owned *or controlled* by the source and [2] to which the public access is precluded by a fence or other physical barriers." REC 1138 (emphasis added). In 2019, EPA issued detailed guidance on exclusions to "ambient air." REC 1138–1151. EPA affirmed previous guidance that legal control means that the "owner or operator of the source has the legal right to use the land, and that its land-use right includes" the power to control and to exclude public access. REC 1142. EPA also

broadened the "fence or other physical barriers" (i.e., practical control) element to recognize that physical boundaries are not the only way in which to preclude public access. REC 1146. Specifically, EPA recognized that other measures (such as video surveillance, monitoring, clear signage, and routine security patrols) may be effective in deterring or precluding general public access to the land. *Id*. EPA emphasized that individual, case-by-case analyses of effective control measures should not incorporate a bright-line test. REC 1147–1148. As EPA explains in the 2019 guidance, agencies should apply a "rule of reason in evaluating the effectiveness of any measure proposed by a source …" *Id*.

In the context of permitting for mining projects, state agencies regularly rely on this EPA guidance, including the "rule of reason" principle, when determining that applicants will have legal control over ambient air boundaries and will impose sufficient measures to practically control access. Indeed, practical control measures beyond fencing and physical barriers, such as those relied on for this Project by the Forest Service in the ROD and by DEQ in the PTC, are typical and necessary for mining projects, given the large-scale nature of such operations.

Although Petitioner conflates the two elements of public access in its analysis, Petitioner expressly states that it is only challenging the first element—legal control—or whether Perpetua has land-use rights that include the authority to control and exclude access from the Stibnite Access Route. Petitioner did not request reconsideration of the Board's determination in the Final Order that Perpetua will preclude practical access by the general public.

ARGUMENT

The Forest Service's FEIS and ROD do not warrant remand of the PTC to DEQ for reconsideration of its ambient air boundary analysis because (I) the Errata expressly confirms that the Stibnite Access Route is not a public road; (II) the FEIS and ROD support the Board's

original conclusion that Perpetua has legal (as well as practical) control over the Stibnite Access Route; and (III) the FEIS and ROD provide no new evidence to trigger reconsideration.

I. The Forest Service's Errata Expressly Confirms that the Stibnite Access Route is Not a Public Road

Petitioner largely ignores the Forest Service's Errata to the FEIS, which flatly contradicts Petitioner's argument and further confirms that Perpetua has legal control over the Stibnite Access Route. *See* Pooser Decl., Exhibit 6 at PRI 1070. The Errata added the following statement to the end of a paragraph in the FEIS reviewing the many measures that Perpetua will take to restrict access to the Project site:

> Because public use of the road would be subject to Perpetua's control measures on general use, *the public access road is not considered a public road*.

Id. (emphasis added). The Forest Service explained that "[t]he addition clarifies the status of the access road through the site with regard to whether it will be operated as a public road." *Id.*

This characterization of the Stibnite Access Route is consistent with Forest Service guidance, which limits a "public road" to one that is "(1) [a]vailable, except during scheduled periods, extreme weather, or emergency conditions; (2) [p]assable by four-wheel standard passenger cars; and open to the general public for use without restrictive gates, prohibitive signs or regulation other than restrictions based on size, weight, or class of registration." *See Pub. Lands for the People, Inc. v. United States Dep't of Agric.*, 2010 U.S. Dist. LEXIS 132748, at *34–35 (E.D. Cal. Dec. 14, 2010). Indeed, Perpetua has the legal authorization from the Forest Service to control access to the Stibnite Access Route with restrictive gates, prohibitive signs, and other control measures set out in the PTC, FEIS, and ROD. Pooser Decl., Exh. 1 at REC 376, Exh. 5 at PRI 1054, Exh. 7 at PRI 1077−1078.

Petitioner attempts to waive away the statements of the Forest Service in the Errata by claiming that it does not change the ambient air analysis for air permitting. Pet. Mot. at 12, n. 2. Petitioner relies on an excerpt from EPA guidance to argue that ownership of the road or property is inconsequential. *Id.* However, the excerpt Petitioner references concerns a narrow circumstance that is not at play here—whether individuals allowed access to a downwind property are considered members of the public for purposes of the ambient air analysis for a separate, upwind property. REC 1145. More broadly, Petitioner misses the main point of the statement in the Errata: the Stibnite Access Route is not a public road where the public will have uncontrolled access.

The Forest Service's Errata explicitly contradicts Petitioner's claim that the FEIS and ROD "unequivocally establish" that the Stibnite Access Route is for public use. An analysis of "fact-dependent, context-specific, and policy-laden choices" by the Forest Service in an EIS is due "substantial deference."[3] The Forest Service's unequivocal confirmation in the Errata that the Stibnite Access Route is not a public road reconfirms the conclusion in the DEIS, Supplemental EIS, FEIS, and ROD (and the PTC and Statement of Basis) that Perpetua will maintain legal control over access through the Stibnite Access Route. This determination should end the inquiry.

II. The FEIS and ROD Provide No New Evidence

Petitioner's argument hinges on the claim that the FEIS and ROD provide new evidence that "unequivocally establish that the Stibnite Road Access Route is for public use and that Perpetua does not have legal authority to preclude such use." Pet. Mot. at 3 (emphasis added).

[3] Seven Cty. Infrastructure Coal. v. Eagle Cty., 221 L.Ed.2d 820, 837 (U.S. 2025).

Petitioner's claim of alleged "new" evidence is simply wrong as a factual matter. Petitioner's Motion should be denied for this reason alone.

The FEIS and ROD provide clear descriptions of Perpetua's control of access and nothing in the FEIS or ROD changes either the Forest Service's analysis of the control question in the DEIS and the Supplemental DEIS, or the DEQ's analysis of the question when it first issued the PTC in June 2022. To be crystal clear, the characterization of Perpetua's legal control over the Stibnite Access Route has not changed throughout DEQ's development of the PTC, the Board's review of Petitioner's challenge, or the Forest Service's NEPA review.

DEQ's June 2022 Statement of Basis for the PTC recognized that Perpetua "will legally control the [Project site]" and provide limited public access through the Stibnite Access Route, subject to restrictions in Perpetua's Access Management Plan:

> [Perpetua] has the legal authority to control access to the Stibnite Road access route and would provide seasonal (non-winter conditions) access only. At the discretion of [Perpetua], additional access controls may occur during various phases of construction, during mine operations that present potential safely hazards such as blasting, due to inclement weather, or under any other circumstances that may present a threat to the protection of public or employee health and safety. [Perpetua] has the legal and practical ability to enforce its control over roadway access and to monitor traffic passing through the [Project] site.

Pooser Decl., Exh. 2 at REC 676–677.

The PTC then provides the following minimum control measures that Perpetua will implement in its Access Management Plan relative to the Stibnite Access Route:

- Preclude unauthorized access at primary access points through the use of security escort vehicles, manned guardhouses, locked gates, barriers, or equivalent measures;
- Post warning signs and place boulders at secondary access points;
- Use trained security personnel to patrol the Project site and escort trespassers off the site;

- Provide access only to "registered guests" for the sole purpose of passing through the Project site to another destination; and
- Require guests to complete a registration sheet that explains Perpetua's requirements for accessing the site and identifies potential hazards.

See id., Exh. 1 at REC 376.

The relevant analysis and conditions have not changed since DEQ made its initial decisions in May 2024 approving the air boundary included within the PTC. Nonetheless, Petitioner erroneously claims that certain excerpts from the FEIS and ROD now establish that Perpetua will not legally control the Stibnite Access Route. Pet. Mot. at 3–7. Petitioner cites a series of excerpts which describe the location and physical characteristics of the Route, its limited seasonal use for access through the Project site, and the control that the Forest Service authorizes Perpetua to exert over the Route. *Id.* But the content of these excerpts are also found in the DEIS and Supplemental DEIS. Indeed, for many of the excerpts, the Forest Service used *nearly the exact same language* as it used in the Supplemental DEIS—which was available at the time of DEQ's decision—with only a few grammatical differences. *Compare* Pet. Mot. at 4 (citing FEIS at ES-25) *with* Pooser Decl., Exh. 4, Excerpts from Supplemental DEIS at PRI 1035; *compare* Pet. Mot. at 7 (citing ROD at 74, 102) *with* Pooser Decl., Exh. 4, Excerpts from Supplemental DEIS at PRI 1040 *and* Pooser Decl., Exh. 3, Excerpts from DEIS at PRI 1027–1028.

In one example, Petitioner conveniently left out the full quotation from the FEIS, which describes those restrictions Perpetua will use to control access (denoted below in italics) and are directly relevant to Perpetua's legal control over access to the Stibnite Access Route:

> During operations, the public access road through the Operations Area Boundary would provide seasonal use, open to all vehicles; access would not be provided in winter when impassable (current county maintenance standards) and signs would inform the public of

> seasonal and temporary closures. *Public vehicles passing through would be required to check-in with mine personnel at the North or South SGP entry points and would receive a safety briefing and would also be required to check-out with SGP personnel upon exiting the SGP. For safety purposes, public access would be separated from other SGP roads by berms, security fencing, and the underpass to allow the public road to pass beneath the mine haul road. No stopping or deviating from the public access road would be allowed. Perpetua could restrict access to any vehicles due to concerns related to public or employee health and safety, such as during road construction and maintenance, blasting, highwall scaling, mining in the immediate area of the road, and similar operations.*

Pooser Decl., Exh. 4, Excerpts from Supplemental DEIS at PRI 1039 (emphasis added). *See also id.*, Exh. 3, Excerpts from DEIS at PRI 1027–1028.

The attached Exhibits—which include Forest Service determinations that Perpetua requests be administratively noticed by the Board[4]—include portions of the DEQ permitting record and additional NEPA documents that further demonstrate this consistency. *See id.*, Exh. 1, Excerpts from Permit to Construct, Exh. 2, Excerpts from Statement of Basis, Exh. 3, Excerpts from DEIS, Exh. 4, Excerpts from Supplemental DEIS, Exh. 5, Excerpts from FEIS, Exh. 6, Excerpts from Errata, Exh. 7, Excerpts from ROD.

Nor do the FEIS and ROD *require* public access—in fact the agency explicitly stated the opposite in the Errata. Nonethless, Petitioner claims that Perpetua does not have legal control over the Stibnite Access Route because the FEIS analyzed and the ROD approved of "allowing public access" over the Stibnite Access Route "pursuant to the Forest Service's Travel Management Rule." Pet. Mot. at 7–8. Petitioner argues that the Stibnite Access Route is "open to

[4] Pursuant to IDAPA § 62.01.01.479, Idaho Code § 67-5251(4)(a), Idaho Code § 9-101(3), and I.R.E. Rule 201(b)(2), Perpetua requests that the Board take judicial notice that the Forest Service made the determinations in the highlighted portions of the NEPA documents. These highlighted portions provide adjudicative facts that are "not subject to reasonable dispute because" they are part of "official acts" of the Forest Service. *See* Hastings v. Idaho Dep't of Water Res., 173 Idaho 630, 547 P.3d 1190, 1200-01 (2024) (affirming the district court's decision to take judicial notice of a conditional permit issued by the Idaho Department of Water Resources under Idaho Code § 9-101(3) and I.R.E. Rule 201(b)(2)).

public use" under the Travel Management Rule such that an additional regulatory process would be required for Perpetua to restrict access to the Route. *Id.*

As an initial matter, whether the Forest Service should undertake a separate, additional regulatory process is beyond the scope of this proceeding and does not implicate the Board's authority in its review of the PTC. In addition, Petitioner's characterization of this analysis under the Travel Management Rule and applicability to the ambient air boundary analysis is incorrect and misleading. The designation of Forest Service roads under the Travel Management Rule only broadly establishes roads "that are designated for motor vehicle use" and prohibits travel outside of such roads. 36 C.F.R. § 212.50(a). Under the text of the Rule, road designations do not restrict the ability of the Forest Service to authorize lessees or project operators to control public access to such roads, as the Forest Service authorizes Perpetua to do in the ROD. *See* 36 C.F.R. Part 212, Subpart B.

Moreover, the Forest Service's analysis under the Travel Management Rule presents no new information since the Board made its decision in May 2024 —rather, the Plan simply reiterates the control measures that Perpetua has authority to implement over the "[t]he reroute of Stibnite Road" through the Project site. Pooser Decl., Exh. 5 at PRI 1065, Exh. 7 at PRI 1075. The Forest Service analyzed the "reroute" under the Travel Management Rule's Minimization Criteria, which only concern impacts on forest resources, wildlife, and populated areas; conflicts between motor vehicle use and recreation on National Forest lands; and conflicts among different classes of motor vehicle use, and populated areas. *See id.*; 36 C.F.R. § 212.55(b). Contrary to Petitioner's claim, this limited analysis neither addresses nor impacts Perpetua's legal authority under the ROD to control access through the Project Site. And, as the Forest

Service acknowledges in the FEIS, Perpetua analyzed these same criteria for the reroute of Stibnite Road in the 2021 Mine Plan. *See* Pooser Decl., Exh. 5 at PRI 1065–1067.

At bottom, Petitioner appears to suggest that the Forest Service somehow lacked the authority to limit public access on the Stibnite Access Route without further proceedings. This suggestion is legally incorrect with respect to federal law. But, more importantly in the current circumstances, a motion before the Board relating to a state permit is not the proper forum to raise such a federal challenge.[5]

The Stibnite Access Route is an element of the approved Mine Plan for the Project that is in the ultimate control of Perpetua—as illustrated by the measures Perpetua will implement to limit access and manage use as well as by the Forest Services' findings in the Errata and other relevant documentation. The DEIS, Supplemental EIS, and FEIS analyzed the environmental impacts of Perpetua's Mine Plan, including the restricted public access (controlled and limited by Perpetua) through the Stibnite Access Route. *See* Pooser Decl., Exh. 3, Exh. 4, Exh. 5. Then, in the ROD, the Forest Service approved Perpetua's Mine Plan and authorized Perpetua to control use of the Route and preclude public access pursuant to the Access Management Plan. Therefore, nothing has changed from the information in the DEIS or Supplemental DEIS on which the Board relied for its decision in May 2024, and there is nothing "new" for the Board to reevaluate now.

[5] Even assuming for the sake of argument that Petitioner could establish that some further process is required under federal regulations for the Forest Service to impose limitations on the public's use of the Stibnite Access Route, that would not change the outcome or the decision by the Forest Service to authorize the project and, therefore, is not a basis to disturb the authorization or delay construction of the project. *See* Seven Cty. Infrastructure Coal., 221 L.Ed.2d at 837.

III. The FEIS and ROD Support the Board's Original Conclusion that Perpetua Will Have Legal Control Over the Stibnite Access Route

In its May 2024 Final Order, the Board concluded that there was sufficient evidence to demonstrate that Perpetua will have legal control over the Stibnite Access Route. REC 3698–3703. Additionally, the Board explained that Perpetua's measures to control practical access "make[] clear that access. . . will only be available under a very limited basis and not to the 'general public.'" REC 3702. Because the characterization of Perpetua's legal control over the Stibnite Access Route in the FEIS and ROD are consistent with the PTC, Statement of Basis, DEIS, and Supplemental DEIS, nothing in these final NEPA documents alters the Board's conclusions. The FEIS and ROD authorize Perpetua to restrict and control when and under what conditions vehicles use the Stibnite Access Route as DEQ authorized in the PTC. *See* Pooser Decl., Exh. 5, Exh. 7. Accordingly, the FEIS and ROD support the Board's Final Order.

While Petitioner spends much of its Motion for Reconsideration arguing that Perpetua does not have legal control over the Stibnite Access Route and that DEQ cannot exclude the Route from the ambient air analysis, these arguments merely repeat the claims that Petitioner has been making for nearly three years in briefing this contested case before the Board. *See* REC 0339–0343; REC 2336–2340; REC 3476–3483; REC 3629–3655.

As the United States Supreme Court emphasized in its decision in *Seven County Coalition v. Eagle County, Colorado*, 221 L.Ed.2d 820, 837 (U.S. 2025) last month, "[d]elay upon delay" creates a process that "seems to borde[r] on the Kafkaesque" and unduly slows projects and increases costs.[6] The Supreme Court emphasized the importance of deferring to the expertise of regulatory agencies in their factual and scientific determinations as well as avoiding

[6] Seven Cty. Infrastructure Coal. at 837 (internal quotation marks excluded).

"micromanaging" agency determinations that fall within " a broad zone of reasonableness," particularly in the context of large and complex infrastructure projects which have suffered from excessive regulatory delays, litigation, and judicial overreach. 221 L.Ed.2d at 837–38. While the Supreme Court's decision regarded analysis under NEPA, rather than the Clean Air Act, the Court's core concerns are directly on point—a "course correction" is necessary to provide greater predictability for infrastructure planning and financing and to prevent excessive administrative and judicial review that unfairly hinders project development. *See id.*

Here, DEQ and the Board properly and carefully analyzed the relevant legal and factual matters regarding the ambient air boundary established in the PTC. Petitioner's Motion merely repackages its prior legal arguments to repeat already-rejected claims and overheated rhetoric. There is no need for additional process. The Board already addressed these arguments in the May 2024 Final Order, and Petitioner fails to establish the existence of new evidence that would undermine the Board's initial conclusion. There is nothing left to reconsider.

CONCLUSION

As the FEIS and the ROD provide no new information that would change DEQ's conclusion, remand to DEQ is neither appropriate nor necessary. Remand would be a waste of agency resources and time, particularly in light of the years of review that DEQ has already spent scrutinizing the PTC.

BEFORE THE BOARD OF ENVIRONMENTAL QUALITY
STATE OF IDAHO

IN THE MATTER OF AIR QUALITY PERMIT TO CONSTRUCT P-2019.0047 NEZ PERCE TRIBE, IDAHO CONSERVATION LEAGUE, and SAVE THE SOUTH FORK SALMON, Petitioners, v. IDAHO DEPARTMENT OF ENVIRONMENTAL QUALITY, Respondent, and PERPETUA RESOURCES IDAHO, INC., Intervenor-Respondent.	Case Docket No. 0101-22-01 OAH Case No. 23-245-01 DECLARATION OF W. CHRISTOPHER POOSER IN SUPPORT OF PERPETUA'S OPPOSITION TO RECONSIDERATION

I, W. CHRISTOPHER POOSER, declare as follows:

1. I am a partner at Stoel Rives LLP and an attorney of record for Intervenor-Respondent Perpetua Resources Idaho, Inc. ("Perpetua") in the above-entitled matter. As such, I

have personal knowledge of the facts and statements contained in this Declaration. I submit this Declaration in support of Perpetua's Opposition to Petitioner's Motion for Reconsideration Based on New Evidence.

2. Exhibits 1 through 2 are true and correct excerpts from Idaho Department of Environmental Quality permitting documents regarding the Stibnite Gold Project that are currently in the record and labeled with REC numbers. Portions of the documents relevant to Perpetua's Opposition have been highlighted for ease of reading.

3. Exhibits 3 through 7 are true and correct excerpts from the United States Forest Service's review of the Stibnite Gold Project under the National Environmental Policy Act, obtained online from the Payette National Forest Stibnite Gold Project EIS website: https://www.fs.usda.gov/project/?project=50516. For purposes of the record, these documents have been Bates-stamped with "PRI" numbers consistent with previous declarations. Portions of the documents relevant to Perpetua's Opposition have been highlighted for ease of reading.

Ex. No.	REC or Bates No.	Document Description
1	REC 367, 376	Excerpts from Permit to Construct (June 17, 2022)
2	REC 410, 415, 676–677, 893–897	Excerpts from Statement of Basis (June 17, 2022)
3	PRI 1021–1033	Excerpts from Draft Environmental Impact Statement (August 2020)
4	PRI 1034–1048	Excerpts from Supplemental Draft Environmental Impact Statement (October 28, 2022)

EXHIBIT 1
Excerpts from Permit to Construct

Air Quality

PERMIT TO CONSTRUCT

Permittee	Perpetua Resources Idaho, Inc.
Permit Number	P-2019.0047
Project ID	62288
Facility ID	085-00011
Facility Location	Forest Service Roads NF-374 and NF-412 Stibnite, Idaho 83611

Permit Authority

This permit (a) is issued according to the "Rules for the Control of Air Pollution in Idaho" (Rules), IDAPA 58.01.01.200–228; (b) pertains only to emissions of air contaminants regulated by the State of Idaho and to the sources specifically allowed to be constructed or modified by this permit; (c) has been granted on the basis of design information presented with the application; (d) does not affect the title of the premises upon which the equipment is to be located; (e) does not release the permittee from any liability for any loss due to damage to person or property caused by, resulting from, or arising out of the design, installation, maintenance, or operation of the proposed equipment; (f) does not release the permittee from compliance with other applicable federal, state, tribal, or local laws, regulations, or ordinances; and (g) in no manner implies or suggests that the Idaho Department of Environmental Quality (DEQ) or its officers, agents, or employees assume any liability, directly or indirectly, for any loss due to damage to person or property caused by, resulting from, or arising out of design, installation, maintenance, or operation of the proposed equipment. Changes in design, equipment, or operations may be considered a modification subject to DEQ review in accordance with IDAPA 58.01.01.200–228.

Date Issued June 17, 2022

the Stockpile Transfer to Reclaim Conveyors (OC9), Reclaim Conveyors to SAG Mill Feed Conveyor (OC10), and SAG Mill Feed Transfer to SAG Mill conveyor (OC11).

- Develop specific criteria to determine what frequency and type (water and/or chemical) of dust suppressant must be applied, and appropriate suppressant application rates. Chemical dust suppressants shall be applied consistent with manufacturer's instructions and recommendations.
- Develop and implement precautionary measures to address high-wind events, such as when average (sustained) wind speed is forecast to exceed 25 miles per hour.
- Provide training/orientation to all relevant employees regarding FDCP requirements, including the necessity of restricting public access as specified in the Access Management Plan (AMP). Visible emissions evaluations shall be conducted by the permittee's employees who are certified visible emission observers.
- At least once each year, evaluate FDCP requirements to identify additional requirements and evaluate effectiveness of practices, including dust suppressant application rates, as appropriate.

2.7 The permittee shall develop and maintain an AMP that identifies the facility boundary and all primary and secondary access points, and clearly specifies measures used to discourage public access to the facility. The permittee shall comply with the measures identified in the AMP at all times. The measures specified in the AMP shall be incorporated by reference to this permit and shall be enforceable permit conditions. At a minimum, the AMP shall include requirements to:

- Observe all primary access points to preclude unauthorized public access. Onsite personnel shall be available for this purpose during active mining and mineral processing operations. Public access to the facility may be monitored by the use of security escort vehicles or manned guardhouses, or sufficiently precluded by the use of locked gates, barriers, or equivalent measures. Primary access points include the North and South Security Gates.
- Post warning signs and periodically patrol secondary access points to the facility to preclude public access. Onsite personnel shall be available for this purpose. Plans shall be described in the AMP, including identifying the access points monitored, the frequency of patrol, and measures employed to discourage access (e.g., locked gates, barriers, natural features, etc.). Secondary access points include secondary roadways and trails traversing the facility.
- Only registered guests of the facility will be allowed access to or through the facility. Those seeking to be a guest for the sole purpose of passing through the facility to another destination shall be provided a registration sheet that explains Perpetua's requirements for accessing the site and identifies potential hazards of the site.

2.8 Copies of the FDCP and AMP shall be submitted to DEQ for approval 30 days prior to startup at the address provided (Permit Condition 2.26), and shall remain onsite at all times. Any changes to the FDCP or the AMP shall be submitted to DEQ for review, comment, and approval 30 days prior to the change.

