Statement of Basis
Automotive Coating Operations General Permit

Final

Kennedy’s Body & Paint Inc.
Lewiston, Idaho
Facility ID No. 069-00062
Permit to Construct P-2011.0140
Project No. 60964

December 28, 2011
Morrie Lewis
Permit Writer

The purpose of this Statement of Basis is to satisfy the requirements of IDAPA 58.01.01.et seq, Rules for the Control of Air Pollution in Idaho, for issuing air permits.
ACRONYMS, UNITS, AND CHEMICAL NOMENCLATURE

AQCR  Air Quality Control Region
Btu   British thermal units
CAS No. Chemical Abstracts Service registry number
CE    control efficiency
CFR   Code of Federal Regulations
CO    carbon monoxide
DEQ   Department of Environmental Quality
EL    screening emission levels
EPA   U.S. Environmental Protection Agency
gal/day gallons per calendar day
gal/hr  gallons per hour
gal/yr  gallons per consecutive 12 calendar month period
gr    grain (1 lb = 7,000 grains)
HAP   hazardous air pollutants
hr/yr  hours per year
HVLP  high volume, low pressure (applies to paint spray guns)
IDAPA a numbering designation for all administrative rules in Idaho promulgated in accordance with the Idaho Administrative Procedures Act
lb/gal pounds per gallon
lb/hr  pounds per hour
LPG   Liquefied Petroleum Gas
MMBtu million British thermal units
MSDS  Material Safety Data Sheets
NAICS North American Industry Classification System
NESHAP National Emission Standards for Hazardous Air Pollutants
NO₂ nitrogen dioxide
NOₓ nitrogen oxides
NSPS  New Source Performance Standards
PC    permit condition
PM₁₀ particulate matter with an aerodynamic diameter less than or equal to a nominal 10 micrometers
ppm   parts per million
PTC   permit to construct
PTE   potential to emit
Rules Rules for the Control of Air Pollution in Idaho
scf   standard cubic feet
short-term emission estimate or emission limit with an averaging period of 24 hours or less
SIC   Standard Industrial Classification
SM80  synthetic minor facility with emissions greater than or equal to 80% of a major source threshold
SO₂ sulfur dioxide
SOₓ sulfur oxides
T/yr  tons per consecutive 12-calendar month period
T2    Tier II operating permit
TAP   toxic air pollutants
TE    transfer efficiency
UTM   Universal Transverse Mercator
VOC   volatile organic compounds
FACILITY INFORMATION

Description
Kennedy’s Body & Paint Inc. is an auto body repair and refinishing facility with paint spray booth(s) which may be equipped with paint spray booth heater(s). The paint spray booth(s) are pressurized cross-draft booth(s) with glass fiber filtration media for control of particulate emissions. Drying and paint curing is done in the paint spray booth(s). Natural gas-fired burner(s) may be used to heat the paint spray booth(s). The process includes application of coatings via HVLP (or equivalent with at least 65% transfer efficiency) paint spray guns.

Permitting History
This is the initial PTC for an existing facility that was constructed in 1975-1998, thus there is no permitting history.

Application Scope
This is the initial PTC for an existing facility that was constructed in 1975-1998.

Application Chronology
December 1, 2011   DEQ received an application and a $1,500 application and processing fee.
December 7, 2011   DEQ determined that the application was complete.
December 12 – 27, 2011 DEQ provided an opportunity to request a public comment period on the application and proposed permitting action.
December 28, 2011   DEQ issued the final permit and statement of basis.

TECHNICAL ANALYSIS
The facility utilizes glass fiber filtration media for control of particulate matter emissions from the automotive coating operation. In addition, HVLP paint guns (or equivalent) are used to minimize \( PM_{10} \) and VOC emissions from painting. The HVLP (or equivalent) spray equipment will control \( PM_{10} \) and VOC emissions by having more paint transfer to the desired surfaces than traditional painting equipment.

