## 1 Introduction

This report presents preliminary assessment and site inspection (PA/SI) results for the Gold Creek Area Mines in Bonner County, Idaho. Under a cooperative agreement with the US Environmental Protection Agency (EPA), Region 10, the Idaho Department of Environmental Quality (DEQ) provides technical support for performing the PA/SI process at various mine and industrial sites located on private, state, or mixed ownership (public and private) lands. Additional information about DEQ's PA program is found at <http://www.deq.idaho.gov/preliminary-assessments>.

DEQ initiated the PA program in February 2002 to prioritize and assess potentially contaminated sites. Due to accessibility and funding considerations, priority is given to sites where potential contamination poses the most substantial threat to human health or the environment. Recently, DEQ focused efforts in areas where residential and recreational developments are encroaching on historic mining districts. Priority is also given to mining districts where groups or clusters of sites can be cost-effectively assessed on a watershed basis.

This PA/SI assesses the threat posed to human health and the environment and determines the need for additional investigation. The PA/SI work in the Gold Creek Area Mines focused on accessing upstream and downstream areas of groups or clusters of mine sites in a watershed. This focus helped to assess changes since past investigations and remediation work at specific mine sites so DEQ can prioritize future actions.

## 2 Site Background

The Gold Creek Area Mines are located in Bonner County, Idaho, on the southeastern tip of Lake Pend Oreille within the Lakeview mining district approximately 21 miles north-northeast of Coeur d'Alene (Figure 1). The sites are located on a mix of private property and US Forest Service (USFS) land.

### 2.1 Site Location

Site Name:	Gold Creek Area Mines
Location:	Immediately south of Lakeview, Idaho. Can be accessed via Lakeview Road and Bunco Road (332) as well as numerous forest service roads.
County:	Bonner
Latitude/Longitude:	47°55'59.08"N, 116°26'29.94"W

The Gold Creek Area Mines site includes 14 mines, one mill site, and a waste repository located within an approximate 5- x 6.5-mile mountainous area near the small community of Lakeview, Idaho, on the south end of Lake Pend Oreille (Figure 1). The elevation of the mapped area ranges from 2,063 feet at lake level to 5,146 feet on Green Mountain. Most slopes are steep with an estimated average gradient of 30 degrees, varying from 10 degrees and less on the tops of ridges

to over 60 degrees on the lakeshore cliffs. The drainage consists of deeply entrenched streams, some of which show marked control by joints and faults.

Gold Creek is a small 12,465-acre tributary watershed to the southern end of Lake Pend Oreille, and is an important Bull Char (Bull Trout) spawning stream of the Lake Pend Oreille tributaries (DEQ 2003).

## **2.2 Ownership History**

Ownership of property around Gold Creek Area Mines is a mix of private and federal lands (Figure 1).

## **2.3 Climatology**

Climate information is based on a summary for the Avery Ranger Station 2, Idaho (Station 100528), located northwest of the Gold Creek Mines, obtained from the Western Regional Climate Center (WRCC 2019). Based on data collected from 1968 to 2005, total annual precipitation averages 37.63 inches with a total annual snowfall average of 77.6 inches. The driest months of the year are July and August. The average annual high temperature is 56.0°F, and the average annual low temperature is 35.2°F. August is the hottest month with an average high temperature of 83.8°F. January is the coldest month with an average low temperature of 20.7°F.

## **2.4 Operations and Waste Characteristics**

The geology and history of past mining activities help to understand the levels of production, commodities, and potential waste types at the site. This information documents the importance of historic mining districts and operations when reevaluated from an economics, multiple land use, human health risks, and ecological risks perspective. Historical research identifies the potential contaminants of concern, estimates the magnitude of waste at the site, locates potentially dangerous physical hazards such as open adits and shafts, and identifies historical land uses that coincide with mining. Numerous sources were researched before visiting the site and conducting the PA/SI.

### **2.4.1 Historical Site Operations**

Table 1 summarizes the commodities and production for each mine (IGS 2018). Key documents containing geology and history of past mining activities include the following:

- *History of Selected Mines in the Lakeview Mining District, Bonner County, Idaho* (Mitchell 2000)
- *Geology and Mineral Resources of the Lakeview Mining District, Idaho* (Kun 1974)
- *Site Inspection Report for the Abandoned and Inactive Mines in Idaho on U.S. Forest Service Lands (Region 1), Idaho Panhandle National Forest: Volume II: Gold Creek Drainage* (Bennett and Mitchell 2003)

**Table 1. Commodities and production (IGS 2018).**

<b>Mine</b>	<b>Commodities (Production)</b>
Conjecture Mine	Antimony, barium, copper (10,001–50,000 lb), gold (101–500 oz), lead (50,001–100,000 lb), silver (50,001–100,000 oz), tungsten, zinc (50,001–100,000 lb)
Weber Mine (alias: Rainbow, New Rainbow Mine, Webber)	Antimony, copper (5,001–10,000 lb), gold (1,001–5,000 oz), lead (500,001–2,000,000 lb), silver (500,001–2,000,000 oz), zinc (10,001–50,000 lb)
Keep Cool Mine	Copper (10,001–50,000 lb), gold (101–500 oz), lead (100,001–500,000 lb), silver (10,001–50,000 oz), zinc (500,001–2,000,000 lb)
Idaho Lakeview Mine (alias: Idaho-Hewer Mine, Venezuela [various spellings], Hewer, Western Adventure)	Copper (10,000–50,000 lb), gold (101–500 oz), lead (100,001–500,000 lb), silver (100,001–500,000 oz), zinc (50,001–100,000 lb)
Perry Mine	Silver
Silver Leaf Group Prospect	Gold (0–50 oz), lead (1,001–5,000 lb), silver (501–1,000 oz), zinc
New Rainbow Mine (alias: Rainbow, Silver Bell, Silver Bull)	Gold (0–50 oz), lead (10,001–50,000 lb), silver (5,001–10,000 oz), zinc
Mine	Commodities (Production)
Bloody Shirt Prospect (alias: Max Dunn Prospect)	Silver
Wieberg (alias: Wiberg)	Lead, silver
Long Hand Mine (alias: Princess Panama, Shooneah Mining Co. Ltd., Swastika)	Copper, gold, lead, silver
Grafter Mine (alias: Hidden Treasure Mine)	Antimony, lead (101–500 lb), silver (1,001–5,000 oz)
Gold Creek Iron Deposit	Iron
Lakeview Limestone Quarries	Dolomite
Rennie Prospect (alias: Comet)	Lead (501–1,000 lb), silver (101–500 oz)