Excerpts from Statement of Basis

Statement of Basis

Permit to Construct No. P-2019.0047
Project ID 62288

Perpetua Resources Idaho, Inc.
Stibnite, Idaho

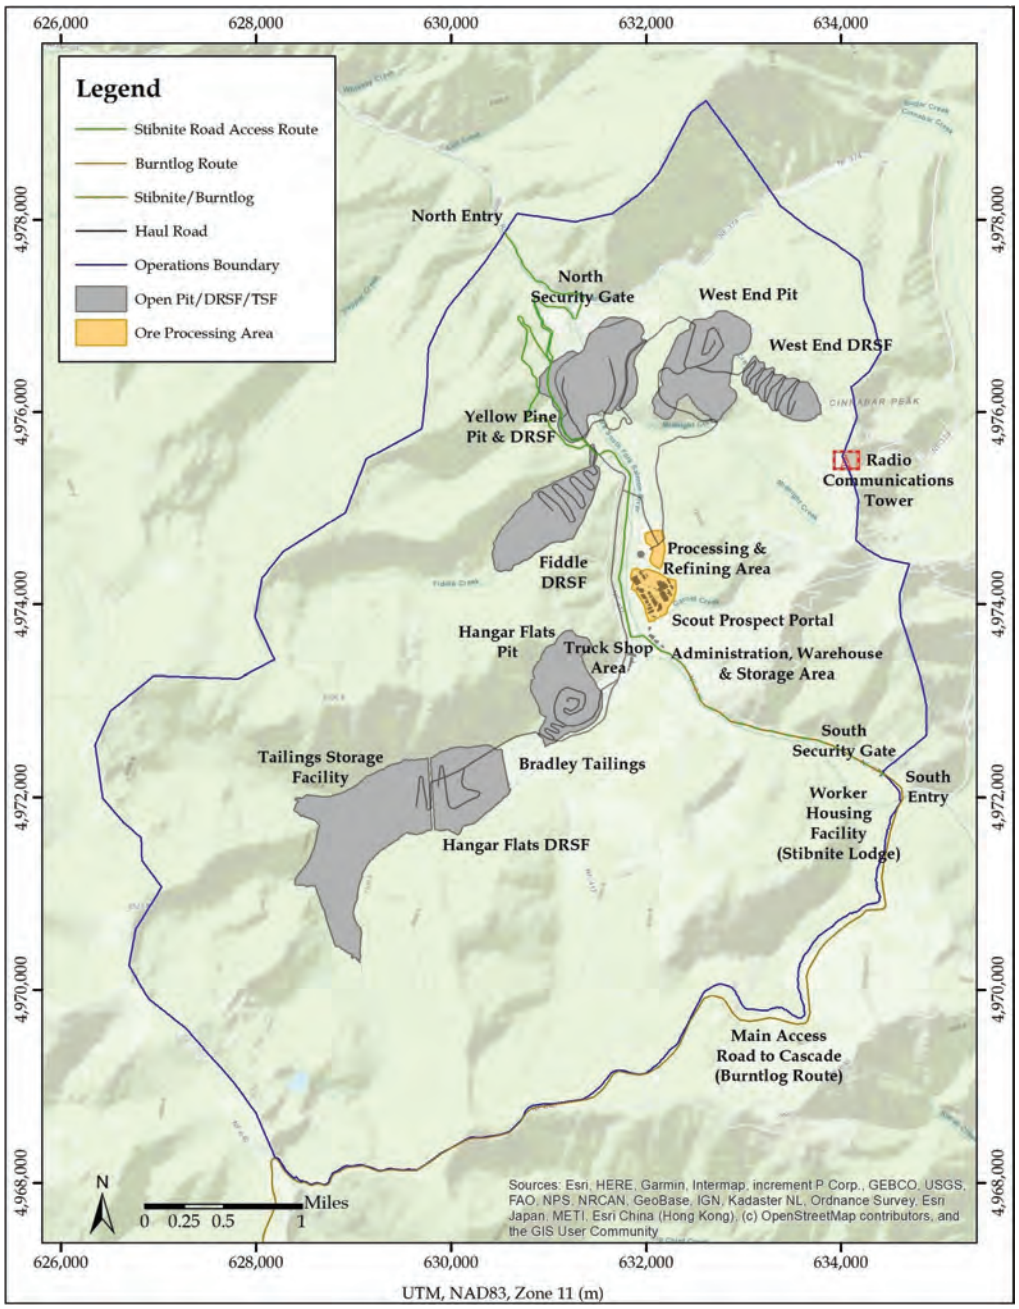
Facility ID 085-00011

Final

June 17, 2022

Kelli Wetzel KW
Permit Writer

The purpose of this Statement of Basis is to satisfy the requirements of IDAPA 58.01.01.et seq, Rules for the Control of Air Pollution in Idaho, for issuing air permits.



FACILITY INFORMATION

Description

Perpetua Resources Idaho, Inc. (PRI) proposes to construct and operate the Stibnite Gold Project (SGP), consisting of conventional open-pit mining, ore preparation, and gold extraction operations.

SGP is to be located in Valley County at the intersection Forest Service roads NF-374 and NF-412 (Stibnite Road), approximately 10 miles east of Yellow Pine. The proposed Burntlog Route access road will provide year-round access to the site. The project comprises a combination of public national forest and private lands. The mining operations boundary within which public access will be excluded is defined in Figure 1. This operations boundary also defines the ambient air boundary used in all ambient air quality impact analyses.

Figure 1 PROJECT AREA OF OPERATIONS

3.3.10 Ambient Air Boundary

Ambient air is defined in Section 006 of the Idaho Air Rules as "that portion of the atmosphere, external to buildings, to which the general public has access."

PRI will legally control the SGP, an active industrial site where mining activities will occur, such as heavy equipment operation. Most areas of the mine will require strict safety protocols and controlled access. PRI has established an operations boundary to identify the area where public access will be excluded. Public access inside the operations boundary will be restricted for the life of the mine by physical barriers at points of potential access, including the current Stibnite Road point of entry and proposed site access via the Burntlog Route, as well as natural features of the landscape that prevent access. Consistent with the guidance provided in the EPA's draft revised policy on ambient air (EPA 2018b), public access control will include the following measures:

- Primary Access Points: The Stibnite Road (north) and Burntlog Route (south) access points will include locked gates. Guard shacks will be located at each gate to monitor all vehicle ingress/egress. Each gate also will include appropriate adjacent barriers (i.e., fencing, bollards, boulders, or other barriers) to prevent any vehicle from circumventing the gate and gaining site access. These primary access points are also controlled by adjacent natural features, such as streams and creeks, steep topography, and areas of thick vegetation and undergrowth that serve as natural barriers or impediments to access.

- Secondary Access Points: Other potential access points, such as secondary roadways and trails, will include posted signs warning the public against entry into the site. At these locations, boulders will be placed across the trail and at an appropriate width adjacent to the trail to prevent any vehicle from circumventing the barrier. These secondary access points also incorporate adjacent natural features, such as streams and creeks, steep topography, and areas of thick vegetation and undergrowth that serve as natural barriers or impediments to access. Some mine features, such as the TSF and process plant areas, will include perimeter fencing.

- Surveillance: PRI security personnel will routinely patrol mine facilities and roadways for unauthorized individuals. In addition, all onsite personnel will be trained on the necessity of restricting public access to areas within the operations boundary. Any suspected trespassing by unauthorized individuals will be reported immediately to security, and trespassers will be escorted off the site.

In response to comments from local community citizens, PRI will manage an access route to provide the general public with limited access through the SGP site between Stibnite Road at Sugar Creek and Thunder Mountain Road at Meadow Creek (shown in Figure 2). This route will be managed in accordance with the Stibnite Road Access Management Plan which is summarized as follows:

The proposed Stibnite Road access route through the SGP site is meant to provide controlled through-site access that is safe, provides travel-time comparable to current conditions and is consistent with the United States Forest Service travel management plan. The Stibnite Road access route extends from the north entry point southward to the Administration, Warehouse and Storage Area. Continuing southward, the Stibnite Road access route incorporates the Burntlog access road segment that occurs within the operations area and extends to the south entry point as shown on Figure 2. PRI has the legal authority to control access to the Stibnite Road access route and would provide seasonal (non-winter conditions) access only. At the discretion of PRI, additional access controls may occur during various phases of construction, during mine operations that present potential safely hazards such as blasting, due to

REC 7497
REC 0676
PET 310

inclement weather, or under any other circumstances that may present a threat to the protection of public or employee health and safety. PRI has the legal and practical ability to enforce its control over roadway access and to monitor traffic passing through the SGP site. Signage will be placed at the North Security Gate (near the bridge over Sugar Creek) and the South Security Gate (near the Stibnite Lodge) to provide information to travelers, and guard shacks will be located at each gate to monitor all vehicle ingress/egress. Persons wishing to traverse the SGP site on the Stibnite Road access route will be required to check in at the security gate to receive a safety briefing and to alert mine staff of their presence. Travelers will be required to check out upon exiting the site to ensure passage through the site in a safe and timely manner. Travelers will not be allowed to stop or loiter while traveling though the operations area. Along its full length, the Stibnite Road access route would have appropriate signage to direct travelers and would be separated from mine haul roads and areas of mine operations by fencing, berms, or gates to prevent travelers from straying from the route. When possible and to the degree practicable, anticipated public access restrictions will be communicated to the public in a timely manner so that they may plan appropriately. Receptors on the Stibnite Road access route were not included in the SGP air quality analyses as this road is not considered ambient air.

The worker housing facility will be located within the project operations boundary, near the south access security gate. This housing facility will be used strictly for accommodating employees, contractors, and official visitors, and it will not be accessible to the general public. Therefore, the atmosphere over the land occupied by the worker housing facility is not considered ambient air, and receptors were not placed at this location for the air quality analyses.

The operations boundary, shown in Figure 2 above and Figure 9 below, was used to define the ambient air boundary for air dispersion modeling purposes.

3.3.11 Nearby Co-Contributing Sources

If impacts of neighboring emission sources on receptors showing a significant impact from the sources subject to the permitting action are not adequately accounted for by the background concentration used, then emissions from those sources must be modeled. The nearest significant permitted facility to SGP is Tamarack Mill, located more than 75 kilometers (km) west. This facility is located too far away to cause a significant concentration gradient along the periphery of the SGP and was therefore not included in the cumulative impact analyses for SGP.

3.3.12 Receptor Network

DEQ determined that the receptor grid used in the submitted modeling analyses was adequate to resolve maximum modeled impacts.

The SGP air quality analyses were performed using the following receptor spacing and extents (Table 18):

- 25-m-spaced receptors placed along the ambient air boundary;
- 50-m-spaced receptors extending 250 m beyond the ambient air boundary;
- 100-m-spaced receptors extending 1 km beyond the 50-m-spaced receptors;
- 500-m-spaced receptors extending 5 km beyond the ambient air boundary; and
- 1-km-spaced receptors extending 10 km beyond the ambient air boundary.

In addition, each highest modeled impact was evaluated further by performing a hot-spot analysis using a finer 25-m-spacing receptor grid. The modeling receptor grid is shown below in Figure 9. The full grid,

Midas Gold Idaho, Inc. - Stibnite Gold Project
Stibnite Road Access Management Plan – Version 1

April 15, 2020

1 Purpose and Objectives

This Stibnite Road Access Management Plan (Plan) describes the methods whereby Midas Gold Idaho, Inc. (Midas Gold), an Idaho corporation, would manage access on designated roads that traverse the proposed Stibnite Gold Project (SGP) mine site. The SGP is described in Midas Gold's Plan of Restoration and Operations (PRO).

The SGP is a proposed open pit mine that will be located at Stibnite, in central Idaho (see inset, Figure 1). The United States Forest Service (USFS) Forest System Road (FR) that passes through Stibnite (Stibnite Road; FR 50412) extends from the village of Yellow Pine eastward along the East Fork of the South Fork of the Salmon River for approximately 14 miles. Stibnite Road then continues south through the historic Stibnite mine site and connects with Thunder Mountain Road (FR 50375) on the southeastern portion of the proposed SGP. This route also allows for access to Meadow Creek Lookout Road (FR 51290; see Figure 1). As initially proposed, construction and operations at the SGP would prohibit access through the mine site for the life of the mine (approximately 20 to 25 years). During this period, alternative access to Thunder Mountain Road and Meadow Creek Lookout Road would be provided via the newly constructed Burntlog Route; a proposed mine access route that would connect the existing Burnt Log Road to Thunder Mountain Road with a new section of roadway and an upgraded section of Meadow Creek Lookout Road. Additionally, as proposed in the PRO, an off-highway vehicle (OHV) Trail would be upgraded to connect Horse Heaven/Powerline Road to Meadow Creek Lookout Road. Public access routes proposed in the PRO are illustrated in Figure 1. As part of reclamation of the SGP and closure of the mine site, Stibnite Road would be re-established in an alignment similar to its current location and would become the primary access route to Thunder Mountain Road. The Burntlog Route would be reclaimed to its previous condition and would no longer be connected to Thunder Mountain Road.

Following the presentation of the proposed public access routes described above in Midas Gold's PRO, an alternative public access route has been proposed by Midas Gold and would pass through the SGP mine site (Stibnite Road access route). This alternative route is under evaluation as part of the USFS's obligation to review the SGP in accordance with the National Environmental Policy Act (NEPA). One of the alternatives currently being evaluated in the Draft environmental impact statement (EIS), Alternative 2, would provide continued access through the SGP site on a realigned Stibnite Road during mine operations. The implementation of this Plan is contingent upon the selection of the applicable alternative by the USFS as the preferred alternative for the SGP and inclusion of the proposed Stibnite Road access route as a component of the approved SGP.

The health and safety of the public and the employees of the SGP is Midas Gold's priority. The procedures included in this Plan would be implemented by Midas Gold over the course of the life of the mine to ensure that the use of the Stibnite Road access route is conducted safely and responsibly.

2 Project Information

2.1 Introduction

Midas Gold has proposed to redevelop portions of the Stibnite Mining District (District) as described in the SGP PRO, submitted to the United States Forest Service (USFS) in September 2016. The SGP will be located at Stibnite in Valley County, approximately 92 miles by air and 144 miles by road northeast of Boise, Idaho; 44 air miles northeast of Cascade, Idaho; and 10 air miles east of Yellow Pine, Idaho. Current access to the site is from State Highway 55 to the SGP area via Warm Lake, Johnson Creek, and Stibnite Roads as shown in Figure 1. The proposed layout of the SGP mine features is illustrated in Figure 2.

Mining operations in the District first began in the 1920s and continued episodically through 1996. Proposed SGP mine operations described in Section 9 of the PRO would include open-pit mining in the three previously mined areas:

- The Yellow Pine open pit will encompass the area of the former Yellow Pine pit, Homestake pit, and portions of the Bradley Mining Company rock dumps.
- The West End open pit will encompass the former Stibnite Mines, Inc., open pits.
- The Hangar Flats open pit will encompass the former underground Meadow Creek Mine area, Hecla heap, and adjacent former mill and smelter area.

Other features and facilities that would be part of SGP mine operations include development rock storage facilities (DRSF), a tailings storage facility (TSF) and tailings pipeline, surface water management features (diversions, collection ditches, stormwater collection ponds), an ore processing facility, a water treatment facility, equipment maintenance and storage buildings, a worker housing facility, and all associated haul roads and access roads. The north and south points of entry to the SGP would have security gates and guard shacks that would be occupied on a continual basis. Features related to SGP mine but located off-site are illustrated in Figure 1 and include the Landmark Road Maintenance Facility, Stibnite Gold Logistics Facility, and features associated with powerline upgrades and extension.

The general timeline for constructing, operating, restoring, and mitigating the SGP is approximately 20 to 25 years, including 3 years of site preparation, construction, and early restoration activities; 12 to 15 years of operations; and 5 to 7 years of final closure and reclamation work. The SGP will produce gold, silver, and antimony over the 12- to 15-year mining period.

2.2 The SGP and NEPA

The proposed SGP occurs on patented mining claims (private land) and land administered by the United States Forest Service (USFS) within both the Boise National Forest (BNF) and Payette National Forest (PNF). The Big Creek/Stibnite Management Area 13, which includes the District, is administered by the Krassel Ranger District of the PNF. Proposed actions that occur on Federally managed lands require environmental review and analysis in compliance with NEPA. The NEPA analysis for the SGP was initiated

in mid-2017 with the USFS as the lead agency. The USFS is preparing an EIS to evaluate the environmental effects of the proposed SGP as well as a range of alternatives to the proposed action.

Public comments received for the SGP indicated that the change in access through the SGP for 20 to 25 years was of significant concern, particularly for those in the Johnson Creek and Yellow Pine area who use Stibnite Road to access Thunder Mountain Road and points beyond. At the direction of the USFS, Midas Gold evaluated numerous additional access options for the SGP that provided access similar to existing conditions and travel times. Midas Gold identified a suitable access route through the SGP site that would provide through-site access during operations. The road was designed to be separated from mine operations and to provide access similar to that provided by the existing Stibnite Road. The alternative access route through the SGP was included for consideration in the Draft EIS document as a component of Alternative 2.

2.3 Proposed Stibnite Road Access Route Through the SGP

The proposed SGP Stibnite Road access route that is currently under evaluation in the SGP Draft EIS is illustrated in Figure 2 and would include one of the two optional routes described below. During mine site construction, a new 12-foot-wide gravel road would be constructed to provide public access from Stibnite Road on the northern end of the SGP to Thunder Mountain Road on the southeastern end of the site. Along its full length, the Stibnite Road access route would have appropriate signage to direct travelers and would be separated from mine haul roads and areas of mine operations by fencing, berms, or gates to prevent travelers from straying from the route.

Two optional routes were identified and include variations in alignment in the vicinity of the Yellow Pine pit:

- **Stibnite Road Access Route: Option 1** – The access road would begin at the North Security Gate and would be constructed along a widened bench of the western portion of Yellow Pine pit during an early operational phase of the mine. South of the Yellow Pine pit this road would pass beneath the mine haul leading to the Fiddle Creek DRSF and would then parallel a mine haul road along a partially revegetated portion of the former Bradley mine haul road. In the central portion of the SGP site near the Mine Administration Building, the road would connect with the Burntlog Route and continue southeast toward the Worker Housing Facility and the South (Main) Security Gate. From the north end (North Security Gate) of the SGP to the south end (South Security Gate), this road would be approximately 3 miles in length.

- **Stibnite Road Access Route: Option 2** – The access road would begin at the North Security Gate and would be constructed west of the Yellow Pine pit. South of the Yellow Pine pit this road would pass beneath the mine haul leading to the Fiddle Creek DRSF and would then parallel a mine haul road along a partially revegetated portion of the former Bradley mine haul road. In the central portion of the SGP site near the Mine Administration Building, the road would connect with the Burntlog Route and continue southeast toward the Worker Housing Facility and the South (Main) Security Gate. From the north end (North Security Gate) of the SGP to the south end (South Security Gate), this road would be approximately 4 miles in length.

Based on assessment of impacts and public and agency feedback, one of these two options would be selected if Alternative 2 is identified as the Preferred Alternative for the Midas Gold SGP.

2.4 Access Controls

The proposed Stibnite Road access route through the SGP site is meant to provide controlled, through-site access that is safe, and provides travel-time comparable to current conditions. Additionally, the Stibnite Road access route would provide access that is consistent with the USFS travel management plan. Whereas Stibnite Road between Yellow Pine and Stibnite is not plowed in winter, Midas Gold would operate the Stibnite Road access route on a seasonal basis, i.e. access would not be provided in winter. Public access to the road would begin when Stibnite Road becomes passable in the Spring.

For either of the two route options described above, the northern extent of the Stibnite Road access route would begin at the North Security Gate, would continue southward traversing the SGP mine site, would connect with the Burntlog Route and would continue southeastward out of the mine operations area. The access route would exit South Security Gate near the employee housing facility.

Midas Gold has the legal authority to control access to the Stibnite Road access route and would provide seasonal (non-winter conditions) access only. At the discretion of Midas Gold, additional access controls may occur during various phases of construction, during mine operations that present potential safety hazards such as blasting or pit expansion, due to inclement weather, or under any other circumstances that may present a threat to the protection of public health and safety. Midas Gold has the legal and practical ability to enforce its control over roadway access and to monitor traffic passing through the SGP site. Signage would be placed at the North Security Gate (near the bridge over Sugar Creek) and the Main (South) Security Gate (near the Stibnite Lodge) entry points to provide information to travelers, and guard shacks would be located at each SGP Site entry gate to monitor all vehicle ingress/egress. To ensure passage through the site in a safe and timely manner, persons wishing to traverse the SGP site on the Stibnite Road access route would be required to check in at the security gate upon entry to receive a safety briefing and to alert mine staff as to their presence. After passing through the SGP site, travelers would also be required to stop at the guard shack upon exiting to check out. Travelers would not be allowed to stop or loiter while traveling though the operations area. Along its full length, the Stibnite Road access route would have appropriate signage to direct travelers and would be separated from mine haul roads and areas of mine operations by fencing, berms, or gates to prevent travelers from straying from the route.

Midas Gold would have the ability to temporarily restrict travel along the Stibnite Road access route for the protection of public health and safety. When possible and to the degree practicable, anticipated public access restrictions would be communicated to the public in a timely manner so that they may plan appropriately.

3 Conclusion

Midas Gold's SGP is under evaluation by the USFS and is proceeding through environmental analysis under NEPA. Midas Gold's proposed action and several alternatives to the proposed action will be included in the forthcoming Draft EIS. Alternative 2 in the Draft EIS includes an access alternative that would route a roadway, the Stibnite Road access route, through the mine site.

Maintaining and protecting SGP mine employee and public health and safety is Midas Gold's priority. This Stibnite Road Access Management Plan has been prepared to demonstrate that appropriate best practices, roadway construction features, and Midas Gold SGP site security measures would be in place over the life of the SGP mine and would effectively control access to the Stibnite Road access route.

This Plan will be updated and revised as appropriate.

Table 2.2-1 Primary Differences Between the Action Alternatives

SGP Phase	Component/Subcomponent	Alternative 1	Alternative 2	Alternative 3	Alternative 4
All Phases	SGP timeline	• Construction: Approximately 3 years • Operations: Approximately 12 years • Exploration: Approximately 15 years (during construction and operations) • Reclamation: Approximately 5 years • Environmental Monitoring: As long as needed	Same as Alternative 1	Same as Alternative 1 : .	Same as Alternative 1 except: Construction: Approximately 5 years
All Phases	Access Roads	Construction/Operations: • Yellow Pine Route for mine site access during early construction with minor improvements • Burntlog Route for mine site access during construction, mining and ore processing operations, and closure and reclamation. • Associated eight borrow areas developed along Burntlog Route for materials needed for road improvements and maintenance Closure and Reclamation • New sections of Burntlog Route to be reclaimed after the closure and reclamation period	Same as Alternative 1, except: • Reroute of a 5.3-mile segment of the Burntlog Route (Riordan Creek Segment)	Same as Alternative 1, except: • The Burntlog Route in the vicinity of the East Fork South Fork Salmon River (EFSFSR) TSF rerouted on a new road segment, to come into the mine site adjacent to Blowout Creek during operations • Rerouting of the Burntlog Route would eliminate access to two of the eight borrow areas	• Yellow Pine Route upgraded and used for mine site access throughout life of mine instead of the Burntlog Route • Access route around the Yellow Pine pit for employee access and deliveries of supplies and equipment to the processing, warehouse, worker housing facility, and administration areas • No improvements or construction of new segments for Burntlog Route • Associated borrow sources developed along the Yellow Pine Route for materials needed for road improvements and maintenance
All Phases	Public Access	Construction: • Temporary groomed over-snow vehicle (OSV) trail on the west side of Johnson Creek from Trout Creek to Landmark while Burntlog Route is constructed • Cabin Creek Road Groomed OSV trail • Public roads remain open through the mine site with temporary closures as needed to accommodate construction • Off-highway vehicle (OHV) Trail from Horse Heaven/Powerline to Meadow Creek Lookout Road (National Forest System Road [FR] 51290) Operations: • Stibnite Road (County Road [CR] 50-412) / Thunder Mountain Road (FR 50375) closed through the mine site • Public access allowed on Burntlog Route to Thunder Mountain Road (FR 50375) through the mine site • OHV Trail from Horse Heaven/Powerline to Meadow Creek Lookout Road (FR 51290) • Cabin Creek Road Groomed OSV trail Closure and Reclamation: • New road constructed over the Yellow Pine DRSF (backfilled Yellow Pine pit) connecting Stibnite Road (CR 50-412) to Thunder Mountain Road (FR 50375)	Construction: Same as Alternative 1 Operations: Same as Alternative 1 except: • Public access through the mine site provided by constructing new road to link Stibnite Road (CR 50-412) to Thunder Mountain Road (FR 50375) with two options: ○ Option 1 - through Yellow Pine pit and below mine haul road ○ Option 2 - west of Yellow Pine pit and below mine haul road Closure and Reclamation: Same as Alternative 1	Construction: Same as Alternative 1 except: • Meadow Creek Lookout Road would be upgraded from Burntlog Route to Monumental Summit for public access • No OHV Trail from Horse Heaven/Powerline to Meadow Creek Lookout Road (FR 51290) Operations: Same as Alternative 1 except: • No public access through the mine site • Public access on Burntlog Route connecting to upgraded Meadow Creek Lookout Road (FR 51290) • No OHV Trail from Horse Heaven/Powerline to Meadow Creek Lookout Road (FR 51290) Closure and Reclamation: • Road established over Yellow Pine DRSF (same as Alt 1) to middle of mine site where public access provided around the TSF using one of two options: ○ Conversion of the temporary operational TSF access road along the TSF pipeline route to a permanent public access road connecting to the existing road at both ends ○ Retention of mine access road through Blowout Creek drainage for public access	Construction: Same as Alternative 1 except: • No OHV Trail from Horse Heaven/Powerline to Meadow Creek Lookout Road (FR 51290) • Groomed OSV trail on the west side of Johnson Creek from Wapiti Meadows to Landmark from construction through mine closure Operations: Same as Alternative 1 except: • No OHV Trail from Horse Heaven/Powerline to Meadow Creek Lookout Road (FR 51290) • Public access through the mine site provided on same route as mine access around the Yellow Pine pit. • Groomed OSV trail on the west side of Johnson Creek from Trout Creek to Landmark from construction through mine closure Closure and Reclamation: Same as Alternative 1

REC 7506

PRI-00001022

2.4.3 Timeline

Timelines for construction, operations, and closure and reclamation for Alternative 2 would be the same as for Alternative 1.