Emission Inventories

Potential to Emit

IDAPA 58.01.01.006 defines Potential to Emit as the maximum capacity of a facility or stationary source to emit an air pollutant under its physical and operational design. Any physical or operational limitation on the capacity of the facility or source to emit an air pollutant, including air pollution control equipment and restrictions on hours of operation or on the type or amount of material combusted, stored or processed, shall be treated as part of its design if the limitation or the effect it would have on emissions is state or federally enforceable. Secondary emissions do not count in determining the potential to emit of a facility or stationary source.

Using this definition of Potential to Emit an emission inventory was developed for the automotive coating operation associated with this proposed project (see Appendix A for detailed potential to emit calculations). Criteria pollutant and HAP PTE were estimated based on the worst-case VOC, PM<sub>10</sub>, and HAP content for coatings as taken from the DEQ Automotive Coating EI spreadsheet (see Appendix A and the DEQ website).

Uncontrolled Potential to Emit

Using the definition of Potential to Emit, uncontrolled Potential to Emit is then defined as the maximum capacity of a facility or stationary source to emit an air pollutant under its physical and operational design. Any physical or operational limitation on the capacity of the facility or source to emit an air pollutant, including air pollution control equipment and restrictions on hours of operation or on the type or amount of material combusted, stored or processed, shall not be treated as part of its design since the limitation or the effect it would have on emissions is not state or federally enforceable.

The uncontrolled Potential to Emit is used to determine if a facility is a “Synthetic Minor” source of emissions. Synthetic Minor sources are facilities that have an uncontrolled Potential to Emit for criteria pollutants or HAPs above the applicable Major Source threshold without permit limits.
The following table presents the uncontrolled Potential to Emit for criteria pollutants as determined by DEQ staff. See Appendix A and the DEQ website for a detailed presentation of the calculations and the assumptions used to determine emissions for each emissions unit. For this automotive coating operation uncontrolled Potential to Emit is based upon a worst-case for operation of the facility of 2,080 hr/yr (8 hr/day x 260 days/yr) with all coating operations occurring during this time. Since there is prep time (the time spent preparing the automobile for the application of coating) and paint drying time (the time the automobile spends in the booth with the burner operating to facilitate hardening of the coating) associated with applying coatings, this was considered to be the worst-case maximum for which emissions would occur.

</tbody>
</table>

(a) Estimates provided in this summary table are for heater(s) with heat input capacity of 5.75 MMBtu/hr (combined), while the proposed heater(s) may be of lesser capacity.

The following table presents the uncontrolled Potential to Emit for HAP pollutants as determined by DEQ staff. For this automotive coating operation uncontrolled HAP emissions were calculated by using the DEQ Automotive Coating EI spreadsheet (see Appendix A, and the DEQ website) and setting paint use to 4.0 gallons per day (as limited by the permit). Then, the worst-case maximum HAPs Potential to Emit was determined for all paints listed in the spreadsheet. As discussed previously, HAP emissions were assumed to occur during the worst-case for operation of the facility of 2,080 hr/yr.

Pre-Project Potential to Emit

Pre-project Potential to Emit is used to establish the change in emissions at a facility as a result of this project. This is an existing facility. However, since this is the first time the facility is receiving a permit, pre-project emissions are set to zero for all criteria pollutants.

Post-Project Potential to Emit

Post-project Potential to Emit is used to establish the change in emissions at a facility and to determine the facility’s classification as a result of this project. Post project Potential to Emit includes all permit limits resulting from this project.

The following table presents the post-project potential to emit for criteria pollutants from all emissions units at the facility as verified by DEQ staff. See Appendix A and the DEQ website for a detailed presentation of the calculations of these emissions for each emissions unit.

a) Controlled average emission rate in pounds per hour is a short-term average, based on the proposed daily operating schedule and maximum hourly emission rate estimates.
b) Controlled average emission rate in tons per year is an annual average, based on the proposed annual operating schedule and annual limits.
c) Estimates provided in this summary table are for heater(s) with heat input capacity of 5.75 MMBtu/hr (combined), while the proposed heater(s) may be of lesser capacity.