Notes: oz = ounce, lb = pound

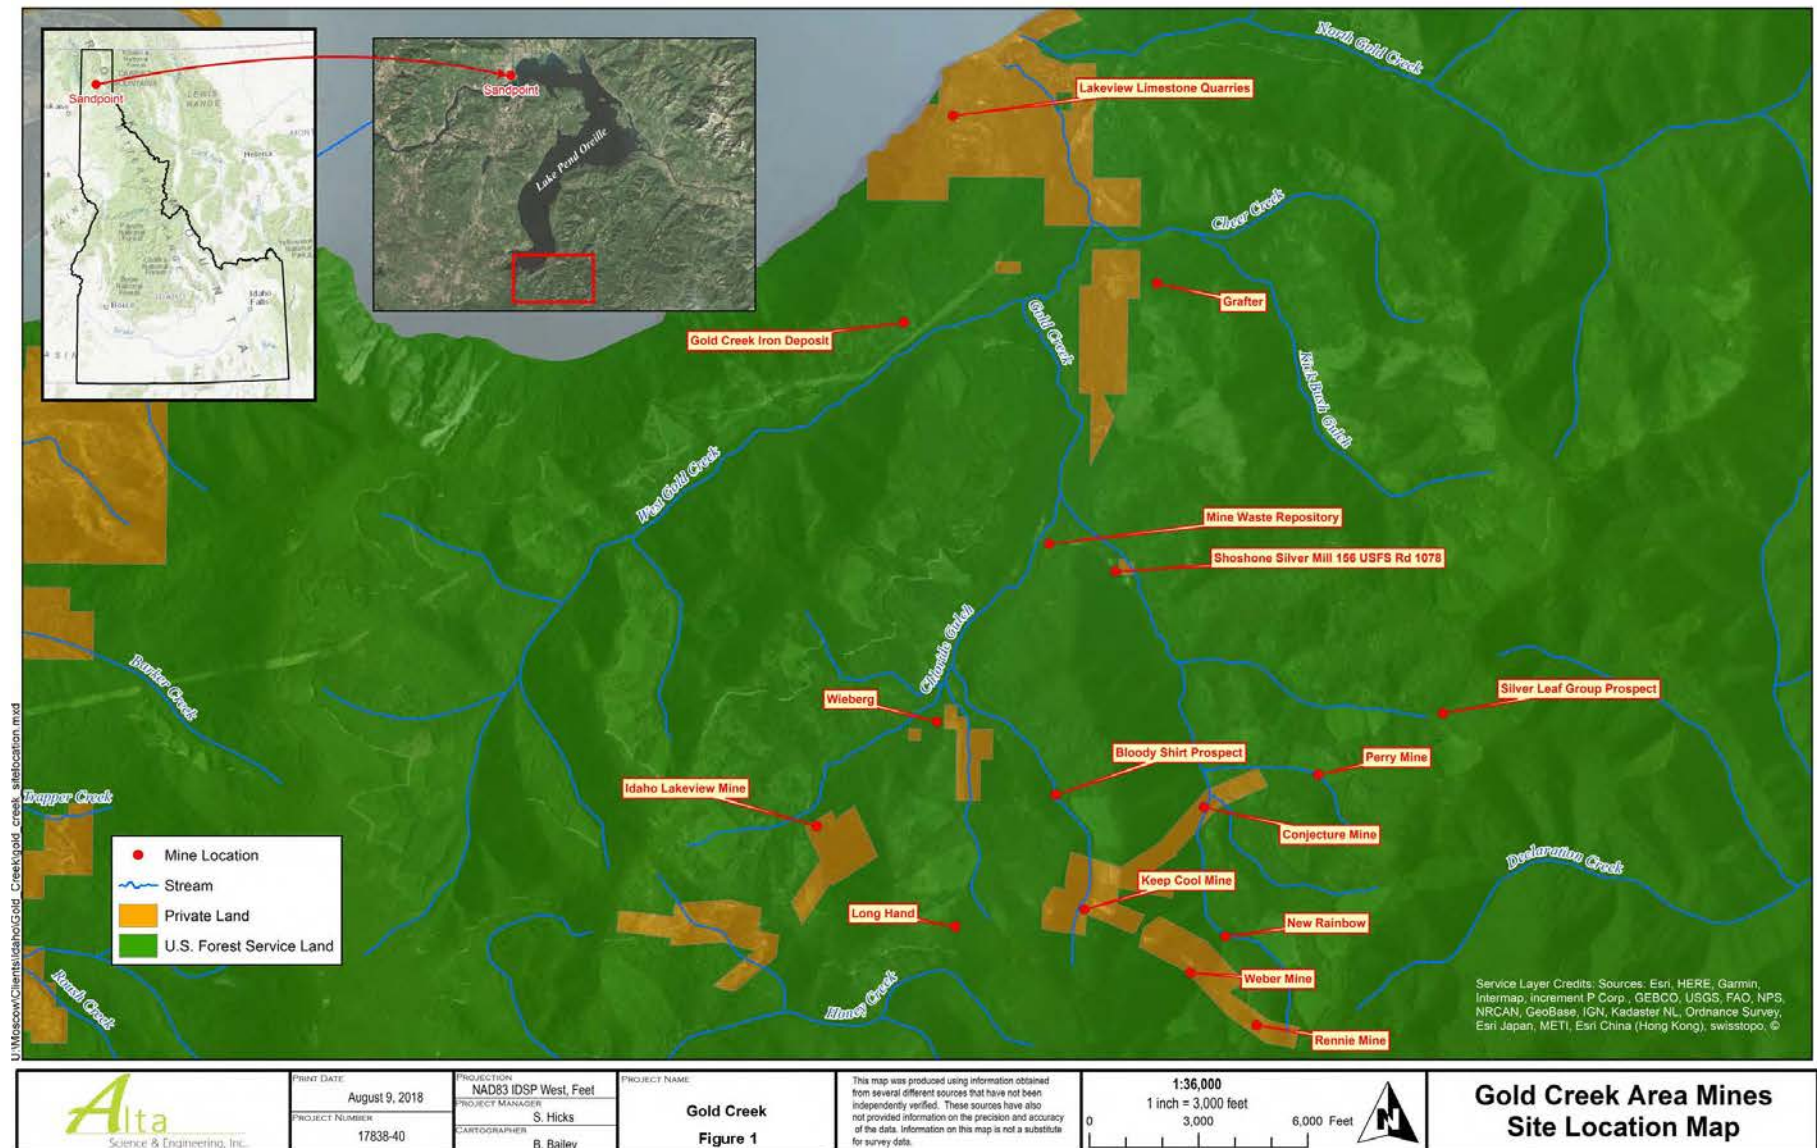

Figure 1. Site location map.

Other areas of interest include the Shoshone Silver Mill and the waste repository located on USFS property.

The Shoshone Silver Mill is located on Gold Creek downstream of the Conjecture Mine and upstream of the confluence with Chloride Gulch. The mill was built in 1980, operated intermittently in the 1980s, and, although still considered an active facility, was last operated in 1992 (Mitchell 2000; Weston 2002). The mill received ore from Weber Mine, Keep Cool Mine, and Idaho Lakeview Mine (Weston 2002). Potential sources on the site include a tailing pond and two ore stockpiles (Weston 2002).

The mine waste repository is located on USFS land above the confluence of Gold Creek and Chloride Gulch. The repository received contaminated material from the Idaho Lakeview Mine and Conjecture Mine sites and contains approximately 97,705 cubic yards of mine waste materials. The repository is covered with a protective barrier.

#### **2.4.2 Sources**

Based on information from previous site investigations, sources in the Gold Creek drainage include nine adits with seepage or flowing water; sixteen waste dumps; two sites with tailings; multiple ore piles at the Shoshone Silver Mill; open pits and trenches at select sites; residual and/or capped waste remaining from remedial actions at two sites; and a covered mine waste repository.

The contaminants of concern are metals and inorganic compounds associated with historical mining activities, primarily arsenic, lead, and manganese. Other contaminants of concern include antimony, beryllium, cadmium, chromium, cobalt, copper, cyanide, mercury, nickel, selenium, silver, and zinc, which were above background soil values (Weston 2002).

### **2.5 Previous Investigations**

Information on previous investigations conducted at Gold Creek Area Mines is presented below.

#### **2.5.1 Gold Creek Shoshone Silver Mill PA/SI Report**

In April 2002, EPA and Roy F. Weston, Inc. (Weston) completed a PA/SI for the Gold Creek Shoshone Silver Mill. The PA/SI determined if the site had the potential to release hazardous substances that pose a threat to human health or the environment, identified waste sources at the site, evaluated the threat posed by migration of or exposure to hazardous substances from the site, collected information for EPA's Hazard Ranking System, and determined if further site investigations were warranted (Weston 2002).

In July and August 2001, 15 source samples (ore and soil), 31 sediment samples, and 5 surface soil samples were collected. Source characterization samples were collected from soils located by aboveground storage tanks, tailings pond, ore piles, and surface soils surrounding various drums, burn pile, scrap metal pile, and former landfill. Additional soil samples were collected from overland flow paths and background sample locations. Sediment samples were collected in Gold Creek downstream of the mill site, in Gold Creek's delta to Lake Pend Oreille, and from background sample locations.

Metals results from source locations above the background sample results include antimony (17.4–641 milligrams per kilogram [mg/kg]), arsenic (254–55,500 mg/kg), beryllium (1.5 mg/kg), cadmium (1.2–33.3 mg/kg), chromium (13.9 mg/kg), cobalt (46.5 mg/kg), copper (74.2–915 mg/kg), lead (161–9,550 mg/kg), manganese (3,840–8,440 mg/kg), mercury (0.12–3.6 mg/kg), nickel (51.6 mg/kg), selenium (1.2–2.4 mg/kg), silver (3.2–236 mg/kg), zinc (407.33–14,700 mg/kg), and cyanide (2.8 mg/kg). Metals from Gold Creek sediments downstream of the mill site above the background sample results include arsenic, cadmium, copper, lead, silver, and zinc. No metals were above background sample results in the Gold Creek delta sediment samples.

### **2.5.2 Mine Waste Characterization and Repository Evaluation of Various Mines in the Gold Creek Drainage, Lakeview Mining District**

In June 2002, the US Department of Agriculture Forest Service and Maxim Technologies, Inc. (Maxim) completed a site investigation and characterization for six mine waste sites in the Gold Creek drainage (Conjecture Mine, New Rainbow Mine, Weber Mine, Keep Cool Mine, Idaho Lakeview Mine, and Chloride Gulch). The site investigation and characterization obtained additional information on the nature, extent, and magnitude of mine waste in support of potential remedial actions (Maxim 2002).