2.4.4 Construction Phase

Construction activities and timing under Alternative 2 would be essentially the same as under Alternative 1. However, the modifications described in **Table 2.4-1** above would eliminate, relocate or modify interrelated construction activities.

2.4.4.1 Access Roads

BURNTLOG ROUTE – RIORDAN CREEK SEGMENT

Under Alternative 2, a section of new road construction along Burntlog Route (**Figure 2.4-3**) would be located on the south side of the Riordan Creek drainage and cross Riordan Creek north of Black Lake. The approximately 5.3-mile road segment would have 12 stream crossings, 3 of which cross perennial streams. The elevation of this road segment is approximately 8,000 to 8,600 feet and the average grade of this road segment would be 5 to 6 percent. The new construction portion of Burntlog Route under Alternative 2 would be approximately 13.5 miles and under Alternative 1 would be approximately 15 miles.

2.4.4.2 Public Access

STIBNITE ROAD TO THUNDER MOUNTAIN ROAD LINK

During mine site construction, a new 12-foot-wide gravel road would be constructed to provide public access from Stibnite Road (CR 50-412) to Thunder Mountain Road (FR 50375). The public access road would be constructed prior to the removal of development rock from Yellow Pine pit.

There are two options for a public access road through the mine site:

- Option 1 (**Figure 2.4-4**) – Constructed along a widened bench of the western portion of Yellow Pine pit (**Figure 2.4-5**). South of Yellow Pine pit this road would parallel a mine haul road and use a partially revegetated portion of the former Bradley mine haul road (**Figure 2.4-6**). The public access road portion through Yellow Pine pit would include a rockfall catchment area. This road would be approximately 3 miles in length.
- Option 2 (**Figure 2.4-7**) – Constructed west of the Yellow Pine pit. South of Yellow Pine pit, this road would parallel a mine haul road and use a partially revegetated portion of the former Bradley mine haul road (**Figure 2.4-8**). This road would be approximately 4 miles in length.

Based on assessment of impacts and public and agency feedback, one of these two options would be selected.

PRI-00001025

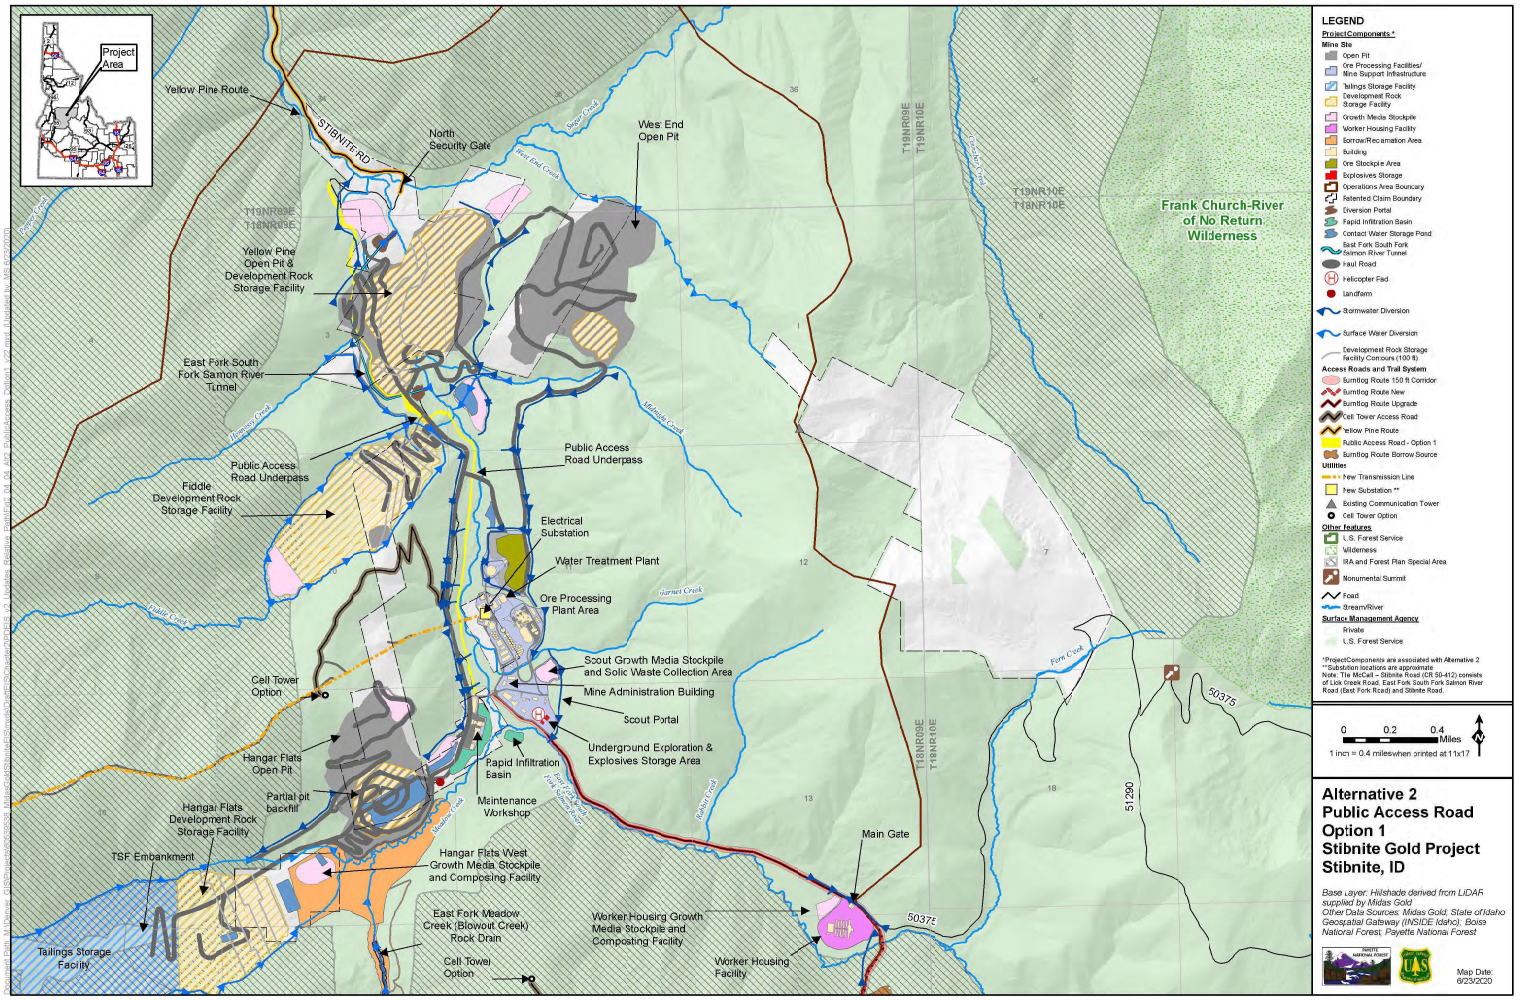

Figure Source: AECOM 2020a

Figure 2.4-4 Alternative 2 Public Access Road Option 1

REC 7510

PRI-00001026

When the volume of water needing treatment in the Centralized WTP exceeds 4,000 gpm, such as during spring runoff, contact water ponds would be used to equalize the flows through the Centralized WTP. For high water years, mine pits also could be temporarily used to hold water for treatment.

During mine operation, the Centralized WTP is expected to require the following chemicals and reagents on an annual basis.

Sodium Hypochlorite – 15,000 gallons

Ferric Sulfate – 125,000 gallons/year

Hydrated Lime – 250 tons

Organic Flocculant (polymer) – 1,900 gallons

Sulfuric Acid – 2,400 gallons

Sodium Bisulfite – 2,000 gallons

Organic sulfide precipitant, if needed

Transport of these chemicals and reagents would add approximately 40 round trips for delivery to the operational AADT presented in **Table 2.4-3**. An estimated 2 to 4 employees would be required to operate the Centralized WTP.

The resulting solids from the Centralized WTP are not expected to be classified as a hazardous waste, and would be disposed in the TSF. Treated water would be discharged through the RIBs and/or direct discharge to the EFSFSR through an IPDES permitted outfall.

2.4.5.7 Access Roads

Access during operations would be the same as described in Alternative 1, except that a portion of the Burntlog Route would be relocated as described in Section 2.4.3.1, Access Roads.

2.4.5.8 Public Access

STIBNITE ROAD TO THUNDER MOUNTAIN ROAD LINK

Public Access during operations would be the same as described in Alternative 1, except that a new 12-foot-wide gravel road would be constructed to provide public access from Stibnite Road (CR 50-412) to Thunder Mountain Road (FR 50375) as described in Section 2.4.4.2, Public Access. The public access road would be used to travel through the mine site and would provide seasonal use, open to all vehicles. Vehicles passing through the mine site would be required to check-in with mine personnel at the Main or North Gates guard shacks upon entering the mine site and would receive a safety briefing. Vehicles on the public access road would be required to pass through the mine site without stopping or deviating from the public access road and would be required to check-out with mine site personnel upon exiting the mine site, to ensure they are clear of the site for safety purposes. Midas Gold would have the option to restrict mine site access to any vehicles due to concerns related to public or employee health

and safety, such as during blasting, mining in the immediate area of the road and other similar operations.

Berms, security fencing, and two underpasses, to allow the public road to pass beneath the mine haul road, would separate the public access road from other mine site roads. One underpass would be located north of the Fiddle DRSF and a second underpass would be located near the ore processing facility area. The public access road would be temporarily closed during construction and maintenance, and during other mining activities that would be considered public safety hazards (e.g., highwall scaling, blasting). Signs would be placed to inform the public of temporary closures and the public access road would not be plowed in the winter.

2.4.5.9 Off-site Facilities

Under Alternative 2, a maintenance facility (Burntlog Maintenance Facility) would be constructed within a borrow source site 4.4 miles east of the junction of Johnson Creek Road and Warm Lake Road (**Figure 2.4-1**). The relocated maintenance facility would include the same components as described in Alternative 1.

2.4.5.10 Traffic

The production of lime on-site would reduce lime deliveries to the site by 2,032 trips per year and would require an average of 133 additional propane deliveries per year (Midas Gold 2018b).

Table 2.4-3 shows the expected operational supply and haulage traffic under Alternative 2. The AADT for Alternative 2 is 50 vehicles.

2.4.6 Closure and Reclamation

Closure and Reclamation activities under Alternative 2 would be the same as under Alternative 1, except as described below.

2.4.6.1 Hangar Flats DRSF

Upon completion of final grading of the Hangar Flats DRSF, a low permeability geosynthetic cover would be placed on the top of the DRSF, which would be designed to limit infiltration through the DRSF. The geosynthetic liner would be overlain by placement of an inert soil/rock layer and growth media and revegetated.

2.4.6.2 Fiddle DRSF

Upon completion of final grading of the Fiddle DRSF, a low permeability geosynthetic cover would be placed on the top and outslopes of the DRSF that is designed to limit infiltration through the DRSF. The geosynthetic liner would be overlain by placement of an inert soil/rock layer and growth media and revegetated.

4 ENVIRONMENTAL CONSEQUENCES

4.1 INTRODUCTION

Chapter 4 describes the potential environmental consequences of implementing each of the alternatives presented in Chapter 2. Pursuant to 40 Code of Federal Regulations (CFR) 1500.1(b) and 1500.4, this section summarizes the completed analysis and forms the scientific and analytical basis for the comparison of alternatives. The alternatives described in Chapter 2 may cause, either directly or indirectly, changes in the human and natural environment. This Environmental Impact Statement (EIS) analyzes these potential changes and discloses the effects to the decision-makers and the public. Disclosure is a fundamental goal of the National Environmental Policy Act (NEPA). In addition, cumulative effects along with applicable mitigation measures and irreversible and irretrievable effects also are discussed. Effects of each action can be neutral, beneficial, and/or adverse. Effects are quantified whenever possible, and/or are qualitatively discussed.

The individual resource discussions are generally presented by issue(s) and organized with the presentation of the effects analysis issues and indicators for the resource; a brief methodology for the analysis of impacts; an evaluation of the alternatives' impacts to the resource; a discussion of cumulative effects, irreversible and irretrievable commitments, and short-term uses versus long-term productivity; followed by a summary of impacts by issues and indicators. The final subsection provides a table summarizing and comparing quantitative and qualitative impacts to each resource by alternative.

Section 4.1, Introduction, provides a brief explanation of what each resource section will address, including a summary of incomplete and unavailable information relevant to evaluating significant adverse impacts; the presentation of past, present, and reasonably foreseeable future actions (RFFAs) used for the direct, indirect, and cumulative impact analyses; and a discussion of Forest Plan Consistency and Potential Forest Plan Amendments.

4.1.1 Effects Analysis Indicators and Methodology of Analysis

An issue is defined as a point of disagreement, debate, or dispute with a proposed activity based on some anticipated effect. Issues are described in terms of cause and effect; that is, if an action occurs, an impact could result. Issues are addressed by describing comparative factors that provide a way to define, compare, and contrast the effects of the alternatives, including No Action.

REC 7513

PRI-00001029

Table 4.3-21 Maximum Annual HAP and Air Toxics Emissions Summary – Alternative 2 NSR Inventory [1]

Source Category	HCN (tpy)	H_2SO_4 (tpy)	HAP (tpy)	Hg (lbs/yr)
Ore Processing and Refining	0.97	8.9	1.8	24.9
Mining Fugitive	0.0	0.0	.0004	7.1
Total	**0.97**	**8.9**	**5.3**	**32.0**

Table Source: Air Sciences 2020

Table Notes:

1 - The HAP and Air Toxics emissions conform to the accepted PTC application to IDEQ.

H_2SO_4 = sulfuric acid, mist form. HCN = hydrogen cyanide.

HAP = Hazardous Air Pollutants. Hg = mercury (all forms).

tpy. = Tons per year. VOCs = Volatile Organic Compounds.

4.3.2.2.3 OPERATIONS PHASE – CONTROLLED ACCESS ROADWAY

The controlled access road for Alternative 2 is shown in **Figure 4.3-2** as it was included in a supplemental dispersion modeling analysis for this alternative. Although the route would be hypothetically open to all vehicles year-round, the level of usage is expected to vary seasonally because the destination areas are generally inaccessible except to over-snow vehicles between December and March. Roadway dust emissions would be reduced or eliminated during the wet months and periods of snow cover. In consideration of this, the modeling of the roadway impacts was only performed for the period of April through November. In addition, the IDEQ determination that the road is not within the regulated ambient air means that NAAQS do not apply for protection of individuals using the road.

To assess possible risk due to use of the controlled access roadway, supplemental dispersion modeling for this alternative treated the path of the public access road as "ambient air." This requires that model receptors be positioned along the route as illustrated in **Figure 4.3-2** to predict pollutant concentrations. Treatment of the access road as ambient air could be considered a conservative approach, because several measures would be in place, consistent with EPA policy regarding sufficient measures to restrict or control public access (EPA 2019a). All public traffic on the proposed road would be required to check in and out of the mine site, and therefore they could be considered guests of the mine. Public vehicles would need to be checked in at security checkpoints at either end of the route through the Operations Area Boundary. Because the roadway would be fenced off, and on a separate ROW, no public access to the mine site or other operational areas would be allowed. Taken together, these practices allowed IDEQ to determine that the controlled access roadway can be excluded from ambient air analyses.

4.16.2.2.2 Public Access

Under Alternative 2, public access would be the same as Alternative 1 (e.g., the newly constructed Burntlog Route connecting to Meadow Creek Lookout Road [FR 51290]), except public access also would be provided through the mine site from Stibnite Road to Thunder Mountain Road (FR 50375) during mining operations. The newly constructed Burntlog Route connecting to Meadow Creek Lookout Road and then Thunder Mountain Road would allow public access when other routes are not available (i.e., the public access route through the mine site). The newly constructed roadway portion of the Burntlog Route would be a temporary road that is necessary for mining purposes and would meet 36 CFR 228A requirements for environmental protection. Public motor vehicle use would be allowed on the newly constructed, private mining road when other public access roads are blocked by mine operations. Approximately 13.5 miles of new roads managed by Midas Gold, but open to public access when needed, would be created.

After mine construction is complete, a 12-foot-wide, approximately 3- to 4-mile gravel road connecting Stibnite Road to Thunder Mountain Road would be open to all vehicles year-round. Midas Gold would maintain the public access road under Valley County's FRTA easement; however, it would not be plowed. There are two options for public access through the mine site (refer to Section 2.4.4.2, Public Access). Under Option 1, an approximately 3-mile public access road through a widened portion of the western side of Yellow Pine pit and paralleling a mine haul road would be constructed. Under Option 2, an approximately 4-mile public access road west of the Yellow Pine pit and paralleling the same mine haul road as Option 1 would be constructed. The selected public access road option would be separated from the mine site roads by berms, security fencing, and underpasses. For added safety, the public access road would be temporarily closed during construction and maintenance activities of the public access road, and during other mining activities that would be considered public safety hazards (e.g., high wall scaling and blasting). Signs would be placed to inform the public of the closure. During closures on the road through the mine site, public use of the Burntlog Route would be allowed.

4.16.2.2.3 Closure and Reclamation

Impacts to traffic volume and public access under Alternative 2 would be similar to those described under Alternative 1 for closure and reclamation; however, Alternative 2 would require an additional 40 truck trips per year to deliver chemicals for water treatment in perpetuity. Like operations, 40 truck trips for water treatment would provide an increase of 0.1 AADT for closure and reclamation and post-closure traffic. Post-closure, traffic to the mine site (i.e., the additional 40 truck trips per year required to deliver chemicals for water treatment in perpetuity) would no longer utilize the Burntlog Route, but would use the Yellow Pine Route to access the mine site which would be plowed to provide year-round access for treatment plant workers. Water treatment-related deliveries would not occur during the winter; supplies and waste would be stockpiled on site. Public access to and through the mine site would remain post reclamation and would require revision to the existing FRTA easement with Valley County.

relates to noise is "low" and the possibility is rated as "low," with an overall public health rating of "negligible."

4.18.2.1.4.3 Nutrition

Activities in the SGP area related to nutrition include fishing, hunting, or gathering of berries (or other edible vegetation). Contaminants in surface water could potentially bioaccumulate in the edible tissues of fish in impacted surface water or in wildlife that drink impacted surface water. Likewise, contaminants in soil could potentially bioaccumulate in plants growing in impacted soils. As discussed above, implementation of controls and surface water management during mine operations and the closure and reclamation activities would likely decrease concentrations of contaminants in soil and surface water relative to existing conditions. In addition, recreational exposures are expected to be of limited frequency and short duration (the Payette National Forest camping stay limit for individual campground sites is 16 days). For these reasons, the magnitude of impact on public health as it relates to nutrition is "low" and the possibility is rated as "low," with an overall public health rating of "negligible." There are no differences in impact findings among the construction, operation, and closure and reclamation phases of Alternative 1.

4.18.2.2 Alternative 2

Alternative 2 is similar to Alternative 1 with the main differences consisting of re-routing of a segment of the Burntlog Route, allowing public access through the mine site during operations, change in the location of the maintenance facility, re-routing a portion of the transmission line to be upgraded around the Thunder Mountain Estates, generating lime at the mine site, and establishment of a Centralized Water Treatment Plant. These changes are intended to reduce potential effects on surface water quality, reduce potential traffic related issues by providing public access through the mine site and potentially decreasing incidental public use of Burntlog Route, reduce SGP-related annual average daily traffic to the mine site during operations (through on-site lime generation) and reduce overall disturbance in the SGP area. However, Alternative 2 also would include an on-site propane-fired lime kiln and has higher air emissions than Alternative 1.

As discussed in Section 4.3.2, Direct and Indirect Effects on Air Quality, the $PM_{2.5}$ "annual" average (computed as the mean values from April through November) and PM_{10} 24-hour average concentrations (12.8 µg/m^3 and 179.7 µg/m^3, respectively) are predicted to be slightly over the respective NAAQS criteria at receptors along the public access road through the mine site (12 µg/m^3 and 150 µg/m^3, respectively). NAAQS are set at a level expected to protect public health with an adequate margin of safety, taking into consideration effects on susceptible populations. Signage and security checkpoints would alert the public to requirements for driving through the mine site, including check in and out at the checkpoints, no stopping or loitering while traversing the operations area, and restrictions would be enforced by signage, fencing, berms and/or gates to restrict travel to the designated route. The amount of time spent within the mine site on the public access road would be of limited duration. In addition, it is anticipated that people would only occasionally use the route through the mine site, such that the frequency

of exposure would be limited. While air modeling results exceeded the NAAQS criteria during the operations phase along the public access road through the mine site, the limited duration and frequency of exposure to PM at modeled air concentrations would likely be minimal, which would significantly reduce the public health impact associated with air quality, even for sensitive subpopulations. The slight exceedances of the NAAQS criteria along the public access road are expected to have little to no effect on the health of the general population, however, sensitive susceptible populations are at greater risk of health effects associated with air quality conditions.

Overall, impacts to public health and safety under Alternative 2 would therefore be slightly improved compared to Alternative 1 for traffic-related issues and surface water quality impacts. However, on-site lime generation could lead to slightly greater air quality impacts along the public access route through the mine site, that could affect sensitive subpopulations.

4.18.2.3 Alternative 3

Alternative 3 is similar to Alternative 1 with the main differences being no construction of the Meadow Creek off-highway-vehicle Connector Trail, the tailings storage facility (TSF) constructed in the EFSFSR, and different access through the mine site after mine closure/reclamation. Impacts to public health and safety would be essentially the same as those described under Alternative 1.

4.18.2.4 Alternative 4

Alternative 4 is similar to Alternative 1 with the main differences being the use of the Yellow Pine Route for access to the mine for all phases, and public road access through the mine during operations (similar to Alternative 2). These changes would result in different impacts than Alternative 1, particularly the use of the Yellow Pine Route.

Under Alternative 4, the Yellow Pine Route would be used from construction through operations and closure and reclamation and the Burntlog Route would not be constructed. Use of Johnson Creek (CR 10-413) and Stibnite (CR 50-412) roads as the primary route to the mine site during construction, operations, and closure and reclamation would result in increased noise, traffic, and safety-related issues from mine-related traffic along the Yellow Pine Route. The Yellow Pine Route would route all mine-related traffic through the Village of Yellow Pine and public traffic and mine traffic would share the same road from Landmark to the mine site. Additionally, the Yellow Pine Route would result in one point of entry to the SGP, effectively combining public access with mining traffic for the life of the mine. This limited ingress/egress to the SGP site also will impact emergency vehicle access during periods of road blockage.