The following table presents the post project Potential to Emit for HAP pollutants from all emissions units at the facility as determined by DEQ staff. The DEQ Automotive Coating EI spreadsheet (see Appendix A and the DEQ website) was used to determine post project Potential to Emit for HAP pollutants.

Change in Potential to Emit

The project’s change in Potential to Emit is used to determine if a public comment period may be required or if emissions modeling may be required, and to determine the processing fee per IDAPA 58.01.01.225.

The following table presents the change in the Potential to Emit for criteria pollutants as a result of this project.

2011.0140  Page 7
Non-Carcinogenic and Carcinogenic TAPs Potential to Emit

Because of the daily coating material use limits imposed by DEQ, and agreed to by the facility in applying for this Automotive Coating “General Permit”, no EL specified in IDAPA 58.01.01.585 or 586 are expected to be exceeded by the facility (see Appendix A and the DEQ website).

Ambient Air Quality Impact Analyses

Based on the daily coating material use limits imposed by DEQ and agreed to by the facility in applying for this Automotive Coating Operations General Permit, it was determined whether the PTE for the automotive coating operation exceeded DEQ modeling guideline thresholds. The following table compares the post-project facility-wide annual emissions to the DEQ modeling guideline thresholds (per the State of Idaho Air Quality Modeling Guideline, 12/31/2002).

Table 7 PTE FOR CRITERIA POLLUTANTS COMPARED TO THE DEQ MODELING GUIDELINE THRESHOLDS

<table>
<thead>
<tr>

</tr>
<tr>
<td>Lead</td>
<td>0.0000006 or 0.003 lb/mo</td>
<td>0.6 or 100 lb/month</td>
<td>No</td>
</tr>
</tbody>
</table>

Therefore the automotive coating operation did not require criteria pollutant modeling.

As presented in the DEQ Automotive Coatings EI Spreadsheet (see Appendix A and the DEQ website), there are no TAP that required facility modeling for exceeding the pounds per hour screening emission levels (EL) provided in IDAPA 58.01.01.585 and .586. Therefore the automotive coating operation did not require TAP modeling.

REGULATORY ANALYSIS

Attainment Designation (40 CFR 81.313)

Kennedy’s Body & Paint Inc. is located in Nez Perce County, which is designated as attainment or unclassifiable for PM$_{2.5}$, PM$_{10}$, SO$_2$, NO$_x$, CO, and Ozone. Refer to 40 CFR 81.313 for additional information.

Facility Classification AIRS/AFS

“Synthetic Minor” for AIRS/AFS classification for criteria pollutants is defined as the uncontrolled Potential to Emit for criteria pollutants are above the applicable major source thresholds and the Potential to Emit for criteria pollutants fall below the applicable major source thresholds. Therefore, the following table compares the uncontrolled Potential to Emit and the Potential to Emit for criteria pollutants to the Major Source thresholds to determine if the facility will be “Synthetic Minor.”
Table 8 UNCONTROLLED PTE AND PTE COMPARED TO CRITERIA POLLUTANT MAJOR SOURCE_THRESHOLDS

<table>
<thead>
<tr>
<th>Pollutant</th>
<th>Uncontrolled PTE (T/yr)</th>
<th>PTE (T/yr)</th>
<th>Major Source Thresholds (T/yr)</th>
<th>Uncontrolled PTE Exceeds the Major Source Threshold and PTE Exceeds the Major Source Threshold?</th>
</tr>
</thead>
<tbody>
<tr>
<td>PM₁₀</td>
<td>6.85</td>

<td>No</td>
</tr>
</tbody>
</table>

“Synthetic Minor” for AIRS/AFS classification for HAP pollutants is defined as the uncontrolled Potential to Emit for HAP pollutants are above the applicable major source thresholds and the Potential to Emit for HAPs pollutants fall below the applicable major source thresholds. Therefore, the following table compares the uncontrolled Potential to Emit and the Potential to Emit for HAP pollutants to the Major Source thresholds to determine if the facility will be “Synthetic Minor.”