As part of the site investigation, mine waste, sediment, and soil samples were collected at the sites and submitted to analytical laboratories for total and leachable metals, acid/base accounting, and physical properties testing. Approximately 220,000 cubic yards of mine waste at 19 waste areas was identified at the six source sites. Total metals results were compared to cleanup guidelines, and leachable metals results were compared to aquatic standards.

Total metals that exceeded cleanup guidelines included antimony, arsenic, cadmium, lead, and manganese. Leachable metals exceeding aquatic life standards include arsenic, cadmium, copper, lead, mercury, and zinc.

### **2.5.3 Site Inspection Report for the Abandoned and Inactive Mines in Idaho on USFS Lands (Region 1), Idaho Panhandle National Forest: Volume II: Gold Creek Drainage**

In 2003, the Idaho Geological Survey, under a participation agreement with the USFS, completed a site inspection of abandoned and inactive mines located in the Gold Creek drainage within the Idaho Panhandle National Forest. The site investigation identified all mines with possible human health, environmental, and/or safety issues on USFS land (Bennett and Mitchell 2003).

Site investigation and sampling was conducted at 22 mining properties. Sampling included grab and composite soil samples as well as surface water samples at sites identified with potential problems. Water sample results were compared to maximum contaminant levels (MCLs) and aquatic life standards. Soil sample results were compared to median values of metals in rock from the Belt Supergroup and to background limits established by the EPA for the Clark Fork Superfund site.

Results from mill waste samples exceeded the Clark Fork Superfund background levels for arsenic, copper, lead, and zinc, and leach test results showed arsenic, cadmium, and lead are leachable from tailings. Total metals that exceeded MCLs or aquatic life standards in one or more surface water sample include aluminum, arsenic, cadmium, copper, iron, lead, manganese, mercury, and zinc. Sites with potential environmental hazards based on soil and water results include Bloody Shirt Prospect, Wieberg, Silver Leaf Group Prospect, Conjecture Mine, Idaho Lakeview Mine, Keep Cool Mine, New Rainbow Mine, and Shoshone Mill.

## **2.6 2018 Site Investigation Activities**

Under contract with DEQ, Alta Science and Engineering, Inc. (Alta) personnel visited the Gold Creek Area Mines and collected sediment and surface water samples from August 27–30, 2018. Sample collection information, field parameters, stream discharge, and analytical results are presented in this section.

Sampling and laboratory analysis was conducted according to the *Gold Creek Area Mines Site Investigation Sampling and Analysis (SAP)/Quality Assurance Project Plan (QAPP)* (Alta 2018a). All samples were collected, handled, and stored following the SAP/QAPP requirements. Surface water samples and sediment samples were submitted to SVL Analytical, Inc. (SVL) laboratory for analysis.

Site photographs are included in Appendix A. Laboratory data reports are included in Appendix B. Review and discussion of QA/QC samples is presented in the “QA/QC Review of the 2018 Gold Creek Area Mines Site Investigation Sampling” memorandum (Alta 2018b) in Appendix C.

### **2.6.1 Sediment Sampling**

Sediment samples were collected using dedicated plastic scoops, and collected material was placed into 8-ounce glass jars. Materials, such as rocks and vegetation, were removed during sampling. Per QA/QC requirements, duplicate samples were collected; no rinsate blanks were collected because dedicated sampling equipment was used. Samples were delivered by Alta to SVL for analysis of total metals (antimony, arsenic, beryllium, cadmium, chromium, cobalt, copper, iron, lead, manganese, mercury, nickel, selenium, silver, and zinc) by method EPA 3050B and 6010B/D and total cyanide by method SW 846 9012B (EPA 1996a; EPA 1996b; EPA 2018; EPA 2004).

A total of 33 sediment samples (excluding QA/QC samples) were collected: 10 samples from dry streams and 23 samples collocated with surface water samples (Figure 2). Sediment sample location descriptions and laboratory analytical results are presented in Table 2.

### **2.6.2 Surface Water Sampling**

Surface water samples were collected using the dip sampling method from the *Techniques of Water-Resources Investigations (TWRI), Book 9, Chapter A4, Collection of Water Samples* (USGS 2006) and described in the project QAPP (Alta 2018a). QA/QC samples included duplicates, field blanks, and rinsate blanks. Samples were delivered to SVL for analysis of total metals (antimony, arsenic, beryllium, cadmium, chromium, cobalt, copper, iron, lead, manganese, mercury, nickel, selenium, silver, and zinc) by EPA SW-846 test methods 3050B,

6010B/D, and 6020B, and total cyanide by SW-846 method 9012B (EPA 1996a; EPA 1996b; EPA 2018; EPA 2014; EPA 2004).

A total of 23 surface water samples (excluding QA/QC samples) were collected from locations downstream and upstream of source areas (Figure 2). Surface water sample location descriptions, laboratory analytical results, and water quality parameters are presented in Table 3.

### **3 Migration/Exposure Pathways**

This section discusses the 2018 PA/SI surface water and sediment sampling results for the overland migration pathways.

#### **3.1 Surface Water Migration Pathway**

The overland or surface water migration pathway target distance limit (TDL) begins at the probable point of entry (PPE) of surface water runoff from the site to a surface water body and extends downstream for 15 miles. Fourteen mine and/or mill sites with potential sources to surface water are located on Gold Creek and its tributaries. In all cases, the 15-mile TDL is completed in Lake Pend Oreille.

During the site visit in August 2018, no surface water was observed at 10 sample locations; however, sediment samples were collected from the dry streams. The presence of a surface water pathway may be seasonal (e.g., during snow melt) or only present during high precipitation events at these locations.

Flowing water was observed within the 15-mile TDL on Gold Creek, West Gold Creek, North Gold Creek, Chloride Gulch, and many of the tributaries to these creeks. Surface water and collocated sediment samples were collected at all sample sites with flowing water. Sample locations are shown in Figure 2.

##### **3.1.1 Overland Route and Target Distance Limit**

Waste sources at Gold Creek Area Mines are located in mountainous terrain. The majority of surface water flowing through the site originates in Gold Creek and its tributaries. Gold Creek originates approximately 5 miles south-southeast of Lakeview, Idaho, on the southern end of Lake Pend Oreille. Gold Creek flows generally north to its confluence with Lake Pend Oreille. Tributaries to Gold Creek include West Gold Creek, Chloride Gulch, and Kick Bush Gulch as well as numerous smaller, unnamed tributaries.

Surface water and collocated sediment samples were collected from instream locations upstream and downstream of source areas (Figure 2).