The steep terrain along the Yellow Pine Route would likely be a greater risk to public safety under Alternative 4, because it would be the only route used for the life of the SGP and would require safety considerations for geotechnical hazards, landslides, and avalanche zones (see Section 4.2, Geologic Resources and Geotechnical Hazards). Overall, Alternative 4 could lead to greater public health and safety impacts compared to Alternative 1 through use of the Yellow Pine Route (increase traffic-related issues and increased geotechnical, landslide, and

REC 7519

PRI-00001034

During operations, mine-related traffic would include transport of employees to and from the SGP, delivery of supplies, and activities associated with road maintenance such as snowplowing and sanding. Under the 2021 MMP and the Johnson Creek Route Alternative, operational AADT would be 50 vehicles (33 heavy vehicles and 17 light vehicles), resulting in approximately four mine-related vehicles per hour traveling outside the SGP.

The upgraded Burnt Log Road and the newly constructed Burntlog Route would experience an increase in traffic of over 71 percent under the 2021 MMP, with 27.5 percent of the traffic comprised of heavy vehicles. Although heavy vehicles currently use Johnson Creek Route to access the SGP, the Johnson Creek Route Alternative traffic would result in a noticeable change in baseline driver experience and slower drive times due to the substantial increase in mine-related heavy vehicles along the Johnson Creek Route during the life of the SGP. Even though upgrades to Johnson Creek Road and Stibnite Road would be made, these roads would still have many curves and slopes.

During closure and reclamation, activities including slope recontouring, facility removal, seeding and planting, and post-closure environmental monitoring would require approximately 7 years. Closure and reclamation would generate a total estimated AADT of 27 vehicles (15 heavy vehicles and 12 light vehicles). Post-closure monitoring activities would generate a total estimated AADT of six light vehicles.

Local roads experience a seasonal effect which results in noticeable differences in traffic. Valley County has many summer recreational areas that attract visitors from May through October with peak AADT levels in June, July, and August. Mine access via the Johnson Creek Route would be more impactful on summer recreational traffic because it would utilize established roads rather than new road development. Winter driving conditions influence the amount of traffic and result in lower AADT levels during the winter months. Therefore, the effect of SGP traffic on these roads would show a noticeably greater increase in mine-related winter traffic during winter. Post-closure winter traffic would not be as noticeable as heavy vehicle deliveries would not occur and approximately six mine-related light vehicles per day would utilize the accessible roadways in the analysis area for monitoring and maintenance purposes.

Public Access

Under the 2021 MMP, public access to the SGP area would be enhanced by the development of a new access road (Burntlog Route) compliant with current road standards. Under both action alternatives, there would also be a controlled public access route through the SGP during the operations, and closure and reclamation phases; however, public access would be intermittently interrupted during the construction phase. Under the Johnson Creek Route Alternative, the Burntlog Route would not be constructed, and the Johnson Creek Route would be used for both public and SGP-related access. To continue providing OSV access to Landmark, a 10.4-mile groomed OSV route between Warm Lake and Trout Creek Campground on Cabin Creek Road would be created as part of the 2021 MMP along with a parking area, resulting in a new winter access facility that would be maintained by Valley County.

Safety and Emergency Access

For the duration of the SGP, the increase in total volume of mine-related vehicles, specifically heavy vehicles or trucks, on the Yellow Pine and Burntlog routes would result in an increased risk for accidents occurring between public and SGP-related traffic due to the one-lane constraints during construction, for

REC 7520

PRI-00001035

Table 2.2-1 Action Alternatives Summary

SGP Phase	Component/ Subcomponent	2021 MMP	Johnson Creek Route Alternative
All Phases	SGP timeline	• Construction: Approximately 3 years. • Operations: Approximately 15 years. • Exploration: Approximately 17 years (during construction and operations). • Reclamation: Approximately 5 years (except for the TSF which would require an additional 9 years for tailings dewatering and consolidation). • Closure/Post-Closure Water Treatment: Approximately through Mine Year 40. • Environmental Monitoring: As long as needed.	Same as 2021 MMP except: • Construction: Approximately 5 years (upgrading the existing Johnson Creek and Stibnite Roads to provide permanent mine access).
All Phases	Access Roads	Construction/Operations: • Warm lake road from State Highway (SH) 55 to Johnson Creek Route intersection (34 miles). • Johnson Creek Route for SGP access during early construction with minor improvements within the road prism. • Burntlog Route (38 miles) for SGP access during last year of construction, mining and ore processing operations, and closure and reclamation. Includes improvements of existing segments (23 miles) and road construction for new segments (15 miles). • Up to eight borrow areas developed along Burntlog Route for materials needed for road improvements and maintenance. • Access route around the Yellow Pine pit for public access. Closure and Reclamation: • New sections of Burntlog Route to be reclaimed after the closure and reclamation period.	• Warm lake road from SH 55 to Johnson Creek Route intersection (34 miles). • Johnson Creek Route (39 miles: Johnson Creek Road 25 miles, Stibnite Road 14 miles) upgraded and used for access throughout life of mine (LOM) instead of the Burntlog Route. • Access route around the Yellow Pine pit for public access, employee access, and deliveries of supplies and equipment to the processing, warehouse, worker housing facility, and administration areas. • No improvements or construction of new segments for Burntlog Route. • Up to seven borrow sources developed along the Johnson Creek Route for materials needed for road improvements and maintenance. Closure and Reclamation: • Improved Johnson Creek and Stibnite roads would not be reclaimed to pre-existing conditions.

REC 7521

PRI-00001036

SGP Phase	Component/ Subcomponent	2021 MMP	Johnson Creek Route Alternative
All Phases	Public Access	Construction: • Temporary groomed over-snow vehicle (OSV) trail on the west side of Johnson Creek from Trout Creek to Landmark while Burntlog Route is constructed (8 miles). • OSV trail on west side of Johnson Creek from Wapiti Meadows to Trout Creek campground closed during construction (9 miles). • OSV trail from Warm Lake to Landmark closed during construction through operations (8.5 miles). • Cabin Creek Road Groomed OSV trail (11 miles). • Public roads remain open through the SGP with temporary closures as needed to accommodate construction. Operations: • Groomed OSV trail moves from west side of Johnson Creek Road to Johnson Creek Road from Landmark to Wapiti Meadows (16.7 miles). • Stibnite Road (County Road [CR] 50-412) / Thunder Mountain Road (FR 50375) closed through the SGP. • Seasonal public access through the Operations Area Boundary provided by constructing new road through Yellow Pine pit and below mine haul road to link Stibnite Road (FR 50412) to Thunder Mountain Road (FR 50375). • Public access allowed on Burntlog Route to Thunder Mountain Road (FR 50375). Closure and Reclamation: • New road constructed over the Yellow Pine Backfill (backfilled Yellow Pine pit) connecting Stibnite Road (FR 50412) to Thunder Mountain Road (FR 50375).	Construction and Operations: Same as 2021 MMP except: • OSV trail on the west side of Johnson Creek from Wapiti Meadows to Trout Creek campground would be closed from construction through mine closure (9 miles). • Groomed OSV trail on the west side of Johnson Creek from Trout Creek to Landmark lasting from construction through mine closure. Closure and Reclamation: Same as 2021 MMP.

REC 7522

PRI-00001037

- Expanded wintertime public vehicle access on Warm Lake Road east of Warm Lake Lodge would commingle SGP and public travel.

Changes to the SH 55 and Warm Lake Road intersection would improve access for large trucks carrying equipment and supplies to the SGP and would facilitate turns from SH 55 onto Warm Lake Road and from Warm Lake Road back onto SH 55. Any changes proposed to the intersection would need to be approved and implemented by the Idaho Transportation Department (ITD). Recommended changes to the intersection include: the addition of left and right turning lanes (Parametrix 2018a); an intersection modification to accommodate larger trucks; potential relocation of two power poles (HDR Engineering, Inc. [HDR] 2017a); and a modification to the westbound approach at Warm Lake Road to improve the view of traffic coming from the north.

Johnson Creek Route

During the initial construction period of the Burntlog Route (approximately 2 to 3 years), mine-related traffic would access the SGP from SH 55, north of the city of Cascade, via Warm Lake Road for approximately 34 miles, then north on Johnson Creek Road (CR 10-413) for approximately 25 miles to the village of Yellow Pine, and from Yellow Pine east approximately 14 miles to the SGP via the Stibnite Road (CR 50-412). The portion of the route that includes Johnson Creek Road and Stibnite Road is known as the Johnson Creek Route. This route is primarily situated topographically adjacent to the valley bottom, paralleling Johnson Creek and then the East Fork SFSR.

Johnson Creek Road is a county-maintained, native-surface road that is open to vehicles with seasonal restrictions due to snow. During the winter, Valley County plows approximately 10 miles of Johnson Creek Road from Yellow Pine south to Wapiti Meadow Ranch and grooms the remaining 17 miles of Johnson Creek Road from Wapiti Meadow Ranch to Warm Lake Road at Landmark for OSV use. Valley County does not plow Warm Lake Road from Warm Lake to Landmark; this section is a designated groomed OSV route.

The Stibnite Road portion of the route is also a county-maintained native surface road, open to all vehicles with seasonal restrictions due to snow. This road is plowed in the winter by Perpetua through an agreement with Valley County. Stibnite Road connects to Thunder Mountain Road on the southeastern portion of the Stibnite site and currently provides seasonal (non-winter) public access through the site.

REC 7523

PRI-00001038

2.4.4.4 Public Access

During construction of the SGP and completion of the Burntlog Route, to the degree practicable, the public would continue to have access on forest roads currently available to the public (**Figure 2.4-1**). However, current public access through the SGP on Stibnite Road would be restricted for a period of approximately one year while a new through-site public access road is constructed. A new 4-mile long, 12-foot-wide gravel road would be constructed to provide public access from Stibnite Road (FR 50412) to Thunder Mountain Road through the SGP (**Figure 2.4-2**). The road would be constructed on a widened bench on the west side within the Yellow Pine pit, then head south of the Yellow Pine pit, where this road would utilize an underpass to cross under a SGP haul road and continue southward, parallel to and on the east side of the mine haul road on a partially revegetated portion of a former haul road (**Figure 2.4-2**). Southwest of the ore processing area, the public access road would connect with Thunder Mountain Road and continue toward the worker housing facility, exiting the SGP to the southeast.

During operations, the public access road through the SGP would provide seasonal use, open to all vehicles; access would not be provided in winter when impassable (current county maintenance standards) and signs would inform the public of seasonal and temporary closures. Vehicles passing through the SGP would be required to check-in with mine personnel at the North or South SGP entry points and would receive a safety briefing and would also be required to check-out with SGP personnel upon exiting the SGP. For safety purposes, public access would be separated from other SGP roads by berms, security fencing, and the underpass to allow the public road to pass beneath the mine haul road. No stopping or deviating from the public access road would be allowed. Perpetua would restrict SGP access to any vehicles due to concerns related to public or employee health and safety, such as during road construction and maintenance, blasting, highwall scaling, mining in the immediate area of the road, and similar operations.

Public access would continue along Johnson Creek Road and Burnt Log Road. Total closures of half-day to multiple days could occur during construction work on Stibnite Road between the village of Yellow Pine and the SGP, part of Thunder Mountain Road, and Burnt Log Road.

Public use of the Burntlog Route would provide motorized access to Meadow Creek Lookout Road (FR 51290) and Monumental Summit. Other routes available for public use are shown on **Figure 2.4-1**.

Public access by foot via existing trails or on roads would be restricted within the Operations Area Boundary shown on **Figure 2.4-2**. Security personnel, fencing (including wildlife exclusion fencing), and signs would restrict public access to vehicular traffic on the designated public access roadway inside the Operations Area Boundary.

Warm Lake to Landmark Groomed OSV Trail

Due to year-round access to the SGP along the Burntlog Route, an existing, approximately 8.5-mile-long groomed OSV trail from Warm Lake to Landmark would be closed for the life of the SGP. To replace this recreational use, a dedicated alternative OSV route would be established from Warm Lake area to Landmark via the Cabin Creek/Trout Creek drainages and Johnson Creek Road (**Figure 2.4-4**).

REC 7524

PRI-00001039

Description	Resources Affected
A new 12-foot-wide gravel road would be constructed to provide public access from Stibnite Road (FR 50412) to Thunder Mountain Road (FR 50375) through the SGP. During operations, the public access road would be used to travel through the SGP and would provide seasonal use, open to all vehicles. Vehicles passing through the SGP would be required to check-in with mine personnel at the North or South SGP entry points.	Transportation and Access, Health and Safety
Post reclamation, a road would be established over the backfilled Yellow Pine pit to allow public access through the reclaimed site and connect Stibnite Road (FR 50412) to Thunder Mountain Road (FR 50375). This would replace the operational phase public access route.	Transportation and Access
Prior to site preparation and construction of surface facilities, vegetation would be removed from operating areas. Merchantable timber on NFS surface lands could be purchased from the USFS. Non-merchantable trees, deadwood, shrubs, and slash would be removed, and any remaining vegetation would be grubbed using a bulldozer. The resulting material would be saved for future use in reclamation activities. Specifically, the organic matter would be chipped and stockpiled for use as mulch or blended to create a growth media additive. After vegetation removal, growth media would be salvaged and stockpiled. Stockpiles would be stabilized, seeded, and mulched to protect the stockpiles from wind and water erosion.	Vegetation
Perpetua would inspect and remove vegetation material (including noxious weeds) from mechanical equipment and properly dispose to minimize the spread of unwanted vegetation.	Vegetation
Wood wastes and wood mulch are the two primary sources of compost. Food waste produced from on-site meal preparation and wastes may provide another source. Combined and properly managed during composting, these materials would provide a source of organic matter to be blended into substrate materials suitable for mitigation.	Vegetation
Perpetua would be responsible for noxious weed control within areas disturbed by SGP activities.	Vegetation, Wildlife
Develop and employ planting plans for wildlife benefits (cover, forage, etc.) using approved seed mixes.	Vegetation, Wildlife
Perpetua would use aquatic safe herbicides during vegetation management activities and noxious weed control. Adhere to chemical label restrictions, federal/state rules on usage. Use proper equipment for chemical application by trained personnel.	Vegetation, Fish
Perpetua or its designated contractor(s) would perform long-term maintenance as necessary, including maintaining and monitoring the Mitigation Area (including stream and wetlands) in perpetuity once the final performance standards are met or until such responsibility is relinquished to an appropriate third party (Forest Service, etc.) as approved by the USACE.	Vegetation, Wetlands
Perpetua would plant stream reclamation reaches and wetland reclamation areas with native plant species that are present in PAB, PEM, PSS, and palustrine forested wetlands and riparian areas along streams throughout the Mitigation Area.	Vegetation, Wetlands
To address stream temperature, riparian planting widths along restored and enhanced stream reaches would be 18 feet wide on each stream bank where possible. Taller and denser vegetation such as spruce trees would be planted. Further, the creation of the lined Stibnite Lake, a feature similar in size to the present Yellow Pine pit lake, would replace the function of the existing Yellow Pine pit lake in buffering stream temperature extremes and reduce maximum stream temperatures in East Fork SFSR in and downstream of the SGP.	Vegetation, Wetlands, Surface Water, Reclamation
Pre-construction water management activities would include the installation of surface water management features and implementation of best management practices to reduce erosion and sediment delivery to streams. These water management features and best management practices could include sedimentation ponds; run-on water diversion ditches, trenches, and/or berms; runoff water collection ditches; silt fence; water bars; culverts; energy dissipation structures; terraces; and other features specified in construction permits.	Water Resources

REC 7526

PRI-00001041

Issue	Indicator	Baseline Conditions	No Action Alternative	2021 MMP	Johnson Creek Route Alternative
				After mine reclamation, direct public access through the mine to Thunder Mountain Road would be restored.	
	Changes in recreation physical setting characteristics and related ROS class (by season) measured in acres.	Designated ROS classes in the analysis area vary by season, and include Rural, Roaded Natural, Roaded Modified, Semi-Primitive Motorized, Semi-Primitive Non-Motorized, and Primitive. Estimated existing ROS physical settings are similar.	Generally, existing designated ROS classes and physical recreation setting characteristics would remain as is. Modifications to the recreation setting in the SGP area continued low level of unauthorized motorized use, and increased winter motorized access and use could lead to changes in the designated ROS class and/or ROS physical setting of some areas due to additional motorized use both in the summer and winter. Acreage of Estimated ROS Physical Setting Classes – Summer/Winter: • Primitive: 17,278/21,370 acres • Semi Primitive Non-Motorized: 218,512/245,210 acres • Semi-Primitive Motorized: 83,497/240,387 acres • Semi-Primitive Motorized Groomed (winter only): 50,436 acres (this acreage overlaps other features) • Roaded Natural: 140,594/7,511 acres • Rural: 81,450/26,853 acres	Several components would result in inconsistencies with existing designated ROS classes including: Burntlog Route, plowing of the Burntlog Route, temporary plowing of the Johnson Creek Road and Stibnite Road, plowing of Warm Lake Road (CR 10-579), new transmission line. Acreage of Disturbance to ROS Physical Setting Classes During Operations – Summer/Winter: Primitive: 0/0 acres Semi Primitive Non-Motorized: 0/0 acres Semi-Primitive Motorized: 42/364 acres Semi-Primitive Motorized Groomed (winter only): 163 acres Roaded Natural: 685/387 acres Rural: 345/322 acres	Similar to the 2021 MMP, except there would be no inconsistencies with existing designated ROS classes related to the Burntlog Route or plowing of the Burntlog Route. Inconsistency with the existing designated ROS class for Johnson Creek and Stibnite Roads in the winter would not be temporary during construction (as in the 2021 MMP) but would continue through operations and reclamation because the roads would be plowed as part of the Johnson Creek Route. Acreage of Estimated ROS Physical Setting Classes During Operations – Summer/Winter: Primitive: 0/0 acres Semi Primitive Non-Motorized: 0/0 acres Semi-Primitive Motorized: 43/212 acres Semi-Primitive Motorized Groomed (winter only): 113 acres Roaded Natural: 387/34acres Rural: 353/536 acres
	Changes in recreation facilities (trails, campgrounds, trailheads), including the level of development and setting.	The Warm Lake area contains most of the developed recreation facilities (apart from trailheads). Scattered campgrounds and other facilities also are located in the Big Creek and Landmark areas and along Johnson Creek Road around and south of Yellow Pine. Developed recreation facilities primarily include campgrounds, cabins/lookouts, trailheads, and trails.	Same as Baseline Condition	The Stibnite Mining District Interpretive Site would be closed until after mine reclamation. Mine components would alter the setting of recreation facilities adjacent to them to a more developed setting due to increased man-made development, noise, traffic, etc. These components include the mine and facilities at the SGP, Burntlog Route, upgraded transmission lines, new transmission line to the SGP, Johnson Creek substation, cell tower on Meadow Creek Lookout Road, use of Warm Lake Road, and temporary use of the Johnson Creek Route.	Similar to the 2021 MMP, except the Burntlog Route would not be built and therefore would not affect the setting of existing recreation facilities. In addition, changes to the setting of recreation facilities along the Johnson Creek Route would be affected through reclamation and not just temporarily during construction.
	Changes in recreation use, potentially due to changes in recreation facilities, opportunities, access, and setting.	Developed recreation use is limited to the developed recreation sites (i.e., overnight facilities) located primarily in the Warm Lake, Landmark and Johnson Creek Road areas. Most recreation in the analysis area is dispersed use, which occurs outside of developed recreation sites.	Existing recreation use would continue. Some unauthorized motorized use may continue to occur off of existing roads and motorized trails. Motorized winter use has expanded in recent years, and may continue to expand in the future, resulting in additional OSV routes and additional areas receiving winter motorized use.	There would be public access through the SGP, which may result in less displacement of use to areas/facilities accessed from Thunder Mountain Road (FR 50375). In addition, there would be less likelihood for increased dispersed recreation use along the Burntlog Route as this route would only be available for public use when the route through the SGP was closed. Some recreation use may return to the SGP area after reclamation; however, due to the changes in the recreation setting, some use may be displaced to areas where the recreation setting is more natural.	Similar to the 2021 MMP. The Burntlog Route would not be built; therefore, there would be no resulting displacement or increase in recreation use from this route.

REC 7527

PRI-00001042

The maintenance of certain NFS roads is coordinated between the Forest Service and Valley County through Schedule A agreements. Typically, NFS road maintenance activities (including dust control, removal of debris from roadway and rights-of-way, road repair, and snow removal) are coordinated with the Valley County Roads and Bridge Department. Most Valley County backcountry roads are closed through the winter and melt off in the spring (Valley County 2017). Similarly, NFS roads are closed by snow in the winter and re-open once the snow melts off in the spring. Therefore, roads do not open for through-traffic until at least mid-June and often close to public use as early as October 15.

3.16.4.2 Primary Routes

There are three existing primary routes within the analysis area to access the Operations Area Boundary from Cascade or McCall: Johnson Creek, Lick Creek, and SFSR routes as shown on **Figure 3.16-1**. All of the routes require the use of Idaho SH 55.

Johnson Creek Route

During non-winter conditions (roads clear of snow), the Operations Area Boundary can be accessed from the City of Cascade by traveling northeast on Warm Lake Road for about 34 miles to Landmark, then north on Johnson Creek Road for approximately 25 miles to the village of Yellow Pine, and approximately 14 miles east on the Stibnite Road portion of McCall-Stibnite Road (Stibnite Road). The Johnson Creek Route, which only includes Johnson Creek Road and the Stibnite Road portion of McCall-Stibnite Road, is currently used to access the Operations Area Boundary during the summer.

The Johnson Creek Road is a county maintained, native surface road that is open to vehicles with seasonal restrictions due to snow. During the winter, Valley County plows approximately 10 miles of Johnson Creek Road from Yellow Pine to Wapiti Meadow Ranch and Perpetua (under agreement with Valley County) plows along Stibnite Road. Valley County grooms the remaining 17 miles of Johnson Creek Road from Wapiti Meadow Ranch to Warm Lake Road at Landmark for OSV use. Valley County does not plow Warm Lake Road from Warm Lake to Landmark. This section is a designated groomed OSV route.

The Stibnite Road portion of the route is also a county-maintained native surface road, open to all vehicles with seasonal restrictions due to snow. This road is plowed in the winter by Perpetua through an agreement with Valley County. Stibnite Road connects to Thunder Mountain Road on the southeastern portion of the Stibnite site and currently provides public access through the site.

Lick Creek Route

The SGP also can be accessed from McCall during non-winter conditions by traveling east on the Lick Creek portion of McCall-Stibnite Road (Lick Creek Road) for approximately 37 miles to the East Fork South Fork portion of McCall-Stibnite Road (East Fork Road), then approximately 16 miles to the village of Yellow Pine, and approximately 14 miles east on Stibnite Road. Lick Creek Road is not maintained during the winter; however, East Fork Road and Stibnite Road are plowed from SFSR Road to Yellow Pine by Valley County and from Yellow Pine to the Operations Area Boundary by Perpetua to access their private land inholdings in the area.

REC 7528

PRI-00001043

wastes. There would be temporary air quality effects related to the earthmoving and tailpipe emissions from the construction equipment and vehicles used to access the site. This work is planned to occur between 2022 and 2024.

If none of the action alternatives proceed, the current uses by Perpetua and other users on patented mine/mill site claims and on the PNF and BNF would continue to follow all existing applicable air quality regulations. Uses of NFS lands that may result in air pollutant emissions include mineral exploration, dispersed OHV use, snowmobiling, and other forms of recreation.

4.3.4.2 2021 MMP

Construction and Operations Description

The construction of the 2021 MMP includes building power transmission, access roads, and mining/processing facilities. These operations are to be performed during LOM 1 through LOM 3. Operations would begin in LOM 4 through LOM 18. Access road construction would consist of development of the Burntlog Route for mine access and minor improvements for the Johnson Creek route. Also, while the Burntlog Route is being developed, a temporary groomed OSV trail would be constructed on the west side of Johnson Creek from Trout Creek to Landmark for public access. Other public access construction would be a Cabin Creek Road groomed OSV trail. Eight borrow sources along the Burntlog Route would also be constructed.

During operations, public access through the site would be provided by constructing a new road around the Yellow Pine pit and below the mine haul road to link Stibnite Road to Thunder Mountain Road. Public access would also be allowed on the Burntlog Route.

Lastly, operations would include communication towers and an offsite logistics and road maintenance facilities. A cell tower would be located north of the Hangar Flats pit with very high frequency repeater sites. There would also be a communication site at the SGLF with upgrades to the existing site. The Burntlog road maintenance facility would be located approximately 4.4 miles east of the junction of Johnson Creek Road and Warm Lake Road along the proposed Burntlog Route.