Table 9 UNCONTROLLED PTE AND PTE COMPARED TO HAP MAJOR SOURCE_THRESHOLDS

<table>
<thead>
<tr>

<td>2.36</td>
<td>10</td>
<td>No</td>
</tr>
<tr>
<td><strong>Total</strong></td>
<td><strong>11.00</strong></td>
<td><strong>11.00</strong></td>
<td><strong>25</strong></td>
<td>No</td>
</tr>
</tbody>
</table>

As demonstrated in Table 8 the facility has an uncontrolled potential to emit for PM₁₀, SO₂, NOₓ, CO, and VOC emissions are less than the Major Source thresholds of 100 T/yr for each pollutant. In addition, as demonstrated in Table 9 the facility has an uncontrolled potential for each HAP less than the Major Source threshold of 10 T/yr and for all HAPs combined less than the Major Source threshold of 25 T/yr. Therefore, this facility is not designated as a Synthetic Minor facility.

**Permit to Construct (IDAPA 58.01.01.201)**

An application was submitted requesting a permit to construct the proposed facility. Therefore, this permitting action was processed in accordance with the procedures of IDAPA 58.01.01.200-228.

**Tier II Operating Permit (IDAPA 58.01.01.401)**

An application was submitted for a permit to construct, and an optional Tier II operating permit was not requested. Therefore, the procedures of IDAPA 58.01.01.400-410 were not applicable to this permitting action.
Visible Emissions (IDAPA 58.01.01.625)

The emissions from the automotive coating process are subject to the State of Idaho visible emissions standard of 20% opacity. This requirement is assured by Permit Condition 6.

Rules for the Control of Odors (IDAPA 58.01.01.775-776)

The facility is subject to the general restrictions for the control of odors from the facility. This requirement is assured by Permit Conditions 7 and 12.

Title V Classification (IDAPA 58.01.01.300, 40 CFR Part 70)

IDAPA 58.01.01.006.118 defines a Tier I source as “any source located at a major facility as defined in Section 008.” IDAPA 58.01.01.008.10 defines a major facility as either:

- The facility emits or has the potential to emit ten (10) tons per year (T/yr) or more of any hazardous air pollutant, other than radionuclides, or
- The facility emits or has the potential to emit twenty-five (25) T/yr or more of any combination of any hazardous air pollutants, other than radionuclides.

Uncontrolled HAP emissions were calculated by using the DEQ Automotive Coating EI spreadsheet (see Appendix A, and the DEQ website) and setting paint use to 4.0 gallons per day (as limited by the permit). Then worst-case HAP emissions were determined for all paints listed in the spreadsheet. Then emissions were assumed to occur 2,080 hours per year as a worst-case assumption.

The following table compares the post-project facility-wide annual worst-case uncontrolled emission rate for all HAPs emitted by the source to the HAPS Major Source thresholds in order to determine if the facility is a HAPs Major Source.

<table>
<thead>
<tr>
<th>HAP Pollutants</th>
<th>PTE (T/yr)</th>

<td>2.36</td>
<td>10</td>
<td>No</td>
</tr>
<tr>
<td><strong>Total</strong></td>
<td><strong>11.00</strong></td>
<td><strong>25</strong></td>
<td><strong>No</strong></td>
</tr>
</tbody>
</table>

As presented in the preceding table the PTE for each HAP is less than 10 T/yr and the PTE for all HAP combined is less than 25 T/yr. Therefore, this facility is not a HAPs Major Source subject to Tier I permitting requirements.

As discussed previously the facility is located in Nez Perce County (AQCR 62), which is designated as unclassifiable/attainment for PM$_{2.5}$, PM$_{10}$, SO$_2$, NO$_x$, CO, and Ozone for federal and state criteria air pollutants. Therefore, the following table compares the post-project facility-wide annual PTE for all criteria pollutants emitted by the source to the applicable criteria pollutant Major Source thresholds in order to determine if the facility is a criteria pollutant Major Source.
Table 11  PTE COMPARED TO CRITERIA POLLUTANT MAJOR SOURCE THRESHOLDS

<table>
<thead>
<tr>

<td>No</td>
</tr>
<tr>
<td>VOC</td>
<td>12.32</td>
<td>100</td>
<td>No</td>
</tr>
</tbody>
</table>

As presented in the preceding table the PTE for each criteria pollutant is less than 100 T/yr. Therefore, this facility is not a criteria pollutant Major Source subject to Tier I permitting requirements.