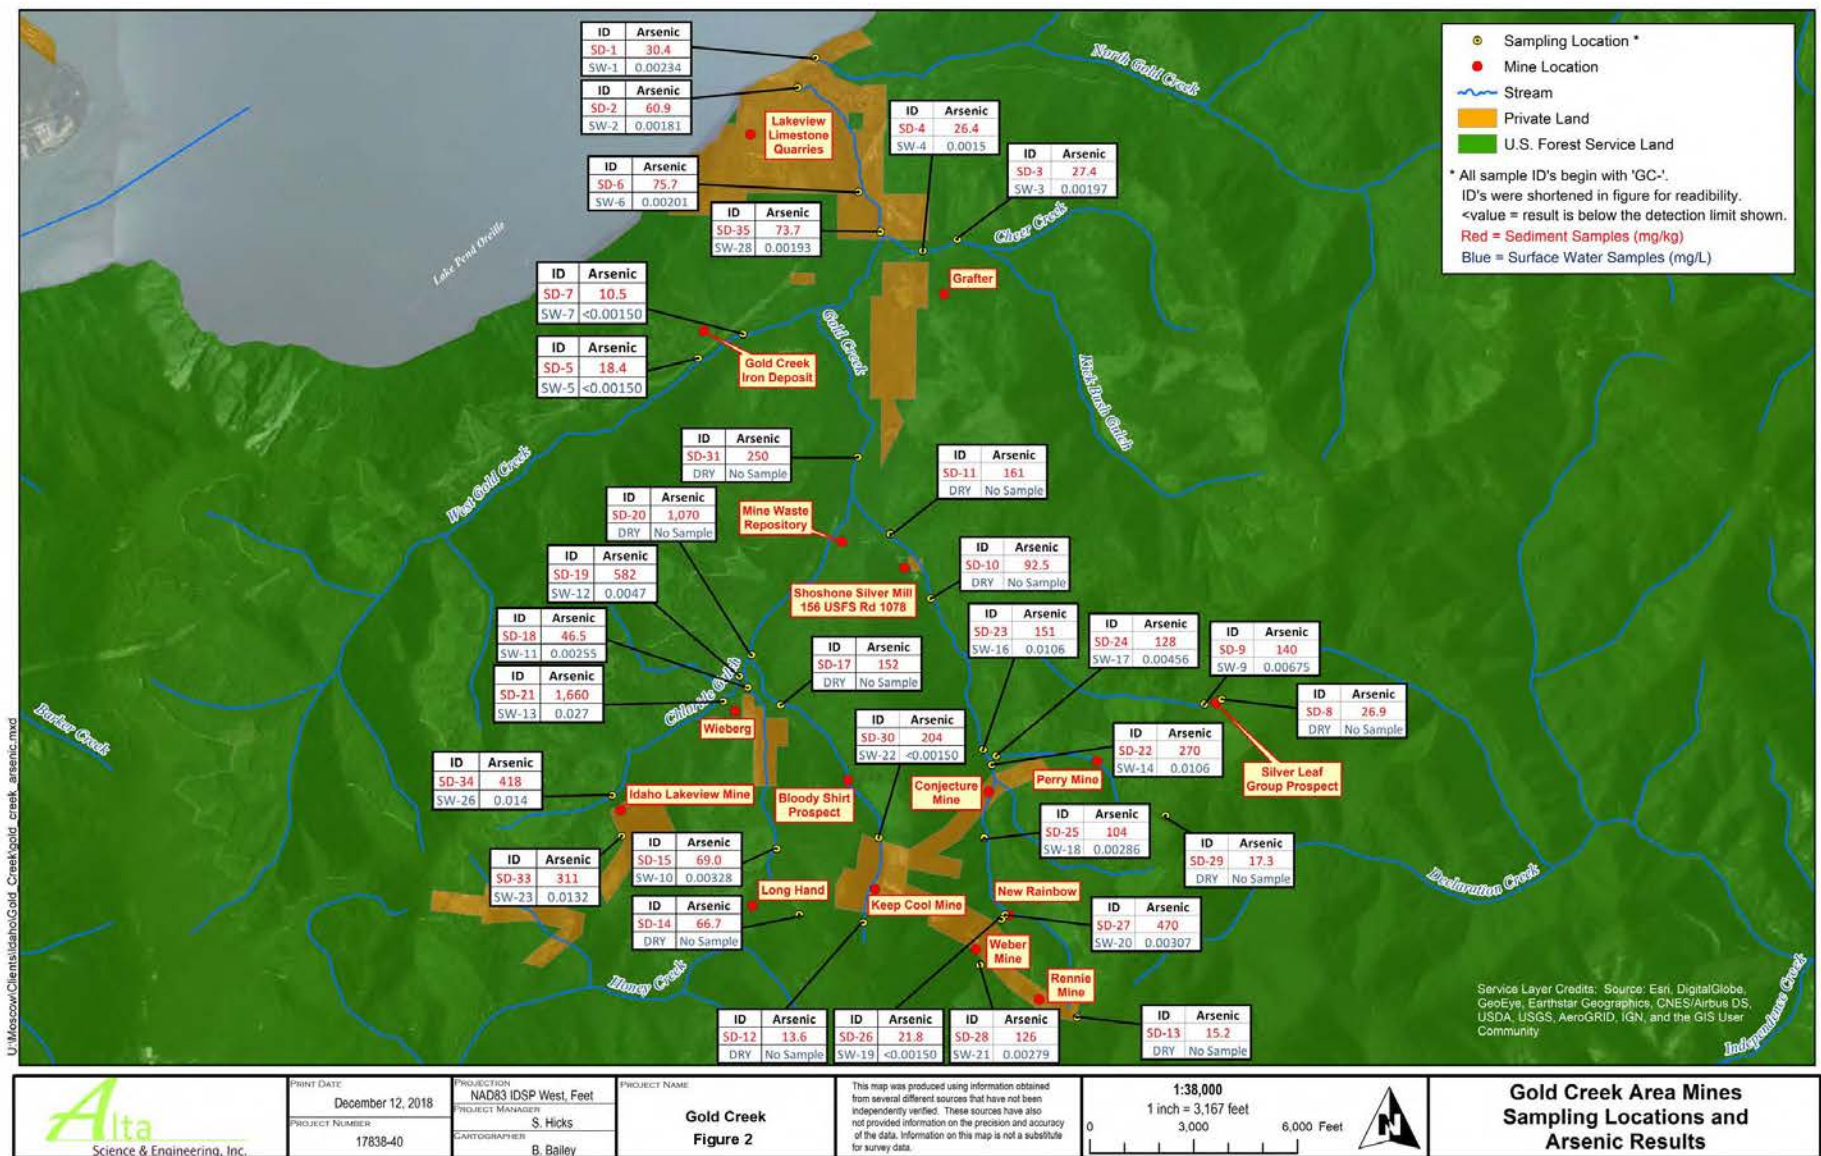

Figure 2. Sample locations and arsenic results.

Table 2. Sediment sample analytical results.

NA = not available  
<value = result is below the detection limit shown

### **Upstream/Background Locations**

Nine sample locations were identified upstream of all source areas. Of the nine identified sites, five were dry and only sediment samples were collected; four had flowing water where both sediment and surface water samples were collected. These locations establish background values for streams within the 15-mile TDL (Figure 2):

- West Gold Creek upstream of the Gold Creek Iron Deposit.
- Chloride Gulch upstream of the Idaho Lakeview Mine.
- Unnamed tributary to Chloride Gulch upstream of Long Hand Mine.
- Unnamed tributary to Chloride Gulch upstream of the Keep Cool Mine.
- Gold Creek upstream of the Rennie Mine (near the headwaters).
- Unnamed tributary to Gold Creek upstream of the Perry Mine.
- Unnamed tributary to Gold Creek upstream of the Silver Leaf Group Prospect.
- Unnamed tributary to Gold Creek upstream of the Weber Mine.
- Kick Bush Creek below the confluence with Cheer Creek and upstream of the Grafter Mine.

### **Downstream Locations**

Twenty-four sample locations were identified downstream of source areas and confluences of streams with upstream source areas. Of the 24 identified sites, 19 sites had flowing water where surface water and collocated sediment samples were collected; sediment samples were collected from five dry locations. These locations were evaluated for potential impacts to surface water and sediment from historic mining practices in streams within the 15-mile TDL.

Because some streams contain multiple source locations, many downstream sample locations also serve as upstream sample locations for additional downstream source sites and/or confluences of side drainages that also contain source sites (Figure 2):

- West Gold Creek
  - One sample downstream of the Gold Creek Iron Deposit and upstream of the confluence with Gold Creek.
- Chloride Gulch
  - One sample downstream of the Idaho Lakeview Mine and upstream of Wieberg.
  - One sample downstream of Wieberg and upstream of the confluence with unnamed tributaries.
  - One sample downstream of the unnamed tributary where Wieberg is located and upstream of the unnamed tributary where the Bloody Shirt Prospect is located.
  - One sample below the confluence with an unnamed tributary where the Keep Cool Mine and Bloody Shirt Prospect are located. This sample is upstream of the mine waste repository at the confluence of Chloride Gulch and Gold Creek.
- Chloride Gulch Unnamed Tributaries
  - One sample downstream of the Long Hand Mine and upstream of Wieberg.
  - One sample downstream of Wieberg and upstream of the confluence with Chloride Gulch.
  - One sample downstream of the Keep Cool Mine and upstream of the Bloody Shirt Prospect.

- One sample downstream of the Bloody Shirt Prospect.
- Gold Creek
  - One sample downstream of the Rennie Mine and upstream of the New Rainbow Mine.
  - One sample downstream of the New Rainbow Mine and upstream of the Conjecture Mine.
  - One sample downstream of the Conjecture Mine and upstream of an unnamed tributary where the Perry Mine is located.
  - One sample downstream of the unnamed tributary where the Perry Mine is located and upstream of the unnamed tributary where the Silver Leaf Group Prospect is located.
  - One sample downstream of the unnamed tributary where the Silver Leaf Group Prospect is located and upstream of the Shoshone Silver Mill.
  - One sample downstream of the Shoshone Silver Mill and upstream of the confluence of Gold Creek with Chloride Gulch.
  - One sample downstream of the confluence of Chloride Gulch and Gold Creek. This sample is also downstream of the mine waste repository.
  - One sample downstream of the confluence of West Gold Creek and Gold Creek.
  - One sample downstream of Kick Bush Creek and Gold Creek. This sample is upstream of the Lakeview Limestone Quarries.
- Gold Creek Unnamed Tributaries:
  - One sample downstream of the Perry Mine and upstream of the confluence with Gold Creek.
  - One sample downstream of the Silver Leaf Group Prospect and upstream of the confluence with Gold Creek.
  - One sample downstream of the Weber Mine and upstream of the confluence with Gold Creek.
- Kick Bush Creek (tributary to Gold Creek):
  - One sample downstream of the Grafter Mine and upstream of the confluence with Gold Creek.
- Lake Pend Oreille:
  - One sample in Lake Pend Oreille below the mouth of Gold Creek.
  - One sample in Lake Pend Oreille below the mouth of North Gold Creek. This location serves as a downstream sample for the North Gold Creek drainage, which contains a number of mine sites. Sites on North Gold Creek are not part of this PA/SI, and the single sample should determine if mines in the North Gold Creek drainage are also potentially impacting water quality near the lake.