Construction and Operations Air Emissions Inventory

Air pollutant emissions were initially estimated for activities and process sources included in the 2021 MMP for each LOM year. The LOM years presented in this discussion are based on years starting with LOM 1 as the first year of construction. LOM 6 is expected to produce the highest overall annual total of criteria pollutant emissions.

Air pollutant emission point sources for the construction phase would include engine-driven generators, portable conical crusher and screens, diesel-fired heaters, and engine-driven air compressors. The fugitive sources related to mine construction and operations would be haul, access, and construction road dust from vehicle travel during the pre-production years, as well as earth-moving equipment, material transfers, storage in several construction stockpiles and waste rock piles, tailpipe emissions and exploratory activities. The use of ANFO explosives also would be considered a mine construction phase source, as well as an ongoing operations phase source.

REC 7529

PRI-00001044

existing conditions. If the results from this computation are below the NAAQS, then impacts at other locations in the domain would be below the NAAQS as well.

For NAAQS modeling inputs, the highest emissions of each pollutant during any LOM year were determined and provided in **Table 4.3-6**. For the 2021 MMP, the highest criteria pollutant emissions occur during two different years, LOM 6 (CO, NO_X, and SO_2) and LOM 10 ($PM_{2.5}$ and PM_{10}). Therefore, to capture the highest modeled concentration for each pollutant, separate modeling was performed for LOM 6 and 10 (i.e., two models). Note that VOC emission maximums from LOM 3 were not modeled because there is no specific NAAQS for these emissions, however VOCs are addressed as part of the secondary $PM_{2.5}$ analysis.

Table 4.3-6 LOM Years for Pollutant-Specific Maximum Annual Emissions

Pollutant	LOM Year	SGP Total Annual Emissions (tpy)
CO	6	535.5
NO_2	6	335.2
PM_{10}	10	320.1
$PM_{2.5}$	10	69.2
SO_2	6	7.3
VOC	3	27.4
HAPs	10	8.5
Hg	10	13.3 (lb/yr)

The 2021 MMP would include a 12-foot wide gravel road to provide public access from Stibnite Road (FR 50412) to Thunder Mountain Road (FR 50375) through the SGP. Perpetua received a final PTC from IDEQ on June 17, 2022. This application proposed to exclude the public road on the basis of restricted access and maintaining full control, and that people traveling on the road would be considered "guests of the mine." IDEQ accepted the private road concept proposed by Perpetua (see PTC Condition 2.7, Response to Comments #16 and Statement of Basis on the IDEQ website) and in response to comments on February 18, 2021, also states that the roadway between Stibnite Road at Sugar Creek and Thunder Mountain Road at Meadow Creek was appropriately excluded from ambient air. Additionally, the EPA Region X has indicated that the access road could possibly be excluded from ambient air if sufficient enforceable measures are taken to comply with the 2019 revised policy (EPA 2019a). To comply with this measure, Perpetua has developed a transportation management plan and is included as Appendix D of the Air Quality Specialist Report (Forest Service 2022a).

The AERMOD dispersion modeling results for the 2021 MMP analysis emissions and comparison with the applicable NAAQS are provided in **Table 4.3-7**. The geographic location of the maximum impacts amongst the criteria pollutants and averaging periods between LOM 6 and 10 are provided in Figure 4 of the Air Quality Analysis Addendum ModPro2 (Air Sciences 2021a). The results demonstrate compliance with all NAAQS and would be considered to have a moderate impact locally and minor impact regionally. Additionally, **Table 4.3-8** provides geographic locations of the NAAQS maximums.

REC 7530

PRI-00001045

Controlled public access through the SGP during mine operations would be provided by an access road connecting McCall-Stibnite Road (CR 50-412) to Thunder Mountain Road (FR 50375) through the mine area. Similar to this same feature described under the 2021 MMP, this public access road would be constructed during the first year of mine operation and public access to this road would be carefully controlled; fences would prohibit public visitors on this road from having access to the SGP mining or support activities.

Construction

The Burntlog Route would not be constructed. Using the Johnson Creek Route for mine access would avoid disturbance-related air quality impacts from construction of approximately 20 miles of new road for the Burntlog Route. This would have the effect of decreasing overall roadway construction phase vehicle tailpipe and airborne dust emissions. The topographic features of the route (e.g., a portion of the route is along a river through a canyon) do not affect the nature of the air emissions during construction. However, the location of air pollutant concentrations may differ because construction activities would take place along a different ROW compared to other action alternatives.

No road widening or straightening of curves would be required for the Johnson Creek Road (CR 10-413) portion of the alternative. The Stibnite Road (CR 50-412) portion would be improved by widening curves to accommodate 55-foot semi-truck trailers. Approximately one mile of road past the village of Yellow Pine would be paved. Based on relative roadway length affected, these changes in roadway construction to improve the Johnson Creek Route would represent a decrease of overall construction phase emissions. However, the magnitude of the emissions difference would be small compared to total construction emissions during the first three LOM years. Also, the construction phase emissions for these upgrades to the Johnson Creek Route would be less than the emissions for construction of approximately 20 miles of new road to develop the Burntlog Route under other action alternatives.

This alternative would require an extra 2 years (3 vs 5) for construction of the upgrades to the Johnson Creek Route and the SGP. As a result, operations would start in LOM 6 instead of LOM 4 and the highest impact years for emissions would be LOM 8 and 12 (as compared to LOM 6 and 10 for the 2021 MMP).

Operations

The Johnson Creek Route would be used to access the SGP. The length of this route is approximately 1.5 miles shorter than the Burntlog Route, so that the overall tailpipe emissions for vehicles accessing the SGP would be slightly less for this alternative. The location of ambient air pollutant concentrations due to vehicle traffic would differ, with such effects being located along the Johnson Creek Route.

Providing public access through the SGP reduces the miles of new motorized trails open to all vehicles in the Meadow Creek IRA, and this is expected to reduce net air quality effects due to vehicles traversing the SGP area.

Several air pollution design features proposed by Perpetua are common to both action alternatives and are described in **Section 2.4.9**. Emission control devices and designs would be put in place to abate emissions of particulate matter, Hg, and criteria pollutant emissions from internal-combustion engines the same as

REC 7531

PRI-00001046

Access and Transportation

Access to and through the Operations Area Boundary would be maintained during construction, operation, and closure and reclamation. There would be public access through the Operations Area Boundary during construction and operations via a new gravel road constructed to connect Stibnite Road to Thunder Mountain Road. Climatic changes causing an increase in severe events, such as floods, landslides, and avalanches, can add stress to roadways and other infrastructure, which may result in more frequent maintenance and repairs.

Heritage Resources and Tribal Rights and Interests

The 2021 MMP could impact historic properties, due to ground and visual disturbance in the SGP area. Changing climatic conditions are expected to exacerbate the damage and loss of heritage resources and natural areas utilized by tribes for activities such as hunting, fishing, and gathering in the SGP area through increased soil erosion, more frequent and intense wildfires, flooding, degraded water quality, and wildlife and fish habitat impacts.

Public Health and Safety

Climate change impacts to public health and safety would be experienced through impacts to air, soil, and water quality. The 2021 MMP has the potential to impact public health and safety through the transportation and use of fuels and chemicals, natural environmental hazards, economic impacts, changes to public services and infrastructure, and impacts to the local population.

Climate change could exacerbate some impacts to public health and safety by affecting the way potential hazardous material spills enter the environment. It also could increase the frequency and amplify the impacts of natural hazards such as avalanches and landslides, flash floods, and wildfires (Halofsky et al. 2018). More extreme heat days and higher temperatures over time could increase air quality and health risks over both the short and long term, impacting the public and the employees' abilities to work (Runkle et al. 2017).

Recreation

Much of the SGP area is used for recreation year-round, which would be both directly and indirectly impacted by climate change. The 2021 MMP has the potential to impact recreational access, recreation facilities, dispersed recreation areas, special use permits, recreational motorized travel, and recreation use. Direct impacts from climate change would include variable precipitation and rising temperatures, which could affect individual decisions to recreate in a certain area. Indirect impacts from climate change would be experienced through the changing conditions that may alter the recreation facilities, opportunities, and setting.

Changing climatic conditions could alter the ecological conditions that affect the quality of the recreation experience, including warmer water temperatures, decreased streamflow, and habitat loss and fragmentation. In the Rocky Mountain region, it is expected that snow-based activities (skiing, snowmobiling) would be impacted negatively by climate change due to warmer winters (Halofsky et al. 2018). Primitive area use, horseback riding on trails, motorized water activities, birding, hunting, and fishing in the region also are expected to be negatively influenced by climate change; however, longer

REC 7532

PRI-00001047

Public Access

Road closure impacts on the Johnson Creek route would be the same as those described under the 2021 MMP, except impacts to recreation access, use, and opportunities along Thunder Mountain Road would begin during construction and continue until the public access road through the Operations Area Boundary was complete and open to public use to provide access to the Thunder Mountain area. Construction under the Johnson Creek Route Alternative is expected to take 2 years longer than the 2021 MMP.

The impacts to public access through the Operations Area Boundary would be the same as under the 2021 MMP. The public access road would provide access to recreation sites/areas via Thunder Mountain Road; therefore, the access road would allow continuous access to the Thunder Mountain Road sites/areas. However, as described under the 2021 MMP, there would be temporary closures of this route during some mining activities that would result in minor, short term, and localized impacts to recreation.

Landmark Maintenance Facility

The Landmark Maintenance Facility would be located approximately 0.1 mile south of Landmark and the historic cabins located there. Access to the maintenance facility would be off Warm Lake Road. There would be no delays or additional traffic along Warm Lake Road in this area since the Burntlog Route would not be constructed, but rather from all construction-related traffic using Warm Lake Road to Johnson Creek Road. It is assumed that construction equipment would travel east on Warm Lake Road; therefore, delays would likely affect access to Horn Creek Road, Rec Spur 579U2, 450 South, and Burnt Log Road, which are east of the maintenance facility site. This impact is anticipated to be moderate, short term, and localized.

Noise associated with construction activities could reduce opportunities for noise-sensitive recreation activities at and around the maintenance facility location (up to 1.1 miles away) (AECOM 2019c), including wildlife-related recreation activities, because wildlife may be displaced. Construction activities would not affect use of the historic cabins; however, construction noise at the site may affect the recreation setting of the cabins, because it may be audible from the cabin sites. Some recreationists may choose to visit other areas or sites to avoid delays or noise from construction activities. Any reduction in recreation opportunities, displacement of dispersed recreational use, or changes in access would be temporary until maintenance facility construction was completed. These impacts would be minor, short term, and localized.

Development of the Landmark Maintenance Facility would reduce recreation opportunities due to physical removal of acreage for the facility (3.5 acres). Traffic due to maintenance activities and vehicles would not be expected to result in frequent traffic delays on Warm Lake Road but may result in occasional delays due to road plowing, grading, repairs, etc., and would occur as operational impacts because the facility site would be accessed via the Johnson Creek Route. Traffic and other operational noise from the maintenance facility would generally not be audible from the facility; however, road maintenance activities would result in noise levels above background ambient noise levels of 40 dBA for up to 0.8 to 1 mile from the road (AECOM 2019c). This would likely reduce opportunities for some recreational activities in this area, particularly wildlife-related recreation activities, because wildlife may be displaced from the general maintenance facility area. Operation activity noise from the maintenance

REC 7535

PRI-00001049

in slower travel times for non-mine-related traffic and may deter other travelers from using these roadways. Travelers may use alternative roadways including McCall-Stibnite Road to South Fork Salmon River Road.

During operations, mine-related traffic would include transport of employees to and from the SGP, delivery of supplies, and activities associated with road maintenance such as snowplowing and sanding. Under the 2021 MMP and the Johnson Creek Route Alternative, operational AADT would be 50 vehicles (33 heavy vehicles and 17 light vehicles), resulting in approximately four mine-related vehicles per hour traveling outside the SGP.

The upgraded Burnt Log Road and the newly constructed Burntlog Route would experience an increase in traffic of over 71 percent under the 2021 MMP, with 27.5 percent of the traffic comprised of heavy vehicles. Under the Johnson Creek Route Alternative, traffic on Johnson Creek Road and Stibnite Road would increase approximately 71 percent as well, also with 27.5 percent of the traffic comprised of heavy vehicles. Although heavy vehicles currently use Johnson Creek Route to access the SGP, the Johnson Creek Route Alternative traffic would result in a noticeable change in baseline driver experience and slower drive times due to the substantial increase in mine-related heavy vehicles along the Johnson Creek Route during the life of the SGP. Even though upgrades to Johnson Creek Road and Stibnite Road would be made, these roads would still have many curves and slopes.

During closure and reclamation, activities including slope recontouring, facility removal, seeding and planting, and post-closure environmental monitoring would require approximately 7 years. Closure and reclamation would generate a total estimated AADT of 27 vehicles (15 heavy vehicles and 12 light vehicles). Post-closure monitoring activities would generate a total estimated AADT of six light vehicles.

Local roads experience a seasonal effect which results in noticeable differences in traffic. Valley County has many summer recreational areas that attract visitors from May through October with peak AADT levels in June, July, and August. Mine access via the Johnson Creek Route would be more impactful on summer recreational traffic because it would utilize established roads rather than new road development. Winter driving conditions influence the amount of traffic and result in lower AADT levels during the winter months. Therefore, the effect of SGP traffic on these roads would show a noticeably greater increase in mine-related winter traffic during winter. Post-closure winter traffic would not be as noticeable as heavy vehicle deliveries would not occur and approximately six mine-related light vehicles per day would utilize the accessible roadways in the analysis area for monitoring and maintenance purposes.

Public Access

Under the 2021 MMP, public access to the SGP area would be enhanced by the development of a new access road (Burntlog Route) compliant with current road standards. Under both action alternatives, there would also be a controlled public access route through the SGP during the operations, and closure and reclamation phases; however, public access would be intermittently interrupted during the construction phase. Under the Johnson Creek Route Alternative, the Burntlog Route would not be constructed, and the Johnson Creek Route would be used for both public and SGP-related access. To continue providing OSV access to Landmark, a groomed OSV route between Warm Lake and Trout Creek Campground on Cabin Creek Road would be established as part of the 2021 MMP to connect to Landmark from Trout Creek

REC 7536 PRI-00001050

alternatives. Because **Table 2.2-1** describes primary differences, not all the components listed above are included in the table.

Table 2.2-1 Action Alternatives Summary

SGP Phase	Component/ Subcomponent	2021 MMP	Johnson Creek Route Alternative
All Phases	SGP timeline	• Construction: Approximately 3 years. • Operations: Approximately 15 years. • Exploration: Approximately 17 years (during construction and operations). • Reclamation: Approximately 5 years (except for the TSF which would require an additional 9 years for tailings dewatering and consolidation). • Closure/Post-Closure Water Treatment: Approximately through Mine Year 40. • Environmental Monitoring: As long as needed.	Same as 2021 MMP except: • Construction: Approximately 5 years (upgrading the existing Johnson Creek and Stibnite Roads to provide permanent mine access).
All Phases	Access Roads	Construction/Operations: • Warm lake road from State Highway (SH) 55 to Johnson Creek Route intersection (34 miles). • Johnson Creek Route for SGP access during early construction with minor improvements within the road prism. • Burntlog Route (38 miles) for SGP access during last year of construction, mining and ore processing operations, and closure and reclamation. Includes improvements of existing segments (23 miles) and road construction for new segments (15 miles). • Up to eight borrow areas developed along Burntlog Route for materials needed for road improvements and maintenance. • Access route around the Yellow Pine pit for public access. Closure and Reclamation: • New sections of Burntlog Route to be reclaimed after the closure and reclamation period.	• Warm lake road from SH 55 to Johnson Creek Route intersection (34 miles). • Johnson Creek Route (39 miles: Johnson Creek Road 25 miles, Stibnite Road 14 miles) upgraded and used for access throughout life of mine (LOM) instead of the Burntlog Route. • Access route around the Yellow Pine pit for public access, employee access, and deliveries of supplies and equipment to the processing, warehouse, worker housing facility, and administration areas. • No improvements or construction of new segments for Burntlog Route. • Up to seven borrow sources developed along the Johnson Creek Route for materials needed for road improvements and maintenance. Closure and Reclamation: • Improved Johnson Creek and Stibnite roads would not be reclaimed to pre-existing conditions.

REC 7537

PRI-00001051

SGP Phase	Component/ Subcomponent	2021 MMP	Johnson Creek Route Alternative
All Phases	Public Access	Construction: • Temporary groomed over-snow vehicle (OSV) route on the west side of Johnson Creek from Trout Creek to Landmark while Burntlog Route is constructed (8 miles). • OSV route on Johnson Creek Road from Wapiti Meadows to Trout Creek Campground closed during construction (9 miles). • OSV route from Warm Lake to Landmark closed during construction through reclamation and closure (8.5 miles). • Cabin Creek Road groomed OSV route (11 miles). • Public roads remain open through the Operations Area Boundary with temporary closures as needed to accommodate construction. Operations: • Groomed OSV route moves from west side of Johnson Creek Road to Johnson Creek Road from Landmark to Wapiti Meadows (16.7 miles). • Stibnite Road (County Road [CR] 50-412) / Thunder Mountain Road (FR 50375) closed through the Operations Area Boundary. • Seasonal public access through the Operations Area Boundary provided by constructing new road through Yellow Pine pit and below mine haul road to link Stibnite Road (FR 50412) to Thunder Mountain Road (FR 50375). • Public access allowed on Burntlog Route to Thunder Mountain Road (FR 50375). Closure and Reclamation: • New road constructed over the Yellow Pine Backfill (backfilled Yellow Pine pit) connecting Stibnite Road (FR 50412) to Thunder Mountain Road (FR 50375).	Construction and Operations: Same as 2021 MMP except: • OSV route on the west side of Johnson Creek from Wapiti Meadows to Trout Creek Campground would be closed from construction through mine closure (9 miles). • Groomed OSV route on the west side of Johnson Creek from Trout Creek to Landmark lasting from construction through mine closure. Closure and Reclamation: Same as 2021 MMP.

REC 7538

PRI-00001052

OSV route would minimize the interactions between SGP traffic and recreational traffic in the winter. The proposed OSV route is illustrated in **Figure 2.4-4**.

- Expanded wintertime public vehicle access on Warm Lake Road east of Warm Lake Lodge would commingle SGP and public travel.

Changes to the SH 55 and Warm Lake Road intersection would improve access for large trucks carrying equipment and supplies to the SGP and would facilitate turns from SH 55 onto Warm Lake Road and from Warm Lake Road back onto SH 55. Any changes proposed to the intersection would need to be approved and implemented by the Idaho Transportation Department (ITD). Recommended changes to the intersection include: the addition of left and right turning lanes (Parametrix 2018a); an intersection modification to accommodate larger trucks; potential relocation of two power poles (HDR Engineering, Inc. [HDR] 2017a); and a modification to the westbound approach at Warm Lake Road to improve the view of traffic coming from the north.

Johnson Creek Route

During the initial construction period of the Burntlog Route (approximately 2 to 3 years), mine-related traffic would access the SGP from SH 55, north of the city of Cascade, via Warm Lake Road for approximately 34 miles, then north on Johnson Creek Road (CR 10-413) for approximately 25 miles to the village of Yellow Pine, and from Yellow Pine east approximately 14 miles to the SGP via the Stibnite Road (CR 50-412). The portion of the route that includes Johnson Creek Road and Stibnite Road is known as the Johnson Creek Route. This route is primarily situated topographically adjacent to the valley bottom, paralleling Johnson Creek and then the East Fork SFSR.

Johnson Creek Road is a county-maintained, native-surface road that is open to vehicles with seasonal restrictions due to snow. During the winter, Valley County plows approximately 10 miles of Johnson Creek Road from Yellow Pine south to Wapiti Meadow Ranch and grooms the remaining 17 miles of Johnson Creek Road from Wapiti Meadow Ranch to Warm Lake Road at Landmark for OSV use. Valley County does not plow Warm Lake Road from Warm Lake to Landmark; this section is a designated groomed OSV route.

The Stibnite Road portion of the route is also a county-maintained native surface road, open to all vehicles with seasonal restrictions due to snow. This road is plowed in the winter by Perpetua through an agreement with Valley County. Stibnite Road connects to Thunder Mountain Road on the southeastern portion of the Stibnite site and currently provides seasonal (non-winter) public access through the site.

Minor surface improvements (such as ditch and culvert repair, adding gravel, winter snow removal, resurfacing if required, and summer dust suppression) would occur on the Johnson Creek Route under the 2021 MMP to reduce sediment runoff and dust generation. However, there would be no road alignment modification or widening of these existing roads along the Johnson Creek Route. The road varies in elevation from approximately 4,750 to 6,700 feet amsl with an average grade of 1.5 to 2 percent with occasional local segments with grade up to approximately 8 percent.

REC 7539

PRI-00001053

2.4.4.4 Public Access

During construction of the SGP and completion of the Burntlog Route, to the degree practicable, the public would continue to have access on forest roads currently available to the public (**Figure 2.4-1**). However, public access through the Operations Area Boundary on Stibnite Road would be restricted for a period of approximately one year while a new through-site public access road is constructed. A new 4-mile long, 12-foot-wide gravel road would be constructed to provide public access from Stibnite Road (FR 50412) to Thunder Mountain Road through the SGP (**Figure 2.4-2**). The road would be constructed on a widened bench on the west side within the Yellow Pine pit, then head south of the Yellow Pine pit, where this road would utilize an underpass to cross under a SGP haul road and continue southward, parallel to and on the east side of the mine haul road on a partially revegetated portion of a former haul road (**Figure 2.4-2**). Southwest of the ore processing area, the public access road would connect with Thunder Mountain Road and continue toward the worker housing facility, exiting the SGP to the southeast.

During operations, the public access road through the Operations Area Boundary would provide seasonal use, open to all vehicles; access would not be provided in winter when impassable (current county maintenance standards) and signs would inform the public of seasonal and temporary closures. Public vehicles passing through would be required to check-in with mine personnel at the North or South SGP entry points and would receive a safety briefing and would also be required to check-out with SGP personnel upon exiting the SGP. For safety purposes, public access would be separated from other SGP roads by berms, security fencing, and the underpass to allow the public road to pass beneath the mine haul road. No stopping or deviating from the public access road would be allowed. Perpetua could restrict access to any vehicles due to concerns related to public or employee health and safety, such as during road construction and maintenance, blasting, highwall scaling, mining in the immediate area of the road, and similar operations.

Public access along Johnson Creek Road during the life of the SGP would be unchanged; however, closures spanning from a half-day to multiple days could occur due to construction activities. Total closures of half-day to multiple days could occur during construction work on Stibnite Road between the village of Yellow Pine and the SGP, part of Thunder Mountain Road, and Burnt Log Road.

Public access on existing segments of the Burnt Log Road would be restricted for limited periods of time to upgrade road segments during construction of the Burntlog Route. Other routes available for public use are shown on **Figure 2.4-1**.

Public access by foot via existing trails or on roads would be restricted within the Operations Area Boundary shown on **Figure 2.4-2**. Security personnel, fencing (including wildlife exclusion fencing), and signs would restrict public access to vehicular traffic on the designated public access roadway inside the Operations Area Boundary.

