Pocatello, ID 83204

RE: Final $401 Water Quality Certification for the Tin Cup Creek Bridge Project, NWW-2001-2300230

Dear Mr. Hubbard,

Enclosed is the final water quality certification for the above referenced individual Army Corps of Engineers project, (NWW-2001-2300230). No comments were received during the 21-day period that the document was available on our website for public comment. Please make sure that your staff and contracted individuals read the document and are familiar with conditions of the certification (pages 4-7).

If you have questions or concerns, please contact Greg Mladenka at (208) 239-5014 or via email at greg.mladenka@deq.idaho.gov.

Sincerely,

Bruce Olenick
Regional Administrator
Pocatello Regional Office

Enclosure
c: Shane Skaar, Army Corps of Engineers – Boise Regulatory Field Office
404 Permit Application Number: NWW-2001-2300230, Tin Cup Creek Bridge Project  

Nationwide Permit Number: 14, Linear Transportation  

Applicant/Authorized Agent: Idaho Transportation Department – District 5  

Project Location: N 42.986082 Lat., W -111.163002 Lon. - State Highway 34, Milepost 106.8, Wayan, Idaho in Caribou County  

Receiving Water Body: Tincup Creek  

Pursuant to the provisions of Section 401(a)(1) of the Federal Water Pollution Control Act (Clean Water Act), as amended; 33 U.S.C. Section 1341(a)(1); and Idaho Code §§ 39-101 et seq. and 39-3601 et seq., the Idaho Department of Environmental Quality (DEQ) has authority to review activities receiving Section 404 dredge and fill permits and issue water quality certification decisions.

Based upon our review of the joint application for permit, received on August 29, 2019, DEQ certifies that if the permittee complies with the terms and conditions imposed by the permit along with the conditions set forth in this water quality certification, then there is reasonable assurance the activity will comply with the applicable requirements of Sections 301, 302, 303, 306, and 307 of the Clean Water Act, the Idaho Water Quality Standards (WQS) (IDAPA 58.01.02), and other appropriate water quality requirements of state law.

This certification does not constitute authorization of the permitted activities by any other state or federal agency or private person or entity. This certification does not excuse the permit holder from the obligation to obtain any other necessary approvals, authorizations, or permits.

Project Description

Idaho Transportation Department is replacing two (2) perched, failing culverts with a single-span bridge on Highway 34 over Tincup Creek at milepost 106.8. The new bridge will ensure a safe and operational roadway as the current structure does not meet safety and design standards. This project is located within the Caribou-Targhee National Forest.

Antidegradation Review

The WQS contain an antidegradation policy providing three levels of protection to water bodies in Idaho (IDAPA 58.01.02.051).
• Tier I Protection. The first level of protection applies to all water bodies subject to Clean Water Act jurisdiction and ensures that existing uses of a water body and the level of water quality necessary to protect those existing uses will be maintained and protected (IDAPA 58.01.02.051.01; 58.01.02.052.01). Additionally, a Tier I review is performed for all new or reissued permits or licenses (IDAPA 58.01.02.052.07).

• Tier II Protection. The second level of protection applies to those water bodies considered high quality and ensures that no lowering of water quality will be allowed unless deemed necessary to accommodate important economic or social development (IDAPA 58.01.02.051.02; 58.01.02.052.08).

• Tier III Protection. The third level of protection applies to water bodies that have been designated outstanding resource waters and requires that activities not cause a lowering of water quality (IDAPA 58.01.02.051.03; 58.01.02.052.09).

DEQ is employing a water body by water body approach to implementing Idaho’s antidegradation policy. This approach means that any water body fully supporting its beneficial uses will be considered high quality (IDAPA 58.01.02.052.05.a). Any water body not fully supporting its beneficial uses will be provided Tier I protection for that use, unless specific circumstances warranting Tier II protection are met (IDAPA 58.01.02.052.05.c). The most recent federally approved Integrated Report and supporting data are used to determine support status and the tier of protection (IDAPA 58.01.02.052.05).

**Pollutants of Concern**

The primary pollutant of concern for this project is sediment. As part of the Section 401 water quality certification, DEQ is requiring the applicant comply with various conditions to protect water quality and to meet Idaho WQS, including the water quality criteria applicable to sediment.