Sediment samples are compared to EPA Regional Screening Levels (RSLs) for residential and industrial soils. Surface water samples are compared to EPA MCLs for drinking water and RSLs for tap water. Results are discussed below. Sediment sample results are shown in Table 2, surface water results are shown in Table 3, and arsenic results are presented on Figure 2.

### **3.1.1.1 Gold Creek**

#### **Sediment Sample Results**

Arsenic concentrations in sediment samples from Gold Creek exceed the EPA RSL for both residential soil (0.68 mg/kg) and industrial soil (3 mg/kg) at all Gold Creek sample locations (Table 2). Antimony concentrations exceed the EPA RSL for residential soil (31 mg/kg) at five downstream locations; lead concentrations exceed the EPA RSL for residential soil (400 mg/kg) at three downstream locations; and manganese exceeds the EPA RSL for residential soil (1,800 mg/kg) at two downstream locations and in the background sample. Analytes greater than three times the corresponding background sample at some locations include antimony, arsenic, cadmium, lead, silver, and zinc.

A review of analytes with concentrations greater than three times the background sample from upstream to downstream, comparing each concentration to the previous upstream sample, shows the following (Table 2):

- Antimony increases below New Rainbow and Conjecture Mines.
- Arsenic increases below New Rainbow Mine, Conjecture Mine, Shoshone Silver Mill, Chloride Gulch, and the mine waste repository.
- Cadmium increases below New Rainbow Mine, the unnamed tributary where the Perry Mine is located, and the Shoshone Silver Mill.
- Lead increases below New Rainbow Mine, Conjecture Mine, and the unnamed tributary where the Perry Mine is located.
- Silver increases below New Rainbow Mine and the unnamed tributary where the Perry Mine is located.
- Zinc increases below New Rainbow Mine, Conjecture Mine, the unnamed tributary where the Perry Mine is located, and the Shoshone Silver Mill.

#### **Surface Water Sample Results**

Arsenic, antimony, and zinc were detected in surface water samples from Gold Creek. Arsenic concentrations exceeded the EPA RSL for tap water (0.000052 milligram per liter [mg/L]) in all detected samples and the EPA MCL for drinking water (0.01 mg/L) in two samples. Antimony concentrations exceeded the EPA MCL (0.006 mg/L) for all three detected samples (Table 3). The background sample location for Gold Creek was dry. At the furthest upstream sample (GC-SW-19) location with flowing water (upstream of all other sample locations), arsenic and antimony were not detected. GC-SW-19 serves as an alternate background sample for Gold Creek. Arsenic concentrations in surface water are more than three times the corresponding background sample at two sample locations downstream of the Conjecture Mine.

### **3.1.1.2 Gold Creek Unnamed Tributaries**

#### **Sediment Sample Results**

Arsenic concentrations in sediment samples from unnamed tributaries to Gold Creek exceed the EPA RSL for both residential and industrial soil at all sample locations (Table 2). Antimony concentrations exceed the EPA RSL for residential soil at both sample locations on the unnamed tributary where the Weber Mine is located. Lead concentrations exceed the EPA RSL for both

residential and industrial soil at the downstream location on the unnamed tributary where the Weber Mine is located. Manganese exceeds the EPA RSL for residential soil at the downstream location on the unnamed tributary where the Weber Mine is located. Analytes greater than three times the corresponding background sample at some locations include antimony, arsenic, cadmium, lead, manganese, mercury, silver, and zinc.

A review of analytes with concentrations greater than three times the background sample from upstream to downstream, comparing each concentration to the previous upstream sample, shows the following (Table 2):

- Antimony, cadmium, and manganese increase below the Weber Mine.
- Arsenic, silver, and zinc increase below the Perry Mine, Silver Leaf Group Prospect, and Weber Mine.
- Lead increases below the Silver Leaf Group Prospect and Weber Mine.
- Mercury increases below the Silver Leaf Group Prospect.

### **Surface Water Sample Results**

All samples on Gold Creek unnamed tributaries where flowing water was present exceeded the EPA RSL for arsenic in tap water, and one sample exceeded the EPA RSL for antimony in tap water (0.0078 mg/L) and the EPA MCL for antimony (Table 3). The background sample locations on two of three unnamed tributaries were dry. On the flowing unnamed tributary to Gold Creek where the Weber Mine is located, the downstream sample from the Weber Mine has an antimony concentration greater than three times the corresponding background sample (Table 3, Figure 2).

#### **3.1.1.3 Kick Bush Creek**

##### **Sediment Sample Results**

Arsenic concentrations in sediment samples from Kick Bush Creek, a tributary to Gold Creek, exceed the EPA RSL for both residential and industrial soil for both sample locations (Table 2). No other analytes exceed EPA RSLs, and no analytes were greater than three times the corresponding background sample.

##### **Surface Water Sample Results**

Arsenic concentrations in surface water in Kick Bush Creek exceeded the EPA RSL for tap water (Table 3). The background sample (GC-SW-3) arsenic concentration was slightly higher than the downstream sample below the Gafter Mine.

#### **3.1.1.4 Chloride Gulch**

##### **Sediment Sample Results**

Arsenic concentrations in sediment samples from Chloride Gulch, a major tributary to Gold Creek, exceed the EPA RSL for both residential and industrial soil for all sample locations (Table 2). Antimony concentrations exceed the EPA RSL for residential soil at one downstream sample location; lead concentrations exceed the EPA RSL for residential soil at two downstream sample locations; and manganese exceeds the EPA RSL for residential soil at one downstream

location. Analytes greater than three times the corresponding background sample include antimony, arsenic, cadmium, lead, manganese, mercury, silver, and zinc.

A review of analytes with concentrations greater than three times the background sample from upstream to downstream, comparing each concentration to the previous upstream sample, show the following (Table 2):

- Antimony, lead, manganese, silver, and zinc increase below Wieberg and the unnamed tributary where the Keep Cool Mine and Bloody Shirt Prospect are located.
- Arsenic and mercury increase below Wieberg.
- Cadmium increases below Wieberg, the unnamed tributary where the Long Hand Mine and Wieberg are located, and the unnamed tributary where the Keep Cool Mine and Bloody Shirt Prospect are located.

### **Surface Water Sample Results**

Detected analytes on Chloride Gulch surface water samples include antimony in one of four samples, arsenic in all four samples, and zinc in three of four samples (Table 3). The detected antimony concentration exceeds the EPA MCL. Arsenic concentrations exceed the EPA MCL in three of four samples and the EPA RSL for tap water in all four samples. The most downstream sample on Chloride Gulch, upstream of the mine waste repository and the confluence of Gold Creek, was dry.

#### ***3.1.1.5 Chloride Gulch Unnamed Tributaries***

### **Sediment Sample Results**

Arsenic concentrations in sediment samples from unnamed tributaries to Chloride Gulch exceed the EPA RSL for both residential and industrial soil at all sample locations (Table 2). Lead concentrations exceed the EPA RSL for residential soil at two downstream sample locations and the EPA RSL for industrial soil at one downstream location. Manganese exceeds the EPA RSL for residential soil at one downstream location. Analytes greater than three times the corresponding background sample location include antimony, arsenic, cadmium, chromium, copper, lead, manganese, silver, and zinc.

A review of analytes with concentrations greater than three times the background sample from upstream to downstream, comparing each concentration to the previous upstream sample, shows antimony, arsenic, cadmium, copper, lead, manganese, silver, and zinc increasing below the Keep Cool Mine, and chromium increasing below the Long Hand Mine.

### **Surface Water Sample Results**

Arsenic concentrations exceed the EPA RSL for tap water in two of three samples from Chloride Gulch unnamed tributaries (Table 3). The background sample locations for both unnamed tributaries were dry.

#### ***3.1.1.6 West Gold Creek***

### **Sediment Sample Results**

Arsenic concentrations in sediment samples from West Gold Creek, a major tributary to Gold Creek, exceed the EPA RSL for both residential and industrial soil for both sample locations (Table 2). No other analytes exceed EPA RSLs, and no analytes were greater than three times the corresponding background sample.