**PSD Classification (40 CFR 52.21)**

The facility is not a major stationary source as defined in 40 CFR 52.21(b)(1), nor is it undergoing any physical change at a stationary source, not otherwise qualifying under paragraph 40 CFR 52.21(b)(1) as a major stationary source, that would constitute a major stationary source by itself as defined in 40 CFR 52. Therefore, in accordance with 40 CFR 52.21(a)(2), PSD requirements are not applicable.

**NSPS Applicability (40 CFR 60)**

The facility is not subject to any NSPS requirements.

**NESHAP Applicability (40 CFR 61)**

The facility is not subject to any NESHAP requirements in 40 CFR 61.

**MACT Applicability (40 CFR 63)**

40 CFR 63, Subpart HHHHHH.......................... National Emission Standards for Hazardous Air Pollutants: Paint Stripping and Miscellaneous Surface Coating Operations at Area Sources

40 CFR 63.11169.................................................. What is the purpose of this subpart?

In accordance with §63.11169, subpart HHHHHH establishes national emission standards for hazardous air pollutants (HAP) for area sources involved in auto body refinishing operations that encompass motor vehicle and mobile equipment spray-applied surface coating operations.

40 CFR 63.11170.................................................. Am I subject to this subpart?

In accordance with §63.11170(a), this automotive coating operation is subject to this subpart because the facility will be operated as an area source of HAP. The facility is a source of HAP that is not a major source of HAP, is not located at a major source, and is not part of a major source of HAP emissions. In addition, the facility will perform one or more activities listed in this section, including spray application of coatings, as defined in §63.11180, to motor vehicles and mobile equipment including operations that are located in stationary structures at fixed locations.

40 CFR 63.11171.................................................. How do I know if my source is considered a new source or an existing source?

In accordance with §63.11171(b), the automotive coating operation is the collection of mixing rooms and equipment; spray booths, curing ovens, and associated equipment; spray guns and associated equipment; spray gun cleaning equipment; and equipment used for storage, handling, recovery, or recycling of cleaning solvent or waste paint. Paint stripping was not proposed as a business activity.
In accordance with §63.11171(c), this automotive coating operation is an existing source because it commenced construction prior to September 17, 2007, by installing new paint stripping or surface coating equipment, and the new surface coating equipment will be used at a source that was actively engaged in paint stripping and/or miscellaneous surface coating prior to September 17, 2007.

40 CFR 63.11172 ........................................... When do I have to comply with this subpart?

In accordance with §63.11172(a)(2), because the initial startup of the facility occurred prior to January 9, 2008, the compliance date is January 10, 2011.

40 CFR 63.11173 ........................................... What are my general requirements for complying with this subpart?

Because the facility has not proposed paint-stripping activities, the requirements of §63.11173(a) through (f) are not applicable. Because the facility is an automotive coating operation, in accordance with §63.11173(e), the permittee must meet the requirements in paragraphs (e)(1) through (e)(5) of this section.

In accordance with §63.11173(f), each owner or operator of an affected automotive coating operation must ensure and certify that all new and existing personnel, including contract personnel, who spray apply surface coatings, as defined in §63.11180, are trained in the proper application of surface coatings as required by paragraph (e)(1) of this section. The training program must include, at a minimum, the items listed in paragraphs (f)(1) through (f)(3) of this section.

In accordance with §63.11173(g), as required by paragraph (e)(1) of this section, all new and existing personnel at an affected motor vehicle and mobile equipment or miscellaneous surface coating source, including contract personnel, who spray apply surface coatings, as defined in §63.11180, must be trained by the dates specified in paragraphs (g)(1) and (2) of this section. Employees who transfer within a company to a position as a painter are subject to the same requirements as a new hire.