REC 7540

PRI-00001054

Description	Resources Affected
Perpetua would submit an annual report to the USFS and the other federal and state agencies that are responsible for issuing authorizations applicable to reclamation for the preceding calendar year. The annual report would contain descriptions of the reclamation activities completed during the previous year, a summary of areas reclaimed, a discussion of the results of the reclamation monitoring conducted, and corrective actions implemented.	Soils, Reclamation
A new 12-foot-wide gravel road would be constructed to provide public access from Stibnite Road (FR 50412) to Thunder Mountain Road (FR 50375) through the SGP. During operations, the public access road would be used to travel through the SGP and would provide seasonal use, open to all vehicles. Vehicles passing through the SGP would be required to check-in with mine personnel at the North or South SGP entry points.	Transportation and Access, Health and Safety
Post reclamation, a road would be established over the backfilled Yellow Pine pit to allow public access through the reclaimed site and connect Stibnite Road (FR 50412) to Thunder Mountain Road (FR 50375). This would replace the operational phase public access route.	Transportation and Access
Prior to site preparation and construction of surface facilities, vegetation would be removed from operating areas. Trees and deadwood, shrubs, and slash not needed to construct windrows at the edge of Burntlog Route disturbance (to function as sediment barriers), would be chipped, and suitable soil would be separately salvaged and stockpiled (except for a small portion that would be 'live handled') for use as part of site reclamation and restoration. Portions of the salvaged soil would be blended with the chipped wood to create growth media. All growth media placed in stockpiles would be stabilized, seeded, and mulched to protect the stockpiles from wind and water erosion.	Vegetation
Perpetua would inspect and remove vegetation material (including noxious weeds) from mechanical equipment and properly dispose to minimize the spread of unwanted vegetation.	Vegetation
Wood wastes and wood mulch are the two primary sources of compost. Food waste produced from on-site meal preparation and wastes may provide another source. Combined and properly managed during composting, these materials would provide a source of organic matter to be blended into substrate materials suitable for mitigation.	Vegetation
Perpetua would be responsible for noxious weed control within areas disturbed by SGP activities.	Vegetation, Wildlife
Develop and employ planting plans for wildlife benefits (cover, forage, etc.) using approved seed mixes.	Vegetation, Wildlife
Perpetua would use aquatic safe herbicides during vegetation management activities and noxious weed control. Adhere to chemical label restrictions, Federal and State rules on usage. Use proper equipment for chemical application by trained personnel.	Vegetation, Fish
Perpetua or its designated contractor(s) would perform long-term maintenance as necessary, including maintaining and monitoring the Mitigation Area (including stream and wetlands) in perpetuity once the final performance standards are met or until such responsibility is relinquished to an appropriate third party (Forest Service, etc.) as approved by the USACE.	Vegetation, Wetlands
Perpetua would plant stream reclamation reaches and wetland reclamation areas with native plant species that are present in PAB, PEM, PSS, and palustrine forested wetlands and riparian areas along streams throughout the Mitigation Area.	Vegetation, Wetlands
To address stream temperature, riparian planting widths along restored and enhanced stream reaches would be 18 feet wide on each stream bank where possible. Taller and denser vegetation such as spruce trees would be planted. Further, the creation of the lined Stibnite Lake, a feature similar in size to the present Yellow Pine pit lake, would replace the function of the existing Yellow Pine pit lake in buffering stream temperature extremes and reduce maximum stream temperatures in East Fork SFSR in and downstream of the SGP.	Vegetation, Wetlands, Surface Water, Reclamation

Issue	Indicator	Baseline Conditions	No Action Alternative	2021 MMP	Johnson Creek Route Alternative
Land Use and Land Management					
The SGP would cause changes in land use or land management.	Acres of land used for SGP components by land management agency.	(Analysis area) Private: 925 acres State: 77 acres BNF: 1,027 acres PNF: 2,373 acres BOR: 25 acres	Same as Baseline Condition.	Private: 819 acres State: 62 acres BNF: 933 acres PNF: 1,439 acres BOR: 12.5 acres	Private: 828 acres State: 62 acres BNF: 820 acres PNF: 1,372 acres BOR: 12.5 acres
	Acres of total and new land disturbance within SGP area.	Existing disturbance acreage within analysis area: 1,554 acres (includes historic mine disturbance, existing roads and utilities)	Same as Baseline Condition.	Disturbance acreage impacts: 3,266 total acres 51% (1,674 acres) of total is new disturbance	Disturbance acreage impacts: 3,095 total acres 50% (1,544 acres) of total is new disturbance
The SGP could cause changes in or create new ROWs or easements.	Miles or acres of new or changed ROWs or easements, regardless of jurisdiction.	Total existing ROW (transmission lines and roads): 666 acres	Same as Baseline Condition.	Total new ROW (transmission lines and roads): 763 acres	Total new ROW (transmission lines and roads): 639 acres
Access and Transportation					
The SGP may affect access to public lands during mine construction, operations, and closure and reclamation.	Number, location, and description of changes in access due to new and improved roadways.	See **Table 3.16-1** and **Figure 3.16-1**.	Same as Baseline Condition.	Burntlog Route (plowed). Mine site public access during operations (not plowed). Loss of winter groomed OSV route on Warm Lake Road to Landmark. Loss of winter groomed OSV route on Johnson Creek Road from Wapiti Meadows to Trout Creek Campground during construction of Burntlog Route.	No Burntlog Route, only Johnson Creek Route (plowed). Mine site public access during operations (not plowed). Loss of winter groomed OSV route on Warm Lake Road to Landmark. Loss of winter groomed OSV route on Johnson Creek Road from Wapiti Meadows to Trout Creek Campground for life of SGP.
The SGP may change the miles of roads and trails, the amount of use, and types of vehicles on each road or trail.	Miles of new road for public use.	Forest Service = 1,557 miles Valley County = 278 miles State = 131 miles	Same as Baseline Condition.	Forest Service = no change Valley County = 2.2 miles State = no change Private = 15 miles (with an additional 4 miles through the SGP)	Forest Service = no change Valley County = 2.2 miles State = no change Private = 4 miles through the SGP
	Change in amount of use.	See **Table 3.16-2** for existing roads.	Same as Baseline Condition.	Johnson Creek Route = 5 mine-related vehicles/hr. during construction Burntlog Route = 4 mine- related vehicles/hr. during operations; 2 mine-related vehicles/hr. closure and operations	Johnson Creek Route = 5 mine-related vehicles/hr. during construction; 4 mine- related vehicles/hr. during operations; 2 mine-related vehicles/hr. closure and reclamation
	Changes in frequency of rail, air, and water transportation.	Rail – no active lines Air – 7 public use airports Water – Port of Lewiston	Same as Baseline Condition.	Rail - No impact. Air – Helicopter usage for when roads are inaccessible. Water – potentially 1 roundtrip (2 truck trips) daily of antimony concentrate that could be shipped out via the Port of Lewiston.	Rail - No impact. Air – Helicopter usage for when roads are inaccessible. Helicopter usage during construction to install repeaters. Water – potentially 1 roundtrip (2 truck trips) daily of antimony concentrate that could be shipped out via the Port of Lewiston.

REC 7542

PRI-00001056

Issue	Indicator	Baseline Conditions	No Action Alternative	2021 MMP	Johnson Creek Route Alternative
	Changes in recreation physical setting characteristics and related ROS class (by season) measured in acres.	Designated ROS classes in the analysis area vary by season, and include Rural, Roaded Natural, Roaded Modified, Semi-Primitive Motorized, Semi-Primitive Non-Motorized, and Primitive. Estimated existing ROS physical settings are similar.	Generally, existing designated ROS classes and physical recreation setting characteristics would remain as is. Modifications to the recreation setting in the SGP area continued low level of unauthorized motorized use, and increased winter motorized access and use could lead to changes in the designated ROS class and/or ROS physical setting of some areas due to additional motorized use both in the summer and winter. Acreage of Estimated ROS Physical Setting Classes – Summer/Winter: • Primitive: 17,278/21,370 acres • Semi Primitive Non-Motorized: 218,512/245,210 acres • Semi-Primitive Motorized: 83,497/240,387 acres • Semi-Primitive Motorized Groomed (winter only): 50,436 acres (this acreage overlaps other features) • Roaded Natural: 140,594/7,511 acres • Rural: 81,450/26,853 acres	Several components would result in inconsistencies with existing designated ROS classes including: Burntlog Route, plowing of the Burntlog Route, temporary plowing of the Johnson Creek Road and Stibnite Road, plowing of Warm Lake Road (CR 10-579), new transmission line. Acreage of Disturbance to ROS Physical Setting Classes During Operations – Summer/Winter: Primitive: 0/0 acres Semi Primitive Non-Motorized: 0/0 acres Semi-Primitive Motorized: 42/364 acres Semi-Primitive Motorized Groomed (winter only): 163 acres Roaded Natural: 685/387 acres Rural: 345/322 acres	Similar to the 2021 MMP, except there would be no inconsistencies with existing designated ROS classes related to the Burntlog Route or plowing of the Burntlog Route. Inconsistency with the existing designated ROS class for Johnson Creek and Stibnite Roads in the winter would not be temporary during construction (as in the 2021 MMP) but would continue through operations and reclamation because the roads would be plowed as part of the Johnson Creek Route. Acreage of Estimated ROS Physical Setting Classes During Operations – Summer/Winter: Primitive: 0/0 acres Semi Primitive Non-Motorized: 0/0 acres Semi-Primitive Motorized: 43/212 acres Semi-Primitive Motorized Groomed (winter only): 113 acres Roaded Natural: 387/34acres Rural: 353/536 acres
	Changes in recreation facilities (trails, campgrounds, trailheads), including the level of development and setting.	The Warm Lake area contains most of the developed recreation facilities (apart from trailheads). Scattered campgrounds and other facilities also are located in the Big Creek and Landmark areas and along Johnson Creek Road around and south of Yellow Pine. Developed recreation facilities primarily include campgrounds, cabins/lookouts, trailheads, and trails.	Same as Baseline Condition	The Stibnite Mining District Interpretive Site would be closed until after mine reclamation. Mine components would alter the setting of recreation facilities adjacent to them to a more developed setting due to increased man-made development, noise, traffic, etc. These components include the mine and facilities within the Operations Area Boundary, Burntlog Route, upgraded transmission lines, new transmission line to the Operations Area, Johnson Creek substation, a small VHF repeater on Meadow Creek Lookout, use of Warm Lake Road, and temporary use of the Johnson Creek Route.	Similar to the 2021 MMP, except the Burntlog Route would not be built and therefore would not affect the setting of existing recreation facilities. In addition, changes to the setting of recreation facilities along the Johnson Creek Route would be affected through reclamation and not just temporarily during construction.
	Changes in recreation use, potentially due to changes in recreation facilities, opportunities, access, and setting.	Developed recreation use is limited to the developed recreation sites (i.e., overnight facilities) located primarily in the Warm Lake, Landmark and Johnson Creek Road areas. Most recreation in the analysis area is dispersed use, which occurs outside of developed recreation sites.	Existing recreation use would continue. Some unauthorized motorized use may continue to occur off of existing roads and motorized trails. Motorized winter use has expanded in recent years, and may continue to expand in the future, resulting in additional OSV routes and additional areas receiving winter motorized use.	There would be public access through the Operations Area Boundary, which may result in less displacement of use to areas/facilities accessed from Thunder Mountain Road (FR 50375). In addition, there could be increased dispersed recreation use along the Burntlog Route . Some recreation use may return to the Operations Area Boundary after reclamation; however, due to the changes in the recreation setting, some use may be displaced to areas where the recreation setting is more natural.	Similar to the 2021 MMP. The Burntlog Route would not be built; therefore, there would be no resulting displacement or increase in recreation use from this route.

REC 7543

PRI-00001057

Johnson Creek Road

During non-winter conditions (roads clear of snow), the Operations Area Boundary can be accessed from the City of Cascade by traveling northeast on Warm Lake Road for about 34 miles to Landmark, then north on Johnson Creek Road for approximately 25 miles to the village of Yellow Pine, and approximately 14 miles east on the Stibnite Road portion of McCall-Stibnite Road (Stibnite Road). Johnson Creek Road and the Stibnite Road portion of McCall-Stibnite Road is currently used to access the Operations Area Boundary during the summer.

The Johnson Creek Road is a county maintained, native surface road that is open to vehicles with seasonal restrictions due to snow. During the winter, Valley County plows approximately 10 miles of Johnson Creek Road from Yellow Pine to Wapiti Meadow Ranch and Perpetua (under agreement with Valley County) plows along Stibnite Road. Valley County grooms the remaining 17 miles of Johnson Creek Road from Wapiti Meadow Ranch to Warm Lake Road at Landmark for OSV use. Valley County does not plow Warm Lake Road from Warm Lake to Landmark. This section is a designated groomed OSV route.

McCall-Stibnite Road

The Stibnite Road from the intersection with Johnson Creek Road then east to the mine is also a county-maintained native surface road, open to all vehicles with seasonal restrictions due to snow. This road is plowed in the winter by Perpetua through an agreement with Valley County. Stibnite Road connects to Thunder Mountain Road on the southeastern portion of the Stibnite mine site and currently provides public access through the mine area.

The analysis area can be accessed from McCall during non-winter conditions by traveling east on the Lick Creek Road portion of McCall-Stibnite Road for approximately 37 miles to the East Fork Road portion of McCall-Stibnite Road, then approximately 16 miles to the village of Yellow Pine, and approximately 14 miles east on Stibnite Road. Lick Creek Road is not maintained during the winter; however, East Fork Road and Stibnite Road are plowed from the intersection with SFSR Road to Yellow Pine by Valley County and from Yellow Pine to the Operations Area Boundary by Perpetua to access their private land inholdings in the area. Although the Lick Creek and East Fork roads are not proposed to be used by the SGP, they provide access for other users of the analysis area.

South Fork Salmon River Road

The SFSR Road can be accessed year-round from Cascade by traveling approximately 24 miles northeast on Warm Lake Road to the intersection with SFSR Road. It then travels north for approximately 30 miles to intersect with the East Fork Road portion of the McCall-Stibnite Road. Some segments along SFSR Road have sharp curves which can be challenging for heavy vehicle travel. Although this route currently provides the only access to the Operations Area Boundary during winter months, it is not proposed to be used by the SGP.

3.16.4.3 Existing Stream Crossings

Existing stream crossings along the existing Johnson Creek, Stibnite, and Burnt Log roads are shown on **Figure 3.13-7**. There are 213 existing stream crossings along existing main access roads in the analysis

REC 7544 PRI-00001058

If none of the action alternatives proceed, the current uses by Perpetua and other users on patented mine/mill site claims and on NFS lands would continue to follow all existing applicable air quality regulations. Uses of NFS lands that may result in air pollutant emissions include mineral exploration, dispersed OHV use, snowmobiling, and other forms of recreation.

4.3.4.2 2021 MMP

Construction and Operations Description

The construction of the 2021 MMP includes building power transmission, access roads, and mining/processing facilities. These operations are to be performed during LOM 1 through LOM 3. Operations would begin in LOM 4 through LOM 18. Access road construction would consist of development of the Burntlog Route for mine access and minor improvements for the Johnson Creek route. Also, while the Burntlog Route is being developed, a temporary groomed OSV trail would be constructed on the west side of Johnson Creek from Trout Creek to Landmark for public access. Other public access construction would be a Cabin Creek Road groomed OSV trail. Eight borrow sources along the Burntlog Route would also be constructed.

During operations, restricted public access through the site would be provided by constructing a new road around the Yellow Pine pit and below the mine haul road to link Stibnite Road to Thunder Mountain Road.

Lastly, operations would include communication towers and an offsite logistics and road maintenance facilities. A cell tower would be located north of the Hangar Flats pit with very high frequency repeater sites. There would also be a communication site at the SGLF with upgrades to the existing site. The Burntlog road maintenance facility would be located approximately 4.4 miles east of the junction of Johnson Creek Road and Warm Lake Road along the proposed Burntlog Route.

Construction and Operations Air Emissions Inventory

Air pollutant emissions were initially estimated for activities and process sources included in the 2021 MMP for each LOM year. The LOM years presented in this discussion are based on years starting with LOM 1 as the first year of construction. LOM 6 is expected to produce the highest overall annual total of criteria pollutant emissions.

Air pollutant emission point sources for the construction phase would include engine-driven generators, portable conical crusher and screens, diesel-fired heaters, and engine-driven air compressors. The fugitive sources related to mine construction and operations would be haul, access, and construction road dust from vehicle travel during the pre-production years, as well as earth-moving equipment, material transfers, storage in several construction stockpiles and development rock piles, tailpipe emissions and exploratory activities. The use of ANFO explosives also would be considered a mine construction phase source, as well as an ongoing operations phase source.

REC 7545

PRI-00001059

emissions. These process exhaust control technologies are accounted for in the maximum emissions estimates in **Table 4.3-5**:

- Activated carbon regeneration kiln – wet scrubber and activated carbon filter;
- Retort – activated carbon canisters and filter pack; and
- Induction furnaces – baghouse filter and activated carbon filter pack.

Near-Field Analysis NAAQS

Assessment of conformance to the NAAQS is based on the highest receptor concentration in the modeling domain for the pollutants and averaging times corresponding to the standards. The modeled maximum concentration at each receptor is added to the selected background concentrations that represent current existing conditions. If the results from this computation are below the NAAQS, then impacts at other locations in the domain would be below the NAAQS as well.

For NAAQS modeling inputs, the highest emissions of each pollutant during any LOM year were determined and provided in **Table 4.3-6**. For the 2021 MMP, the highest criteria pollutant emissions occur during two different years, LOM 6 (CO, NO_X, and SO_2) and LOM 10 ($PM_{2.5}$ and PM_{10}). Therefore, to capture the highest modeled concentration for each pollutant, separate modeling was performed for LOM 6 and 10 (i.e., two models). Note that VOC emission maximums from LOM 3 were not modeled because there is no specific NAAQS for these emissions, however VOCs are addressed as part of the secondary $PM_{2.5}$ analysis.

Table 4.3-6 LOM Years for Pollutant-Specific Maximum Annual Emissions

Pollutant	LOM Year	SGP Total Annual Emissions (tpy)
CO	6	535.5
NO_2	6	335.2
PM_{10}	10	320.1
$PM_{2.5}$	10	69.2
SO_2	6	7.3
VOC	3	27.4
HAPs	10	8.5
Hg	10	13.3 (lb/yr)

The 2021 MMP would include a 12-foot-wide gravel road to provide public access from Stibnite Road (FR 50412) to Thunder Mountain Road (FR 50375) through the SGP. Perpetua received a final PTC from IDEQ on June 17, 2022. This application proposed to exclude the public road on the basis of restricted access and maintaining full control, and that people traveling on the road would be considered "guests of the mine." IDEQ accepted the private road concept proposed by Perpetua (see PTC Condition 2.7, Response to Comments #16 and Statement of Basis on the IDEQ website) and in response to comments on February 18, 2021, also states that the roadway between Stibnite Road at Sugar Creek and Thunder Mountain Road at Meadow Creek was appropriately excluded from ambient air. Additionally, the EPA

REC 7546 PRI-00001060

Region X has indicated that the access road could possibly be excluded from ambient air if sufficient enforceable measures are taken to comply with the 2019 revised policy (EPA 2019a). Exclusion of the public access road from ambient air protections is a unique case that relies on measures assumed to meet the standards inferred in the 2019 revised ambient air policy. However, a formal EPA policy review of the ambient air boundary for the SGP has not been conducted nor requested. A formal review is not necessarily required. The EPA did provide formal comment on IDEQ's air quality PTC recommending a review be requested by the State and that initial measures in the PTC were too ambiguous to determine compliance with the revised ambient air policy. To comply with this measure, Perpetua has developed a transportation management plan that is included as Appendix D of the Air Quality Specialist Report (Forest Service 2023a).

The AERMOD dispersion modeling results for the 2021 MMP analysis emissions and comparison with the applicable NAAQS are provided in **Table 4.3-7**. The geographic location of the maximum impacts amongst the criteria pollutants and averaging periods between LOM 6 and 10 are provided in Figure 4 of the Air Quality Analysis Addendum ModPro2 (Air Sciences 2021a). The results demonstrate compliance with all NAAQS and would be considered to have a moderate impact locally and minor impact regionally. Additionally, **Table 4.3-8** provides geographic locations of the NAAQS maximums.

Table 4.3-7 Near-Field NAAQS Compliance Demonstration

Pollutant	Averaging Time	Maximum Modeled Conc. (µg/m³)	Background Conc.[3] (µg/m³)	Total Impact Conc. (µg/m³)	NAAQS (µg/m³)	NAAQS Compliance
CO	8 hours	404.6	1,110	1,515	10,000	Yes
CO	1 hour	495.5	1,740	2,236	40,000	Yes
Lead	3-month rolling	Not Required[1]	Not Required[1]	Not Required[1]	Not Required[1]	Not Required[1]
NO_2	Annual	19.8	0.9	20.7	100	Yes
NO_2	1 hour	129.8	4.3	134.1	188	Yes
O_3	8 hours	3.0	117.7	120.7	137	Yes
PM_{10}	24 hours	15	37.0	51.9	150	Yes
$PM_{2.5}$ [2]	Annual	1.1	3.5	4.6	12	Yes
$PM_{2.5}$ [2]	24 hours	2.7	15.0	17.7	35	Yes
SO_2	1 hour	3.0	12.3	15.3	196	Yes
SO_2	3 hours	1.8	16.8	18.6	1,300	Yes

[1] Lead modeling is not required per IDEQ as the facility-wide emissions are less than 10 percent of the lead significant emission rate of 0.6 tpy and considered "Below Regulatory Concern".
[2] Includes the secondary impacts.
[3] All background concentrations are derived from the NW Airquest data (WSU 2018).

REC 7547 PRI-00001061

SGP would be slightly less for this alternative. The location of ambient air pollutant concentrations due to vehicle traffic would differ, with such effects being located along the Johnson Creek Route.

Providing public access through the SGP reduces the miles of new motorized trails open to all vehicles in the Meadow Creek IRA, and this is expected to reduce net air quality effects due to vehicles traversing the SGP area.

Several air pollution design features proposed by Perpetua are common to both action alternatives and are described in **Section 2.4.9**. Emission control devices and designs would be put in place to abate emissions of particulate matter, Hg, and criteria pollutant emissions from internal-combustion engines the same as the 2021 MMP. Operational and reclamation air emission impacts for this alternative would therefore be the same as the 2021 MMP.

The stationary facilities would be designed, constructed, and operated with the same air pollution controls as the 2021 MMP to comply with applicable regulations and any air quality permits issued by IDEQ. The PTC includes stipulations for control of airborne dust from vehicle traffic along the Johnson Creek Route that are based on applicable state and federal regulations.

4.3.5 Mitigation Measures

Mitigation measures required by the Forest Service would represent reasonable and effective means to reduce the impacts identified in the previous narrative or to reduce uncertainty regarding the forecasting of impacts into the future. These mitigation measures would be in addition to the Forest Service requirements and EDFs (**Section 2.4.9**) accounted for in the preceding impact analysis.

A number of emission controls and monitoring actions have been proposed by Perpetua in compliance with government requirements. These are described below:

Perpetua would develop a fugitive dust control plan (FDCP) that would address the following at a minimum:

- Procedures followed by Perpetua employees to control and minimize fugitive dust emissions.
- Trigger levels to be set that require corrective action.
- Actions to bring fugitive dust emissions within acceptable ranges.
- Steps to demonstrate that appropriate corrective procedures are followed.
- Procedures to verify that Perpetua is controlling avoidable fugitive dust emissions.

Additionally, the IDEQ permit would include the following control measures proposed by Perpetua for HAP and mercury emissions. The implementation of these requirements was included in the Forest Service's assessment of air quality effects and the Forest Service decision includes implementation of these control measures:

- Mining – chemical dust suppressant and water application on haul roads, reasonable controls, FDCP
- Rock dumps and storage piles - reasonable controls, FDCP

REC 7548

PRI-00001062

temperatures and reduced stream flows. The SGP area could experience climate change impacts to fish resources and fish habitat by lowering streamflows, increased water temperatures, and decreased water quality which would adversely impact aquatic species and habitat. Process and design modifications, such as rerouting Hennessy Creek, lining the Meadow Creek diversion channel, piping low flows, and the complete backfill of Hangar Flats pit that would improve streamflow and temperature in Meadow Creek, would help to reduce these impacts.

Wildlife and Wildlife Habitat

Climate change impacts to wildlife and wildlife habitat in the SGP area would include habitat loss and fragmentation, physiological sensitivities, and alterations in the timing of seasonal life cycles. Habitat loss and fragmentation may occur in the region and analysis area due to the increased potential for wildfire that is anticipated from changing climatic conditions (Halofsky et al. 2018). Construction and operation of the SGP, access roads, utilities, and off-site facilities would additionally impact wildlife from habitat loss and fragmentation. Reclamation activities are intended to achieve post-mining land use for wildlife habitat as reasonably possible, which would help to reclaim habitat connectivity. However, some displacement and habitat fragmentation would be a long-term effect.

Timber Resources

Timber resources in the SGP area are vulnerable to climate change impacts from changing temperatures and precipitation patterns, increased wildfire frequency and intensity, and insects and disease. Direct effects of climate change on timber (e.g., temperature and precipitation) are likely to be minor, but indirect effects from various disturbances (e.g., increased temperatures and warmer winters causing insect and disease outbreaks) may be significant for the timber industry (Halofsky et al. 2018).