### **Surface Water Sample Results**

Surface water samples from West Gold Creek had no detects for total metals or total cyanide.

#### **3.1.1.7 Lake Pend Oreille**

### **Sediment Sample Results**

Arsenic concentrations in both sediment samples (from the mouths of Gold Creek and North Gold Creek in Lake Pend Oreille) exceed the EPA RSLs for both residential and industrial soil. No other analytes exceed EPA RSLs. Arsenic at the mouth of Gold Creek is greater than three times the corresponding background sample (Table 2).

### **Surface Water Sample Results**

Arsenic was detected in surface water at the mouth of North Gold Creek to Lake Pend Oreille and exceeds the EPA RSL for tap water (Table 3). No upstream/background sample was collected for North Fork Gold Creek. Arsenic from the mouth of Gold Creek to Lake Pend Oreille exceeds the EPA RSL for tap water but is not significantly greater than the corresponding background sample. No other analytes were detected in Lake Pend Oreille surface water samples.

### **3.1.2 Drinking Water Targets**

Three public water system (PWS) sources are located within the Gold Creek Area Mines. A surface water intake (T1090074S1) for the Lakeview Townsite Improvement Association (PWS #ID1090074) is located on a spring to North Gold Creek east of Lakeview. The source water delineation showing the area of contribution to this intake is depicted on Figure 3. This PWS serves approximately 50 people through 36 connections (DEQ 2018).

Well E0005609 for the Gold Creek Lodge (PWS #ID1090048) is located near Gold Creek south of Lakeview. Figure 4 shows the source water delineation and the area of contribution to this intake. This PWS serves approximately 25 people through 9 connections (DEQ 2018).

Well E0005610 for the Lakeview Resort (PWS #ID1090076) is located near North Gold Creek just north of Lakeview. Figure 5 shows the location of this intake. An assessment for this PWS has not been conducted (DEQ 2018).

Surface water quality upstream of the PWS intakes for the Lakeview Townsite Improvement Association and Lakeview Resort are located on North Gold Creek and were not evaluated during this PA/SI. The section of Gold Creek immediately upstream of the PWS for the Gold Creek Lodge was dry, and surface water quality could not be evaluated.

Figure 3. Lakeview Townsite Improvement Association PWS.

Figure 4. Gold Creek Lodge PWS.

Figure 5. Lakeview Resort PWS.

### 3.1.3 Human Food Chain Targets

Fishing is not permitted on Gold Creek and its tributaries and within a 100-yard radius into Lake Pend Oreille from the mouth of Gold Creek. Outside of the closure area at the mouth of Gold Creek, Lake Pend Oreille is open to fishing; however, fish catch statistics could not be located. Game fish species in Lake Pend Oreille include Bluegill, Brown Trout, Bull Trout, Bullhead Catfish, Crappie, Cutthroat Trout, Kokanee, Lake Trout, Largemouth Bass, Mountain Whitefish, Northern Pike, Rainbow Trout, Smallmouth Bass, Walleye, and Yellow Perch (IDFG 2018).

Idaho Department of Health and Welfare (IDHW) issued fish consumption advisories for Lake Pend Oreille for Lake Trout, Whitefish, and Bass (IDHW 2018).

### 3.1.4 Environmental Targets

Sensitive species can have large habitat ranges that overlap the vicinity of the Gold Creek Area Mines. The resource list obtained during a search of the Information and Planning Conservation System (USFWS 2018a), identified the following species in the Gold Creek Area Mines and the 15-mile TDL corridor:

- Mammals: Canada Lynx, *Lynx Canadensis*, threatened species and North American Wolverine, *Gulo gulo luscus*, proposed threatened species.
- Fishes: Bull Trout, *Salvelinus confluentus*, threatened species and threatened species-designated critical habitat.

Wetlands are present along the 15-mile TDL (USFWS 2018b). A freshwater emergent wetland, freshwater pond, and number of freshwater forested/shrub wetlands are present within the project area. Gold Creek drains directly to a lake habitat (Figure 6).