**Receiving Water Body Level of Protection**

This project is located on Tincup Creek within the Salt River Subbasin assessment unit (AU) 17040105SK003_03 (Tincup Creek – source to Idaho/Wyoming border). This AU does not have any designated beneficial uses. Because DEQ presumes most waters in the state will support cold water aquatic life and primary or secondary contact recreation beneficial uses, undesignated waters are protected for these uses (IDAPA 58.01.02.101.01.a). In addition to these uses, all waters of the state are protected for agricultural and industrial water supply, wildlife habitat, and aesthetics (IDAPA 58.01.02.100).

According to DEQ’s 2016 Integrated Report, this receiving water body AU is fully supporting its assessed uses (IDAPA 58.01.02.052.05.a). As such, DEQ will provide Tier II protection in addition to Tier I for this water body (IDAPA 58.01.02.051.02; 58.01.02.051.01).

**Protection and Maintenance of Existing Uses (Tier I Protection)**

A Tier I review is performed for all new or reissued permits or licenses, applies to all waters subject to the jurisdiction of the Clean Water Act, and requires demonstration that existing uses and the level of water quality necessary to protect existing uses shall be maintained and
protected. The numeric and narrative criteria in the WQS are set at levels that ensure protection of existing and designated beneficial uses.

Water bodies not supporting existing or designated beneficial uses must be identified as water quality limited, and a total maximum daily load (TMDL) must be prepared for those pollutants causing impairment. Once a TMDL is developed, discharges of causative pollutants shall be consistent with the allocations in the TMDL (IDAPA 58.01.02.055.05). Prior to the development of the TMDL, the WQS require the application of the antidegradation policy and implementation provisions to maintain and protect uses (IDAPA 58.01.02.055.04).

In addition to the beneficial uses discussed above, salmonid spawning has also been identified as an existing use. Salmonid spawning is a subcategory of cold water aquatic life. All existing uses will be protected and maintained by applying the numeric and narrative criteria in the Idaho WQS. Therefore, the permit ensures that the level of water quality necessary to protect both existing and designated uses is maintained and protected in compliance with the Tier I provisions of Idaho’s WQS (IDAPA 58.01.02.051.01 and 58.01.02.052.07).

During the construction phase, the applicant will implement, install, maintain, monitor, and adaptively manage best management practices (BMPs) directed toward reducing erosion and minimizing turbidity levels in receiving water bodies downstream of the project. In addition, permanent erosion and sediment controls will be implemented, which will minimize or prevent future sediment contributions from the project area. As long as the project is conducted in accordance with the provisions of the project plans, Section 404 permit, and conditions of this certification, then there is reasonable assurance the project will comply with the state’s numeric and narrative criteria.

**High-Quality Waters (Tier II Protection)**

Tincup Creek is considered high quality for cold water aquatic life and contact recreation. As such, the water quality relevant to aquatic life and recreation beneficial uses of Tincup Creek must be maintained and protected, unless a lowering of water quality is deemed necessary to accommodate important social or economic development.

To determine whether degradation will occur, DEQ must evaluate how the permit issuance will affect water quality for each pollutant that is relevant to cold water aquatic life and contact recreation uses of the Tincup Creek (IDAPA 58.01.02.052.06). As noted above, sediment is the pollutant of concern for this permit. Because sediment is not relevant to contact recreation, project activities will not result in a lowering of water quality with respect to recreational beneficial use support. However, sediment is relevant to the cold water aquatic life beneficial uses and the permittee must minimize the introduction of sediment through the implementation of best management practices (BMPs). This project will adhere to USFS fish biology and hydrology staff recommendations to perform work during in-stream work windows to avoid and minimize impacts to native fish. The new structure will further facilitate fish passage and will also limit long-term impacts to the natural channel. Riparian disturbance will be minimized to avoid erosion and maintain habitat along Tincup Creek. Vegetation impacted by construction activities will be replanted with native species. In-water work will be performed during periods of low flow. The development and implementation of a sediment control plan is required in order to reduce turbidity, as well as monitoring during active construction activity. As such, the project complies with IDAPA 58.01.02.051.02 and IDAPA 58.01.02.052.06.
In order to maintain the ambient water quality conditions, permanent erosion and sediment controls must be implemented, which will minimize or prevent future sediment contributions from the project area. The provisions in the 404 permit, coupled with the conditions of this certification, ensure that degradation to Tincup Creek (assessment unit 17040105SK003_03) will not occur. Therefore, DEQ concludes that this project complies with the Tier II provisions of Idaho’s WQS (IDAPA 58.01.02.051.02; 58.01.02.052.06 and 58.01.02.052.08).