Compliance with these requirements is assured by Permit Condition 16.

40 CFR 63.11174 ........................................... What parts of the General Provisions apply to me?

In accordance with §63.11174(a), Table 1 of this subpart shows which parts of the general provisions in Subpart A apply. Compliance with these requirements is assured by Permit Condition 16.

In accordance with §63.11174(b), an owner or operator of an area source subject to this subpart is exempt from the obligation to obtain a permit under 40 CFR part 70 or 71 provided that a permit under 40 CFR 70.3(a) or 71.3(a) is not required for a reason other than becoming area source subject to this subpart. This permit application and permitting action involve a permit to construct, and will not utilize the requirements and procedures in IDAPA 58.01.01.300-399 for the issuance of Tier I operating permits.

40 CFR 63.11175 ........................................... What notifications must I submit?

In accordance with §63.11175(a), because the facility is a surface coating operation subject to this subpart, the initial notification required by §63.9(b) must be submitted. For this existing operation, the initial notification must be submitted no later than on or before January 11, 2011.

In accordance with §63.11175(b), because the facility is an existing source, the permittee is not required to submit a separate notification of compliance status in addition to the initial notification specified in paragraph (a) of this subpart provided the permittee was able to certify compliance on the date of the initial notification, as part of the initial notification, and the permittee’s compliance status has not since changed. The permittee must submit a notification of compliance status on or before March 11, 2011. The permittee is required to submit the information specified in paragraphs (b)(1) through (4) of this section with the notification of compliance status.

Compliance with these requirements is assured by Permit Condition 18.
What reports must I submit?

In accordance with §63.11176(a), because the permittee is an owner or operator of a paint stripping, motor vehicle or mobile equipment, or miscellaneous surface coating affected source, the permittee is required to submit a report in each calendar year in which information previously submitted in either the initial notification required by §63.11175(a), notification of compliance, or a previous annual notification of changes report submitted under this paragraph, has changed. Deviations from the relevant requirements in §63.11173(a) through (g) on the date of the report will be deemed to be a change. The annual notification of changes report must be submitted prior to March 1 of each calendar year when reportable changes have occurred and must include the information specified in paragraphs (a)(1) through (2) of this section.

Compliance with these requirements is assured by Permit Condition 19.

Because the facility has not proposed to conduct paint stripping operations, the MeCl minimization plan requirements are not applicable (see Permit Condition 9).

What records must I keep?

In accordance with §63.11177, because the permittee is the owner or operator of a surface coating operation, the permittee must keep the records specified in paragraphs (a) through (d), (g), and (h) of this section. Because the permittee has not proposed to conduct paint stripping operations, the requirements of paragraphs (e) and (f) of this section are not applicable. Compliance with these requirements is assured by Permit Condition 17.

In what form and for how long must I keep my records?

In accordance with 40 CFR 63.11178(a) because the permittee is the owner or operator of an affected source, the permittee must maintain copies of the records specified in §63.11177 for a period of at least five years after the date of each record. Copies of records must be kept on site and in a printed or electronic form that is readily accessible for inspection for at least the first two years after their date, and may be kept off-site after that two year period. Compliance with these requirements is assured by Permit Condition 17.

Who implements and enforces this subpart?

In accordance with §63.11179(a), this subpart can be implemented and enforced by the U.S. Environmental Protection Agency (EPA), or a delegated authority. At the time of this permitting action, the EPA has not delegated authority to the State of Idaho. However, IDAPA 58.01.01.107.03.i incorporates by reference all Federal Clean Air Act requirements including 40 CFR 63, Subpart HHHHHH. Therefore, the requirements of this subpart have been placed in the permit.

What definitions do I need to know?

Terms used in this subpart are defined in accordance with §63.11180.

**Permit Conditions Review**

This section describes the permit conditions for this initial permit.

Permit Condition 1 establishes the permit to construct scope.

Permit Condition 2 provides a description of the regulated sources and the control equipment used at the facility.

Permit Condition 3 provides a process description of the facility.