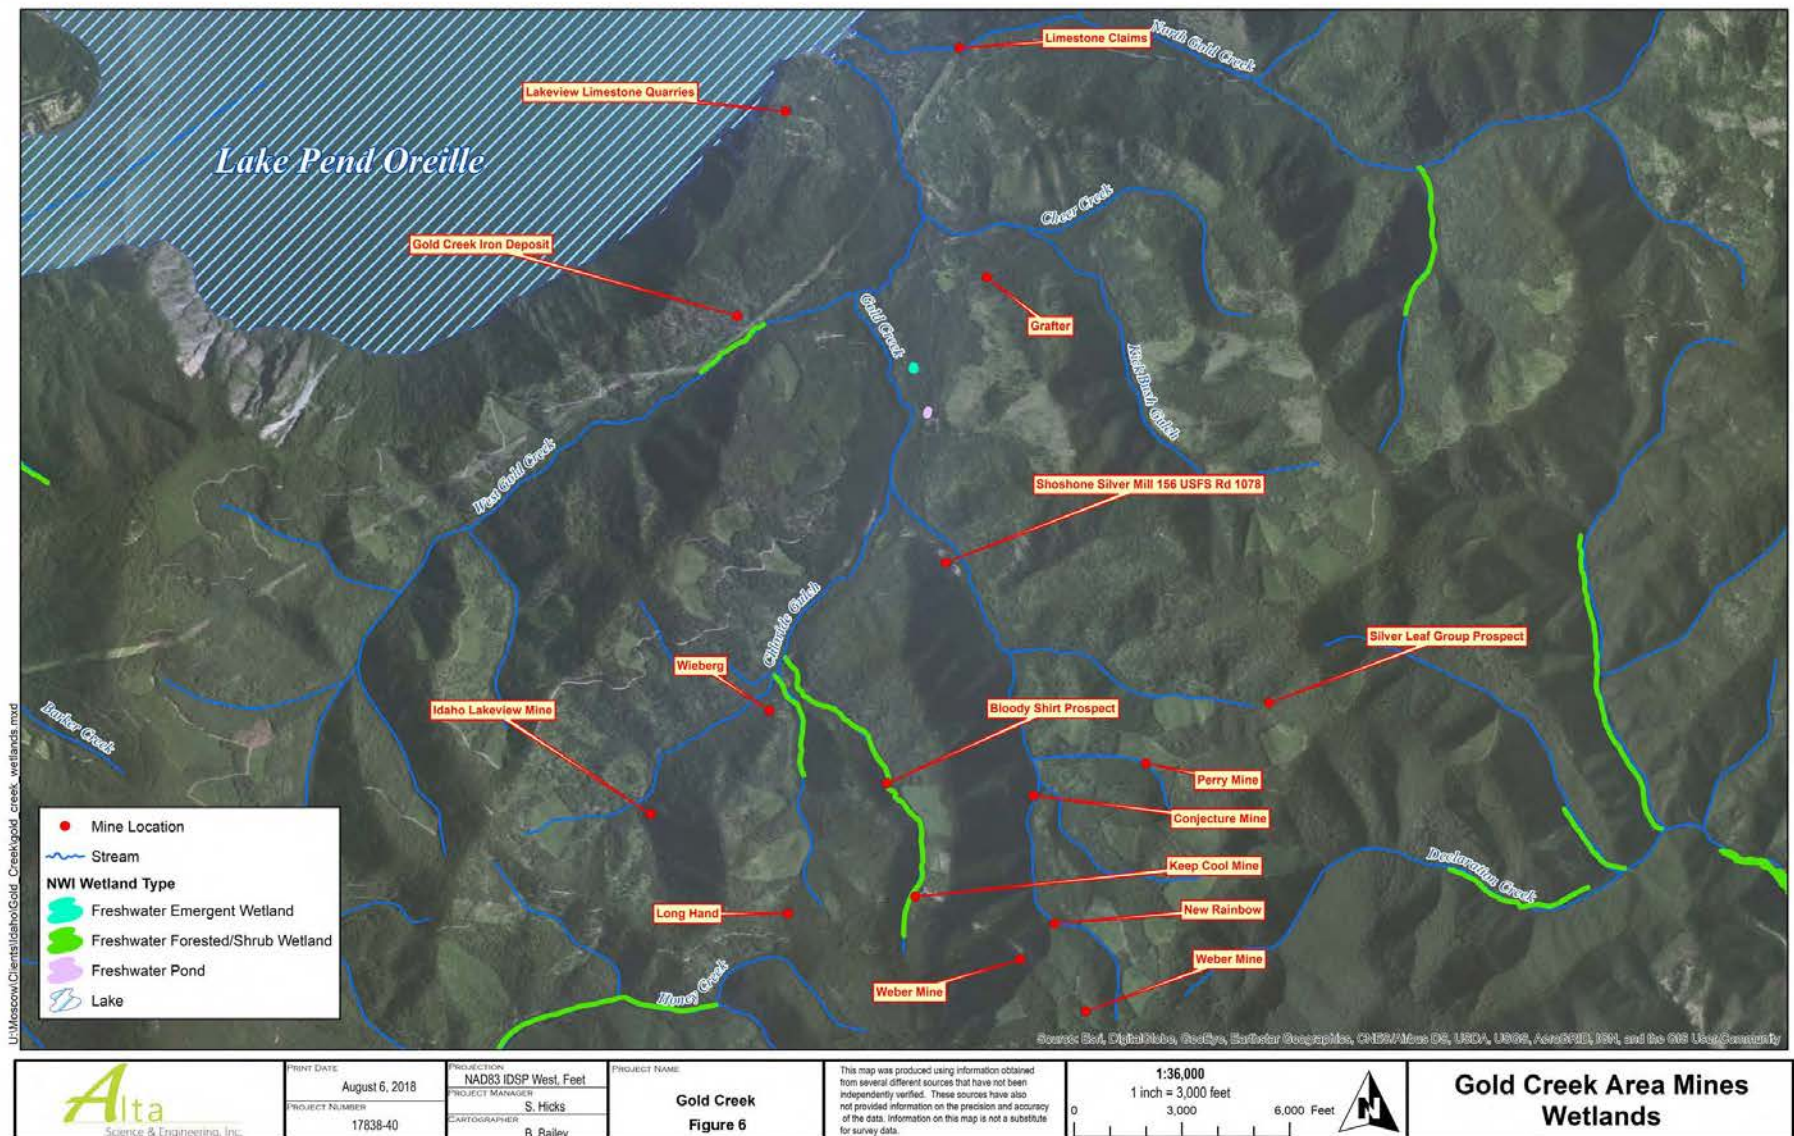

Figure 6. Gold Creek Area Mines wetland.

## 4 Summary and Conclusions

This PA/SI was conducted to assess the threat posed by the Gold Creek Area Mines to human health and the environment and to determine the need for additional investigation. The PA/SI work in the Gold Creek Area Mines focused on accessing upstream and downstream areas of groups or clusters of mine sites in a watershed. This focus helped to assess changes since past investigations and remedial actions at specific mine sites so DEQ can prioritize future actions.

- Arsenic concentrations in sediment at all sample locations and lead concentrations at two locations exceed EPA RSLs for both residential and industrial soils. Antimony, lead, and manganese concentrations exceed EPA RSLs for residential soils at eight, six, and seven locations, respectively.
- Metals concentrations in sediment samples greater than three times the corresponding background sample at some locations include antimony, arsenic, beryllium, cadmium, chromium, copper, lead, manganese, mercury, silver, and zinc.
- A review of analytes with concentrations greater than three times the background sample, comparing each concentration to the previous upstream sample, shows increases in metals concentrations below nine mine and/or mill sites: New Rainbow Mine, Conjecture Mine, Shoshone Silver Mill, Weber Mine, Perry Mine, Silver Leaf Group Prospect, Wieberg, Keep Cool Mine, and Long-Hand Mine.
- Arsenic and antimony in some surface water samples exceed EPA MCLs for drinking water and/or EPA RSLs for tap water; however, no significant increases were detected of metals concentrations above corresponding background samples in surface water.
- Detections of arsenic and other metals discussed in this PA/SI identify a concern for human health and the environment; therefore, DEQ recommends **Additional Actions** for this site.
- Further investigation should focus on the areas with the highest concentrations of arsenic and other metals in sediments, in particular, Gold Creek, Chloride Gulch, their tributaries, and the mines upstream of the measured increases in metals concentrations within these drainages. To further investigate the impacts of historic mining on the watershed, DEQ recommends obtaining access agreements with private landowners and/or collecting additional samples in publicly accessible areas within these drainages.

Solid samples are analyzed on an as-received, wet-weight basis, unless otherwise requested.

Sample preparation is defined by the client as per their Data Quality Objectives.

This report supercedes any previous reports for this Work Order. The complete report includes pages for each sample, a full QC report, and a notes section.

Analyses were performed in accordance with SVL standard operating procedures and calibrations were performed and met SVL internal QC criteria.

The results presented in this report relate only to the samples, and meet all requirements of the NELAC Standards unless otherwise noted.

**Notes and Definitions**

Q3	Sample was received with improper chemical preservation.
Q5	Sample was received with inadequate preservation, but preserved by the laboratory.
LCS	Laboratory Control Sample (Blank Spike)
RPD	Relative Percent Difference
UDL	A result is less than the detection limit
0.30R>S	% recovery not applicable; spike level is less than 30% of the sample concentration
<RL	A result is less than the reporting limit
MRL	Method Reporting Limit
MDL	Method Detection Limit
N/A	Not Applicable

Solid samples are analyzed on an as-received, wet-weight basis, unless otherwise requested.

Sample preparation is defined by the client as per their Data Quality Objectives.

This report supercedes any previous reports for this Work Order. The complete report includes pages for each sample, a full QC report, and a notes section.

Analyses were performed in accordance with SVL standard operating procedures and calibrations were performed and met SVL internal QC criteria.

The results presented in this report relate only to the samples, and meet all requirements of the NELAC Standards unless otherwise noted.

**Case Narrative: X8H0766**

11/8/18 DG Report is reissued with dry weight corrected results.

**Notes and Definitions**

D2	Sample required dilution due to high concentration of target analyte.
M3	The spike recovery value is unusable since the analyte concentration in the sample is disproportionate to spike level. The LCS was acceptable.
LCS	Laboratory Control Sample (Blank Spike)
RPD	Relative Percent Difference
UDL	A result is less than the detection limit
0.30R>S	% recovery not applicable; spike level is less than 30% of the sample concentration
<RL	A result is less than the reporting limit
MRL	Method Reporting Limit
MDL	Method Detection Limit
N/A	Not Applicable

Solid samples are analyzed on an as-received, wet-weight basis, unless otherwise requested.

Sample preparation is defined by the client as per their Data Quality Objectives.

This report supercedes any previous reports for this Work Order. The complete report includes pages for each sample, a full QC report, and a notes section.

Analyses were performed in accordance with SVL standard operating procedures and calibrations were performed and met SVL internal QC criteria.

The results presented in this report relate only to the samples, and meet all requirements of the NELAC Standards unless otherwise noted.

### Case Narrative: X8H0769

11/8/18 DG Report is reissued with dry weight corrected results.

**Notes and Definitions**

D2	Sample required dilution due to high concentration of target analyte.
M2	Matrix spike recovery was low, but the LCS recovery was acceptable.
M3	The spike recovery value is unusable since the analyte concentration in the sample is disproportionate to spike level. The LCS was acceptable.
LCS	Laboratory Control Sample (Blank Spike)
RPD	Relative Percent Difference
UDL	A result is less than the detection limit
0.30R>S	% recovery not applicable; spike level is less than 30% of the sample concentration
<RL	A result is less than the reporting limit
MRL	Method Reporting Limit
MDL	Method Detection Limit
N/A	Not Applicable

## **Appendix C. QA/QC Review**

---

## INTERNAL PROJECT MEMORANDUM

**To:** Shelley Hicks, Project Manager, Kellogg  
Susan Spalinger, Principal, Moscow

**From:** Mara Thorhaug, Quality Assurance Manager, Kellogg

**Date:** December 11, 2018

**Job Code:** IDEQ Contract K157 TO #33A 17838-40

**Subject:** QA/QC Review of the 2018 Gold Creek Area Mines Site Investigation Sampling

---

### Section 1 Introduction

This memorandum provides a summary of the data validation and data quality assessment performed for sampling conducted from August 27 through August 30, 2018 at the Gold Creek Area Mines. Sampling procedures and the quality assurance/quality control review followed guidelines set forth in the following documents:

- Sampling Analysis Plan (SAP) / Quality Assurance Project Plan (QAPP) for Gold Creek Area Mines Site Investigation (Alta 2018)
- National Functional Guidelines for Inorganic Superfund Methods Data Review (USEPA 2017)
- Guidance on Environmental Data Verification and Data Validation (USEPA 2002)
- Guidance for Labeling Externally Validated Laboratory Analytical Data for Superfund Use (USEPA 2009)

This memo discusses the data quality assessment and data validation performed for the Sample Delivery Groups (SDGs) listed in Table 1. Data qualifiers used in this review are defined in the *National Functional Guidelines for Inorganic Superfund Methods Data Review* (USEPA 2017).