Conditions Necessary to Ensure Compliance with Water Quality Standards or Other Appropriate Water Quality Requirements of State Law

General Conditions

1. This certification is conditioned upon the requirement that any modification (e.g., change in BMPs, work windows, etc.) of the permitted activity shall first be provided to DEQ for review to determine compliance with Idaho WQS and to provide additional certification pursuant to Section 401. Such modifications may not be implemented until DEQ has determined whether additional certification is necessary.

2. DEQ reserves the right to modify, amend, or revoke this certification if DEQ determines that, due to changes in relevant circumstances—including without limitation, changes in project activities, the characteristics of the receiving water bodies, or state WQS—there is no longer reasonable assurance of compliance with WQS or other appropriate requirements of state law.

3. If ownership of the project changes, the certification holder shall notify DEQ, in writing, upon transferring this ownership or responsibility for compliance with these conditions to another person or party. The new owner/operator shall request, in writing, the transfer of this water quality certification to his/her name.

4. A copy of this certification must be kept on the job site and readily available for review by any contractor working on the project and any federal, state, or local government personnel.

5. Project areas shall be clearly identified in the field prior to initiating land-disturbing activities to ensure avoidance of impacts to waters of the state beyond project footprints.

6. The applicant shall provide access to the project site and all mitigation sites upon request by DEQ personnel for site inspections, monitoring, and/or to ensure that conditions of this certification are being met.

7. The applicant is responsible for all work done by contractors and must ensure the contractors are informed of and follow all the conditions described in this certification and the Section 404 permit.

8. If this project disturbs more than 1 acre and there is potential for discharge of stormwater to waters of the state, coverage under the EPA Stormwater Construction General Permit must be obtained. More information can be found at https://www.epa.gov/npdes-permits/stormwater-discharges-construction-activities-region-10.

9. Instream construction must take place during low flow and outside of the cutthroat trout spawning/incubation period of May 1st through July 15th.
10. From the plans, it appears the existing streambed under the structure will be excavated to install riprap to protect the structure. The streambed must be returned to its present invert elevation and proper channel dimensions after this disturbance. Given that this activity has the potential to destabilize the stream bed through this area, grade controls and/or adequate bed material must be incorporated to prevent head-ward cutting and downstream scour.

**Turbidity**

11. Sediment resulting from this activity must be mitigated to prevent violations of the turbidity standard as stipulated under the Idaho WQS (IDAPA 58.01.02). *Any violation of this standard must be reported to the DEQ regional office immediately.*

12. All practical BMPs on disturbed banks and within the waters of the state must be implemented to minimize turbidity. Visual observation is acceptable to determine whether BMPs are functioning properly. If a plume is observed, the project may be causing an exceedance of WQS and the permittee must inspect the condition of the projects BMPs. If the BMPs appear to be functioning to their fullest capability, then the permittee must modify the activity or implement additional BMPs (this may also include modifying existing BMPs).

13. Containment measures such as silt curtains, geotextile fabrics, and silt fences must be implemented and properly maintained to minimize instream sediment suspension and resulting turbidity.

14. Turbidity monitoring must be conducted, recorded, and reported as described below. Monitoring must occur each day during project implementation when project activities may result in turbidity increases above background levels. *A properly and regularly calibrated turbidimeter is required.*

A reading must be taken at a relatively undisturbed area up-current from in-water disturbance or discharge to establish background turbidity levels for each monitoring event. Background turbidity, location, date, and time must be recorded prior to monitoring down-current.