Permit Condition 4 provides a description of the control devices used at the facility.

Permit Condition 5 establishes hourly and annual emission limits for PM$_{10}$ and VOC emissions from the automotive coating operation.

Permit Condition 6 incorporates opacity limits for the paint booth stacks, vents, or functionally equivalent openings associated with the automotive coating operation in accordance with IDAPA 58.01.01.625.

Permit Condition 7 incorporates odor limits that the permittee shall not allow, suffer, cause, or permit the emission of odorous gasses, liquids, or solids to the atmosphere in such quantities as to cause air pollution in accordance with IDAPA 58.01.01.776.
Permit Condition 8 establishes that only natural gas and/or LPG is allowed to be used as fuel in the paint spray booth heater(s) as proposed by the applicant.

Permit Condition 9 establishes that the facility will not use MeCl to remove paint from vehicles at the facility. This was done because MeCl was not proposed by the applicant to be used at this facility and the emissions were not included in the DEQ Automotive Coating EI Spreadsheet (see Appendix A, and the DEQ website). In addition, Subpart HHHHHH has additional requirements for facilities that use MeCl to remove paint as mentioned previously in the discussion of Subpart HHHHHH in the MACT Applicability Section.

Permit Condition 10 establishes a daily use limit for all coating materials used in the automotive coating process as proposed by the applicant. This limit was established to ensure compliance with the PM₁₀ and VOC emission limits specified in Permit Condition 5 and the TAP emission estimates specified in the DEQ Automotive Coating EI Spreadsheet (see Appendix A and the DEQ website).

Permit Condition 11 incorporates the Subpart HHHHHH requirement that the permittee conducts all automotive coating operations in the paint spray booth or preparation station with the filters in place, exhaust fan(s) operating, and door(s) or curtain(s) closed, that the operation shall use a HVLP spray gun, and that the permittee shall maintain and operate the spray paint booth and preparation station exhaust filter systems in accordance with the manufacturer’s specifications. This condition also defines a paint spray booth and preparation station.

Permit Condition 12 establishes that the permittee shall maintain records of all odor complaints received, perform appropriate corrective actions, and maintain records of corrective actions taken at the facility for the automotive coating process. This was required because automotive operation operations are expected to have odors that might be offensive to their immediate neighbors.

Permit Condition 13 establishes that the permittee shall maintain material purchase records and Material Safety Data Sheets (MSDS) for the automotive coating process. This condition was placed in the permit to ensure compliance with the Coating Materials Use Limit permit condition.

Permit Condition 14 establishes that the permittee shall maintain daily usage records of pre-treatment wash primers, primers, topcoats, clear coats, and thinners/reducers materials used for the automotive coating process. This condition was placed in the permit to ensure compliance with the Coating Materials Use Limit permit condition.

Permit Condition 15 establishes that the permittee shall maintain records as required by the General Provision recordkeeping requirements.

Permit Condition 16 incorporates requirements that will allow the facility to comply with the general operating requirements of 40 CFR 63, Subpart HHHHHH – MACT Standards and Management Practices for Paint Stripping and Miscellaneous Coating Operations unless the facility is exempt from HHHHHH.

Permit Condition 17 incorporates requirements that will allow the facility to comply with the monitoring and recordkeeping requirements of 40 CFR 63, Subpart HHHHHH – MACT Standards and Management Practices for Paint Stripping and Miscellaneous Coating Operations unless the facility is exempt from HHHHHH.

Permit Condition 18 incorporates requirements that will allow the facility to comply with the initial notification and reporting requirements of 40 CFR 63, Subpart HHHHHH – MACT Standards and Management Practices for Paint Stripping and Miscellaneous Coating Operations unless the facility is exempt from HHHHHH.

Permit Condition 19 incorporates requirements that will allow the facility to comply with the annual notification and reporting requirements of 40 CFR 63, Subpart HHHHHH – MACT Standards and Management Practices for Paint Stripping and Miscellaneous Coating Operations unless the facility is exempt from HHHHHH.