The 2021 MMP would result in ground disturbance in locations currently covered by forested vegetation. Post-closure, disturbed areas would be revegetated. To address losses of vegetation from disturbance, the Reclamation and Closure Plan (Tetra Tech 2021a) proposes to replant with conifer and other tree species, which would be located completely within the Operations Area Boundary. The success of the reclamation could be impacted due to the increased risk to timber from wildfire, insects, and disease due to climate change (American Forests 2017; Halofsky et al. 2018).

Land Use and Land Management

The 2021 MMP would alter land use in areas of new or expanded right-of-way and easements to accommodate access roads, utilities, and off-site facilities. Climate change could also impact how lands in the SGP area are used in the long term, altering the surrounding environment (e.g., decreasing ground cover, larger wildfire burn areas, decreased stream flows impacting how the area is used for recreational or tribal purposes) and impacting accessibility. Land management effects caused by the SGP are not expected to be noticeably impacted by climate change.

Access and Transportation

Access to and through the Operations Area Boundary would be maintained during construction, operation, and closure and reclamation. There would be public access through the Operations Area Boundary during construction and operations via a new gravel road constructed to connect Stibnite Road

REC 7549

PRI-00001063

to Thunder Mountain Road. Climatic changes causing an increase in severe events, such as floods, landslides, and avalanches, can add stress to roadways and other infrastructure, which may result in more frequent maintenance and repairs.

Heritage Resources and Tribal Rights and Interests

The 2021 MMP could impact historic properties, due to ground and visual disturbance in the SGP area. Changing climatic conditions are expected to exacerbate the damage and loss of heritage resources and natural areas utilized by tribes for activities such as hunting, fishing, and gathering in the SGP area through increased soil erosion, more frequent and intense wildfires, flooding, degraded water quality, and wildlife and fish habitat impacts.

Public Health and Safety

Climate change impacts to public health and safety would be experienced through impacts to air, soil, and water quality. The 2021 MMP has the potential to impact public health and safety through the transportation and use of fuels and chemicals, natural environmental hazards, economic impacts, changes to public services and infrastructure, and impacts to the local population.

Climate change could exacerbate some impacts to public health and safety by affecting the way potential hazardous material spills enter the environment. It also could increase the frequency and amplify the impacts of natural hazards such as avalanches and landslides, flash floods, and wildfires (Halofsky et al. 2018). More extreme heat days and higher temperatures over time could increase air quality and health risks over both the short and long term, impacting the public and the employees' abilities to work (Runkle et al. 2017).

Recreation

Much of the SGP area is used for recreation year-round, which would be both directly and indirectly impacted by climate change. The 2021 MMP has the potential to impact recreational access, recreation facilities, dispersed recreation areas, special use permits, recreational motorized travel, and recreation use. Direct impacts from climate change would include variable precipitation and rising temperatures, which could affect individual decisions to recreate in a certain area. Indirect impacts from climate change would be experienced through the changing conditions that may alter the recreation facilities, opportunities, and setting.

Changing climatic conditions could alter the ecological conditions that affect the quality of the recreation experience, including warmer water temperatures, decreased streamflow, and habitat loss and fragmentation. In the Rocky Mountain region, it is expected that snow-based activities (skiing, snowmobiling) would be impacted negatively by climate change due to warmer winters (Halofsky et al. 2018). Primitive area use, horseback riding on trails, motorized water activities, birding, hunting, and fishing in the region also are expected to be negatively influenced by climate change; however, longer periods of warmer temperatures are expected to increase participation in warm-weather activities such as water recreation and hiking (Askew and Bowker 2018).

REC 7550

PRI-00001064

the area, as some species sensitive to human presence may not return to the area for years after the mine is closed, resulting in a minor, permanent, and localized impact.

The 2021 MMP components that would affect the Idaho Wilderness Company operating area during closure and reclamation would be similar to those described for construction and operations. The loss of cellular coverage on portions of the analysis area may impact customer safety in the SGP but would aid in returning primitive recreation experiences to the FCRNRW areas in the Idaho Wilderness Company operating area. Providing public access through the SGP after closure and reclamation would restore the ability for the Idaho Wilderness Company to reach portions of their operating area without a detour. Displacement of permitted use may continue past reclamation due to permanent changes in the recreation setting within the Operations Area Boundary and potential changes to wildlife present in the area, as some species sensitive to human presence may not return to the area for years after the mine is closed, which would result in a minor, permanent, and localized impact.

Closure and reclamation of all 2021 MMP components would affect the Juniper Mountain Outfitters operating area either directly or indirectly due to recreation displacement from other areas. The ability of Juniper Mountain Outfitters to access their operating area, provide IOGLB licensed activities, and the quality of recreation experiences for customers participating in guided activities near these components may be impacted during closure and reclamation due to noise and reclamation activity. Displacement of permitted use may continue past reclamation due to the changes in the recreation setting in the Operations Area Boundary, and potential changes to wildlife present in the area, as some species sensitive to human presence may not return to the area for years after the mine is closed, which would result in a negligible, permanent, and localized impact.

There are no 2021 MMP components that would impact the North Shore or Warm Lake Lodges, Warm Lake Camp, YWAM, or Warm Lake recreation residence tract during closure and reclamation; therefore, no impacts are anticipated.

Winter use of the Cabin Creek Road OSV route during closure and reclamation would continue to impact the Paradise Valley recreation residence tract as described for construction and operations.

Travel Management Rule

The reroute of Stibnite Road and the designation of a temporary OSV route to replace an existing OSV route are actions that fall under the Travel Management Rule (36 CFR 212), Subparts B and C, respectively (FSM7715.03(5)). These actions require consideration under the Travel Management Rule Minimization Criteria (36 CFR 212.55(b)). The responsible official shall consider the effects on the following, with the objective of minimizing:

- Damage to soil, watershed, vegetation, and other forest resources;
- Harassment of wildlife and significant disruption of wildlife habitats;
- Conflicts between motor vehicle use and existing or proposed recreations uses of NFS lands or neighboring federal lands;
- Conflicts among different classes of motor vehicle uses of NFS lands or neighboring federal lands; and,

REC 7551

PRI-00001065

- Compatibility of motor vehicle use with existing conditions in populated areas, taking into account sound, emissions, and other factors.

Table 4.19-3 describes where the Travel Management Rule criteria were addressed in the EIS.

Table 4.19-3 Criteria for Designation of Roads, Trails, and Areas Review

Criteria	Section of EIS Addressing Criteria	Applicable Screening Criteria
General Criteria 36 CFR 212.55(a)		
NFS natural and cultural resources, public safety, provision of recreation opportunities, access needs, conflicts among uses of NFS lands, the need for maintenance and administration of roads, trails, and areas that would arise if the uses under consideration are designated, and availability of resources for maintenance and administration.	Sections 4.17, 4.18, 4.19, 4.16, and 4.15	Heritage resources, public health and safety, recreation, access and transportation, land use and land management.
Consider combinations of uses (such as motorized and non-motorized, different vehicle classes, and highway-legal and non-highway-legal vehicles).	Section 4.16	Access and transportation.
Minimization Criteria 36 CFR 212.55(b)		
Damage to soil, watershed, vegetation, and other forest resources.	Sections 4.5, 4.8, 4.9, 4.10, and 4.14	Watersheds and water resources, soils, vegetation, and other forest resources
Harassment of wildlife and significant disruption of wildlife habitats.	Section 4.13	Wildlife and TES Wildlife
Conflicts between motor vehicle use and existing or proposed recreation uses of NFS lands or neighboring federal lands.	Sections 4.16 and 4.19	Recreation conflict. Motor vehicle conflict and compatibility
Conflicts among different classes of motor vehicle uses of NFS lands or neighboring federal lands.	Section 4.16, the Transportation Management Plan, EDFs (Table 2.4-13), and Forest Service Requirements (Table 2.4-12)	Motor vehicle conflict and compatibility Road engineering geometry and criteria.
Compatibility of motor vehicle use with existing conditions in populated areas, taking into account sound, emissions, and other factors.	Section 4.23, the Transportation Management Plan, EDFs (Table 2.4-13), and Forest Service Requirements (Table 2.4-12)	Designated areas, special designations, or potential special designations. Rights of access.

The 2021 MMP considered the minimization criteria for the reroute of Stibnite Road through the mine site and the temporary relocation of the Warm Lake OSV route to Cabin Creek Road and west of Johnson

REC 7552

PRI-00001066

Creek Road. Damage to soil, watershed, vegetation, and other forest resources was analyzed by determining if the routes intersect with impaired watersheds, wetlands, riparian areas, high-risk flood hazard areas, soils having erosion potential, and riparian vegetation communities.

4.19.2.3 Johnson Creek Route Alternative

The Johnson Creek Route Alternative is similar to the 2021 MMP, with the main differences that affect recreation consisting of use of the Johnson Creek Route for access to the mine for all phases (no construction or use of the Burntlog Route); a change in the location of the Landmark Maintenance Facility; and use of helicopters for construction and maintenance of cell towers and repeater sites in IRAs managed for backcountry/restoration. These changes would result in different impacts than the 2021 MMP, particularly the use of the Johnson Creek Route.

Recreation Opportunities, Facilities, Access, and Use

Construction and Operations

Impacts of the Johnson Creek Route Alternative during construction and operations would be the same as those described under the 2021 MMP, except for those described below. The Burntlog Route and Burntlog Maintenance Facility would not be constructed under the Johnson Creek Route Alternative; therefore, there would be no construction impacts related to those facilities.

Johnson Creek Route

Year-Round

Use of Johnson Creek and Stibnite roads as the route to the Operations Area Boundary during construction, operations, and reclamation and closure would result in impacts to the recreation setting of the existing recreation sites/areas along these roads due to increased noise, traffic, and safety-related issues from mine-related traffic (Forest Service 2023d, 2023k), leading to a change in recreation experiences for some visitors. Traffic on Johnson Creek and Stibnite roads would substantially increase (almost two times the current traffic conditions, respectively), thereby increasing the noise and activity near campgrounds and trailheads adjacent to these roads. Impacts are anticipated to be moderate, short-term, and localized.

Recreation facilities affected by the increase in traffic and traffic noise would include Burntlog and Quartz Creek Trailheads; Buck Mountain, Trout Creek, Ice Hole, Golden Gate, and Yellow Pine Campgrounds; Twin Bridges dispersed camping area; and Johnson Creek Cabin. The recreation setting of these facilities would be altered to a more developed setting due to an increase in the sights and sounds of humans, which would displace recreationists to avoid noise associated with activities and traffic along Johnson Creek and Stibnite roads, particularly recreationists participating in non-motorized activities. Motorized users who use Johnson Creek and Stibnite roads for recreation also may be displaced due to the increased traffic along the roadways. Wildlife-related recreation opportunities also would decrease along these roadways due to wildlife displacement from traffic and noise. This impact is anticipated to be minor, short term, and localized.

REC 7553

PRI-00001067

groomed OSV route would be inaccessible as it is north of the Trout Creek Campground on the closed OSV route between the campground and Wapiti Meadows. The new groomed OSV route along Johnson Creek Road would remain through operations and closure/reclamation under the Johnson Creek Route Alternative as the Johnson Creek Route would be used throughout the life of the SGP. Therefore, impacts from the plowing of Johnson Creek Road under the Johnson Creek Route Alternative are anticipated to be minor, long term, and localized.

Public Access

Road closure impacts on the Johnson Creek route would be the same as those described under the 2021 MMP, except impacts to recreation access, use, and opportunities along Thunder Mountain Road would begin during construction and continue until the public access road through the Operations Area Boundary was complete and open to public use to provide access to the Thunder Mountain area. Construction under the Johnson Creek Route Alternative is expected to take 2 years longer than the 2021 MMP.

The impacts to public access through the Operations Area Boundary would be the same as under the 2021 MMP. The public access road would provide access to recreation sites/areas via Thunder Mountain Road; therefore, the access road would allow continuous access to the Thunder Mountain Road sites/areas. However, as described under the 2021 MMP, there would be temporary closures of this route during some mining activities that would result in minor, short term, and localized impacts to recreation.

Landmark Maintenance Facility

The Landmark Maintenance Facility would be located approximately 0.1 mile south of Landmark and the historic cabins located there. Access to the maintenance facility would be off Warm Lake Road. There would be no delays or additional traffic along Warm Lake Road in this area since the Burntlog Route would not be constructed, but rather from all construction-related traffic using Warm Lake Road to Johnson Creek Road. It is assumed that construction equipment would travel east on Warm Lake Road; therefore, delays would likely affect access to Horn Creek Road, Rec Spur 579U2, 450 South, and Burnt Log Road, which are east of the maintenance facility site. This impact is anticipated to be moderate, short term, and localized.

Noise associated with construction activities could reduce opportunities for noise-sensitive recreation activities at and around the maintenance facility location (up to 1.1 miles away) (AECOM 2019c), including wildlife-related recreation activities, because wildlife may be displaced. Construction activities would not affect use of the historic cabins; however, construction noise at the site may affect the recreation setting of the cabins, because it may be audible from the cabin sites. Some recreationists may choose to visit other areas or sites to avoid delays or noise from construction activities. Any reduction in recreation opportunities, displacement of dispersed recreational use, or changes in access would be temporary until maintenance facility construction was completed. These impacts would be minor, short term, and localized.

Development of the Landmark Maintenance Facility would reduce recreation opportunities due to physical removal of acreage for the facility (3.5 acres). Traffic due to maintenance activities and vehicles would not be expected to result in frequent traffic delays on Warm Lake Road but may result in

Stibnite Gold Project Final Environmental Impact Statement Errata Document

1. Introduction

The Stibnite Gold Project Draft Record of Decision and the Final Environmental Impact Statement (FEIS) were released on September 6, 2024. This errata sheet documents corrections to the text of the September 2024 published FEIS and should be reviewed along with the FEIS. These corrections reflect instructions provided by Kelly Orr, the Intermountain Region Deputy Regional Forester, in the response to objections dated October 21, 2024, and additional clarifications. These corrections are consistent with the direction given in Forest Service Handbook 1909.15, Chapter 10, Section 18. There are no changes to the project or significant new circumstances identified in this errata sheet that affect the analysis and conclusions in the Stibnite Gold Project FEIS, therefore, a supplement to or revision of the FEIS is not needed. These changes also apply to the Stibnite Gold Project specialist reports, as applicable.

Article II. Chapter 2

1. FEIS, Chapter 2, Section 2.4.4.4 Public Access (page 2-20)

The description regarding seasonal public access through the operating mine site to Thunder Mountain Road is modified per the italicized text:

During operations, the public access road through the Operations Area Boundary would provide seasonal use, open to all vehicles; access would not be provided in winter when impassable (current county maintenance standards) and signs would inform the public of seasonal and temporary closures. Public vehicles passing through would be required to check-in with mine personnel at the North or South SGP entry points and would receive a safety briefing and would also be required to check-out with SGP personnel upon exiting the SGP. For safety purposes, public access would be separated from other SGP roads by berms, security fencing, and the underpass to allow the public road to pass beneath the mine haul road. No stopping or deviating from the public access road would be allowed. Perpetua could restrict access to any vehicles due to concerns related to public or employee health and safety, such as during road construction and maintenance, blasting, highwall scaling, mining in the immediate area of the road, and similar operations. *Because public use of the road would be subject to Perpetua's control measures on general use, the public access road is not considered a public road.*

Significance: The addition clarifies the status of the access road through the site with regard to whether it will be operated as a public road.

2. FEIS, Chapter 2, Section 2.4.9 Environmental Design Features (Table 2.4-12 on page 2-106)

An environmental design feature used in the wildlife specialist report effects analysis unintentionally omitted from Table 2.4-12. The following row is added into Table 2.4-12 on page 2-106.

January 2025

REC 7559

PRI-00001071

preparation and early construction until the worker housing facility is constructed. Administrative offices, a transportation hub, warehouses, and assay laboratory facilities, all supporting mine-related activities, will be located offsite and outside of the operations area boundary.

Prior to site preparation and construction of surface facilities, vegetation will be removed from operating areas. Any merchantable timber on National Forest System lands will be purchased from the Forest Service through a timber sale. Access to the mine site during the construction period will be from Cascade, Idaho via the County Road 10-579 (Warm Lake Road), to County Road 10-413 (Johnson Creek Road), and then to County Road 50-412 (Stibnite Road). As part of the Stibnite Gold Project construction, a new access route, the Burntlog Route, will be constructed to connect the Warm Lake Road to the mine site. The new Burntlog Route will be used during the operating and closure periods and will be reclaimed as part of closure. The Burntlog Route will be used by Perpetua and its contractors for mine access, but public use of the route will be restricted as described in the Burnt Log Route Public Access Restriction mitigation measure in Part 2.3.10. The Johnson Creek Road and Stibnite Road will only be used for alternative site access in case of emergency or unplanned closure of the Burntlog Route.

Mining

The Selected Alternative includes a total of approximately 3,266 acres of new and re-disturbance of surface resources through the creation or expansion of three open-pits, an ore processing area, a tailings storage facility and buttress, an access roads, a transmission line, dewatering and industrial water supply wells, a worker housing facility, a road maintenance facility, an underground exploration decline, and other ancillary facilities (**Figure 1**). The acreages of disturbance for each mine feature are presented in Table 2.4-1 of the FEIS.

The proposed facilities and methods of mining are described in greater detail in Section 2.4 of the FEIS. The estimated operating mine life is approximately 15 years preceded by a three-year construction period, a five-year closure period, and an estimated 15-year post-closure period for water treatment of residual process solution. Perpetua will employ approximately 640 personnel during the construction period, 580 personnel during the operating period, 160 personnel during the closure period, and 40 personnel during the post-closure period.

General mine operations will include drilling, blasting, loading, and hauling using excavators, dozers, and a fleet of trucks. Ore will be hauled to the on-site mill facility, and overburden will be placed as a buttress to the tailings storage facility embankment or backfilled into the mined-out pits (**Figure 2**). Reclamation will take place concurrently with mining operations, as feasible, and will be completed during the closure and post-closure periods.

The Stibnite Gold Project will consist of mining three primary mineral deposits and the re-mining of historical tailings using conventional open pit mining methods. Ore from three open pits (Yellow Pine, Hangar Flats, and West End pits) will be sent to either the crusher, located near the processing plant, or one of several ore stockpiles in various locations within the operations area boundary (**Figure 2**). Ore will be stockpiled and processed at a future time during extended periods when the ore tonnage or ore type from the pits exceed the availability of the ore processing plant. Pre-stripping or removing the overlying soil and development rock (also known as waste rock) to access the mineral deposit, will commence during the construction phase in Mine Year 2. Ore removal and processing will begin in Mine Year 1 (operations phase) and continue year-round for approximately 15 years. Mine operations will occur in the area of two historical open pit mined areas (Yellow Pine and West End) and one new open pit (Hangar Flats) that includes the sites of former underground mining and mineral processing facilities. Development rock will be hauled to the tailings storage facility embankment or placed in one of four destinations: the tailings storage facility buttress or the Yellow Pine, Hangar Flats, or West End open pits once they are mined out.

REC 7560
PRI-00001072

Mitigation Measures – Whitebark Pine Impact Rectifying and Restoring:

- VEG-11. If damage or removal of any live whitebark pine trees cannot be avoided, the Project Operator will make every reasonable effort to collect the cones, scion, pollen, or other genetic material from live mature trees (particularly "plus" trees) within the same seed zone for future restoration efforts before the live whitebark pine is damaged or killed. The Project Operator will coordinate with the Forest Service and U.S. Fish and Wildlife Service to identify potential restoration efforts for the species within or near the Stibnite Gold Project.
- VEG-12. If collection cannot occur, the Project Operator will contact the Forest Service and U.S. Fish and Wildlife Service to explore additional options, which may include replanting in accordance with current whitebark pine replanting guidelines or best practices, or suitable alternatives with whitebark pine seedlings or seed stock of known superior parentage ("plus" whitebark pine). Whitebark pine used for replanting will be of the same seed zone as the mature trees that were removed.

Clark's Nutcracker Habitat

Issue: Impacts to whitebark pine seed dispersers, primarily the Clark's nutcracker and its habitat.

Mitigation Measure – Clark's Nutcracker:

VEG-13. Where possible, the Project Operator will avoid or limit cutting of mature whitebark pine trees in stands that are of sufficient size to support Clark's nutcracker use of the area (30,888 to 61,776 acres of cone bearing whitebark pine habitat within a 20.3-mile radius).

2.3.9 Wildlife

Wolverine

Issue: Impacts to wolverine habitat.

Mitigation Measure – Wolverine Impact Minimization:

- The Forest Service wildlife biologist will be notified of any occupied wolverine dens encountered during construction and operation.
- If a wolverine is observed within or near the Project, the Forest Service wildlife biologist and U.S. Fish and Wildlife Service will be notified immediately and coordination with Perpetua will occur regarding modifications to construction and operation activities to avoid potential disruption of wolverine denning activities.
- Off road use and the construction of new or temporary roads in wolverine habitat will be limited.
- New or temporary roads will be marked off limits to non-authorized motorized access to reduce traffic and increased access in wolverine habitat.
- For exploratory drilling activities, from December 1 to April 1, a 1-mile no-disturbance buffer will be implemented around denning habitat as modeled using the persistent snow cover layer.

2.3.10 Transportation

Burntlog Route Public Access Restriction

Issue: Unrestricted public use of the Burntlog Route (consisting of the existing Forest Road [FR] 447 [Burnt Log Road] and new road segments connecting to FR 50375 [Thunder Mountain Road] and FR 51290 [Meadow Creek Lookout Road]) would have potential impacts associated with traffic incidents, public safety, emergency services, wildlife interactions, wilderness solitude, and tribal interests.

Mitigation Measure – Burntlog Route public access restriction: Construction of the Stibnite Gold Project is expected to take three years (Mine Years -3 through -1). The Burntlog Route is anticipated to take two years to construct (i.e., Mine Year -3 and -2). The access to Meadow Creek Lookout Road will experience short-term closures during Year -3 when crossings of the new Burntlog Route are constructed.

The through-site public access to Thunder Mountain Road will be largely unaffected during Year -3 with more temporary closures in Year -2, then completely closed during Year -1 before re-opening on a new seasonal access route in Year 1 (Table 3).

Table 3 Access Impacts During Construction and Operations

Road	Mine Year -3	Mine Year -2	Mine Year -1	Mine Operations
Warm Lake Road (Cascade to Landmark)	Limited effects	Limited effects	Limited effects	Limited effects
Johnson Creek Road (Landmark to Yellow Pine)	Limited effects	Temporary closures	Seasonal access	Seasonal access
Stibnite Road (Yellow Pine to Stibnite)	Limited effects	Temporary closures	Closed in Operations Area	Seasonal access
Thunder Mountain Road (Stibnite to Thunder Mountain)	Limited effects	No access when Stibnite Road is temporarily closed	Access through new Burntlog Route only	Seasonal access via new public access road through site
Meadow Creek Lookout Road	Temporary closures for nearby Burntlog Route construction	Limited effects	1.8-mile shared segment with new Burntlog Route	1.8-mile shared segment with new Burntlog Route
New Burntlog Route (Landmark to Stibnite)	Under construction	Under construction	Site access plus public access	Site access with public access restriction

The Burntlog Route will be a mine access road operated by the Stibnite Gold Project for the duration of the project. As such, project-related use of the route will be regulated per the Forest Service's decision on the Stibnite Gold Project and incorporate compliance with the project's Transportation Management Plan. Public use of the Burntlog Route will be restricted. Seasonal use of the newly constructed portions of the Burntlog Route will be allowed only during the snow-free portion of Year -1 when there would be no other access to the Thunder Mountain Road.

Public use of existing segments of the Burntlog Route will not be modified by the Stibnite Gold Project decision but would be subject to temporary closures for new Burntlog Route construction. During operations, public use of existing segments of the Burntlog Route (i.e., Burnt Log Road [FS447], Meadow Creek Lookout Road [FR51290], and Thunder Mountain Road [FR50375]) will be unrestricted. The main road segment where public access would continue will be a 1.8-mile section of the Meadow Creek Lookout Road, coincident with the Burntlog Route. Signage would be placed at all intersections with Forest Service roads and trails to identify road segments with public access restrictions.

The Forest Service will require the Project Operator, to develop and implement a Burntlog Route Access Plan to restrict public access per this mitigation measure and to provide notifications to the public when the newly constructed segments of the Burntlog Route would be open.

characterized according to the Resource Conservation and Recovery Act requirements, managed in compliance with state and federal regulations and recycled or disposed of in existing, permitted facilities. Non-hazardous solid waste will be hauled from the mine site by licensed waste disposal services for disposal off-site.