**Table 1. SDG Data Validation Summary**

Laboratory	SDG	Matrix	Analyses	Data Validation Level (USEPA 2009)	Review Conducted by
SVL	X8H0766	Sediment	Total Metals, <sup>a</sup> Percent solids, Total Cyanide	Stage 2A	Alta
	X8H0769	Sediment			
	X8H0764-1 <sup>b</sup>	Water	Total Metals, <sup>a</sup> Total Cyanide		

<sup>a</sup> Antimony (Sb), arsenic (As), beryllium (Be), cadmium (Cd), chromium (Cr), cobalt (Co), copper (Cu), iron (Fe), lead (Pb), manganese (Mn), mercury (Hg), nickel (Ni), selenium (Se), silver (Ag), and zinc (Zn).

SDG = sample delivery group

USEPA = U.S. Environmental Protection Agency

<sup>b</sup>The water samples were originally analyzed by method 6010D; however, the reporting limits for As and Sb were higher than the USEPA RSLs. Sb and As were reanalyzed using method 6020B. This QA/QC review does not include a review of the 6010D Sb and As results for water.

## Section 2 Data Validation and Quality Review Summary

SVL Analytical, Inc. (SVL) submitted all required deliverables. Attachment A contains the final reports from SVL. Alta's review of the field data and Stage 2A validation of the analytical data are summarized in Table 2. Procedures/checks that require further discussion are explained below the table, as necessary.

**Table 2. Alta's Data Quality Review Summary**

Data Validation/Review Procedure or Check	Acceptable Frequency? <sup>a</sup>	Acceptable Performance? <sup>b</sup>	Data Qualified?	Discussion Item Number
Sample condition upon receipt at laboratory	-	Y	N	-
Preservation	-	Y	N	1
Holding times	-	Y	N	-
Laboratories followed specified analytical methods	-	Y	N	-
Method Blanks	Y	Y	N	-
Laboratory Control Samples	Y	Y	N	-
Matrix Spikes	Y	Y	N	2
Laboratory Duplicates and Matrix Spike Duplicates	Y	Y	N	3

Field Blanks (Table 3)	Y	Y	N	-
Rinsate Blanks (Table 3)	Y	Y	N	4
Field Duplicates (Table 4)	Y	Y	N	-

<sup>a</sup> Frequencies and criteria as defined in the SAP/QAPP (Alta 2018).

<sup>b</sup> As defined in the SAP/QAPP (Alta 2018), *National Functional Guidelines for Inorganic Superfund Data Review* (USEPA 2014), or based on professional judgment of the data validator.

-- = not applicable

1. The sodium hydroxide (NaOH) container for sample GC-SW-4 was received by SVL with a pH of 6, which is less than the requirement of pH 10. SVL adjusted the pH. No data were qualified.
2. Matrix Spikes:
  - a. For SDG X8H0766, the matrix spike result for iron was not usable because the parent sample concentration was more than four times the spike concentration. No data were qualified because the laboratory control sample (LCS) results were acceptable.
  - b. For SDG X8H0769, the matrix spike results for iron, lead, manganese, and zinc were not usable because the parent sample concentrations were more than four times the spike concentrations. No data were qualified because the LCS results were acceptable.
3. Matrix Spike Duplicates:
  - a. For SDG X8H0766, the matrix spike/matrix spike duplicate (MS/MSD) results for manganese were not usable because the parent sample concentration was more than four times the spike concentration; therefore, it is not possible to assess precision. No data were qualified.
  - b. For SDG X8H0769, the MS/MSD results for iron, lead, manganese, and zinc were not usable because the parent sample concentrations were more than four times the spike concentrations. No data were qualified.
4. The SAP/QAPP specified that a rinsate blank would be collected for every day of sampling. One rinsate blank was collected on the day when equipment required decontamination (specifically, the churn splitter, which was only used on the first day). All other surface water samples were collected by filling the sample bottle directly from the stream.

**Table 3. Field and Rinsate Blank Analysis**

Sample Type:	Field Blanks		Rinsate Blank
Site Name:	GC-SW-25	GC-SW-27	GC-SW-8

RPD = Relative Percent Difference = ABS(X1-X2)/((X1+X2)/2)  
X1 = Original Concentration  
X2 = Duplicate Concentration  
mg/kg = milligrams per kilogram  
mg/L = milligrams per liter  
NA = not applicable  
RPD goal of 20% for water, 35% for sediment (Alta 2018)

### **Section 3      Overall Assessment**

Based on this data quality review, the laboratory and field data are determined to be of acceptable quality and meet the data quality objectives for representativeness and comparability. Accuracy and precision are also considered acceptable. Final data and qualifiers are included in Attachment A, as no additional qualifiers were applied during this data validation. No laboratory or field data were rejected based on this data quality review. Completeness for this sampling event is calculated at 100% according to the method in the SAP/QAPP (Alta 2018).

Solid samples are analyzed on an as-received, wet-weight basis, unless otherwise requested.

Sample preparation is defined by the client as per their Data Quality Objectives.

This report supercedes any previous reports for this Work Order. The complete report includes pages for each sample, a full QC report, and a notes section.

Analyses were performed in accordance with SVL standard operating procedures and calibrations were performed and met SVL internal QC criteria.

The results presented in this report relate only to the samples, and meet all requirements of the NELAC Standards unless otherwise noted.

**Notes and Definitions**

Q3	Sample was received with improper chemical preservation.
Q5	Sample was received with inadequate preservation, but preserved by the laboratory.
LCS	Laboratory Control Sample (Blank Spike)
RPD	Relative Percent Difference
UDL	A result is less than the detection limit
0.30R>S	% recovery not applicable; spike level is less than 30% of the sample concentration
<RL	A result is less than the reporting limit
MRL	Method Reporting Limit
MDL	Method Detection Limit
N/A	Not Applicable

Solid samples are analyzed on an as-received, wet-weight basis, unless otherwise requested.

Sample preparation is defined by the client as per their Data Quality Objectives.

This report supercedes any previous reports for this Work Order. The complete report includes pages for each sample, a full QC report, and a notes section.

Analyses were performed in accordance with SVL standard operating procedures and calibrations were performed and met SVL internal QC criteria.

The results presented in this report relate only to the samples, and meet all requirements of the NELAC Standards unless otherwise noted.

**Case Narrative: X8H0766**

11/8/18 DG Report is reissued with dry weight corrected results.

**Notes and Definitions**

D2	Sample required dilution due to high concentration of target analyte.
M3	The spike recovery value is unusable since the analyte concentration in the sample is disproportionate to spike level. The LCS was acceptable.
LCS	Laboratory Control Sample (Blank Spike)
RPD	Relative Percent Difference
UDL	A result is less than the detection limit
0.30R>S	% recovery not applicable; spike level is less than 30% of the sample concentration
<RL	A result is less than the reporting limit
MRL	Method Reporting Limit
MDL	Method Detection Limit
N/A	Not Applicable

Solid samples are analyzed on an as-received, wet-weight basis, unless otherwise requested.

Sample preparation is defined by the client as per their Data Quality Objectives.

This report supercedes any previous reports for this Work Order. The complete report includes pages for each sample, a full QC report, and a notes section.

Analyses were performed in accordance with SVL standard operating procedures and calibrations were performed and met SVL internal QC criteria.

The results presented in this report relate only to the samples, and meet all requirements of the NELAC Standards unless otherwise noted.

**Case Narrative: X8H0769**

11/8/18 DG Report is reissued with dry weight corrected results.

Method	Analyte	Units	MSD Result	Spike Result	Spike Level	% Rec.	RPD	RPD Limit	Batch ID	Analyzed	Notes	

**Classical Chemistry Parameters**

SW846 9012B	Cyanide (total)	mg/kg	3.79	3.91	2.96	80.0	3.1	20	X836035	07-Sep-18		
-------------	-----------------	-------	------	------	------	------	-----	----	---------	-----------	--	--

---

**Notes and Definitions**

D2	Sample required dilution due to high concentration of target analyte.
M2	Matrix spike recovery was low, but the LCS recovery was acceptable.
M3	The spike recovery value is unusable since the analyte concentration in the sample is disproportionate to spike level. The LCS was acceptable.
LCS	Laboratory Control Sample (Blank Spike)
RPD	Relative Percent Difference
UDL	A result is less than the detection limit
0.30R>S	% recovery not applicable; spike level is less than 30% of the sample concentration
<RL	A result is less than the reporting limit
MRL	Method Reporting Limit
MDL	Method Detection Limit
N/A	Not Applicable