Permit Condition 20 establishes that the federal requirements of 40 CFR Part 63 were incorporated by reference into the requirements of this permit per current DEQ guidance and as provided in IDAPA 58.01.01.107.
PUBLIC REVIEW

Public Comment Opportunity

An opportunity for public comment period on the application was provided in accordance with IDAPA 58.01.01.209.01.c. During this time, there were no comments on the application and there was not a request for a public comment period on DEQ’s proposed action. Refer to the Application Chronology for public comment opportunity dates.
APPENDIX A – EMISSION INVENTORIES

Coating Operation Emission Calculations:

A daily coatings material use limit was established for automotive coating operations to demonstrate compliance with applicable ambient air quality standards. Specifically, compliance with IDAPA 58.01.01.585 and 586 for toxic air pollutants (TAP) needs to be determined. Therefore, DEQ staff created the DEQ Automotive Coating EI spreadsheet (see the following pages and the DEQ website). This spreadsheet contains paints from different manufacturers of paints used in the automotive coating industry and multiple paint systems for each brand. The paint brands chosen were based upon discussions with a national paint distributor with several stores throughout the state of Idaho. The TAP data entered in the spreadsheet was taken from the MSDS for the paints listed. Included in the calculations was a safety factor of 20% since all paints available were not analyzed. With this safety factor it is reasonably presumed that the data represents all available automotive coatings. The spreadsheet was then used to demonstrate that with 4.0 gallons per day of coating use, the EL listed in IDAPA 58.01.01.585 and 586 was not exceeded for any of the coatings listed in the spreadsheet. The 4.0 gallons per day of coating was then used to determine worst-case PM$_{10}$ and VOC emissions from Automotive Coating operations (see the calculations as follows).

Uncontrolled emissions are based upon normal operation of the facility of 2,080 hr/yr (8 hr/day x 260 days/yr, normal business hours) with all coating operation occurring during this time. Since there is inherent prep time (the time spent preparing the automobile for the application of coating) and paint drying time (the time the automobile spends in the booth with the burner operating to facilitate hardening of the coating) this was considered to be the worst-case maximum for which emissions could occur.

Therefore, uncontrolled annual PM emissions are calculated using the annual PTE as calculated and backing out the 98% control efficiency of the filter system.

Emission estimates are provided in the following pages.

Paint Spray Booth Heater Emission Calculations:

To determine worst-case emissions from the paint spray booth heater(s) the maximum heat input rating of the burner was assumed to be 5.75 MMBtu/hr with operation of 2,080 hr/yr.

As discussed previously, uncontrolled emissions were based upon normal operation of the facility of 2,080 hr/yr. Therefore, uncontrolled annual criteria pollutant emissions are calculated using the annual criteria pollutant PTE as calculated.

As discussed previously, uncontrolled emissions were based upon normal operation of the facility of 2,080 hr/yr. Therefore, uncontrolled annual criteria pollutant emissions are calculated using the annual criteria pollutant PTE as calculated.

Emission estimates from the spreadsheet are provided in the following pages.

### Assumptions when estimating spray booth heater emissions:

- Maximum gas-fired heater size: 0.75 MMMBtu/hr
- Maximum oil-fired heater size: 0.00 MMMBtu/hr
- Annual heater operation: 2,090 hours
- Natural gas sulfur content: 15 g/100 lb sulfur weight content
- Fuel type: natural gas, LP gas only
- Heaters: single/maximum

### Assumptions when estimating spray booth emissions:

- Maximum coating use rate: 4.00 gallons for all coatings (excluding "B" component)
- Averaging period: 24 months
- Annual booth operation: 8,760 hours
- Transfer efficiency: 0.00 control for particulates
- Benzene: 0.60 control for particulates
- Isocyanate reaction factor: 0.00 control for isocyanates (not applied to RDI)
- Maximum coating density: 16.7 kg/m<sup>3</sup>
- 12.5% odor/mass for isocyanates in hardcoat mixture
- No M<sub>2</sub> of PA compared in the MSU<sub>2</sub>, then 1.0% was assumed