Monitoring must occur every 30 minutes if a visible plume is present approximately 300 feet down-current from the in-water disturbance or point of discharge and within any visible plume. The turbidity, location, date, and time must be recorded for each sample or observation.

Results from the compliance point sampling must be compared to the background levels sampled during each monitoring event. If the downstream turbidity exceeds upstream turbidity by 50 nephelometric turbidity units (NTU) or more, the project is causing an exceedance of the WQS. If an exceedance occurs, the permittee must inspect the condition of the projects BMPs. If the BMPs appear to be functioning to their fullest capability, then the applicant must modify the activity (this may include modifying existing BMPs).

Copies of daily logs for turbidity monitoring must be available to DEQ upon request. The log must include background measurements (in NTUs) or observations; compliance point measurements or observations; comparison of background and compliance point monitoring as a numeric value (in NTUs) or in narrative form; and location, time, and
date for each sampling event. The report must describe all exceedances and subsequent actions taken and the effectiveness of the action including subsequent monitoring.

**Vegetation Protection and Restoration**

15. Disturbance of existing wetlands and native vegetation shall be kept to a minimum.
16. To the maximum extent practical, staging areas and access points should be placed in open, upland areas.
17. Fencing and other barriers should be used to mark the construction areas.
18. Where possible, alternative equipment should be used (e.g., spider hoe or crane).
19. If authorized work results in unavoidable vegetative disturbance, riparian and wetland vegetation shall be successfully reestablished to function for water quality benefit at pre-project levels or improved at the completion of authorized work.

**Management of Hazardous or Deleterious Materials**

20. Petroleum products and hazardous, toxic, and/or deleterious materials shall not be stored, disposed of, or accumulated adjacent to or in the immediate vicinity of waters of the state. Adequate measures and controls must be in place to ensure that those materials will not enter waters of the state as a result of high water, precipitation runoff, wind, storage facility failure, accidents in operation, or unauthorized third-party activities.
21. Vegetable-based hydraulic fluid should be used on equipment operating in or directly adjacent to the channel if this fluid is available.
22. Daily inspections of all fluid systems on equipment to be used in or near waters of the state shall be done to ensure no leaks or potential leaks exist prior to equipment use. A log book of these inspections shall be kept on site and provided to DEQ upon request.
23. Equipment and machinery must be removed from the vicinity of the waters of the state prior to refueling, repair, and/or maintenance.
24. Equipment and machinery shall be steam cleaned of oils and grease in an upland location or staging area with appropriate wastewater controls and treatment prior to entering a water of the state. Any wastewater or wash water must not be allowed to enter a water of the state.
25. Emergency spill procedures shall be in place and may include a spill response kit (e.g., oil absorbent booms or other equipment).
26. In accordance with IDAPA 58.01.02.850, in the event of an unauthorized release of hazardous material to state waters or to land such that there is a likelihood that it will enter state waters, the responsible persons in charge must
   - Make every reasonable effort to abate and stop a continuing spill.
   - Make every reasonable effort to contain spilled material in such a manner that it will not reach surface or ground waters of the state.
   - Call 911 if immediate assistance is required to control, contain, or clean up the spill. If no assistance is needed in cleaning up the spill, contact the Pocatello regional office at 208-236-6160/888-655-6160 during normal working hours or Idaho State Communications Center after normal working hours (1-800-632-8000). If the spilled
volume is above federal reportable quantities, contact the National Response Center (1-800-424-8802).

- Pocatello Regional Office: 208-236-6160 / 888-655-6160

d. Collect, remove, and dispose of the spilled material in a manner approved by DEQ.

**Required Notification**
The permittee must notify the Pocatello Regional Office when authorized work begins.

**Right to Appeal Final Certification**
The final Section 401 Water Quality Certification may be appealed by submitting a petition to initiate a contested case, pursuant to Idaho Code § 39-107(5) and the “Rules of Administrative Procedure before the Board of Environmental Quality” (IDAPA 58.01.23), within 35 days of the date of the final certification.

Questions or comments regarding the actions taken in this certification should be directed to Greg Mladenka, Pocatello Regional Office, 208-236-6160, greg.mladenka@deq.idaho.gov.