7.18 Idaho Roadless Rule

Per 36 CFR 294.25(b), the Idaho Roadless Rule does not affect mining activities conducted pursuant to the General Mining Law of 1872. Idaho Roadless Area characteristics affected by the Stibnite Gold Project have been disclosed in the FEIS. The Idaho Roadless Commission has been briefed routinely throughout the analysis process.

7.19 Travel Management Rule

The reroute of Stibnite Road via the Burntlog Route and the designation of a temporary over-snow vehicle route to replace an existing over-snow vehicle route are actions that fall under the Travel Management Rule (36 CFR 212), Subparts B and C, respectively (FSM 7715.03(5)).

The over-snow vehicle route designation requires consideration under the Travel Management Rule Minimization Criteria (36 CFR 212.55(b)). The environmental design features (see Parts 10.2, 10.3.2, 10.3.3, 10.3.4, 10.3.6, 10.3.7, 10.3.12, and 10.3.14 below) and mitigation measures (see Parts 2.3.2, 2.3.5, 2.3.6, 2.3.8, and 2.3.11) were developed with the objective of minimizing:

- *Damage to soil, watershed, vegetation, and other forest resources* – The route uses the existing Cabin Creek Road (FR 50467) to minimize new ground disturbance. Best management practices and environmental design features protective of soils, water, and vegetation are described in Table 5, Table 6, and Parts 10.3.2, 10.3.7, and 10.3.12 of this ROD below. Cabin Creek, a 303(d) listed stream for water temperature, is adjacent to the over-snow vehicle route. There are no municipal or domestic water supplies in the vicinity of the trail;
- *Harassment of wildlife and significant disruption of wildlife habitats* – The route uses the existing Cabin Creek Road (FR 50467) to minimize effects on wildlife. Best management practices and environmental design features protective of wildlife are described in Table 5, Table 6, and Parts 10.3.3, 10.3.4, and 10.3.6 of this ROD below;
- *Conflicts between motor vehicle use and existing or proposed recreational uses of National Forest System lands or neighboring federal lands* – The route uses the existing Cabin Creek Road (FR 50467) to minimize effects on neighboring recreation;
- *Conflicts among different classes of motor vehicle uses of National Forest System lands or neighboring federal lands* – The over-snow vehicle route does not cross other vehicle routes; and,
- *Compatibility of motor vehicle use with existing conditions in populated areas, taking into account sound, emissions, and other factors* – There are no populated areas in the vicinity of the over-snow vehicle route.

I find that the Selected Alternative complies with the Travel Management Rule.

7.20 Special Uses

The Payette and Boise National Forest Land and Resource Management Plans allow special uses that serve the public, promote public health and safety, protect the environment, are legally mandated, and are compatible with other resources. This may include special uses for ancillary facilities related to exploration and mining-related operations that lie on National Forest System lands outside of mineral lease boundaries. The power transmission line meets the special uses screening criteria at 36 CFR 251.53(l)(4) and considerations put forth at 36 CFR 228 Subpart A for uses in connection with operations under the mining laws.

Description	Type	Reference	Resources Affected
• Temporary wooden structure could be erected around portions of the drill, pumps, and heaters, with acoustic absorbent panels. These temporary structures will not be put in place if they created safety issues related to exhaust vapor build-up. • When feasible, activities such as helicopter use and blasting, could be scheduled at the same time.			
In revegetation and seeding projects in occupied sensitive plant habitat, a Forest botanist shall be consulted to ensure appropriate species are used.	FP Component	BNF and PNF: BTST05	Vegetation
Design and implement projects within occupied habitats of Sensitive species to help prevent them from becoming listed. Use Forest Service-approved portions of Conservation Strategies and Agreements, as appropriate, in the management of Sensitive species habitat to keep management actions from contributing to a trend toward listing for these species.	FP Component	BNF and PNF: WIST02	Wildlife, Vegetation

Table 6 Proponent Proposed Environmental Design Features

Description	Resources Affected
Following crushing, the crushed ore will report via conveyor to a dome-shaped, covered stockpile.	Air Quality
Dust emission controls, such as water sprays and/or bag house dust collectors, will reduce dust from crushing, conveying, and stockpiling.	Air Quality
Dust will be controlled in a similar manner to the ore crushing and conveying process using water sprays and/or bag house dust collectors.	Air Quality
Air emissions from the leaching facility will be captured in a series of air pollution controls, and the material collected will be disposed of as a solid waste or a hazardous waste depending on characterization of the waste.	Air Quality
Air emissions from the induction furnace will be captured in a series of emission controls. Mercury from the induction furnace will be converted to a liquid metallic state, and then securely stored prior to shipment to a certified hazardous waste disposal facility.	Air Quality
Silos will be equipped with air emission controls except for Prill Silo.	Air Quality
All off-highway diesel engines will be Environmental Protection Agency Tier IV or better.	Air Quality, Climate Change
The Project Operator will encourage employees to use company provided shuttle buses as transport to the Stibnite Gold Logistics Facility from towns along SH 55.	Air Quality, Health and Safety, Transportation and Access
Busing and/or vanpooling will be provided for the Project Operator and contractor employees. The associated parking area will accommodate approximately 300 vehicles. To the degree practicable, the Project Operator will mandate the use of busing and vans for employee and contractor transportation to the Stibnite Gold Project and the worker housing facility.	Air Quality, Health and Safety, Transportation and Access
Proper dust control will be employed along transportation corridors and active mining areas using aquatic safe dust suppression chemicals and methods.	Air Quality, Water Resources, Fish, Wildlife

Description	Resources Affected
Other legacy materials may be encountered during construction and operations. If encountered, these materials will be characterized to determine potential for reprocessing, reuse, or disposal.	Hazardous Materials
Small scale composting associated with organic materials generated at the worker housing facility may be incorporated within the centralized growth media stockpile in the Fiddle valley.	Hazardous Materials
An Explosives and Blasting Management Plan will be prepared for the Stibnite Gold Project. Explosives storage, transport, handling, and use will comply with applicable Department of Homeland Security, Bureau of Alcohol, Tobacco, Firearms and Explosives, and Mine Safety and Health Administration regulations.	Health and Safety
For safety and security reasons, no alcohol, firearms, or illegal drugs will be permitted on site.	Health and Safety
For safety and security reasons, public access into the mine area will be prevented by using fencing, gate locking, security personnel, and/or notice postings that prohibit unauthorized entry; no unauthorized vehicles or personnel will be permitted on the Stibnite Gold Project.	Health and Safety
Personnel transporting, handling, or using any hazardous chemicals (including sodium cyanide) will be trained to ensure the safe use of such materials. The Project Operator will design, construct, and manage facilities to conform to International Cyanide Management Code.	Health and Safety, Fish, Wildlife, Hazardous Materials
Fuel and other petroleum products at the site will be stored in above ground containment structures, with appropriate secondary containment measures.	Health and Safety, Fish, Wildlife, Hazardous Materials
Air emissions, groundwater, surface water, and aquatic parameters will be monitored during mine construction, operation, closure, and post-closure as specified in the final authorizations from the regulating agencies.	Monitoring
Monitoring will be conducted following the completion of closure and reclamation of all facilities and disturbance areas to demonstrate compliance with permit requirements and to measure the success of reclamation and mitigation.	Monitoring
The draft EMMP includes the following plans for monitoring aquatic resources: Stream and Wetlands Monitoring and Management Plan and Fisheries and Aquatic Habitat Monitoring and Management Plan.	Monitoring
The ore processing facility building will be enclosed.	Noise, Wildlife, Health and Safety
Appropriate sound dampening and muffling equipment will be utilized to minimize noise excursion from equipment and facilities. When possible, schedule high noise activities at the same time. Monitor and maintain equipment to reduce noise related impacts.	Noise, Wildlife, Health and Safety
When practicable, pumps, generators, and engines will be turned off when not in use to avoid unnecessary noise generation and reduce energy consumption.	Noise, Wildlife, Health and Safety
Electric line power will be utilized during operations to eliminate diesel generator noise, except in emergency situations when grid power is down or temporary use in remote areas where it is not practical to run power lines.	Noise, Wildlife, Health and Safety
An 8-mile temporary 16-foot-wide groomed over-snow vehicle trail will be created adjacent to Johnson Creek Road between Landmark and Trout Creek Campground during construction of the Burntlog Route.	Recreation

Description	Resources Affected
Soil stability will be estimated for all reclaimed areas using qualitative descriptors.	Soils, Reclamation
Slope stability will be monitored during the erosion inspections.	Soils, Reclamation
If the performance of reclaimed areas is not satisfactory, appropriate maintenance activities will be implemented. Maintenance activities may include one or more of the following: • Sediment removal from sediment basins, stormwater drainage channels, and diversions as necessary to maintain their design capacity; • Diverting surface water away from reclaimed areas where erosion jeopardizes attainment of reclamation standards; • Stabilizing rills, gullies, and other erosion features or slope failures that have exposed development rock; • Noxious weed and invasive plant species control; and, • Re-seeding or re-applying reclamation treatments in areas where it is determined through monitoring and agency consultation that reclamation will not meet standards.	Soils, Reclamation
The Project Operator will submit an annual report to the Forest Service and the other federal and state agencies that are responsible for issuing authorizations applicable to reclamation for the preceding calendar year. The annual report will contain descriptions of the reclamation activities completed during the previous year, a summary of areas reclaimed, a discussion of the results of the reclamation monitoring conducted, and corrective actions implemented.	Soils, Reclamation
A new 12-foot-wide gravel road will be constructed to provide public access from Stibnite Road (FR 50412) to Thunder Mountain Road (FR 50375) through the Stibnite Gold Project. During operations, the public access road will be used to travel through the Stibnite Gold Project and will provide seasonal use, open to all vehicles. Vehicles passing through the Stibnite Gold Project will be required to check-in with mine personnel at the North or South Stibnite Gold Project entry points.	Transportation and Access, Health and Safety
Post reclamation, a road will be established over the backfilled Yellow Pine pit to allow public access through the reclaimed site and connect Stibnite Road (FR 50412) to Thunder Mountain Road (FR 50375). This will replace the operational phase public access route.	Transportation and Access
Prior to site preparation and construction of surface facilities, vegetation will be removed from operating areas. Trees and deadwood, shrubs, and slash not needed to construct windrows at the edge of Burntlog Route disturbance (to function as sediment barriers), will be chipped, and suitable soil will be separately salvaged and stockpiled (except for a small portion that will be 'live handled') for use as part of site reclamation and restoration. Portions of the salvaged soil will be blended with the chipped wood to create growth media. All growth media placed in stockpiles will be stabilized, seeded, and mulched to protect the stockpiles from wind and water erosion.	Vegetation
The Project Operator will inspect and remove vegetation material (including noxious weeds) from mechanical equipment and properly dispose to minimize the spread of unwanted vegetation.	Vegetation
Wood wastes and wood mulch are the two primary sources of compost. Food waste produced from on-site meal preparation and wastes may provide another source. Combined and properly managed during composting, these materials will provide a source of organic matter to be blended into substrate materials suitable for mitigation.	Vegetation
The Project Operator will be responsible for noxious weed control within areas disturbed by Stibnite Gold Project activities.	Vegetation, Wildlife
Develop and employ planting plans for wildlife benefits (cover, forage, etc.) using approved seed mixes.	Vegetation, Wildlife

10.3.10 Road Use and Maintenance

Description	Reference
Minor surface improvements (e.g., ditch and culvert repair, adding gravel, winter snow removal, and summer dust suppression) will occur on the Yellow Pine Route to reduce sediment runoff and dust generation.	2021 Modified Mine Plan
Once all final mine closure and reclamation work has been completed, the Project Operator will reduce the 21-foot-wide travel way of 19.8 miles of Burntlog Road (FR 447), 1.3 mile of Meadow Creek Lookout Road (FR 51290), and 2.0 miles along Thunder Mountain Road (FR 375) of Burntlog Route to their approximate pre-mining width.	2021 Modified Mine Plan
The approximately 15 miles of Burntlog Route connecting to Meadow Creek Lookout Road (FR 51290) and Thunder Mountain Road (FR 50375) will be decommissioned.	2021 Modified Mine Plan
Following mining and ore processing operations, unless they are taken over by a third-party for ongoing use and maintenance, the Burntlog Maintenance Facility buildings will be removed. The sewer system and septic tanks for the facility will be decommissioned. Soil and rock beneath fuel storage areas and chemical storage buildings will be tested for contamination. All reagents, petroleum products, solvents, and other hazardous or toxic materials will be removed from the site and disposed of according to applicable state and federal regulations. After demolition of the buildings and facilities, the site will be graded, and drainage restored.	2021 Modified Mine Plan
A new 12-foot-wide gravel road will be constructed to provide public access from Stibnite Road (FR 50412) to Thunder Mountain Road (FR 50375) through the Stibnite Gold Project. During operations, the public access road will be used to travel through the Stibnite Gold Project and will provide seasonal use, open to all vehicles. Vehicles passing through the Stibnite Gold Project will be required to check-in with mine personnel at the North or South Stibnite Gold Project entry points.	2021 Modified Mine Plan
Post reclamation, a road will be established over the backfilled Yellow Pine pit to allow public access through the reclaimed site and connect Stibnite Road (FR 50412) to Thunder Mountain Road (FR 50375). This will replace the operational phase public access route.	2021 Modified Mine Plan
New roads constructed for the Project on National Forest System lands will be closed and reclaimed, as required by Forest Service, once they are no longer needed to support Project construction, operations,	2021 Modified Mine Plan
Project-related traffic will be restricted to existing roadways and Project areas. Off-road travel in previously undisturbed areas will be forbidden.	2021 Modified Mine Plan

10.3.11 Reclamation and Restoration

Description	Reference
Facilities will be located on previously impacted lands when that location fits into mine operations.	2021 Modified Mine Plan
Productive lands that support wildlife and fisheries habitat and dispersed recreation will be established on Project-related surface disturbance.	2021 Modified Mine Plan
Approximately 37 percent of the reclamation will be done concurrent to mining and ore processing; the remaining 63 percent will be accomplished during closure. Annual reclamation activities are described in a schedule provided in Table 3-1 of the Reclamation Closure Plan. Concurrent reclamation areas will focus on construction period restoration efforts (e.g., East Fork Meadow Creek, aka Blowout Creek) and laydown yards, Yellow Pine Pit area facilities, and Hangar Flats Pit area facilities. Closure period activities are focused on the West End Pit area, tailings storage facility area, Fiddle growth media stockpile, and process plant area. This information is also presented graphically in Appendix C to the Compensatory Mitigation Plan.	2021 Modified Mine Plan
The Yellow Pine pit will be backfilled with West End pit development rock during operations.	2021 Modified Mine Plan
A sinuous channel will be constructed through the backfilled area for the reconstructed East Fork South Fork Salmon River with an average valley gradient approximating the historical, pre-disturbance river gradient.	2021 Modified Mine Plan
The backfill will be placed to achieve a mounded final reclamation surface to promote drainage away from the West End pit and prevent formation of a pit lake within Midnight pit.	2021 Modified Mine Plan
The floor of the sidehill pit southwest of the main West End pit will be graded to drain, covered with growth media, and revegetated.	2021 Modified Mine Plan

BEFORE THE BOARD OF ENVIRONMENTAL QUALITY

STATE OF IDAHO

IN THE MATTER OF AIR QUALITY PERMIT TO CONSTRUCT P-2019.0047	Case Docket No. 0101-22-01 OAH Case No. 23-245-01
NEZ PERCE TRIBE, IDAHO CONSERVATION LEAGUE, and SAVE THE SOUTH FORK SALMON, Petitioners, v. IDAHO DEPARTMENT OF ENVIRONMENTAL QUALITY, Respondents, and PERPETUA RESOURCES IDAHO, INC., Intervenor-Respondent.	ORDER ON SAVE THE SOUTH FORK SALMON'S MOTION FOR RECONSIDERATION BASED ON NEW EVIDENCE DATED JUNE 6, 2025

I. INTRODUCTION

On June 6, 2025, Save the South Fork Salmon ("SSFS") filed a *Petitioner Save the South Fork Salmon's Motion for Reconsideration Based on New Evidence and Memorandum in Support* ("Motion for Reconsideration"), along with a *Declaration of Julia Thrower* ("Declaration."). The Motion for Reconsideration seeks reconsideration of the Idaho Department of Environmental Quality Board's ("DEQ Board") *Final Order* issued in this matter on May 27,

2025. The Motion for Reconsideration asserts that the United States Forest Service's January 2025 Final Environmental Impact Statement("FEIS") and Final Record of Decision ("ROD") for the Stibnite Gold Project ("STP") provides relevant new information that addresses the issue of whether Perpetua Resources Idaho, Inc. ("Perpetua") has legal control to preclude public access to the Stibnite Road Access Route such that it was appropriate for the Department of Environmental Quality ("DEQ") to exclude the road from ambient air quality protections when it issued the Air Quality Permit to Construct ("PTC") at issue in this case.

BACKGROUND

The DEQ Board issued a *Final Order* in this matter on May 9, 2024. REC 3695–3720. The Final Order found that 1) DEQ acted reasonably and in accordance with law when it determined that Perpetua will have legal control of the Stibnite Road Access Route such that it could properly be excluded from consideration as ambient air, 2) DEQ acted reasonably and in accordance with law when it determined that Perpetua will have physical and practical control of the Stibnite Road Access Route such that it could properly be excluded from consideration as ambient air, 3) DEQ acted reasonably and in accordance with law when it allowed Perpetua to submit some plans after the PTC was issued, 4) the PTC includes enforceable conditions that will achieve 93.3% dust control, and 5) DEQ did not act reasonably and in accordance with law when it analyzed the ambient arsenic air concentrations for the Stibnite Gold Project. REC 3717. The *Final Order* remanded the ambient arsenic air concentration issue back to the Hearing Officer for additional fact-finding. REC 3717.

On May 23, 2024, Petitioners the Nez Perce Tribe, Idaho Conservation League, and Save the South Fork Salmon filed a *Petitioners' Motion for Clarification and/or Reconsideration* of the *Final Order.* REC 3721–3727. On May 23, 2024, Respondent/Intervenors DEQ and

Perpetua filed a *Joint Motion for Reconsideration and/or Clarification of Final Order* and *Memorandum in Support of Joint Motion for Reconsideration and/or Clarification of Final Order*. REC 3728–3730. On June 3, 2024, Petitioners filed *Petitioners Response Opposing DEQ/Perpetua's Motion for Reconsideration*. REC 3757–3761. On June 4, 2024, DEQ and Perpetua filed a *Joint Motion to Strike Petitioners Response*. REC 3823–3827. The motions raised several issues including that the DEQ Board: 1) vacate the PTC while the matter was on remand or order an amended Application for Permit to Construction be filed, 2) reconsideration of the *Final Order* including clarification of its effective date, 3) reconsider its decision on the ambient arsenic concentrations, 4) hold additional hearings on the arsenic issues before issuing the *Final Order*, 5) reconsider or clarify the instructions on remand to the Hearing Officer.

On June 12, 2024, the DEQ Board issued an *Order on Petitions for Reconsideration and/or Clarification of Final Order* ("Order on Reconsideration"). REC 3835–T3843 The DEQ Board denied all the requests for reconsideration/clarification except the request for clarification of the effective date of the *Final Order*. REC 3842. The DEQ Board stayed issuance of the *Final Order* until the remand before the Hearing Officer was complete and all statutory deadline for revies of the Hearing Officer's Order had run. REC 3840 . The case was remanded to the Hearing Officer and a hearing was held October 17–18, 2024. The Hearing Officer issued a *Findings of Fact, Conclusions of Law, and Preliminary Order* on January 7, 2025. REC 7091–7118. On January 21, 2025, Petitioners filed their *Petitioners' Petition for Review of January 7, 2025 Preliminary Order, Memorandum in Support, and Request for Hearing.* REC 7119–7145. The Petition requested a review of three issues: 1) That the 16/70 adjustment for arsenic was unlawful and not supported by the evidence, 2) the five-year rolling average was not reasonable, and 3) the PTC conditions were insufficient to limit production from West End Pit and/or non-

West End Pit sources to meet arsenic limits. REC 7122. On January 24, 2025, Save the South Fork Salmon filed its *Motion for Reconsideration of the Final Order*. REC 7146–7185. On February 24, 2025, the DEQ Board denied the *Motion for Reconsideration* without prejudice finding that, given it stay of the *Final Order*, the Motion was not timely filed. REC 7343–7348.

On May 27, 2025, the Board issued its *Final Order*. REC 7358–7373. The *Final Order* found: 1) there was Sufficient Evidence to Demonstrate that DEQ Acted Reasonably and in Accordance with Law in Using a Five-Year Rolling Average for T-RACT, 2) there was Sufficient Evidence to Demonstrate that DEQ Acted Reasonably and in Accordance with Law in Not Including Additional Permit Conditions Limiting the Non-West End Pit Production Limit, 3) there was Sufficient Evidence to Demonstrate that DEQ Acted Reasonably and in Accordance with Law When it Applied the 16/70 Adjustment. REC 7371. The Final Order was final as to all issues presented, as well as to all issues previously decided in the Final Order issued in this matter on May 9, 2024. REC 7371.

On June 6, 2025 Petitioners Save the South for Salmon filed *Petitioner's Save the South Fork Salmon Motion for Reconsideration Based on New Evidence and Memorandum in Support*. REC 7374–7391.

ANALYSIS

The Motion for Reconsideration seeks to have the DEQ Board reconsider its *Final Order* based on new evidence in the form of the Forest Service's FEIS and ROD. Petitioners argue that the FEIS and ROD provide new evidence demonstrating that Perpetua will not have legal control to preclude public access over the Stibnite Access Road. In support of this argument, Petitioners cite multiple portions of the FEIS that refer to the Stibnite Access Road as a "public road."

Petition at 4–7. However, the Petitioners failed to site[1] the following language found in the Stibnite Gold Project Final Environmental Impact Statement Errata ("FEIS Errata"):

> During operations, the public access road through the Operations Area Boundary would provide seasonal use, open to all vehicles; access would not be provided in winter when impassable (current county maintenance standards) and signs would inform the public of seasonal and temporary closures. Public vehicles passing through would be required to check-in with mine personnel at the North or South SGP entry points and would receive a safety briefing and would also be required to check-out with SGP personnel upon exiting the SGP. For safety purposes, public access would be separated from other SGP roads by berms, security fencing, and the underpass to allow the public road to pass beneath the mine haul road. No stopping or deviating from the public access road would be allowed. Perpetua could restrict access to any vehicles due to concerns related to public or employee health and safety, such as during road construction and maintenance, blasting, highwall scaling, mining in the immediate area of the road, and similar operations. *Because public use of the road would be subject to Perpetua's control measures on general use, the public access road is not considered a public road.*

Declaration of Julia Thrower at Exhibit 3 p. 1 (italics in original).

This language from the FEIS Errata supports rather than undermines the DEQ Board's analysis set forth in its May 9, 2024 *Final Order*. REC 3698–3703. In the May 9, 2024 *Final* Order, the DEQ Board analyzed the conditions set forth in the PTC that would require Perpetua maintain legal, physical, and practical controls over the Stibnite Access Road such that it was properly excluded from consideration as ambient air. *Id.* Nothing in the language from the FEIS Errata cited above undermines that analysis. Indeed, the italicized last sentence makes it clear that the USFS is expressly not designating the Stibnite Access Road as a "public road." Thus,

[1] While Petitioners do make reference to the FEIS Errata in Footnote 2 on page 12 of their Petition, they do not cite it in the body of their petition, nor deal with it substantively in their analysis.

Petitioners have not presented any new evidence that would cause the DEQ Board to have to reevaluate the analysis it provided on this issue in the May 9, 2024 *Final Order.*

CONCLUSION

Based on the foregoing it is hereby ordered the Motion for Reconsideration is denied.

Dated this 27th day of June, 2025

Dr. John R. MacMillan
Chairman, Idaho Board of Environmental Quality

CERTIFICATE OF SERVICE

I HEREBY CERTIFY that on this 27th day of June 2025, I caused to be served a true and correct copy of the foregoing ORDER ON SAVE THE SOUTH FORK SALMON'S MOTION FOR RECONSIDERATION BASED ON NEW EVIDENCE DATED JUNE 6, 2025 by transmitting a copy thereof in the manner listed below:
